

No mistake can be greater than to suppose that the Lords are the expression of the public opinion, and that they yielded to the pressure of public causes especially when they make a measure by which the people have been taken in some measure by surprise; in consequence of the promptitude with which the last clauses of the bill were agreed to in the House of Commons, and they must make up for the time which has been lost by using promptly that which remains. In all probability, this is the very last effort which will be called on to make in favour of reform—certainly it will be the last, if it is made with the spirit and unanimity with which it ought to be.

The citizens of London, who are always the first in every public-spirited undertaking, have already assembled, and agreed to petition the upper House, and we hope that we shall be able to announce next week that the inhabitants of Liverpool and of other towns have imitated the example. It is quite evident that there is no time to be lost; indeed the people have been taken in some measure by surprise; in consequence of the promptitude with which the last clauses of the bill were agreed to in the House of Commons, and they must make up for the time which has been lost by using promptly that which remains. In all probability, this is the very last effort which will be called on to make in favour of reform—certainly it will be the last, if it is made with the spirit and unanimity with which it ought to be.

It will probably be remembered by most of our readers, that the great efforts which were made some months ago were principally designed and calculated to confirm the KING in his determination, and to influence the House of Commons. It was thought useless to petition the upper House weeks, and even months, before the bill was likely to come before it, but it was always understood that a great and unanimous effort ought to be made to influence their Lordships at the proper time. That time has now at last arrived; in another week the bill will be before the Lords; and the present week ought not to be allowed to pass away without meetings in all parts of the country. The citizens of London, who are always the first in every public-spirited undertaking, have already assembled, and agreed to petition the upper House, and we hope that we shall be able to announce next week that the inhabitants of Liverpool and of other towns have imitated the example. It is quite evident that there is no time to be lost; indeed the people have been taken in some measure by surprise; in consequence of the promptitude with which the last clauses of the bill were agreed to in the House of Commons, and they must make up for the time which has been lost by using promptly that which remains. In all probability, this is the very last effort which will be called on to make in favour of reform—certainly it will be the last, if it is made with the spirit and unanimity with which it ought to be.

Lords.

people to decide whether it shall proceed triumphantly through the remainder of its course, or be strangled in the House of the bill is carried, and it depends in a great measure on the bill, the whole bill, and (we may almost say) nothing but whole bill, is a mere spot on the face of the sun. So far the jury of this clause, when compared with the benefits of the conferring the right of voting on tenants at will; but the in- aspect of any importance is it altered, namely, in the clause amendments of its friends and its enemies. In only one re- the hands of Ministers, having escaped uninjured from the House the same in all essential points as when it came from carried up to the House of Lords. It will enter the upper sent week is ended, it will probably be read a third time and measure ever met with in that assembly; and before the pre- none, after encountering such an opposition as no previous made its

PREFACE.

THE Author having been long impressed with the paramount importance, to those employed in Agricultural pursuits, Cattle dealers, &c., of a cheap, concise, and portable volume of reference, in certain commercial transactions, incidental to their occupations, which involve calculation, and where accuracy and despatch are highly desirable, has attempted to supply the desideratum, by publishing the present work. At Markets, or Public Rouns of Farm Produce, &c. where frequent mistakes must necessarily occur, from hurry and bustle, he trusts that the Ready Reckoner will prove an auxiliary. In the department of Land-measuring, he has laid down such rules and examples, as, he flatters himself, will elucidate and simplify the subject to the Land-owner and Farmer. Neither minute investigation nor experiment has been spared to render the two last parts, viz., Hay and Cattle-measuring, generally useful. A great number of Haystacks and Ricks have been measured and estimated by the rules given in the work, and the weight by measurement found to agree, to a few stones, with the

real weight. Above 200 Live Cattle have also been measured for experiment and the weight by measurement, found to coincide, very nearly, as will be seen by reference to Part 4th, with the actual weight. The Author's chief aim has been, to give as comprehensive a description of each branch, as the limits of the work would permit, and accordingly, in addition to the rules, examples, and tables; a variety of engravings will be found in the body of the work, and a number of notes appended; at the same time he has studied to be as concise as was compatible with perspicuity.

In conclusion, the author begs leave to express his grateful sense of the distinguished patronage he has received from the gentlemen of landed property in the vicinity. To the agricultural class of the community he also feels peculiarly grateful for their cordial encouragement, and for much useful practical information, on the various subjects embraced.

CONTENTS.

PART FIRST,—A Ready Reckoner, showing the price of an acre, and any number of falls in crop, from 10s. to £18.	3
PART SECOND,—Land-Measuring Simplified,	93
PART THIRD,—Hay Measuring. Tables, showing the weight of Ricks from 11 to 707 stones, of 16 lbs., each 24 oz. avoird. Rule for finding the capacity of a Waggon or Cart, and the number of cubic yards in a Dunghill, &c.	117
PART FOURTH,—Cattle Measuring. Tables, showing the weight of the four quarters of Live Cattle, &c., from 2 st. 10 lbs. to 129 st. 7 lbs. Imperial,	147

Part First.

