## A.

A. A, THE first letter of the alphabet in every known language, the Ethiopic or Abyssinian alone excepted, in which it is the thirteenth. Of the sixteen elementary sounds of the human voice, that which is represented by this initial letter is the simplest, and requires the least exertion of the organs to produce it; for its enunciation is effected by merely opening the mouth, and breathing, so that the air propelled through the glottis may resound audibly in the cavity of the mouth and nostrils. Hence this sound is remarkable for its universality as well as simplicity. Many of the lower animals possess the capacity of uttering it, as every one must be sensible who has attended to their distinguishing cries, in all, or at least in many of which, it may be easily recognised. It is also the basis, so to speak, of vocality; for, on attentive examination, it will be found that the other vowels are little more than labial, lingual, dental, or palatal modifications of this primary, universal, and most elementary sound. It is not without reason, therefore, that the symbol of this sound is (with one solitary exception) placed at the commencement of every known alphabet. Cicero seems to have disliked the sound of this letter; for in his treatise *De Oratore*, c. xlix., he denominates it *insuavissima littera*, probably on account of the out-breathing or expiration necessary to produce the sound of it; but, upon the same principle, the other vowels ought also to have shared his displeasure, seeing that they are merely modifications of this primary *στοιχειον* or element.

In the English language, A is the mark or symbol of three different sounds, termed by grammarians the *broad*, the *open*, and the *slender*; epithets, the two former of which have an immediate reference to organic modification, as well as to the impulse or volume of voice; while the latter seems to apply to the degree of intonation alone. Of these varieties of sound, the first, which resembles that of the German A, occurs in such monosyllables as *hall, wall, pall, thrall*, where the *a* is pronounced in the same manner as *au* in *cause*; that is, broad and long. The Saxons, it is probable, expressed only this sound of the letter, which is still commonly retained in the north of England, and prevails universally throughout Scotland, the only parts of the island where the genius and idiom of the Saxon language have withstood modern innovations. The open sound of A, again, resembles that of the Italian in *adagio* and such like words, and is nearly the same with that of *a* in *father, rather*, &c. But the slender sound, which is peculiar to the English language alone, is identical with the sound of the French diphthong *ai* in such words as *mais, paix, gai*, and is exemplified in *hate, late, waste, paste, place, race;* as also in polysyllables, such as *toleration, justification*, with many others which it is unnecessary to specify. So much for the varieties of this initial sound in English words. A, however, is sometimes employed as an affix in burlesque poetry; in which case it has no other effect than to add a syllable to the line, without any alteration of the sense, just as the vowel or interjection O very often does in our old ballads, and in some modern imitations of them. It is also thought to be redundant and insignificative in such words as *arise, awake, aright, adoing, agoing*. But this seems a mistake; for the *a* here used as a prefix, is probably the French abbreviation of the Latin preposition *ad;* and hence it appears to have an intensive effect, adding to and strengthening the import of the word with which it is combined. In the line, "*Arisc, awake*, or be for ever fall'n," it is evident that the words "arise, awake," convey a meaning stronger in degree than the simple words *rise, wake*, would have done. The prepositionary effect in such words as *a-doing, a-going*, is indeed admitted by grammarians; but, if this be the case, where is the distinction between these instances and *a-rise, a-wake*, where the prefix is said to be redundant, except that, by usage, it has coalesced in some measure with the word to which it is prefixed? In such compounds as *a-foot, a-sleep, a-week, a-head, a-man*, as well as when used before local surnames, as *Cornelius a Lapide, Thomas a Kempis, Thomas a Becket*, nobody has ever doubted that the *a* is a preposition. When *a* is used as an article, it is merely an abbreviation of the old primary numeral *ane*, one, and consequently it has no plural signification. Thus *a* house, *a* field, *a* ship, mean *one* house, *one* field, *one* ship; but as it is not one of two, ten, or twenty houses, fields, or ships, but of *any* number, however great or small, hence it becomes in effect quite general and indefinite, or, in other words, the opposite of *the*, which defines and limits the attention to something spoken of, pointed out, or referred to.

Among the ancients, A was a numeral letter, and stood for 500, and when a dash was placed on the top, thus, $\bar{A}$, for ten times that number, or 5000. In the Julian calendar it is the first of the seven Dominical Letters. Long before the establishment of Christianity, it had been in use among the Romans as one of the eight *Litteræ Nundinales;* and it was in imitation of this usage that the Dominical Letters were first introduced. Among logicians, the letter A is employed as a symbol or sign to denote an universal affirmative, in contradistinction to an universal negative proposition, in conformity with the following, which is the first verse of a well-known distich:

Asserit *a*, negat *e*, sed universaliter ambæ.

Thus, the first mode of the first figure, which is a syllogism consisting of three universal affirmative propositions, is said to be a syllogism in B*a*rb*a*r*a*, a word in which the *alphas* alone are significant, the repetition of that letter thrice denoting so many of the propositions to be affirmative and universal, conformably to the technical classification—

B*a*rb*a*r*a*, Cel*a*rent, D*a*rii, Ferio, dato primæ.

In the public assemblies or *comitia* of the Romans the letter A was used in giving votes or suffrages. When a new law was proposed, each voter received a couple of wooden tallies or ballots, one of them marked with a capital A, signifying *Antiquo*, q. d. *antiquam volo*; and the other with U. R., the initials of *Uti Rogas.* Those who were against the proposed law, (or *rogatio*, as it was called) threw the former of these into the urn; meaning thereby *I antiquate it*, I prefer the ancient law, and desire no innovations; while such as were favourable to the bill, as we would call it, threw in the latter, signifying, *Be it as you desire*, or I vote for the measure you propose. A was also marked on tallies or tablets used in voting in criminal trials, and standing for *Absolvo*, denoted acquittal; whence Cicero, in his speech for Milo, denominates it *littera salutaris*, or the letter of acquittal. We may add, in explanation, that, on criminal trials, three of these tallies or tablets were distributed to each of the *judices*, or persons constituting the assize, by whom the accused was to be tried; one of them marked with the letter A, *absolvo*, I acquit; another with the letter C, (*littera tristis*) *condemno*, I condemn; and a third with the letters N. L. *non liquet*, it is not clear. From the number of ballots cast into the urn, those marked with N. L. were deducted, and the *prætor* or *magistratus* pronounced sentence of acquittal or condemnation, according as the A's or the C's were the more numerous. In cases of equality the prisoner was absolved.

In ancient inscriptions, whether on marble, brass, or stone, A stands for *Augustus, Augustalis, ager, agit, aiunt, aliquando, antique, assolet, aut;* A A for *Augusti, Augustæ, Aulus Agerius, æs alienum, ante audita, apud agrum, aurum argentum;* A A A for *Augusti* when they are three in number, and *aurum, argentum, æs;* and sometimes its meaning can only be determined by the context of the inscription. Isidore adds, that when this letter occurs after the word *miles*, a soldier, it denotes him young (*miles adolescens*). On the reverse of ancient medals, it indicates the place where they were struck, as Argos or Athens; but on coins of a modern date, it is the mark of the city of Paris, probably taken anagramwise from the *last* letter of the word *Lutetia.*

A, as an abbreviation, is likewise of frequent occurrence in the works of modern authors; as A. D. for *anno Domini*, A. M. for *artium magister, anno mundi*, &c. The letter *a* with a line above it thus, *ā*, is used in medical prescriptions for *ana*, of each; and sometimes it is written thus, *ā ā;* for example, ℞ *mel. sacchar. et mann. ā vel āā* ℥j; that is, take honey, sugar, and manna, of each one ounce. Put to bills of exchange, A is, in England, an abbreviation of *accepted*, and in France of *accepté.* It is likewise usual with merchants to mark their sets of books with the letters A, B, C, &c., instead of the ordinary numerals, 1, 2, 3, &c. A A A is the chemical abbreviation for *amalgama*, or *amalgamation.*

AA, the name of several small rivers, probably derived from the Celtic *Ach* or Teutonic *Aa*, water. I. A river of Holland in North Brabant; which, passing Helmont, joins the Dommel at Bois-le-Duc. II. A river of Holland, in Groningen, distinguished by the name of Westerwolder Aa, which falls into the Dollart. III. A river of Holland in Overyssel, which, after uniting its waters with the Vecht, flows into the Zuyder Zee. IV. A river of Belgium, in the province of Antwerp, which discharges its waters into the Neethe. V. A small river of Brabant, near Breda. VI. A river of Russia in Europe, in the province of Livonia, which flows from E. to S.W., into the Bay of Riga. VII. Another river of Russia in Courland, which flows into the Dwina, near Riga. VIII. A river of France, rising in the department of Le Nord. It becomes navigable for barges at St Omer, and after a course of about 40 miles falls into the sea at Gravelines. IX. A river of Hanover, which flows into the Ems, in the province of Lingen. X. A river of Switzerland, canton Aargau, which carries the waters of the Hallwyler See into the Aar. XI. A river of Switzerland, carrying the waters of the Lake of Sarnen, canton Unterwalden, into the Lake of Lucerne. XII. Another river of Switzerland, which drains the valley of Engelberg, in Unterwalden, and flows into a bay near the middle of the south side of the Lake of Lucerne. XIII. A small river of Jutland, kingdom of Denmark.

AACHEN. See Aix-la-Chapelle.

AAGARD, Christian, a Danish poet, and Professor of Poetry at Sora. He was born in 1596, and died in 1664. His poems are published in the *Deliciæ quorundam poetarum Danorum.* Leyd. 1695.

AALBORG, one of the sees (*stifts*) into which the Danish kingdom is divided. See Denmark.

Aalborg, a city in Denmark, the capital of the see of the same name. It is situated on the Lymfiord, at the spot where the Oosteræ joins it; it is tolerably fortified; contains a cathedral and several other public buildings; and in 1847 the inhabitants amounted to 7500. There are manufactories of sugar, soap, snuff, chocolate, and scythes, with several distilleries; but the woollen and hosiery trades which formerly existed are nearly extinct. The entrance to the harbour is such as to require vessels drawing more than ten feet of water to lighten before they approach the city. The chief exports are herrings, corn, wool, hides, tar, tallow, and corn spirits. It is in Lat. 57. 2. 57. N., and Long. 9. 56. 36. E.

AALEN, a bailiwick in the circle of Jaxt, in the kingdom of Wirtemberg. Its extent is 108 square miles, or 69,120 acres. It is watered by the river Kocher, has some lofty mountains in the southern part, and is most abundantly wooded. It produces but little corn, and neither fruit nor wine, but pastures a competent number of cattle. There are some iron mines worked. Many articles of wood-ware are produced, and some wool and cotton are spun. It contains one city, one market town, and 190 smaller towns and villages, with 22,000 inhabitants.

Aalen, a city, the capital of the bailiwick of the same name. It has some ironworks, and manufactures of wool and cotton. In 1847 it contained 2800 inhabitants. It is in Lat. 48. 47. 20. N., Long. 10. 7. 27. E.

AALSMEER, a town in the arrondissement of Amsterdam, in the province of North Holland, ten miles SW. of Amsterdam. It is celebrated for its strawberries; and contains 2200 inhabitants, employed in making cotton goods.

AALTEN, a town in the arrondissement of Zutphen, and province of Guelderland, in the Netherlands.

AAM, or AHAM, a measure for liquids, used in Holland, Belgium, and several of the continental states, varying in capacity in different places from 35 to 41 English gallons. See WEIGHTS AND MEASURES.

AAR, the most considerable river in Switzerland, after the Rhine and Rhone. It rises in the glaciers of the Finsteraarhorn, Schreckhorn and Grimsel mountains in Berne; and at Handeck in the valley of Hasli forms a magnificent waterfall of above 150 feet in height. The Aar then flows through the lakes of Brienz and Thun, and on emerging from the latter it becomes navigable, and at length empties itself into the Rhine, opposite Waldshut, after a course of about 170 miles. In its course it receives numerous smaller rivers, the principal of which are the Kander, Saane, and Thiele on the left, and the Emmen, Surin, Reuss, and Limmat, on the right; and on its banks are situated Unterseen, Thun, Berne, Aarburg, Solothurn, and Aarau. It abounds in fish, and carries along with it a considerable quantity of gold sand. This is also the name of several small rivers in Germany.