READY RECKONER.

THE following Tables show the price of an Acre, and any number of Falls in crop of any kind, at 10s. 11s., 12s., 13s., &c. to £18; hence, the value of a lot, consisting of several portions, may be easily found by the addition of their respective prices:— Thus, a lot purchased at £5 : 13s. per acre, containing 1 acre 3 roods and 35 falls.

Look into the table under	£5 13 0 per acre.
120 falls, or 3 roods,	4 4 9
35 falls,	1 4 8½
	£11 2 5½ value of the lot.

Should there be $\frac{1}{3}$, $\frac{1}{2}$, or $\frac{2}{3}$ ths of a fall in the lot, the price of the fall will be found at the bottom of the column, of which take $\frac{1}{3}$, $\frac{1}{2}$, or $\frac{2}{3}$ ths for the price of the fractional part.

Again, should there be an odd 6d. in the price per acre, the value of the lot may be ascertained, as in the following example.

Thus, a lot purchased at £7 : 3 : 6d. per acre, containing 1 acre and 39 falls; find the value at

£7 3s. and £7 4s. ; half the sum will be the value of the lot.

1 acre,	£7 3 0
39 falls,	1 14 10½
	<hr/>
	£8 17 10½

1 acre,	£7 4 0
39 falls,	1 15 1
	<hr/>
	8 19 1
	8 17 10½

2) 17 16 11½ sum.

8 18 5½ value required.

Again, should the price per acre be below 10s. the lowest rate in the tables, the value may be found by division; if, for instance, the price be at 5s. per acre, it is obvious that the value will be exactly the half of what it is at 10s.; and half the value at 11s. will be the value at 5s. 6d. &c. to 9s. 6d.

At 10s. p. Acre			At 11s. p. Acre			At 12s. p. Acre			At 13s. p. Acre			At 14s. p. Acre

END OF PART FIRST.

Part Second.

LAND MEASURING SIMPLIFIED.

Table of English Land Measure.

144 square inches	= 1 square foot.
9 square feet	= 1 square yard.
30 $\frac{1}{4}$ square yards	= 1 square pole.
40 poles	= 1 rood.
4 roods	= 1 acre.

10 sq. chains, or 100,000 sq. links = 1 acre.

The English chain for measuring land is 4 poles, or 2 yards, or 66 feet in length, and is composed of 100 equal links, each 7.92 inches long.

Table of Scotch Land Measure.

144 square inches,	= 1 square foot.
1369 square inches	= 1 square ell.
36 square ells	= 1 square fall.
40 falls	= 1 rood.
4 roods	= 1 acre.

10 sq. chains, or 100,000 sq. links, = 1 acre.

The Scotch chain for measuring land is 4 falls, or 24 ells, or 74 feet in length, and is composed of 100 equal links, each 8.88 inches long.

To Reduce Scotch Acres to English.

1089 : 1369 : : Scotch acres : English.

To Reduce English Acres to Scotch.

1369 : 1089 : : English Acres : Scotch.

How many English acres are in 10 Scotch ?

1089 : 1369 : : 10 : 12 ac. 2 ro. 11p. 11 yds. 6 feet.

How many Scotch acres are in 12 English ?

1369 : 1089 : : 12 : 9 ac. 2 ro. 7 falls 10 ells 9 feet.

The work, however, may be shortened by this approximation :

44 : 35 : : English acres : Scotch, nearly.

35 : 44 : : Scotch acres : English, nearly.

To find the Area of a Square.

Multiply the side by itself ; the product will be the area.

$$462 \times 462 = 213444^*$$

$$\begin{array}{r} 4 \\ \hline \cdot 53776 \\ 40 \\ \hline 21\cdot 51040 \end{array}$$

2 ac. 21 falls.

* In measuring land it is better to note down the distances in links, than in chains and decimals ; the content will thus be found in square links, in reducing which to acres, divide by 100,000 ; but instead of setting down the divisor, point off five figures on the right as decimals, the rest will be acres ; multiply the decimal part

To find the Area of a Rectangle.

Multiply the length by the breadth; the product will be the area.

$$826 \times 382 = 315532$$

$$\begin{array}{r} 4 \\ \hline 32128 \\ 40 \\ \hline 2485120 \end{array}$$

3 acres 24 falls.

*To find the Area of a Rhombus or Rhomboid.*

Multiply the base by the perpendicular* height, the product will be the area.

$$480 \times 372 = 178560$$

$$\begin{array}{r} 4 \\ \hline 314240 \\ 40 \\ \hline 569600 \end{array}$$

1 acre 3 roods 5 falls.

by four for roods, and point off five figures for decimals as before, the rest will be roods; again, multiply the decimal part by forty for falls, and five figures being pointed as before for decimals, the rest will be falls, &c.

* To raise a perpendicular from the chain line to an angular point, let the chain lie extended on the line, hold a straight rod or an offset staff, across the chain at right angles, observe, if the point of the staff be direct to the angular point, if not, move towards the right or left on the chain till the point of the staff be direct to the angular point, then you are at the point in the chain line, from which the perpendicular is to be measured.

$$\begin{array}{r}
 626 \times 210 = 131460 \\
 4 \\
 \hline
 125840 \\
 40 \\
 \hline
 1033600
 \end{array}$$

1 acre 1 rood 10 falls.

To find the Area of a Triangle.

Multiply the base by the perpendicular height; half the product will be the area.

$$\begin{array}{r}
 442 \times 320 \div 2 = 70720 \\
 4 \\

Area, 2 acres 2 roods $2\frac{1}{2}$ falls.

To find the Circumference of a Circle, when the Diameter is given.

Multiply the diameter by 3.1416; the product will be the circumference.

$$860 \times 3.1416 = 2701.7760 \text{ circumference.}$$

To find the Diameter when the Circumference is given.

Divide the circumference by 3.1416; the quotient will be the diameter.

Circumference.

$$2701.7760 \div 3.1416 = 860 \text{ diameter.}$$

To find the Area of a Circle when both the Circumference and Diameter are given.

Multiply the circumference by the diameter; the fourth part of the product will be the area.

Circumference. Diameter.

$$270.1776 \times 86 \div 4 = 5808.8184$$

$$\begin{array}{r} \text{.23235.2736} \\ \hline 40 \end{array}$$

$$\text{Area, 9 falls} = 9.29410.9440$$

When the Diameter only is given.

Multiply the square of the diameter by .7854; the product will be the area.

Diameter.

$$86 \times 86 \times .7854 = 5808.8184$$

$$\begin{array}{r} \text{.23235.2736} \\ \hline 40 \end{array}$$

$$\text{Area, 9 falls} = 9.29410.9440$$

When the Circumference only is given.

Multiply the square of the circumference by .07958; the product will be the area.

Circumference.

$$270.1776 \times 270.1776 \times .07958 = 5809.01655$$

$$\begin{array}{r} \text{.23236.06620} \\ \hline 40 \end{array}$$

$$\text{Area, 9 falls} = 9.29442.64800$$

To measure Offsets.

When a boundary of a field or any other piece of land is not straight, measure a straight line as near to it as convenient, observing also to measure a perpen-

dicular from the base to each bend or angular point of the boundary as you pass it; the offsets will thus form right angled triangles, or trapezoids. Draw a sketch of the piece, and upon it note down the length of each perpendicular; and also the length of each distance on the base between the perpendiculars or angular points, should the boundary line touch the base. Then multiply the base of each triangle by its perpendicular; multiply also the sum of the two parallel sides of each trapezoid, by the length of the base between them. Add all the products together; half their sum will be the area.

$$190 \times 52 = 9880 \text{ Triangle.}$$

$$96 \times 76 = 7296 \text{ do.}$$

$$(76 + 62) = 138 \times 100 = 13800 \text{ Trapezoid.}$$

$$(62 + 82) = 144 \times 98 = 14112 \text{ do.}$$

$$(82 + 79) = 161 \times 162 = 26082 \text{ do.}$$

$$(79 + 48) = 127 \times 94 = 11938 \text{ do.}$$

$$(48 + 82) = 130 \times 102 = 13260 \text{ do.}$$

$$(82 + 52) = 134 \times 161 = 21574 \text{ do.}$$

Area, 1 acre 1 rood 34 falls.

To find the Area of a Field when its Fences or Boundaries are not Straight.

Walk over the field and draw a sketch of its boundaries, dividing it into as many triangles, trapeziums or trapezoids, as will give the content accurately, and be attended with the least labour in measuring. Note down the length of each base and perpendicular as it is measured; then calculate the area of each triangle, trapezium or trapezoid separately—the sum of their areas will be the area of the field. Observe—The numbers should be noted down on the sketch so that they may all read from O, that is, the point where the measurement commenced.

$$375 \times 68 = 25500 \text{ Triangle.}$$

K

To find the Area of a Marsh, or any piece of Land when the necessary Interior Lines cannot be measured.