AARAU, the chief city of the canton of Aargau, situated on the right bank of the river Aar, at the south base of the Jura. It is well built, paved, and lighted, and contains 4500 inhabitants, whose principal occupations are spinning and weaving cotton, making silk ribbons, bleaching, and casting cannon. Lat. 47. 23. 35. N., Long. 6. 2. 55. E. The famous baths of Schintznach are about ten miles distant along the right bank of the Aar. The inhabitants are chiefly Protestants.

AARGAU, or ARGOVIA, one of the cantons of Switzerland. It was originally a part of Berne, but by arrangements begun in 1798, and continued in 1803, it was erected into a separate and independent canton. It is bounded on the north by the river Rhine, which divides it from the duchy of Baden, on the east by Zurich, on the south-east by Zug, on the south by Lucerne, on the south-west by Berne, and on the west by Solothurn and Basle. Its extent is 502 square miles, and it is divided into eleven circles, which are again subdivided into forty-eight smaller ones. By the census taken in 1850, the number of inhabitants amounted to 199,720, comprehending 107,194 Protestants, 91,096 Catholics, and about 1500 Jews.

The greater part of the canton is either level or undulating, but some of the mountains on the right bank of the Aar are of the height of 2700 feet. The chief river is the Rhine, which forms the boundary, and is navigable, though, on account of shoals and rocks, with difficulty. That river receives into it the water of the Aar, the Wigger, the Suren, the Reuss, and the Limmat, as well as that of many smaller brooks and rivulets. The climate is milder than in most parts of Switzerland.

The rearing of cattle, agriculture, and the cultivation of vines and other fruits, are carried on with great activity; and in its towns and villages are found tradesmen, mechanics, and manufactories of all kinds. This is one of the cantons most distinguished for industry and generally diffused prosperity; and by the union of pastoral with mechanical pursuits the citizens have attained a comfort almost unparalleled. The education of the people, by the establishment of improved schools, and by popular publications, has been greatly promoted within the last thirty or forty years, especially in the Protestant parts of the canton.

The legislative power is vested in the great council, consisting of two hundred members, the one half Catholics, and the other Protestants,—who are elected by the general body of the people every six years. A lesser Council, consisting of nine members, is elected by the members of the great Council out of their own body for a like period of six years. The preparation of the annual financial reports is committed to this body, as also the initiative in legislation, subject to the approval and sanction of the great Council. Each circle has a Justice of the Peace who decides in matters under 16 francs. The District Court decides in cases above that sum; but in cases above 160 francs its decision can be appealed to the Highest Court. This canton possesses a military force of 16,000 men, and its resources amount to 16,000,000 of francs, or about £600,000; its income is about 680,000 francs or £27,200, and its expenditure about 650,000 francs or £26,000.

AARHUUS, one of the districts (*stifts*) into which Denmark is divided. It is in the most eastern part of the peninsula of Jutland. The extent is 1825 square miles, or 1,168,000 acres. It is a level country, somewhat undulating, having on its coasts several indentations forming bays, and in the interior there are several lakes, rivers, low hills, and woods. The climate is considered to be the best in Jutland. The greater part of the inhabitants are engaged in cultivation, and produce more corn, potatoes, and flax, than their consumption requires, and thus leave a portion for exportation. The ecclesiastical bishopric of Aarhuus differs from the political see. The latter is divided into two bailiwicks, Aarhuus and Rhanders, and 22 baronies (*herrerders*) comprehending 7 cities, 253 parishes, and 69 noble domains and dwellings. The inhabitants amount to 140,000, many of whom are occupied in the fisheries, and the females in spinning.

AARHUUS, one of the bailiwicks into which the see of the same name in Denmark is divided. Its extent is 864 square miles, or 552,960 acres.

AARHUUS, a city, the capital of the see and of the bailiwick of the same name. It is situated on the Cattegat, in a low plain, where an inland lake empties itself into the sea. The cathedral is a Gothic building, and the largest church in Denmark. In 1848 the inhabitants amounted to 7000. The harbour is small, but good and secure; and now one of the best in Jutland, having regular steam communication with Copenhagen and Callundborg, from which latter place a road leads to Copenhagen. Aarhuus is about 100 miles WNW. from the capital. It exports agricultural produce, spirits, cork, leather, and gloves. It has sugar refineries, and manufactories of wool, cotton, and tobacco. It is in Lat. 56. 9. 35. N., and Long. 10. 8. E.

AARLANDERVEEN, a town of the Netherlands, seventeen miles SSE. of Haarlem. It contains 2688 inhabitants.

AARON, the first high-priest of the Jews, eldest son of Amram and Jochebad, and brother of Moses. By the father's side he was great-grandson, and by the mother's, grandson of Levi. He was born B.C. 1574 (Hales B.C. 1730), three years before Moses, with whom he was associated to conduct the children of Israel from Egypt to Canaan. To this office he received the Divine appointment in consequence of his persuasive fluency of speech, a quality in which Moses was his inferior (Ex. iv. 16; vii. 1).

During the absence of Moses in Mount Sinai receiving the tables of the law, the Israelites, regarding Aaron as their head, clamorously demanded that he should provide them with a visible symbolic image of their God for worship. With this demand he weakly complied, and out of the ornaments of gold contributed for the purpose he cast the figure of the calf, doubtless the same as the Bull-god Apis, the object of Egyptian worship at Memphis. For this sin the Israelites were decimated by sword and plague (Ex. xxxii.)

In obedience to the Divine instruction received by Moses in the Mount, Aaron was appointed high-priest, his sons and descendants, priests, and his tribe, that of Levi, was set apart as the sacerdotal caste. The office was filled by Aaron for nearly forty years, his death occurring on Mount Hor, which he ascended with his brother Moses by the Divine command. He was 123 years of age when he died, his son and brother burying him in a cavern of the mountain.

Aaron, *Ben Asser*, a learned Jew of the fifth century, to whom has been ascribed the invention of the Hebrew points and accents, though some suppose them to be of much higher antiquity.

Aaron, an eminent physician at the beginning of the seventh century. He wrote in Syriac, as mentioned by Hali Abbas, and described the measles and smallpox, diseases then very little known, though in this he was perhaps anticipated by Rhazes in his *Discourse of the Pestilence.*

Aaron, the Caraite, a learned Jew who flourished about the year 1299. He left many works on the Old Testament, among which there is one entitled *A Commentary on the Pentateuch*, which has been much valued. It was written in Hebrew, and printed in folio with a Latin translation, at Jena, in 1710.

Aaron, another Caraite Jew, who lived in the fifteenth century, wrote a concise Hebrew Grammar, entitled *The Perfection of Beauty*, which was printed at Constantinople in 1581.

Aaron, *Pietro*, a Florentine monk of the sixteenth century, an elaborate writer on music. His chief works, which are curious, are *Il Toscanello della Musica*, and *Elucidario in Musica di Alcune Oppenioni Antiche e Moderne.* Venice, 1545, 4to.

Aaron and Julius, *Saints*, were brothers who suffered martyrdom together, during the persecution under the emperor Diocletian, in the year 303, about the same time with St Alban, the first martyr of Britain. We are not told what their British names were, it being usual with the Christian Britons, at the time of baptism, to take new names from the Greek, Latin, or Hebrew. Nor have we any certainty as to the particulars of their death; only that they suffered the most cruel torments. Two churches were dedicated to the brothers, in which their bodies were interred, at Caer-Leon, the ancient metropolis of Wales.

Aaron, or *Haroun, Al Raschid*, a celebrated caliph, or Mahometan sovereign of the Saracen empire; whose history is given under the article Bagdad.

AARSENS, Francis, Lord of Someldyck and Spyck, one of the greatest negotiators of the United Provinces. He was born at the Hague in 1572. His father, Cornelius Aarsens, was secretary to the States; and being acquainted with Mr Mornay du Plessis, at the court of William Prince of Orange, he prevailed upon him to take his son under him, with whom he continued some years. John Olden Barneveldt, who presided over the affairs of Holland and all the United Provinces, sent him afterwards as resident into France, where he learned to negotiate under those profound politicians Henry IV., Villeroy, Jeanin, &c. Soon after, he was invested with the character of ambassador, and was the first who was recognised as such by the French court. He resided in France fifteen years; during which time he received great marks of esteem from the king, who created him a knight and baron; and for this reason he was received among the nobles of the province of Holland. However, he became at length so odious to the French court, that they desired to have him recalled. He was afterwards deputed to Venice, and to several German and Italian Princes, upon occasion of the troubles in Bohemia. He was the first of three extraordinary ambassadors sent to England in 1620, and the second in 1641; in which latter embassy he was accompanied by the Lord of Brederode as first ambassador, and Heemsvliet as third, to negotiate the marriage of Prince William, son of the Prince of Orange, with a daughter of Charles I. He was likewise ambassador extraordinary at the French court in 1624, at the beginning of Cardinal Richelieu's administration, who had a high opinion of him. His unpublished memoirs of the negotiations in which he was engaged, shew him to have been one of the ablest men of his time, and worthy of the confidence and trust reposed in him by his country. But his character is not altogether without stain. His enmity to the Remonstrants was bitter and unrelenting; and he is supposed to have greatly encouraged the violent measures pursued by Prince Maurice against the venerable Barneveldt, and to have been the principal adviser for assembling the persecuting synod of Dordrecht. He died at a very advanced age; and his son, who survived him, was reputed the wealthiest man in Holland.

AAS, a French village in the Lower Pyrenees, 6½ leagues from Oleron, much frequented for its mineral waters and baths. In the adjoining mountains are mines of lead and iron.

AASAR, in *Ancient Geography*, a town of Palestine, in the tribe of Judah, situated between Azotus and Ascalon. In Jerome's time it was a hamlet.

AASI. See Orontes.

AATYL, a town of Syria, 54 miles SSE. of Damascus, chiefly inhabited by Druses. Its extensive ruins shew that it once was a place of importance.

AB, the eleventh month of the civil year of the Hebrews, and the fifth of their ecclesiastical year, which begins with the month Nisan. It answers to the moon of July; that is, to part of our month of the same name, and to the beginning of August: it consists of thirty days. The Jews fast on the first of this month, in memory of Aaron's death; and on the ninth, because on that day both the temple of Solomon, and that erected after the Captivity, were burnt; the former by the Chaldeans, and the latter by the Romans. The same day is also remarkable among that people for the publication of Adrian's *edict*, wherein they were forbidden to continue in Judea, or even to look back when at a distance from Jerusalem, in order to lament the desolation of that city. The eighteenth of the same month is also a fast among the Jews; because the lamp in the sanctuary was that night extinguished, in the time of Ahaz.

Ab, in the Syriac calendar, is the name of the last summer month. The first day of this month they called *Suum-Miriam*, the Fast of the Virgin, because the eastern Christians fasted from that day to the fifteenth, which was therefore called *Fathr-Miriam*, the cessation of the Fast of the Virgin.

ABA (or rather Abou) Hanifah or Hanfa, surnamed Al-Nooma, was the son of Thabet, and born at Cufah, in the 80th year of the Hegira. He is the most celebrated doctor of the orthodox Mussulmans, and his sect is the most esteemed of the four which they severally follow. Almansor caused him to be imprisoned at Bagdad, for having refused to subscribe to the opinion of absolute predestination, which the Mussulmans call Cadha; but afterwards Abou Joseph, who was the sovereign judge or chancellor of the empire under the caliph Hadi, brought his doctrine into such credit, that it became a prevailing opinion, That to be a good Mussulman was to be a Hanifite. He died in the 150th year of the Hegira, in the prison of Bagdad: and it was not till 335 years after his death, that Melick Shah, a sultan of the Seljuckian race, erected to his memory a magnificent monument in the same city, and a college for his followers, in the 485th year of the Hegira, A.D. 1107.

Aba, *Abas*, *Abos*, or *Abus*, in *Ancient Geography*, the name of a mountain in Greater Armenia, situated between the mountains Niphatos and Nibonis. According to Strabo, the Euphrates and Araxes rose from this mountain. It is in

N. Lat. $39\frac{1}{2}$, and unites at its eastern extremity with Mount Ararat.

ABA. See ABÆ.

ABA, ALBON, or OVON, a king of Hungary. He married the sister of Stephen I., and was elected king on the deposition of Peter in 1041. The emperor Henry III. preparing to reinstate Peter on the throne, Aba made an incursion into his dominions, and returned loaded with booty; but was next year obliged to make restitution, by paying a large sum, in order to prevent a threatened invasion from the emperor. He indulged in great familiarity with the lower class of the people; on account of which, and his severity to their order, he became universally odious to the nobility. The fugitive nobles, aided by the emperor, excited a revolt against him. After a bloody battle, Aba was put to flight; and was murdered by his own soldiers in 1044, having reigned three years.

ABABDE, a tribe of Bedouins who inhabit the country south of Kosseir, nearly as far as the latitude of Derr. Many of this race have settled in Upper Egypt, on the east bank of the Nile, from Kenne to Assouan, and from thence to Derr; but the greater part of them still live like Bedouins. They have a bad character, being treacherous, and altogether faithless in their dealings. Great numbers of the dispersed Mamelukes fell victims to the treachery of these Arabs. Their breed of camels, particularly dromedaries, is famed. They are possessed of considerable property, and trade largely in Senna-Mekke, and in charcoal of acacia wood, for the Cairo market, both of which are produced from trees growing abundantly in their own mountains. The Ababde have few horses: when at war with other Arab tribes they fight upon camels, arming themselves with a lance, sword, and target. Their principal tribes are El Fokara, El Ashabat, and El Meleykab. Such of them as encamp with their still more savage neighbours, the Bisharye, speak the language of the latter.

The Bisharye inhabit the mountains southwards from Derr, as far as Suakim. They live entirely upon flesh and milk, eating much of the former raw. Their women are said to be as handsome as those of Abyssinia, and mix in company with strangers, but are reported to be of very depraved habits. Encampments of the Bisharye are found on the northern frontier of Abyssinia; and the sea-coast, from Suakim to Massuah, is peopled by their tribes. They have no fire-arms, but use the bow and arrow.—*Burckhardt's Nubia.*

ABACÆNUM, in *Ancient Geography*, a town of Sicily, whose ruins are supposed to be those lying near Trippi, a citadel on a high and steep mountain not far from Messina. *Fazellus de Reb. Sic.* ix. 7.—*Diodorus Sicul.*

ABACINARE, in writers of the middle age, a cruel species of punishment, in which the criminal was deprived of sight by having a red-hot basin or bowl of metal held before his eyes.

ABACK (a sea term), the situation of the sails when the surfaces are flatted against the masts by the force of the wind. The sails are said to be *taken aback* when they are brought into this situation, either by a sudden change of the wind, or by an alteration in the ship's course. They are *laid aback*, to effect an immediate retreat, without turning to the right or left; or in the sea phrase, to give the ship *stern-way*, in order to avoid some danger discovered before her in a narrow channel, or when she has advanced beyond her station in the line of battle, or otherwise. The sails are placed in this position by slackening their lee braces, and hauling in the weather ones; so that the whole effort of the wind is exerted on the fore part of their surface, which readily pushes the ship astern, unless she is restrained by some counteracting force.

ABACOT, the name of an ancient cap of state worn by the kings of England, the upper part whereof was in the form of a double crown.

ABACTORS, or ABACTORES, a name given to those who drive away, or rather steal, cattle by herds, or great numbers at once; and are therefore very properly distinguished from *fures* or thieves.

ABACUS, among the ancients, was a kind of cupboard or buffet. Livy, describing the luxury into which the Romans degenerated after the conquest of Asia, says they had their *abaci*, beds, &c. plated over with gold.

ABACUS, or ABACISCUS, in *Architecture*, signifies the superior part or member of the capital of a column, and serves as a kind of crowning to both. Vitruvius tells us the abacus was originally intended to represent a square tile laid over an urn, or rather over a basket. The form of the abacus is not the same in all orders: in the Tuscan, Doric, and Ionic, it is generally square; but in the Corinthian and Composite, its four sides are arched inwards, and embellished in the middle with some ornament, as a rose or other flower. Scammozzi uses *abacus* for a concave moulding on the capital of the Tuscan pedestal; and Palladio calls the plinth above the echinus, or boultin, in the Tuscan and Doric orders, by the same name.

ABACUS is also the name of an ancient instrument for facilitating operations in arithmetic. The exhibition of numbers by counters appears happily fitted for unfolding the principles of calculation. In the schools of ancient Greece, the boys acquired the elements of knowledge by working on a smooth board with a narrow rim,—the *Abax;* so named, evidently, from the combination of Α, Β, Γ, the first letters of their alphabet, resembling, except perhaps in size, the tablet likewise called A, B, C, on which the children with us used to begin to learn the art of reading. The pupils, in those distant ages, were instructed to compute, by forming progressive rows of counters, which, according to the wealth or fancy of the individual, consisted of small pebbles, of round bits of bone or ivory, or even of silver coins. From ψηφος, the Greek word for a *pebble*, comes the verb ψηφιζειν, to *compute.* But the same board served also for teaching the rudiments of writing and the principles of Geometry. The *Abax* being strewed with green sand, the *pulvis eruditus* of classic authors, it was easy, with a *radius* or small rod, to trace letters, draw lines, construct triangles, or describe circles.—Besides the original word Αβαξ, the Greeks had the diminutive Αβακιον; and it seems very probable, that this smaller board was commonly used for calculations, while the larger one was reserved among them for the purpose of tracing geometrical diagrams.

Grecian Abacus.

To their calculating board the ancients make frequent allusions. It appears, from the relation of Diogenes Laertius, that the practice of bestowing on pebbles an artificial value, according to the rank or place which they occupied, remounts higher than the age of Solon, the great reformer and legislator of the Athenian commonwealth. This sagacious observer and disinterested statesman, who was, however, no admirer of regal government, used to compare the passive ministers of kings or tyrants to the counters or pebbles of arithmeticians, which are sometimes most important, and at other times quite insignificant.[1] Æschines, in his oration for the Crown, speak-

[1] Ελεγε δε τους παρα τοις τυραννοις δυναμενους παραπλησιους ειναι ταις Ψηφοις ΤΑΙΣ ΕΠΙ ΤΩΝ ΛΟΓΙΣΜΩΝ. και γαρ εκεινων ἑκαστην ποτε μει ΠΛΕΙΩ σημαινειν, ποτε δε ἩΤΤΩ. (DIOG. LAERT. *in Vita Solonis.*)

ing of balanced accounts, says, that *the pebbles were cleared away, and none left.*[1] His rival, Demosthenes, repeating his expression, employs further the verb αντανελειν, which means *to take up as many counters as were laid down.* It is evident, therefore, that the ancients, in keeping their accounts, did not separately draw together the credits and the debts, but set down pebbles for the former, and took up pebbles for the latter. As soon as the board became cleared, the opposite claims were exactly balanced. We may observe, that the phrase *to clear one's scores or accounts,* meaning to settle or adjust them, is still preserved in the popular language of Europe, being suggested by the same practice of reckoning with counters, which prevailed indeed until a comparatively late period.

Roman Abacus.

The Romans borrowed their *Abacus* from the Greeks, and never aspired higher in the pursuit of science. To each pebble or counter required for that board they gave the name of *calculus,* a diminutive formed from *calx, a stone;* and applied the verb *calculare,* to signify the operation of combining or separating such pebbles or counters. Hence innumerable allusions by the Latin authors. *Ponere calculum—subducere calculum, to put down a counter,* or *to take it up;* that is, to add or subtract; *vocare aliquid ad calculum, ut par sit ratio acceptorum et datorum—to submit any thing to calculation, so that the balance of debtor and creditor may be struck.* The emperor Helvius Pertinax, who had been taught, while a boy, the arts of writing and casting accounts, is said, by Julius Capitolinus, to be *litteris elementariis et calculo imbutus.* St Augustine, whose juvenile years were devoted to pleasure and dissipation, acquaints us, in his extraordinary Confessions, that to him no song ever sounded more odious than the repetition or *cantio,* that *one* and *one* make *two,* and *two* and *two* make *four.* The use of the *Abacus,* called sometimes likewise the *Mensa Pythagorica,* formed an essential part of the education of every noble Roman youth:

> Nec qui *abaco numeros, et secto in pulvere metas*
> Scit risisse vafer. PERS. *Sat.* i. 131.

From Martianus Capella we learn that, as refinement advanced, a coloured sand, generally of a greenish hue, was employed to strew the surface of the *abacus.*

> Sic *abacum* perstare jubet, sic *tegmine glauco*
> Pandere pulvereum formarum ductibus æquor.
> Lib. vii. *De Arithmetica.*

A small box or coffer, called a *Loculus,* having compartments for holding the *calculi* or counters, was a necessary appendage of the *abacus.* Instead of carrying a slate and satchel, as in modern times, the Roman boy was accustomed to trudge to school, loaded with his arithmetical board, and his box of counters:

> Quo pueri magnis e centurionibus orti,
> *Lævo suspensi loculos tabulamque lacerto.*
> HORAT. *Sat.* i. 6.

In the progress of luxury, *tali,* or dies made of ivory, were used instead of pebbles, and small silver coins came to supply the place of counters. Under the emperors, every patrician living in a spacious mansion, and indulging in all the pomp and splendour of eastern princes, generally entertained, for various functions, a numerous train of foreign slaves or freedmen in his palace. Of these, the *librarius* or *miniculator,* was employed in teaching the children their letters; but the *notarius* registered expenses, the *rationarius* adjusted and settled accounts, and the *tabularius* or *calculator,* working with his counters and board, performed what computations might be required. Sometimes these laborious combiners of numbers were termed reproachfully *canculones* or *calculones.* In the fervour of operation, their gestures must often have appeared constrained and risible.

> *Computat, ac cevet.* Ponatur calculus, adsint
> Cum tabula pueri.
> JUV. *Sat.* ix. 40.

The nicety acquired in calculation by the Roman youth, was not quite agreeable to the careless and easy temper of Horace.

> Romani pueri *longis rationibus* assem
> Discunt in parteis centum diducere. Dicat
> Filius Albini, Si de quincunce remota est
> Uncia, quid superet? Poteras dixisse, Triens. Eu!
> Rem poteris servare tuam. Redit uncia; quid fit?
> Semis.
> *Epist. ad Pisones.*

It was a practice among the ancients to keep a diary, by marking their fortunate days by a *lapillus,* or small white pebble, and their days of misfortune by a black one. Hence the frequent allusions which occur in the Classics:

> O diem lætum, notandumque mihi *candidissimo calculo!*
> PLIN. *Epist.* vi. 11.

> ......... diesque nobis
> Signandi *melioribus lapillis!*
> MART. ix. 53.

> Hunc, Macrine, diem numera *meliore lapillo,*
> Qui tibi labentes apponit candidus annos.
> PERS. *Sat.* ii. 1, 2.

To facilitate the working by counters, the construction of the *abacus* was afterwards improved. Instead of the perpendicular lines or bars, the board had its surface divided by sets of parallel grooves, by stretched wires, or even by successive rows of holes. It was easy to move small counters in the grooves, to slide perforated beads along the wires, or to stick large nobs or round-headed nails in the different holes. To diminish the number of marks required, every column was surmounted by a shorter one, wherein each counter had the same value as five of the ordinary kind, being half the index of the Denary Scale. The *abacus,* instead of wood, was often, for the sake of convenience and durability, made of metal, frequently brass, and sometimes silver. In the Plate entitled ARITHMETIC, we have copied, from the third volume of the Supplement added by Polenus to the immense Thesaurus of Grævius, two varieties of this instrument, as used by the Romans. They both rest on good authorities, having been delineated from antique monuments,—the first kind by Ursinus, and the second by Marcus Velserus. In the one, the numbers are represented by flattish perforated beads, ranged on parallel wires; and, in the other, they are signified by small round counters moving in parallel grooves. These instruments contain each seven capital bars, expressing in order *units, tens, hundreds, thousands, ten thousands, hundred thousands,* and *millions;* and above them are shorter bars following the same progression, but having five times the relative value. With *four* beads on each of the long wires, and

---

[1] Καν καθαραι ωσιν αἱ Ψηφοι, και μηδεν περιῃ. (DEMOSTHENES *pro Corona.*)

*one* bead on every corresponding short wire, it is evident that any number could be expressed, as far as *ten millions.*

In all these, the *Denary Scale* is followed uniformly; but there is, besides, a small appendage to the arrangement founded on the *Duodenary System.* Immediately below the place of units is added a bar, with its corresponding branch, both marked Θ, being designed to signify *ounces*, or the twelfth parts of a pound. *Five* beads on the long wire, and *one* bead on the short wire, equivalent now to *six*, would therefore denote *eleven* ounces. To express the simpler fractions of an ounce, three very short bars are annexed behind the rest; a bead on the one marked S or Ʒ, the contraction for *Semissis*, denoting *half an ounce;* a bead on the other, which is marked by the inverted Ͻ, the contraction for *Sicilicum*, signifying the *quarter of an ounce;* and a bead on the last very short bar, marked Ƨ, a contraction for the symbol ϙ or *Binæ Sextulæ*, intimating a *duella* or *two-sixths*, that is, *the third part of an ounce.* The second form of the *abacus* differs in no essential respect from the first, the grooves only supplying the place of parallel wires.