Measure any right lined figure, surrounding the marsh, most suitable to its form, having one or more right angles, so that the area of the surrounding figure may be found independently of the interior lines; next, find the area of the space between the boundaries of the marsh, and the lines of the surrounding figure, by measuring perpendiculars from those lines, to all the bends and corners of the marsh; then compute the areas of the small parts without the marsh, by the former rules; the sum of their areas will be the area of the space between the boundaries of the marsh, and the lines of the surrounding figure; subtract this area from the area of the surrounding figure, and the remainder will be the area of the marsh. This will be easily understood by referring to the following example:

The area of the large rectangle, A B C D, is found by multiplying the length, A B, by the breadth, B C, the area of each of the small rectangles is found in a similar manner, and for the area of each of the small trapezoids, multiply the sum of the two parallel sides, by the direct distance between them; half the product will be the area.

$$115 \times 120 = 13800 \text{ Rectangle.}$$

$$225 \times 160 = 36000 \text{ do.}$$

$$325 \times 70 = 22750 \text{ do.}$$

$$125 \times 280 = 35000 \text{ do.}$$

$$(115 + 50) = 165 \times 410 \div 2 = 33825 \text{ Trapezoid.}$$

$$(50 + 225) = 275 \times 170 \div 2 = 23375 \text{ do.}$$

$$(160 + 70) = 230 \times 470 \div 2 = 54050 \text{ do.}$$

$$(325 + 60) = 385 \times 280 \div 2 = 53900 \text{ do.}$$

$$(60 + 125) = 185 \times 230 \div 2 = 21275 \text{ do.}$$

$$(280 + 100) = 380 \times 280 \div 2 = 53200 \text{ do.}$$

$$(100 + 160) = 260 \times 300 \div 2 = 39000 \text{ do.}$$

$$(160 + 120) = 280 \times 325 \div 2 = 45500 \text{ do.}$$

431675

$$1020 \times 860 = 877200$$

$$\underline{\quad\quad\quad} 481675$$

To measure off a certain portion of a Field, when there are Offsets on the given line, and on those adjoining, and the Offsets to be included in the portion.

In the following example, subtract the area of the offsets on the given line, A B, from the portion required; divide the remainder in links, by the number of links in the given line; the quotient will show the length to be taken on the adjoining lines, A C and B D, but the figure, A G B K D C H, will exceed the portion required by the area of the offsets on the lines, A C and B D, on which account, find the area of the offsets on the lines, A C and B D, in links; divide them by the number of links in the given line; the quotient will be the length to be taken back on the lines, A C and B D, that is, from C to e, and from D to m; but the figure, A G B K m e H, will come short of the portion required by the area of the offsets between C e and D m; find the area of these offsets in links; then divide them by the number of links in the line, e m, this quotient added to the length, A e and B m, will be the

length $A r$ and $B s$, where the line of division ought to be drawn.

Measure off 4 acres 2 roods 30 falls, from the following example ; the given line $A B$ being 500 links long.

END OF PART SECOND.

Part Third.

HAY MEASURING.

*How to ascertain the Weight of Hay Stacks and Ricks
by Measurement.*

FIND how many cubic yards the stack contains ; ascertain as nearly as possible the density of the hay, by thrusting a smooth pointed pole about an inch in diameter, from the side of the stack to the centre, judging from the force requisite, which will, of necessity, vary in different stacks according to their density. The kind and quality of the hay,* the soil where it grew,† the degree of ripeness when cut, the state of the weather when

* Perennial ryegrass hay will, in a stack, weigh more per cubic yard, than annual. When either of these kinds is mixed with clover or woolly soft grass, or what is called hose-grass, it will weigh less per cubic yard, than when unmixed. Bog or meadow hay will, in general, weigh more per cubic yard, than ryegrass.

† Hay produced from a good clayey or loamy soil will weigh more per cubic yard than from dry, green cropping land. Hay from a black, mossy, and moorish soil, will weigh less per cubic yard than that from either a good clayey or loamy soil.

making,* and the time it has remained in the stack,† must also be considered, as the weight per cubic yard will depend, to a certain extent, on these circumstances

A Statement of a few of the Stacks and Ricks that were measured for Experiment.

	Cubic Yards.	Stones.	Weight by mea- sure- ment.	Actual Weight
Rick of 10 days' standing,	68 × 4½		306	300
Do. 2 months do.	63 × 5		315	320
Do. 6 months do.	53 × 6		318	322
Stack 6 days do.	52 × 6		312	305
Do. 8 days do.	49 × 6		294	300
Do. 12 days do.	93 × 5½		496	498
Do. 3 months do.	94 × 7		658	670
Do. 3 months do.	128 × 7½		960	950
Do. 8 days do.	140 × 6½		910	900
Do. 8 days do.	290 × 6½		1885	1859
Do. 8 days do.	181 × 6½		1176	1191
Do. 11 months do.	208 × 8½		1768	1751
Do. 4 months do.	205 × 7½		1537	1500
Do. 1 month do.	528 × 7½		3960	3940
Do. 8 days do.	692 × 9		6228	6321

* Hay that has been cut immediately after the flower is fully off, and well preserved from the weather, will weigh more per cubic yard, than hay of the same kind that has been fully ripened and more exposed.

† Ryegrass hay stacks of 8 or 10 days standing, in ordinary cases, from 50 to 100 cubic yards will weigh from 5 to 6 stones of 24 lbs., each 16 oz. avoird.