We should observe that the Romans applied the same word *abacus*, to signify an article of luxurious furniture, resembling in shape the arithmetical board, but often highly ornamental, and destined for a very different purpose,—the relaxation and the amusement of the opulent. It was used in a game apparently similar to that of chess, which displayed a lively image of the struggles and vicissitudes of war. The infamous and abandoned Nero took particular delight in this sort of play, and drove along the surface of the abacus with a beautiful *quadriga*, or chariot of ivory.

The civil arts of Rome were communicated to other nations by the tide of victory, and maintained through the vigour and firmness of her imperial sway. But the simpler and more useful improvements survived the wreck of empire, among the various people again restored by fortune to their barbarous independence. In all transactions wherein money was concerned, it was found convenient to follow the procedure of the Abacus, in representing numbers by counters placed in parallel rows. During the middle ages, it became the usual practice over Europe for merchants, auditors of accounts, or judges appointed to decide in matters of revenue, to appear on a covered *bank* or *bench*, so called, from an old Saxon or Franconian word, signifying a *seat.* Hence those terms were afterwards appropriated to offices for receiving pledges, chambers for the accommodation of money-dealers, or courts for the trying of questions respecting property or the claims of the Crown. Hence also the word *bankrupt*, which occurs in all the dialects of Europe. The term *scaccarium*, from which was derived the French, and thence the English name for the *Exchequer*, anciently signified merely a *chess-board*, being formed from *scaccum*, denoting one of the movable pieces in that intricate game. The reason of this application of the term is sufficiently obvious. The table for accounts was, to facilitate the calculations, always covered with a cloth, resembling the surface of the *scaccarium* or *abacus*, and distinguished by perpendicular and *chequered* lines. The learned Skene was therefore mistaken in supposing that the Exchequer derived its name from the play of chess, because its suitors appear to fight a keen and dubious battle.[1]

Exchequer Board, and other Contrivances.

The Court of Exchequer, which takes cognizance of all questions of revenue, was introduced into England by the Norman conquest. Richard Fitznigel, in a treatise or dialogue on the subject, written about the middle of the twelfth century, says that the *scaccarium* was a quadrangular table about ten feet long and five feet broad, with a ledge or border about four inches high, to prevent any thing from rolling over, and was surrounded on all sides by seats for the judges, the tellers, and other officers. It was covered every year, after the term of Easter, with fresh black cloth, divided by perpendicular white lines, or distinctures, at intervals of about a foot or a palm, and again parted by similar transverse lines. In reckoning, they procceded, he says, according to the rules of arithmetic,[2] using small coins for counters. The lowest bar exhibited *pence*, the one above it *shillings*, the next *pounds;* and the higher bars denoted successively *tens*, *twenties*, *hundreds*, *thousands*, and *ten thousands* of pounds; though, in those early times of penury and severe economy, it very seldom happened that so large a sum as the last ever came to be reckoned. The first bar, therefore, advanced by *dozens*, the second and third by *scores*, and the rest of the stock of bars by the multiples of *ten.* The teller sat about the middle of the table; on his right hand *eleven* pennies were heaped on the first bar, and a pile of *nineteen* shillings on the second; while a quantity of pounds was collected opposite to him, on the third bar. For the sake of expedition, he might employ a different mark to represent half the value of any bar, a silver penny for ten shillings, and a gold penny for ten pounds.

In early times, a chequered board, the emblem of calculation, was hung out, to indicate an office for changing money. It was afterwards adopted as the sign of an inn or *hostelry*, where victuals were sold, or strangers lodged and entertained. We may perceive traces of that ancient practice existing even at present. It is customary in London, and in some provincial towns, to have a chequer, diced with red and white, painted against the sides of the door of a chop-house.

The use of the smaller *abacus* in assisting numerical computation was not unknown during the middle ages. In England, however, it appears to have scarcely entered into actual practice, being mostly confined to those "slender clerks" who, in such a benighted period, passed for men of science and learning. The calculator was styled, in correct Latinity, *abacista;* but, in the Italian dialect, *abbachista*, or *abbachiere.* A different name came afterwards to be imposed. The Arabians, who, under the appellation of Saracens or Moors, conquered Spain, and enriched that insulated country by commendable industry and skill, had likewise introduced their mathematical science. Having adopted a most refined species of numeration, to which they gave the barbarous name of *algarismus*, *algorismus*, or *algorithmus*, from the definite article *al*, and the Greek word *αριθμος*, or *number*, this compound term was adopted by the Christians of the West, in their admiration of superior skill, to signify calculation in general, long before the peculiar mode had become known and practised among them. The term *algarism* was corrupted in English into *augrim* or *awgrym*, as printed by Wynkyn

---

[1] "Because mony persons conveenis in the Checker to playe their causes, contrare uthers, as gif they were fechtand in an arrayed battell, quilk is the forme and ordour of the said playe." (SKENE, ad voc. *Scaccarium.*)

[2] He calls it *Arismetica:* In the *Myrrour of the Worlde*, printed by Caxton, in 1481, it is strangely named *Ars Metrike*, a proof of the total ignorance of Greek at that period in England.

de Worde, at the end of the fifteenth century; and applied even to the pebbles or counters used in ordinary calculation. In confirmation of this remark, we shall not scruple to quote a passage from our ancient poet Chaucer, who flourished about a century before, and whose verses, however rude, are sometimes highly graphic.

> This clerk was cleped hendy Nicholas;
> Of derne love he coude and of solas;
> And therto he was slie and ful prive,
> And like a maiden meke for to se.
> A chambre had he in that hostelrie
> Alone, withouten any compagnie,
> Ful fetisly ydight with herbes sote,
> And he himself was swete as is the rote
> Of licoris, or any setewale.
> His almageste, and bokes gret and smale,
> His astrelabre, longing for his art,
> *His augrim stones, layen faire apart*
> *On shelves couched at his beddes hed,*
> His presse ycovered with a falding red.
> And all above ther lay a gay sautrie,
> On which he made on nightes melodie,
> So swetely, that all the chambre rong:
> And *Angelus ad virginem* he song.
> And after that he song the kinge's note;
> Ful often blessed was his mery throte.
>
> *The Milleres Tale*, v. 13–32.

The *abacus*, with its store of counters, wanted the valuable property of being portable, and was at all times evidently a clumsy and most incommodious implement of calculation. In many cases, it became quite indispensable to adopt some sure and ready method of expressing at least the lower numbers. The ancients employed the variously combined inflections of the fingers on both hands to signify the numerical series, and on this narrow basis they framed a system of considerable extent. In allusion to the very ancient practice of numbering by the arbitrary play of the fingers, Orontes, the son-in-law of Artaxerxes, having incurred the weighty displeasure of that monarch, is reported by Plutarch to have exclaimed in terms exactly of the same import as those before ascribed to Solon, that "the favourites of kings resemble the fingers of the arithmetician, being sometimes at the top and sometimes at the bottom of the scale, and are equivalent at one time to ten thousand, and at another to mere units."[1]

Digital Numeration.

Among the Romans likewise, the allusions to the mode of expressing numbers by the varied inflection of the fingers, are very frequent. Hence the classical expressions, *computare digitis*, and *numerare per digitos*; and hence the line of Ausonius,

> Quot ter luctatus cum pollice computat index.

In this play of the fingers great dexterity was acquired; and hence the phrase which so frequently occurs in the Classics—*micare digitis*. It was customary to begin with the left hand, and thence proceed to the right hand, on which the different combined inflections indicated exactly one hundred times more. Hence the peculiar force of this passage from Juvenal:

> Rex Pylius, magno si quicquam credis Homero,
> Exemplum vitæ fuit a cornice secundæ;
> Felix nimirum, qui tot per sæcula mortem
> Distulit, atque suos jam *dextra* computat annos.
>
> *Sat.* x. 246–249.

Many such allusions to the mode of indicating numbers by the varied position of the fingers or the hands, occur in the writings of Cicero and Quintilian. The ancients, indeed, for want of better instruments, were tempted to push that curious art to a very great extent. By a single inflection of the fingers of the left hand, they proceeded as far as ten; and by combining another inflection with it, they could advance to an hundred. The same signs on the right hand, being augmented, as we have seen, an hundredfold, carried them as far as ten thousand; and by a further combination, those signs, being referred successively to different parts of the body, were again multiplied an hundred times, and therefore extended to a *million*. This kind of pantomime outlived the subversion of the Roman empire, and was particularly fitted for the slothful religious orders who fattened on its ruins, and, relinquishing every manly pursuit, recommended silence as a virtue, or enjoined it as an obligation. Our venerable Bede has explained the practice of manual numeration at some length; and we have given (see Plate Arithmetic) a small specimen of such inflections and digital signs.

These signs were merely fugitive, and it became necessary to adopt other marks, of a permanent nature, for the purpose of recording numbers. But of all the contrivances adopted with this view, the rudest undoubtedly is the method of registering by *tallies*, introduced into England along with the Court of Exchequer, as another badge of the Norman conquest. These consist of straight well-seasoned sticks, of hazel or willow, so called from the French verb *tailler*, to *cut*, because they are squared at each end. The sum of money was marked on the side with notches, by the cutter of tallies, and likewise inscribed on both sides in Roman characters, by the writer of the tallies. The smallest notch signified a penny, a larger one a shilling, and one still larger a pound; but other notches, increasing successively in breadth, were made to denote ten, a hundred, and a thousand. The stick was then cleft through the middle by the deputy-chamberlains, with a knife and a mallet; the one portion being called the *tally*, or sometimes the *scachia*, *stipes*, or *kancia*; and the other portion named the *countertally*, or *folium*.

After the union with Scotland had been concluded in 1707, a store of hazel rods for tallies was sent down to Edinburgh, being intended, no doubt, as a mighty refinement on the Scottish mode of keeping accounts. Their advantages, however, were not perceived or acknowledged, and they have since been suffered, we believe, to lie as so much useless lumber. But the case was very different in England, which is more addicted to a slavish attachment to ancient forms, and opposed to the general progress of society.

This ridiculous plan of keeping the public accounts was maintained up to the year 1834, when a more rational system was adopted, and the old wooden tallies were ordered to be destroyed. The parties entrusted with this duty burnt them in the stoves which heated the House of Lords; and so intense was the heat occasioned by the burning of so great a quantity of dry wood, that it set fire to the building, and consumed the Houses of Parliament, on the 16th October 1834.

Chinese Swan-Pan.

The Chinese have, from the remotest ages, used in all their calculations, an instrument called the *Swan-Pan*, or *Computing Table*, similar in its shape and construction to the *abacus* of the Romans, but more complete and uniform. It consists of a small oblong board surrounded by a high ledge, and parted lengthwise near the top by another ledge. It is then divided vertically by ten smooth and slender rods of bamboo, on which are strung two

---

[1] Καθαπερ οἱ των αριθμητικων ΔΑΚΤΥΛΟΙ νυν μεν ΜΥΡΙΑΔΑΣ, νυν δε ΜΟΝΑΔΑ τιθεναι δυνανται. το αυτο και των βασιλεων φιλους, νυν μεν το παν δυνασθαι νυν δε τουλαχιστον. (Plut. *Apophthegm.*)

small balls of ivory or bone in the upper compartment, and five such balls in the lower and larger compartment; each of the latter on the several bars denoting unit, and each of the former, for the sake of abbreviation, expressing five. See Plate (Arithmetic), where the balls are actually set to signify the numbers annexed.

The system of measures, weights, and coins, which prevails throughout the Chinese empire, being entirely founded on the decimal subdivision, the swan-pan was admirably suited for representing it. The calculator could begin at any particular bar, and reckon with the same facility either upwards or downwards. This advantage of treating fractions exactly like integers was, in practice, of the utmost consequence. Accordingly, those arithmetical machines, but of very different sizes, are constantly used in all the shops and booths of Canton and other cities, and are said to be handled by the native traders with such rapidity and address as quite astonish the European factors.

But the Chinese have also contrived a very neat and simple kind of digital signs for denoting numbers, greatly superior, both in precision and extent, to the method practised by the Romans. Since every finger has three joints, let the thumb-nail of the other hand touch those joints in succession, passing up the one side of the finger, down the middle, and again up the other side, and it will give nine different marks, applicable to the *Denary Scale* of arrangement. On the little finger those marks signify units, on the next finger tens, on the mid-finger hundreds, on the index thousands, and on the thumb hundred thousands. With the combined positions of the joints of the one hand, therefore, it was easy to advance by signs as far as a million. To illustrate more fully this ingenious practice, we have, immediately below the *koua* of the Emperor Fou-hi, copied (See Plate), from a Chinese elementary treatise of education, the figure of a hand, noted at the several joints of each finger, by characters along the inside, corresponding to *one, two,* and *three,* down the middle by those answering to *four, five,* and *six,* and again up the outside by characters expressing *seven, eight,* and *nine.* It is said that the merchants in China are accustomed to conclude bargains with each other by help of those signs; and that often, from selfish or fraudulent views, they conceal the pantomime from the knowledge of by-standers, by only seeming to seize the hand with a hearty grasp. (J. L.)

*Abacus Pythagoricus*, the common multiplication table, so called from its being invented by Pythagoras.

*Abacus Logisticus* is a rectangled triangle, whose sides, forming the right angle, contain the numbers from 1 to 60; and its area, the facta of each two of the numbers perpendicularly opposite. This is also called a *canon of sexagesimals.*

*Abacus et Palmulæ*, in the *Ancient Music*, denote the machinery whereby the strings of polyplectra, or instruments of many strings, were struck with plectra made of quills.

*Abacus Harmonicus* is used by Kircher for the structure and disposition of the keys of a musical instrument, whether to be touched with the hands or the feet.

*Abacus Major*, in metallurgic operations, the name of a trough used in the mines, wherein the ore is washed.

ABADDON, or Apollyon (אבדון, *destruction;* Ἀβαδδων in Rev. ix. 11, where it is rendered by the Greek Ἀπολλυων, *destroyer.*) The former is the Hebrew name, and the latter the Greek, for the angel of death, or the angel of the abyss or 'bottomless pit.' In the Bible, and in every Rabbinical instance, the word אבדון (*abaddon*) means destruction (Job xxxi. 12), or the place of destruction, *i. e.* the subterranean world, Hades, the region of the dead (Job xxvi. 6; xxviii. 22; Prov. xv. 11.) It is in fact the second of the seven names which the Rabbins apply to that region; and they deduce it particularly from Psalm lxxxviii. 11, "Shall thy loving kindness be declared in the grave, or thy faithfulness in (*abaddon*) destruction?"

ABADEH, a Persian town in Fars, 115 miles north of Shirauz, formerly a place of importance but now decayed, though still with a population of about 5000. It is famous for its gardens, the fruits of which are sent to Shirauz.

ABADIR, a title which the Carthaginians gave to gods of the first order. In the Roman mythology, it is the name of a stone which Saturn swallowed, by the contrivance of his wife Ops, believing it to be his new-born son Jupiter: hence it became the object of religious worship.

ABÆ, Ἄβαι, in *Ancient Geography*, a town of Phocis near the frontiers of the Opuntians Locrians famous for an ancient oracle of Apollo, and the treasures of its temple, which was plundered and burnt by the Persians, B.C. 480; and again by the Bœotians, B.C. 346. Hadrian built a smaller temple near the site of the former one. The ruins of Abæ may still be traced on the S.W. side of a peaked hill to the west of Exarkhó. (See Leake's *Northern Greece;* Gell's *Itinerary.*)

ABAFT, a sea term, signifying the hinder part of a ship, or all those parts both within and without which lie towards the stern, in opposition to *afore. Abaft* is also used as a preposition, and signifies *further aft,* or *nearer the stern:* as, the barricade stands *abaft* the main-mast, *i. e.* behind it, or nearer the stern.

ABAISSED, *abaisse*, in *Heraldry*, an epithet applied to the wings of eagles, &c. when the tip looks downwards to the point of the shield, or when the wings are shut; the natural way of bearing them being extended.

ABAKA, Khan, the eighth emperor of the Moguls, a wise and good prince, ascended the throne in 1264. He reigned 17 years, and is by some authors said to have been a Christian. It may be admitted, indeed, that he joined with the Christians in keeping the feast of Easter, in the city Hamadan, a short time before his death. But this is no proof of his Christianity; it having been a common practice, in these times, for Christians and Mahometans to join in keeping the same feasts, when each would compliment the other by doing honour to his solemnity.

ABAKANSK, a range of mountains in the government of Tomsk, in Siberia, extending from the river Tom to the Jenisei, parallel to the Altai mountains.

Abakansk, a fortified town of Siberia, in the government of Tomsk, on the river Abakan. This is considered the mildest and most salubrious place in Siberia; and is remarkable for the tumuli in its neighbourhood, and for some statues of men from seven to nine feet high covered with hieroglyphics. Pop. 1200. Lat. 54. N. Long. 91. 14. E.

ABALLABA, an ancient Roman castle mentioned in the *Notitia Imperii*, the site of which is referred by antiquaries to Appleby in Westmoreland. It was one of the forts erected by Hadrian, A.D. 120.

ABALUS, in *Ancient Geography*, is described as an island in the German Ocean, where amber was found in great abundance. It is called *Basilia* by Timæus, and *Baltia* by Xenophon of Lampsacus. It was probably one of the narrow peninsulas on the Prussian coast, which lie between the Baltic and the lakes called the Frisch and Curisch Haffs.

ABANA, or Amana, and PHARPAR, are called "rivers of Damascus" in 2 Kings v. 12. The main stream by which Damascus is now irrigated is called Barrada (the ancient Chrysorrhoas), and it seems probable that this was the ancient Pharpar: the Abana has been sought in its subsidiary streams, and also in the Fijih, a deep, rapid stream, which falls into the Barrada 15 or 20 miles N.W. of Damascus. See DAMASCUS.

ABANCAY, a district of Peru in the *partido* of Cuzco. Its length is 26 leagues from east to west, its breadth 14. It contains several towns, of which the chief is Abancay. The surface is varied; the plains produce very rich crops of sugar cane, and the principal cereals, as well as much hemp, which is manufactured into cloth in the chief town, where also there are excellent sugar refineries. The mountains afford some silver, and pasturage for large herds of cattle. The town of Abancay is 65 miles from Cuzco, and has one of the finest bridges in Peru.

ABANDONMENT, in *Marine Insurance*, is the surrendering of the ship or goods insured, to the insurers, in consequence of damage or loss sustained from any of the causes insured against. In every case of loss or damage from these causes, the insured is not entitled to abandon, but only when serious injury has been sustained; as where the voyage is lost or not worth pursuing, and the projected adventure frustrated, or where the thing insured is so damaged and spoiled as to be of little or no value to the owner. It was held that, where the damage sustained in a voyage was to the extent of forty-eight per cent. of the value of the vessel, the insured were not entitled to abandon. By abandonment all the rights of the insured are vested in the insurers, who thus become the legal owners of the vessel or goods, and are obliged to pay the full amount of the insurance. The insured must intimate his intention to abandon, within a reasonable time after receiving intelligence of the loss; any unnecessary delay being held as an indication of his intention not to abandon. An abandonment when once made is irrevocable; but in no circumstances is the insured obliged to abandon. In the case of shipwreck or other misfortune, the captain and crew are bound to do all in their power to save the property, without prejudice to the right of abandonment; for which they are entitled to wages and remuneration from the insurers, at least so far as what is saved will allow. (See Marshall and Park, on the *Law of Insurance*.)

ABANO, a town in the Austrian division of Italy, at the foot of the Vicentine Hills, the ancient *Montes Euganei*. It is visited by invalids for the benefit of its baths, which were well known to the ancients, and are noticed by Martial and Claudian as Fontes Aponi. There are five thermal springs, viz., Fonte d'Abano, Mont'-Ortone, San Pietro, Monte Gratto, and San Bartolomeo, besides the hot mud bath, Bagno di Fango; which latter is considered more efficacious for the cure of diseases than the springs. These springs rise through tertiary strata, resting on trap-porphyry, which Breislac considers of volcanic origin. Besides their medicinal virtues, Suetonius relates that they were frequented for the purposes of divination by means of *tali* cast into the basin of the fountain. Suet. *Tib.* xiv. Claud. *Idyll.* 6.

ABANTES, a people of ancient Greece who came originally from Thrace, and settled in Phocis, where they built a town which they called *Aba*, after the name of Abas their leader. If we may credit some ancient authors, the Abantes afterwards migrated to the island of Eubœa; according to other authorities the Abantes of Eubœa came from Athens. The national character of the Abantes was very warlike.

ABANTIAS, or ABANTIS, in *Ancient Geography*, a name of the island Eubœa. See EUBŒA.

ABAPTISTON, in *Surgery*, the perforating part of the instrument called a TREPAN. This instrument, which is mentioned by Galen, Fabricius ab Aquapendente, and others, was a conical saw with a circular edge. Modern practitioners, however, prefer the cylindrical form; and various contrivances have been recommended to obviate the danger that may arise from want of dexterity, or from rashness, in performing the operation of trepanning. The instrument most commonly employed in Britain is the *trephine*, in which the circular saw is moved backward and forward by the hand; but on the Continent the preference is usually given to the *trepan*, in which the circular saw is attached to a handle like that of a carpenter's brace; and this is preferred by Professor Syme, and some of our other eminent surgeons, to the *trephine*, as the latter renders the operation more tedious and laborious. See SURGERY.

ABARAN, a small town in the department of Ziezar, and province of Murcia, in Spain.

ABARAN, a Persian town, about 15 miles north of Nuckschivan, in which the Dominicans had a mission.

ABARIM, high mountains of steep ascent separating the country of the Ammonites and Moabites from the land of Canaan, where Moses died. According to Josephus, they stood opposite to the territory of Jericho, and were the last station but one of the Israelites coming from Egypt. Nebo and Pisgah were parts of these mountains.

ABARIS, the Hyperborean, a celebrated sage of antiquity, whose history and travels have been the subject of much learned discussion. Such a number of fabulous stories[1] were told of him, that Herodotus himself seems to scruple to relate them. He tells us only,[2] that this barbarian was said to have travelled with an arrow, and to have taken no sustenance; but this does not acquaint us with the marvellous properties which were attributed to that arrow; nor that it had been given him by the Hyperborean Apollo. With regard to the occasion of his leaving his native country, Harpocration[3] tells us, that the whole earth being infested with a deadly plague, Apollo, upon being consulted, gave no other answer than that the Athenians should offer up prayers in behalf of all other nations; upon which, several countries deputed ambassadors to Athens, among whom was Abaris the Hyperborean. In this journey, he renewed the alliance between his countrymen and the inhabitants of the island of Delos. It appears that he also went to Lacedæmon; since according to some writers,[4] he there built a temple consecrated to Proserpine the Salutary. It is asserted that he was capable of foretelling earthquakes, driving away plagues, laying storms,[5] &c. He wrote several books, as Suidas[6] informs us, viz., Apollo's arrival in the country of the Hyperboreans; the nuptials of the river Hebrus; Θεογονια or the Generation of the Gods; a collection of oracles, &c.—If the Hebrides, or Western islands of Scotland, (says Mr Toland)[7] were the Hyperboreans of Diodorus,[8] then the celebrated Abaris was of that country; and likewise a Druid, having been the priest of Apollo. Suidas, who knew not the distinction of the insular Hyperboreans, makes him a Scythian; as do some others, misled by the same vulgar error; though Diodorus has truly fixed his country in an island, and not on the Continent. But every thing relating to him is apocryphal, and even his era is doubtful. Some refer his appearance in Greece to the third Olympiad, others to the 21st, while some transfer him to the 52d Olympiad, or 570 years B.C., or somewhat later, about the time of Crœsus of Lydia.