100 to 300 6 to 7
300 to 600 7 to 8

The same after standing 3 or 4 months.

From 50 to 100 cubic yards will weigh from 5½ to 6½ stones &c.

100 to 300 6½ to 7½
300 to 600 7½ to 8½

PROBLEM I. CASE I.

To measure a Hay Stack when the lower part is like a parallelepiped, and the upper like a prism of a triangular form,

RULE. Take the dimensions in feet and inches, and to the height from the bottom to the eaves, add $\frac{1}{2}$ of the perpendicular height from the eaves to the top, for the mean height—multiply the mean length by the mean breadth, and the product again by the mean height, the last product divided by 27, will be the content in cubic yards.

EXAMPLE. How many cubic yards and stones of hay are in a stack, the mean length being 50 feet, the mean breadth 18, the height from the bottom to the eaves 12, and from the eaves to the top 8, allowing $7\frac{1}{2}$ stones to the cubic yard?

After standing 5 or 6 months.

From 50 to 100 cubic yards will weigh, from 6 to 7 stones &c.

100 to 300	7 to 8
300 to 600	9 to 10

The weight per cubic yard, of a hay stack will scarcely increase after five or six months, for although the stack after standing this time decreases in size, and would require to be estimated at more per cubic yard to bring the original weight, yet the weight of the stack decreases also, in consequence of its being exposed to frost, March winds and drought in summer.

$$50 \times 18 \times 16 \div 27 = 533.3 \text{ cubic yards.}$$

$$7\frac{1}{2}$$

266.6
3733.3

4000 stones.

CASE II. *When the lower part is formed like a Prismoid, and the upper like a wedge, whose edge is shorter than its base.*

RULE. Take the dimensions in feet and inches, and to the product of the mean length and breadth at the bottom, add the product of the mean length and breadth at the eaves, to the sum add the sum of the mean lengths of the bottom and eaves multiplied by the sum of the mean breadths of the bottom and eaves, this sum multiplied by 1-6th of the perpendicular height from the bottom to the eaves, will be the content of the lower part of the stack in cubic feet. To twice the mean length at the eaves add the length of the top, multiply this sum by the mean breadth at the eaves, and again by the perpendicular height from the eaves to the top, and 1-6th of the product will be the the content of the upper part in cubic feet, to which add the content of the lower part, for the content of the whole, the sum divided by 27 will be the content in cubic yards.

Example. How many cubic yards and stones of Hay are in a Stack, the mean length and breadth at the bottom being 30 and 15 feet, at the eaves 40 and 18, the perpendicular height, from the bottom to the eaves 12, from the eaves to the top 9, and the length of the top 28, allowing $7\frac{1}{2}$ stones to the cubic yard?

$$30 \times 15 = 450$$

$$40 \times 18 = 720$$

$$70 \times 33 = 2310$$

$$3480$$

$2 = 1\text{-}6\text{th}$ of the height.

$$40 \times 2 = 80$$

$$28$$

$$6960 \text{ lower part.}$$

$$108 \times 18 \times 9 \div 6 = 2916 \text{ upper part.}$$

$$27)9876(365.7 \text{ cubic yards.}$$

$$7.5$$

$$18288 \cdot$$

$$256044 \cdot$$

$$2743.33 \text{ stones.}$$

PROBLEM II.

CASE I. *To measure a Hay Rick, when the lower part is like a Cylinder, and the upper like a Cone.*

Rule. Take the girt of the Rick, at any part between the bottom and the eaves, in feet and inches, which will give the mean girt, and to the height from the

bottom to the eaves, in feet and inches, add $\frac{1}{3}$ of the perpendicular height from the eaves to the top, in feet and inches, for the mean height. Multiply $\cdot 0029474^*$ by the square of the mean girt, and that product again

by the mean height; the last product will be the content in cubic yards.

Example. How many cubic yards and stones are in a hay rick, the mean girt being 50 feet, the perpendicular height from the bottom to the eaves 10, and from the eaves to the top 9, allowing $5\frac{1}{2}$ stones to the cubic yard.

$$9 \div 3 = 3 + 10 = 13 \text{ mean height.}$$

$$\cdot 0029474 \times 50 \times 50 \times 13 = 95\cdot 790 \text{ cubic yards.}$$

5.5

478950

478950

526\cdot 8450 \text{ stones.}

CASE II. *When the lower part of the Rick is formed like a conic frustum, and the upper like a Cone.*

Rule. Take the dimensions in feet and inches, and to the sum of the squares of the girts of the bottom and eaves, add the product of these girts, multiply this sum

* The reason for multiplying by $\cdot 0029474$ is, that $\cdot 07958$ is the area of a circle whose circumference is 1, therefore $\cdot 07958$ divided by 27, is equal to $\cdot 0029474$ nearly.

by the perpendicular height from the bottom to the eaves, to the product add the square of the girt of the eaves multiplied by the perpendicular height from the eaves to the top, the sum multiplied by .0009825 will be the content in cubic yards.

Example. How many cubic yards and stones of hay are in a Rick, the girt at the bottom 36 feet, at the eaves 60, the perpendicular height from the bottom to the eaves 12 feet, and from the eaves to the top 10, allowing $6\frac{1}{2}$ stones to the cubic yard.

$$36 \times 36 = 1296$$

$$60 \times 60 = 3600$$

$$36 \times 60 = 2160$$

$$7056$$

$$12$$

$$84672$$

$$3600 \times 10 = 36000$$

$$120672$$

$$\cdot 0009825$$

302·80 stones by measurement
 300 stones actual weight.

Explanation of the Tables and manner of using them.

They are intended to assist the farmer in estimating the weight of hay in ricks; the numbers along the top are the mean heights from $6\frac{1}{2}$ to 16 feet, those in the left hand column, the mean girts from 12 to 50 feet. Look for the height of the rick at the top of the page, and for the girt on the left hand side, and in the column under the height, opposite to the girt, will be found three different weights of the rick.

Example for table I.

If 13 and 23 are the mean height and girt, in the column under 13, opposite to 23 on the left, are 81, 91, and 101 stones, the first estimated at 4, the second at $4\frac{1}{2}$, and the third at 5 stones, of 24 lbs., each 16 oz. avoirdupois, per cubic yard.

Example for table II.

If 40 and 16 feet are the mean girt and height, in the column under 16, opposite to 40 on the left, are 377, 415, and 452 stones, the first estimated at 5, the second at $5\frac{1}{2}$, and the third at 6 stones of 24 lbs. each 16 oz. avoirdupois, per cubic yard.

The method of taking the dimensions of ricks of different forms, and reducing them to one form, so that they may answer the tables.

CASE I. *When the lower part of the rick is formed like a cylinder, and the upper like a cone.*

Find the girt at any part between the bottom and the eaves, which will give the mean girt, and to the perpendicular height from the bottom to the eaves, add $\frac{2}{3}$ of the perpendicular height from the eaves to the top, for the mean height.

CASE II. *When the lower part of the rick resembles a conic frustum, and the upper a cone.*

Take the girt at the bottom and eaves, and find the difference of these girts, which multiply by .63, and add the product to the girt at the bottom, for the mean girt, and to the perpendicular height from the bottom to the eaves, add $\frac{2}{3}$ of the perpendicular height from the eaves

to the top, for the mean height. Suppose, 18 and 26 feet to be the girts of the bottom and eaves, $26 - 18 = 8 \times .63 = 5.04$, $18 + 5.04 = 23$ feet, the mean girt.

CASE III. *When the lower part of the rick resembles the frustum of a parabolic conoid, and the upper a parabolic conoid.*

Take the girt of the bottom and eaves, and find the difference of these girts, which multiply by .7, and add the product to the girt at the bottom, for the mean girt. Suppose, 25 and 32 feet to be the girts of the bottom and eaves, $32 - 25 = 7 \times .7 = 4.9$, $25 + 4.9 = 30$ feet nearly, the mean girt, and to the perpendicular height, from the bottom to the eaves, add $\frac{1}{2}$ of the perpendicular height from the eaves to the top, for the mean height.

Rule. To prove any result in the tables, multiply .0029474, by the square of the mean girt, and that product again by the mean height the last product will be the content in cubic yards.

Should the weights found in the tables be required in imperial weight, i. e. 14 lbs. to the stone, each lb., 16 oz. avoirdupois, multiply the weight found in the tables by 12 and divide by 7. Suppose the weight of a rick in the tables to be 452 stones.

$$452 \times 12 = 5424 \div 7 = 774 \text{ 6-7th stones imperial.}$$

As the weight of ricks may in some instances come short of, or exceed those given in the tables, either on account of the hay being of a very inferior quality on the one hand, or of a very superior on the other, the farmer may render the tables answerable to these exigences, by using it in the following manner. Sup-

pose any number of ricks to be in a field of the same quality of hay nearly and of the same standing. Take then the dimensions of the one which is of the medium size, weigh it and after looking the tables, see if any of the three results found from these dimensions be the same, or nearly the same, with that found by weighing. By this means it may be known which of the three results should be taken, as most applicable to the rest of the ricks in the field. Should the result found by weighing, be more than the greatest of the three given in the first table, add $\frac{1}{5}$ of the least result to the greatest, and it will be the weight of the rick at $5\frac{1}{2}$ stones to the cubic yard, &c. Again, should the result found by weighing be less than the least given in the table, subtract $\frac{1}{5}$ of this least from itself, and it will give the weight of the rick at $3\frac{1}{2}$ stones to the cubic yard, &c.