ABARTICULATION, in *Anatomy*, a species of articulation, admitting of a manifest motion; called also *Diarthrosis*, and *Dearticulatio*, to distinguish it from that sort of articulation which admits of a very obscure motion, and is called *Synarthrosis*.

ABAS, a weight used in Persia for weighing pearls. It is equal to 2·25 grains Troy.

ABAS, in heathen mythology, the son of Meganira, who entertained Ceres, and offered a sacrifice to that goddess; but Abas ridiculing the ceremony, and giving her opprobrious language, she sprinkled him with a certain mixture she held in her cup, on which he became a newt or water lizard.

ABASSI, or ABASSIS, a silver coin current in Persia, equivalent in value to a French livre, or at present tenpence sterling. It took its name from Schah Abbas II., king of Persia, under whom it was struck.

ABATAMENTUM, in *Law*, is an entry to lands by interposition, *i. e.* when a person dies seized, and another who has no right enters before the heir.

ABATE, in the manege, implies the performing any downward motion properly. Thus a horse is said to *abate* or take down his curvets, when he puts both his hind legs to the ground at once, and observes the same exactness in all the times.

To ABATE, (from the French *abattre*, to pull down, overthrow, demolish, batter down, or destroy,) a term used by the writers of the English common law both in an active and neuter sense; as, To *abate* a castle, is to beat it down. To *abate* a writ, is, by some exception to defeat or overthrow it. A stranger *abateth;* that is, entereth upon a house or land void by the death of him that last possessed it, before the heir takes possession, and so keepeth him out: wherefore, as he that putteth out him in possession is said to disseize, so he that steppeth in between the former possessor and his heir is said to *abate*. In the neuter signification thus: The writ of the demandant shall *abate;* that is, shall be disabled, frustrated, or overthrown. The appeal *abateth* by covin; that is, the accusation is defeated by deceit.

ABATEMENT, in *Heraldry*, an accidental figure supposed to have been added to coats of arms, in order to denote some dishonourable demeanour or stain, whereby the dignity of coat armour was rendered of less esteem.

ABATEMENT, REBATE, or REBATEMENT, in *Commerce*, is a discount for ready money; and it also means a deduction sometimes made at the custom-house from the fixed duties on certain kinds of goods, on account of damage or loss sustained in warehouses. The rate of such deduction is regulated by Act 3 and 4 Will. IV. c. 52.

ABATI, NICCOLO, a celebrated fresco-painter of Modena, born in 1512. His best works are at Modena, and in the Institute of Bologna; and have been highly praised by Zanotti, Algarotti, and Lanzi. He accompanied Primaticcio to France, and assisted in decorating the palace at Fontainbleau. He united skill in drawing, grace, and natural colouring in his pictures. Some of his easel pieces in oil are in different collections; and the finest of them, to be seen in the Dresden Gallery, represents the martyrdom of St Peter and St Paul. Abati died at Paris, in 1571. There are several good painters of his name and family mentioned by Lanzi. *Storia Pittorica*, tom. iv.

ABATIS, an ancient term for an officer of the stables.

ABATIS, or ABATTIS, in military affairs, a kind of defence made of felled trees. In sudden emergencies, the trees are merely laid lengthwise beside each other, with the branches pointed outwards to prevent the approach of the enemy, while the trunks serve as a breast-work to the defendants. When the abatis is employed for the defence of a pass or entrance, the boughs of the trees are stripped of their leaves and pointed, the trunks are planted in the ground, and the branches interwoven with each other.

ABATON, a building at Rhodes, erected as a fence to the trophy of Artemisia, queen of Halicarnassus, Coos, &c. raised in memory of her victory over the Rhodians, or rather to conceal the disgrace of the Rhodians from the eyes of the world; for, to efface or destroy the trophy was with them a point of religious abhorrence.

ABATOR, in *Law*, a term applied to a person who enters a house or lands void by the death of the last possessor, before the true heir.

ABATOS, in *Ancient Geography*, an island in the Nile near Philæ, sacred to Osiris, which the priests alone were permitted to enter.

ABATTOIR, the term applied by the French to designate slaughter-houses for cattle. These useful establishments were introduced into Paris and other large cities by Napoleon. Formerly the multitude of animals slaughtered in Paris, became a nuisance of great magnitude to the inhabitants, from the exhibition of the barbarities practised on the poor animals by the butchers, the piteous cries of sheep and cattle pent up, without food or water, in the confined stalls in which they were crowded, and from the offensive exhalations of putrid blood and offal that proceeded from slaughter-houses, often planted in the most populous parts of the city. The same nuisance, till lately, disgraced the British metropolis, and most of our other great towns. It appears hardly conceivable that London should, till 1852, have tolerated the nuisance of Smithfield market. When this mart was established five centuries ago, it was far beyond the precincts of the city. There, in the midst of a dense population, no fewer than 243,537 head of cattle, and 1,455,249 sheep were sold in 1852, to be afterwards slaughtered in the crowded lanes and ill-ventilated courts of the metropolis; while our more judicious neighbours the French, and our transatlantic brethren in New York and Philadelphia, do not tolerate such sources of disgust and disease in the interior of their great towns.

The abattoirs of Paris, created by Napoleon's decree of 1810, amounted to five in 1818, when they were all completed, and put under excellent regulation. There are three on the north, and two on the south side of Paris; and all are in the outskirts of the town, about two miles from its centre. The largest to the north is in the Rue Rochechouart, between the Barrieres Poissonnieres and des Martyres; the largest on the south side is just behind the Place Breteuil; the rest are near the banks of the Seine. The cattle-markets are all at the distance of some miles from Paris; and the cattle are driven from them to the abattoirs, round by the external Boulevards, so as to avoid the streets as much as possible.

Each butcher goes to his own abattoir; to which are attached proper places for preserving the meat, provided with an iron rack for the fat, pans for melting the tallow, and stalls for the cattle before they are slaughtered. The stalls are furnished with proper racks and troughs for hay and water, that the animals may suffer as little as possible before they are slaughtered. The abattoirs, and the whole establishment are kept very clean, by an abundant supply of water that carries off the blood and all impurities into sewers. Considering the nature of the place, every thing is commendably clean.

An inspector is appointed to each abattoir, whose business it is to prevent the sale of unwholesome meat, and to enforce order and cleanliness. For these accommodations a butcher pays according to the number of animals he slaughters. The sum now paid for each ox is six francs, four for a cow, two for a calf, and one for a sheep or lamb. The money thus raised from all the Parisian abattoirs in 1842, amounted to about £48,000 sterling.

It is greatly to be wished that some regulations like those of the French abattoirs were introduced into all our large towns, especially London, Liverpool, Manchester, Glasgow, &c., as has lately been done at Edinburgh.

In 1851, the corporation of Edinburgh constructed a greatly improved abattoir in that city, from designs prepared by Mr David Cousin, the city architect. It occupies an area of four acres and a quarter, surrounded by a screen-wall, with entrance gates on each side in the Egyptian style of architecture; behind the screen-wall is a large open area, from which access is given to all the different buildings connected with the establishment. The slaughtering booths consist of a double row of buildings, extending in a straight line to about 376 feet in length, with a centre roadway 25 feet wide. There are three separate blocks of building on each side of the roadway, the extreme blocks being each 100 feet in length, and the central one 140 feet, with cross roads 18 feet wide, between these, giving access to the other portions of the grounds. The different ranges of building contain 42 booths in all; each booth is 18 feet wide, 24 feet in length, and 20 feet in height, having a cattle shed attached, 18 feet by 22 feet, and a small enclosed yard behind, with a separate back entrance, by which all the cattle are driven into the sheds, where they are kept previously to being slaughtered. By a series of large ventilators along the roof, and by other contrivances, these buildings are thoroughly ventilated. The large doors of the booths, instead of being hinged in the usual manner, are hung by balance weights, so as to slide up and down similarly to an ordinary sash-window, so that they never interfere with the operations within, or with the thoroughfare of the road.

Improved mechanical contrivances have been introduced, some of them of a novel application, which have secured great facilities in the dressing and preparation of the meat. Each booth is amply provided with water.

In addition to the slaughtering booths, there is large accommodation for triperies, pig-slaughtering houses, tallow-weighing houses, and all the other necessaries of such an establishment.

The whole of the booths have been laid with thick well-dressed pavement, resting on a stratum of concrete twelve inches thick, and the walls to the height of seven feet are formed of solid ashler, so as to prevent the possibility of rats burrowing in them. With this view also, the whole surface of the roadways have been laid with concrete and causewayed with well-dressed whinstone pavement. The drainage also consists entirely of glazed earthenware tubes, so that the whole area of the buildings is rendered impervious to these destructive vermin.

There are two distinct sets of drains, one for surface water, which is conveyed directly into Lochrin burn; the other for soil from the booths, which is conveyed into large tanks formed for its reception, and sold for agricultural purposes.

Before the erection of these buildings, private slaughter-houses were scattered all over the city, often in the most populous districts, where, through want of drainage and imperfect ventilation, they contaminated the whole neighbourhood. Since the opening of the public abattoir, all private slaughter-houses are prohibited.

ABA-UJVAR, one of the palatinates into which the Austrian kingdom of Hungary is divided. It is bounded on the east and south by the county of Zemplin, on the west by those of Torna Borschod and Zips, and on the north by Saros. It is mountainous, and nearly one-half covered with wood. Its chief productions are wine, tobacco, wood, corn, flax, fruit, metals, and precious stones; and it has also some valuable quarries of marble. Its extent is about 1118 square miles, and it contains one city, 10 market-towns, and 227 villages. Population in 1838, 204,000.

ABAUZIT, Firmin, a learned Frenchman, was born at Usez, in Languedoc, in November 1679. His father died when he was but two years of age. To avoid the persecution to which the Protestants of France were exposed in the time of Louis XIV., Abauzit's mother fled with her son to Geneva. From his 10th to his 19th year, his time was wholly devoted to literature; and having made great progress in languages, he studied mathematics, physics, and theology. In the year 1698, he travelled into Holland, where he became acquainted with Bayle, Basnage, and Jurieu. Thence he passed over to England, and was introduced to Sir Isaac Newton, who entertained a very high opinion of his merit. For this philosopher afterwards sent him his *Commercium Epistolicum*, accompanied with a very honourable testimony: "You are well worthy," says Newton, "to judge between Leibnitz and me." The reputation of Abauzit reached the ears of King William, who encouraged him by a very handsome offer to settle in England; which he declined, and returned to Geneva. In 1715 he entered into the society formed for the purpose of translating the New Testament into the French language, and contributed valuable assistance to this work. The chair of philosophy in the university was offered to him in 1723, which he refused; but in 1727 he accepted the office of librarian to the city, the duties of of which were not burdensome, and did not subject him to any particular restraint.

Abauzit was one of the first who embraced the grand truths which the sublime discoveries of Newton disclosed to the world. He defended the doctrines of that philosopher against Father Castel; and discovered an error in the *Principia*, which was corrected by Newton in the second edition of his work. He was a perfect master of many languages; his knowledge was extensive and profound; and the different sciences which he had studied were so well digested and arranged in his retentive mind, that he could at once bring together all that he ever knew on any subject. Rousseau (in his *Heloise*) addressed to Abauzit one of the finest panegyrics which he ever wrote; and a stranger having addressed Voltaire in a flattering manner, by saying he had come to Geneva to see a great man, the poet asked him whether he had seen Abauzit.

This excellent man, having lived universally respected to the great age of 87 years, died in the year 1767, lamented by the republic, and regretted by the learned.

ABAVO, in *Botany*, a synonyme of the Adansonia.