Example. Suppose the weight of a rick in the first table, of the dimensions 13 height and 23 girt, to exceed 101 stones, the greatest result, $\frac{1}{5}$ of 81 the least, is 10 nearly, which being added to 101 the greatest, gives 111 at $5\frac{1}{2}$ stones per cubic yard, again, being added to 111 gives 121 at 6 stones per cubic yard, &c. On the other hand suppose the weight of the same dimensions to be less than 81 the least result, $\frac{1}{5}$ subtracted, gives 71 at $3\frac{1}{2}$ stones per cubic yard, and again subtracted, gives 61 at 3 stones per cubic yard, &c.

Again, in the second table, should the result be more than the greatest, add 1-10th of the least to the greatest, and it will give the weight at $6\frac{1}{2}$ stones to the cubic yard, &c. Or should the result be less than the least, subtract 1-10th of this least from itself, it will give the weight at $4\frac{1}{2}$ stones to the cubic yard, &c.

To find the Capacity of a Waggon or Cart.

RULE. Multiply the length of the mouth by its breadth, and the length of the bottom by its breadth, multiply also the sum of the two lengths by the sum of the two breadths—the sum of these products multiplied by the perpendicular depth, and divided by 6, will be the capacity. By this rule may be found also the capacity of a Mill-hopper, or the solidity of any body of the form of a prismoid.

EXAMPLE. What is the capacity of a coal-waggon, the length and breadth at the mouth being 6 feet 10 inches and 4 feet 8 inches; at the bottom, 4 feet 6 inches and 2 feet 6 inches; and the perpendicular depth, 4 feet 2 inches?

$$\begin{array}{r}
 6 \ 10 \times 4 \ 8 = 31 \ 10 \ 8 \\
 4 \ 6 \times 2 \ 6 = 11 \ 3 \ 0 \\
 \hline
 11 \ 4 \times 7 \ 2 = 81 \ 2 \ 8 \\
 \qquad \qquad \qquad \hline
 \qquad \qquad \qquad 124 \ 4 \ 4 \\
 \qquad \qquad \qquad \quad 4 \ 2 \ 0 \\
 \qquad \qquad \qquad \hline
 \qquad \qquad \qquad 497 \ 5 \ 4 \\
 \qquad \qquad \qquad \quad 20 \ 8 \ 8 \ 8 \\
 \qquad \qquad \qquad \hline
 6) 518 \ 2 \ 0 \ 8 \\
 \qquad \qquad \qquad \hline
 \qquad \qquad \qquad 86 \ 4 \ 4 \ 1 \ 4
 \end{array}$$

What is the capacity of a Cart, the length and breadth at the mouth being 5 feet 2 inches and 4 feet 4 inches; at the bottom 4 feet 8 inches and 3 feet 8 inches; and the perpendicular depth, 1 foot 4 inches?

$$\begin{array}{r}
 5 \ 2 \times 4 \ 4 = 22 \ 4 \ 8 \\
 4 \ 8 \times 3 \ 8 = 17 \ 1 \ 4 \\
 \hline
 9 \ 10 \times 8 \ 0 = 78 \ 8 \ 0 \\
 \qquad \qquad \qquad \hline
 \qquad \qquad \qquad 118 \ 2 \ 0 \\
 \qquad \qquad \qquad \quad 1 \ 4 \ 0 \\
 \qquad \qquad \qquad \hline
 \qquad \qquad \qquad 118 \ 2 \ 0 \\
 \qquad \qquad \qquad \quad 39 \ 4 \ 8 \\
 \qquad \qquad \qquad \hline
 6) 157 \ 6 \ 8 \\
 \qquad \qquad \qquad \hline
 \qquad \qquad \qquad 26 \ 3 \ 1 \ 4
 \end{array}$$

Or by the rule commonly used, i. e. by taking the mean dimensions:

$$\begin{array}{r}
 5 \quad 2+4 \quad 8 \div 2 = 4 \quad 11 \\
 4 \quad 4+3 \quad 8 \div 2 = 4 \quad 0 \\
 \hline
 19 \quad 8 \\
 1 \quad 4 \\
 \hline
 19 \quad 8 \\
 6 \quad 6 \quad 8 \\
 \hline
 26 \quad 2 \quad 8
 \end{array}$$

To find the number of Cubic Yards in a Dunghill, or a Heap of Stones.

Rule. Take the dimensions in feet and inches. Multiply the mean length by the mean breadth, and that product again by the mean depth, the last product divided by 27, will be the content in cubic yards.