ABB, a term among clothiers applied to the yarn of a weaver's warp. They say also *Abb-wool* in the same sense.

Abb, a town of Yemen in Arabia, situated on a mountain in the midst of a very fertile country, 73 miles N.E. of Mocha. Lat. 13. 58. N., Long. 44. 15. E. It contains about 800 houses, and is surrounded by a strong wall; the strects are well paved; and an aqueduct from a neighbouring mountain supplies it with water, which is received in a great reservoir in front of the principal mosque. Population about 5000.

ABBA, in *Ancient Geography*, a town of Africa Propria, near Carthage. *Liv.* xxx. 7.

Abba, in the Syriac and Chaldee languages, literally signifies *a father;* and figuratively, a superior, reputed as a father in respect of age, dignity, or affection. It is more particularly used in the Syriac, Coptic, and Ethiopic churches, as a title given to the bishops. The bishops themselves bestow the title of *Abba* more eminently on the bishop of Alexandria; which occasioned the people to give him the title of *Babba*, or *Papa*, that is *Grandfather;* a title which he bore before the bishop of Rome. It is a Jewish title of honour given to certain Rabbis called *Tanaites:* and it was particularly used, by some writers of the middle age, for the superior of a monastery, usually called abbot.

ABBADIE, James, an eminent Protestant divine, born at Nay in Berne in 1657; first educated there under the famous John la Placette, and afterwards at the university of Sedan, from whence he went into Holland and Germany, and was minister in the French church of Berlin. He left that place in 1690; came into England; was some time minister in the French church in the Savoy, London; and was made dean of Killalo in Ireland. He was strongly attached to the cause of King William, as appears in his elaborate defence of the Revolution, and his History of the *Assassin-*

*ation Plot.* The materials for the last were furnished by the secretaries of state. He had great natural abilities, which he improved by useful learning. His best known and ablest works are, *Traité de la Divinité de Jesus-Christ*, and *Traité de la Religion Chrétienne.* He died in London in 1727, after his return from a tour in Holland.

ABBAS-BEN-ABDUL-MOTALLEB, Mahomet's uncle, opposed his nephew with all his power, regarding him as an impostor and traitor to his country; but in the second year of the Hegira, being overcome and made a prisoner at the battle of Beder in 623, when a great ransom was demanded for him, he represented to Mahomet that his paying it would reduce him to beggary, which would bring dishonour on the family. Mahomet, who knew that he had concealed large sums of money, said to him, "Where are the purses of gold that you gave your mother to keep when you left Mecca? Abbas, who thought this transaction secret, was much surprised; and conceiving that his nephew was really a prophet, embraced his religion. He became one of his principal captains, and saved his life when in imminent danger at the battle of Honain, against the Thakesites, soon after the reduction of Mecca. But besides being a great commander, Abbas was one of the first doctors of Islamism. He is said to have read lectures on every chapter of the Koran, as his nephew pretended to receive them from heaven. He died in 652, and his memory is held in the highest veneration among the Mussulmans to this day.

ABBAS, *Schah*, the Great, was third son of Codabendi, seventh king of Persia of the race of the Sophis. Succeeding to his father in 1585, at the age of 18, he found the affairs of Persia at a low ebb, occasioned by the conquests of the Turks and Tartars. He regained several of the provinces they had seized; but death put a stop to his victories in 1629, after a reign of 44 years. He was the greatest prince who had reigned in Persia for many ages; and it was he who made Ispahan the metropolis of Persia: but his memory is stained with many atrocities.

ABBAS, *Schah*, his great-grandson, ninth king of Persia of the race of the Sophis, succeeded his father Sesi at 13 years of age. He was but 18 when he made himself master of the city of Candahar, which had surrendered in his father's reign to the Great Mogul, and all the province about it; and he preserved it afterwards against this Indian emperor, though he besieged it more than once with an army of 300,000 men. He was a very merciful prince, and openly protected the Christians. He had formed a design of extending the limits of his kingdom toward the north, and for that purpose had levied a powerful army; but death put a stop to all his great designs, at 37 years of age, A.D. 1666.

ABBAS-ABAD, a town founded by Abbas the Great, now a frontier town of Persia, on the Araxes, near which is a strong fortress. It once contained 40,000 houses, and an immense population, which is now reduced to 3388 Tartars, and 1779 Armenians.

ABBASSA, sister of the celebrated Khaliph Haroun Al Raschid, who was given in marriage to his vizier Ghiaffr, on the strange condition that she should remain a virgin; the violation of which, and its terrible consequences, have been the theme of oriental story.

ABBASSIDES, the name of a race who possessed the caliphat for 524 years. There were 37 caliphs of this race who succeeded one another without interruption. They drew their descent from Abbas-Ben-Abdul-Motalleb, a brother of the PROPHET's father. The princes of this family made war on the dynasty of Ommiades, A.D. 746; and in 750 defeated the last caliph of the rival family in the bloody battle of Zab near Mosul. The most celebrated monarchs of this family were Al-Mansur, and Haroun-al-Raschid. Their empire terminated in Mostazem, who fell in battle against the Tartar Prince Hulaku in 1257.

ABBE', in a monastic sense, the same with ABBOT.

ABBE', in a modern sense, the denomination of a class of persons which has been popular in France. They were not in orders; but having received the ceremony of tonsure, were entitled to enjoy certain privileges in the church. The dress of abbés was that of academics or professed scholars. In colleges they were the instructors of youth, and were employed as tutors in private families. Many of them have risen to a distinguished rank in the state, while others have been no less eminent in science and literature.

ABBESS, the superior of an abbey or convent of nuns. The abbess has the same rights and authority over her nuns that the abbots regular have over their monks. The sex indeed does not allow her to perform the spiritual functions annexed to the priesthood, with which the abbot is usually invested; but there are instances of some abbesses who have a right, or rather a privilege, to commission a priest to act for them. They have even a kind of episcopal jurisdiction, as well as some abbots who are exempted from the visitation of their diocesans.

Martene, in his treatise on the rights of the church, observes, that abbesses formerly confessed nuns; but he adds, that their excessive curiosity carried them to such lengths, that there arose a necessity for checking it. However, St Basil, in his Rule, allows the abbess to be present with the priest at the confession of her nuns.

ABBEVILLE, an arrondissement of the department of the Somme, in the north-west of France, which extends over 610 square miles, or 390,300 acres. It is divided into 11 cantons, which are subdivided into 172 communes, and in 1846 contained 137,111 inhabitants.

ABBEVILLE, a city of France, capital of the arrondissement of the same name, situate in a pleasant and fertile valley on both sides of the river Somme, 12 miles above its mouth, and 25 miles N.W. of Amiens. This town, which is strongly fortified on Vauban's system, is neat and well built, and has several bridges, squares, and churches, one of them, St Wulfram's, very antique and curious. A cloth manufactory was established here by Van Robais, a Dutchman, under the patronage of the minister Colbert, as early as 1669; and since that time Abbeville has continued to be one of the most thriving manufacturing towns in France. Besides black cloths of the best quality, there are produced velvets, cottons, linens, serges, sackings, hosiery, packthread, jewellery, soap, glass-wares, &c. It has also establishments for spinning wool, print-works, bleaching-works, tanneries, a paper manufactory, &c.; and being situate in the centre of a fruitful district, it has a considerable trade with the surrounding country. By help of the tides, vessels of 150 tons come up to the town. According to the census of 1846, it had a population of 17,035. A treaty was concluded here in 1225, between Henry III. of England and Louis IX. of France, by which the province of Guienne was ceded to the English. Lat. 50. 7. 4. N. Long. 1. 59. 58. E.

ABBEVILLE, a fertile district of the United States, North America, in S. Carolina, between the rivers Savannah and Saluda. The population in 1850 was 32,148. The chief town of the same name is on Little River, 97 miles west of Columbia.

ABBEY, a monastery, or religious house, governed by a superior under the title of *abbot* or *abbess.*

*Abbeys* differ from *priories* in this, that the former are under the direction of an abbot, the latter of a prior; for abbot and prior (we mean a prior conventual) are much the same thing, differing in little but the name.

Fauchet observes, that, in the early days of the French monarchy, dukes and counts were called *abbots*, and duchies and counties *abbeys*. Even some of their kings are mentioned in history under the title of *abbots*. Philip I., Louis VI., and afterwards the Duke of Orleans, are called *abbots of the monastery of St Aignan*. The dukes of Aquitain were called *abbots of the monastery of St Hilary at Poictiers*; and the earls of Anjou, *of St Aubin, &c.*

Monasteries were at first established as religious houses, to which persons retired from the bustle of the world to spend their time in solitude and devotion. But they soon degenerated from their original institution, and obtained large privileges, exemptions, and riches. They prevailed greatly in Britain before the Reformation, particularly in England; and as they increased in riches, so the state became poor: for the lands which these regulars possessed were *in mortua manu*, i.e. could never revert to the lords who gave them. This inconvenience gave rise to the statutes against gifts *in mortmain*; and Lord Coke tells us, that several lords, at their creation, had a clause in their grant, that the donor might give or sell his land to whom he would (*exceptis viris religiosis et Judæis*) excepting monks and Jews.

These places were wholly abolished in England at the time of the Reformation; Henry VIII. having first appointed visitors to inquire into the lives of the monks and nuns, which were found in some places to be extremely irregular. The abbots, perceiving their dissolution unavoidable, were induced to resign their houses to the king, who by that means became invested with the abbey lands: these were afterwards granted to different persons, whose descendants enjoy them at this day.

Though the suppression of religious houses, even considered in a political light only, was a national benefit, it must be owned, that at the time they flourished, they were far from useless. Abbeys or monasteries were then the repositories, as well as the seminaries, of learning; many valuable books and national records, as well as private history, having been preserved in their libraries, the only places in which they could have been safely lodged in those turbulent times. Many of those which had escaped the ravages of the Danes, were destroyed with more than Gothic barbarity at the dissolution of the abbeys. These ravages are pathetically lamented by John Bale: "A number of those," says he, "who purchased these superstitious mansions, reserved of the library books, some to serve their jakes, some to scour the candlesticks, and some to rub their boots; some they sold to the grocer and soapseller; and some they sent over sea to the bookbinders, not in small numbers, but in whole ships full; yea, the universities of this realm are not clear of so detestable a fact. I know a merchant that bought the contents of two noble libraries for 40s. price; a shame it is to be spoken! This stuff hath he occupied instead of gray paper, by the space of more than these ten years, and yet he hath store enough for as many years to come. I shall judge this to be true, and utter it with heaviness, that neither the Britons under the Romans and Saxons, nor yet the English people under the Danes and Normans had ever such damage of their learned monuments as we have seen in our time."

Every abbey had at least one person whose office it was to instruct youth; and the historians of this country are chiefly beholden to the monks for the knowledge they have of former national events. In these houses also the arts of painting, architecture, and printing, were cultivated. They were hospitals for the sick and poor, and afforded entertainment to travellers at a time when there were no inns. They were likewise an asylum for aged and indigent persons of good family.

ABBEYBOYLE. See Boyle.

ABBEYFEALE, a village of Ireland, in the county of Limerick, on the river Feale, with a population in 1851 of 717. The parish of the same name has an area of 18,150 acres, and 4364 inhabitants.

ABBEYHOLM, a town in Cumberland, so called from an abbey built there by David king of Scots, five miles W.N.W. of Wigton.

ABBEYLEIX, a small town of Ireland, Queen's County, 9 miles S.S.W. of Maryborough. In 1851 the population was 1341. The parish of the same name has an area of 13,547 acres, and 5646 inhabitants.

ABBIATE GRASSO, a town in the Austrian delegation of Pavia, in Italy. It is situate on the canal of Bereguardo, 14 miles W.S.W. of Milan. It contains 4600 inhabitants.

ABBITIBBEE, a district, river, and trading station in British North America, forming part of the Hudson's Bay Company's possessions. The station is situate in Lat. 49. N. Long. 78. 10. W.

ABBON, or Abbo Cernuus, a monk of Saint Germain-des-Prés, who flourished towards the end of the 9th century. He wrote an epic poem in Latin on the siege of Paris by the Northmen in 886-7, of which he was an eye-witness. As a poem his work is of little value; but it is of considerable importance to the historian, as being an accurate narrative of the event.