Example. How many cubic yards are in a dunghill, the mean length, 54 feet 6 inches; the breadths of three different places, 26 feet 6 inches, 27 feet 10 inches and 30 feet 4 inches; the depth of nine different places, 4 feet 3 inches, 5 feet 1 inch, 4 feet 6 inches, 3 feet 9 inches, 4 feet 9 inches, 3 feet 6 inches, 5 feet 6 inches, 4 feet 7 inches and 4 feet 10 inches?

$$26 \text{ } 6+27 \text{ } 10+30 \text{ } 4 \div 3 = 28 \text{ } 2 \text{ } 8 \text{ mean breadth.}$$

$$4 \text{ } 3+5 \text{ } 1+4 \text{ } 6+3 \text{ } 9+4 \text{ } 9+3 \text{ } 6+5 \text{ } 6+4 \text{ } 7+4 \text{ } 10 \div 9 = 4 \text{ } 6 \text{ } 4 \text{ mean depth.}$$

$$54 \text{ } 6 \times 28 \text{ } 2 \text{ } 8 \times 4 \text{ } 6 \text{ } 4 \div 27 = 257 \text{ cubic yds. } 25 \text{ feet.}$$

 present time.

Part Fourth.

CATTLE MEASURING.

How to ascertain the weight of Live Cattle, &c. by measurement.

TAKE the dimensions in feet and inches, in doing which, it is necessary that the beast should be standing square, with its head up : find the girt close behind the shoulder blade, and also the length, from the top of the fore part of the shoulder blade, to the top of the rump bone, at the tail (as represented by the dotted lines on the engravings :) multiply the square of the girt, by 5 times the length, the product divided by 21, will be nearly the weight of the beast's four quarters, in stones of 14 lbs., each 16 oz. avoirdupois, (excepting the tallow, hide and broke.)

The rule is applicable to cattle, &c. when of an ordinary degree of fatness. When the beast is exceedingly fat, 1-18th or 1-20th must be added to the weight by measurement ; but when below an ordinary degree of fatness, 1-18th or 1-20th must be subtracted. A bull being more fleshy, and heavier in the neck than an ox, will weigh from 1-24th to 1-30th more than the weight by measurement. Old cows that have had a considerable number of calves, 1-9th or 1-10th of the weight by measurement must be subtracted. It being customary,

at least in this part of the country, to weigh the head of a swine with the four quarters, 1-6th must be added to the weight by measurement, on account of the head and neck.

In addition to this, the kind and age of the beast, the time it has been fed, and the symmetry of its body, &c. must, in all cases, be taken into account.

EXAMPLE. What is the weight of the four quarters of a cow, 6 feet 1 inch in girt, and 5 feet 4 inches in length?

$$\frac{73}{12} \times \frac{73}{12} \times \frac{16}{3} \times \frac{5}{21} = \frac{426320}{9072} = \text{nearly 47 st. Imperial.}$$

EXAMPLE. What is the weight of the four quarters of a sheep, 3 feet 2 inches in girt, and 2 feet 9 inches in length?

$$\frac{19}{6} \times \frac{19}{6} \times \frac{11}{4} \times \frac{5}{21} = \frac{19855}{3024} = 6 \text{ st. } 7 \text{ lb. Imperial.}$$

EXAMPLE. What is the weight of a swine, 4 feet 4 inches in girt, and 3 feet 10 inches in length ?

$$\frac{13}{3} \times \frac{13}{3} \times \frac{23}{6} \times \frac{5}{21} = \frac{19435}{1134} = 17 \frac{2}{12} \text{ nearly, four qrs.}$$

20 0 Imperial.

The following is a statement of the age, weight of the four quarters, and tallow of a few cattle, killed at Ayr; which were exceedingly fat, the actual weight of the four quarters, of the oxen and bulls, was from 1-18th to 1-20th more than the weight by measurement. The weight in the statement is 16 lbs. to the stone, each lb. 24 oz. avoirdupois.

OXEN.				OXEN.				BULLS.				COWS.

In dealing it is understood that the farmer should get the price of the beef and tallow, and the flesher the hide and broke.

The following is a statement of the weight of the four quarters of a few live cattle, as measured for experiment. The first column contains the weight of the cattle by measurement and the second the actual weight.

	Weight by measurement.		Actual weight.	
	St.	lb.	St.	lb.
Weight of an ox,	30	1	30	2
Do.	36	0	36	2
Do.	19	9	19	9
Do.	32	0	32	6
Weight of a bull,	28	2	28	8
Do.	24	0	24	4
Do.	26	12	27	0
Do.	29	9	30	0
Weight of a young cow,	28	12	28	8
Do.	24	8	24	12
Weight of an old cow,	17	10	18	0
Do.	17	6	16	14
Do.	18	0	18	1
Do.	19	0	19	6
Weight of a swine,	9	8	9	10
Do.	7	0	7	1
Do.	10	0	10	1
Do.	10	8	10	10

In using the following tables, look for the girth of the beast, at the top of the page, and in the same column under the girth, find the length, and in the right hand column, immediately opposite the length, is the weight of the four quarters, in stones of 14 lbs. each 16 oz. avoirdupois. Should the weight be required in stones of 16 lbs. each 24 oz. avoirdupois: multiply the weight found in the tables by 7, and divide the product by 12, reckoning 14 lbs. to the stone, when multiplying by 7, and 16 lbs. to the stone when dividing by 12.