Abbon, or *Abbo Floriacensis*, a learned Frenchman, born in the vicinity of Orleans, in the year 945. He was educated at the schools of Paris and Rheims, where he greatly distinguished himself; and devoted himself with great ardour to the study of all the sciences of his time. In 970, he was chosen abbot of the monastery of Fleury, of which he was a monk; and was engaged in disputes with several of the bishops of his time in defending the rights of his order. In 986, and again in 996, he was sent by King Robert to Rome, in order to appease the pope, who had threatened to interdict the kingdom, and on both occasions he was successful. He was killed in 1004, while endeavouring to quell a tumult between two contending parties of French and Gascons. His chief works were the Lives of the Popes, published in 1602, and some collections of canons, letters, &c.

ABBOT, or Abbat, the superior of a monastery of monks erected into an abbey or priory.

The name *Abbot* is originally Hebrew, where it signifies *father*. The Jews call *father*, in their language, *Ab*; whence the Chaldeans and Syrians formed *Abba*; thence the Greek Ἀββα, which the Latins retained; and hence our *Abbot*, the French *Abbé*, &c. St Mark and St Paul use the Syriac *Abba* in their Greek, by reason it was then commonly known in the synagogues and the primitive assemblies of the Christians; adding to it, by way of interpretation, the word *father*, Ἀββα Ὁ Πατηρ, "Abba, father;" *q. d.* Abba, that is to say, Father. But the name Ab, or Abba, which at first was a term of tenderness and affection, became at length a title of dignity and honour. The Jewish doctors affected it; and one of their most ancient books, containing the sayings or apophthegms of divers of them, is entitled Pirke Abboth or Avoth; *i. e.* Chapter of the Fathers. It was in allusion to this affectation, that Jesus Christ forbade his disciples to call any man their father on earth; which word St Jerome turns against the superiors of the monasteries of his time, for assuming the titles of *Abbots*, or Fathers.

The name *Abbot*, then, appears as old as the institution of monks itself. The governors of the primitive monasteries assumed indifferently the titles *Abbots* and *Archimandrites*. They were really distinguished from the clergy; though frequently confounded with them, because a degree above laymen.

In those early days, the abbots were subject to the bishops and the ordinary pastors. Their monasteries being remote from cities, built in the farthest solitudes, they

Abbot. had no share in ecclesiastical affairs. They went on Sundays to the parish church with the rest of the people; or, if they were too remote, a priest was sent them to administer the sacraments; till at length they were allowed to have priests of their own body. The abbot or archimandrite himself was usually the priest: but his function extended no farther than to the spiritual assistance of his monastery; and he remained still in obedience to the bishop. There being among the abbots several persons of learning, they made a vigorous opposition to the rising heresies of those times; which first occasioned the bishops to call them out of their deserts, and fix them about the suburbs of cities, and at length in the cities themselves; from which era their degeneracy is to be dated. Then the abbots threw off their former plainness and simplicity, assumed the rank of prelates, aspired at being independent of the bishops, and grasped at so much power, that severe laws were made against them at the council of Chalcedon. Many of them, however, carried the point of independency, obtained the appellation of *lord*, and were distinguished by other badges of the episcopate, particularly the mitre.

Hence arose new distinctions between the abbots. Those were termed *mitred* abbots, who were privileged to wear the mitre, and exercise episcopal authority within their respective precincts; being exempted from the jurisdiction of the bishop. Others were called *crosiered* abbots, from their bearing the crosier or pastoral staff. Others were styled *ecumenical* or universal abbots, in imitation of the patriarch of Constantinople: while others were termed *cardinal* abbots, from their superiority over all other abbots. In Britain, the mitred abbots were lords of parliament, and called abbots-sovereign, and abbots-general, to distinguish them from the other abbots. And as there were lords-abbots, so there were also lords-priors, who had exempt jurisdiction, and were likewise lords of parliament.

In Roman Catholic countries, the principal distinctions observed between abbots are those of *regular* and *commendatory*. The former take the vow and wear the habit of their order; whereas the latter are seculars who have received tonsure, but are obliged by their bulls to take orders when of proper age.

Anciently the ceremony of creating an abbot consisted in clothing him with the habit called *cuculus*, or cowl; putting the pastoral staff into his hand, and the shoes called *pedales* on his feet: but at present, it is only a simple benediction, improperly called, by some, consecration.

Abbot is also a title given to others beside the superiors of monasteries: thus bishops whose sees were formerly abbeys, are called abbots. Among the Genoese, the chief magistrate of the republic formerly bore the title of *abbot* of the people.

Abbot, *George*, archbishop of Canterbury, born Oct. 29. 1562, at Guildford in Surrey, was the son of Maurice Abbot, a cloth-worker, who suffered religious persecution in the reign of Queen Mary. He studied at Oxford, and in 1597 was chosen principal of University college. In 1599, he was installed dean of Winchester: the year following he was chosen vice-chancellor of the university of Oxford, and a second time in 1603. In 1604, the translation of the Bible now in use was begun by the direction of King James; and Dr Abbot was the second of eight divines of Oxford, to whom the care of translating the whole New Testament (excepting the Epistles) was committed. The year following, he was a third time vice-chancellor. In 1608, he went to Scotland with George Hume earl of Dunbar, to assist in establishing an union between the churches of Scotland and England; and in this business he conducted himself with so much address and prudence, that it laid the foundation of all his future preferment. King James ever after paid great deference to his advice and counsel; and upon the death of Dr Overton, bishop of Litchfield and Coventry, he named Dr Abbot for his successor, who was accordingly constituted bishop of those two united sees in December 1609. About a month afterwards he was translated to the see of London, and on the second of November following was raised to the archiepiscopal see. Abbot.

It is not however improbable, that his extravagant adulation of his royal master, in which he went as far as any other court chaplain could do, contributed not a little to his rapid preferment. In the preface to a pamphlet which he published, the following specimen of ridiculous flattery occurs: Speaking of the king, he says, "whose life hath been so immaculate and unspotted, &c. that even malice itself, which leaves nothing unsearched, could never find true blemish in it, nor cast probable aspersion on it.—Zealous as a David; learned and wise, the *Solomon* of our age; religious as Josias; careful of spreading Christ's faith as Constantine the Great; just as Moses; undefiled in all his ways as a Jehoshaphat and Hezekiah; full of clemency as another Theodosius."—Yet, as we shall immediately see, Abbot could sometimes oppose the will of the sovereign with courage and constancy.

His great zeal for the Protestant religion made him a strenuous promoter of the match between the Elector Palatine and the Princess Elizabeth; which was accordingly concluded and solemnized the 14th of February 1612, the archbishop performing the ceremony on a stage erected in the royal chapel. In the following year happened the famous case of divorce between the lady Frances Howard, daughter of the earl of Suffolk, and Robert earl of Essex; which has been considered as one of the greatest blemishes of King James's reign. The part which the archbishop took in the business added much to the reputation he had already acquired for incorruptible integrity. It was referred by the king to a court of delegates, whose opinion the king and court wished and expected to be favourable to the divorce. But the archbishop, unawed by royal authority, with inflexible firmness resisted it, and published his reasons for persisting in his opinion; to which the king, disappointed in his views, thought fit to reply: Sentence was given in the lady's favour. In 1618, the king published a declaration, which he ordered to be read in all churches, permitting sports and pastimes on the Lord's day: this gave great uneasiness to the archbishop, who happening to be at Croydon on the day it was ordered to be read, had the courage to forbid it.

Being now in a declining state of health, the archbishop used in the summer to go to Hampshire for the sake of recreation; and being invited by Lord Zouch to hunt in his park at Bramzill, he met there with the greatest misfortune that ever befell him; for he accidentally killed the game-keeper by an arrow from a cross-bow which he shot at one of the deer. This fatal accident threw him into a deep melancholy; and he ever afterwards kept a monthly fast on Tuesday, the day on which it happened; and he settled an annuity of L.20 on the widow.[1] Advantage was taken of this misfortune, to lessen him in the king's favour; but his majesty said, "An angel might have miscarried in this sort." His enemies alleging that he had incurred an irregularity, and was thereby incapacitated for performing the offices of a primate, the king directed a commission to ten persons to inquire into this matter. The result was not satisfactory to his Grace's enemies; it being declared, that, as the murder was involuntary, he had not forfeited his archiepiscopal character.

[1] Fuller's *Church Hist.* cent. xvii. p. 87.

The archbishop after this seldom assisted at the coun-

Abbot.

cil, being chiefly hindered by his infirmities; but in the king's last illness he was sent for, and constantly attended till his majesty expired on the 27th of March 1622. He performed the ceremony of the coronation of King Charles I. though very infirm and distressed with the gout. He was never greatly in this king's favour; and the duke of Buckingham being his declared enemy, watched an opportunity of making him feel the weight of his displeasure. This he at last accomplished, upon the archbishop's refusing to license a sermon, preached by Dr Sibthorpe to justify a loan which the king had demanded, and pregnant with principles which tended to overthrow the constitution. The archbishop was immediately after suspended from all his functions as primate; and they were exercised by certain bishops commissioned by the king, of whom Laud, the archbishop's enemy, and afterwards his successor, was one; while the only cause assigned for this procedure was, that the archbishop could not at that time personally attend those services which were otherwise proper for his cognizance and direction. He did not, however, remain long in this situation; for a parliament being absolutely necessary, his Grace was sent for, and restored to his authority and jurisdiction. But not proving friendly to certain rigorous measures adopted by the prevailing church party, headed by Laud, whose power and interest at court were now very considerable, his presence became unwelcome there; so that, upon the birth of the prince of Wales, afterwards Charles II., Laud had the honour to baptize him, as dean of the chapel. The archbishop being worn out with cares and infirmities, died at Croydon, the 5th of August 1633, aged 71 years; and was buried at Guildford, the place of his nativity, where he had endowed an hospital with lands to the amount of L.300 per annum. A stately monument was erected over the grave, with his effigy in his robes.

He proved himself, in most circumstances of his life, to be a man of great moderation to all parties; and was desirous that the clergy should gain the respect of the laity by the sanctity and purity of their manners, rather than claim it as due to their function. His opinions and principles, however, have drawn upon him many severe reflections; particularly from the earl of Clarendon. But Dr Welwood has done more justice to his merit and abilities.[1] The following is a list of his works, as given in Chalmers's *Biographical Dictionary*:—1. Quæstiones Sex, totidem prælectionibus in Schola Theologica Oxoniæ, pro forma habitis, discussæ et disceptatæ anno 1597, in quibus e Sacra Scriptura et Patribus, quid statuendum sit definitur. Oxon. 1598, 4to. 2. Exposition on the Prophet Jonah, contained in certain Sermons preached in St Marie's Church in Oxford. 1600, 4to. 3. Answer to the Questions of the Citizens of London in January 1600, concerning Cheapside Cross; not printed until 1641. 4. The Reasons which Dr Hill hath brought for the upholding of Papistry unmasked, and showed to be very weak, &c. Oxon. 1604, 4to. 5. A Preface to the Examination of George Sprot, &c. 6. Sermon preached at Westminster, May 26. 1608, at the funeral of Thomas Earl of Dorset, late Lord High Treasurer of England, on Isaiah xl. 6. 1608, 4to. 7. Translation of a part of the New Testament, with the rest of the Oxford divines. 1611. 8. Some Memorials, touching the Nullity between the Earl of Essex and his Lady, pronounced September 25. 1613, at Lambeth; and the difficulties endured in the same. 9. A Brief Description of the whole World, wherein is particularly described all the Monarchies, Empires, and Kingdoms of the same, with their Academies, &c. 1617, 4to. 10. A short Apology for Archbishop Abbot, touching the death of Peter Hawkins, dated October 8. 1621. 11. Treatise of perpetual Visibility and Succession of the true Church in all ages. Lond. 1624, 4to.; published without his name; but his arms, impaled with those of Canterbury, are put before it. 12. A Narrative containing the true cause of his sequestration and disgrace at Court; in two parts; written at Ford, in Kent, 1627, printed in Rushworth's Historical Collections, vol. i. p. 438–461, and in the Annals of King Charles, p. 213–224. 13. History of the Massacre in the Valteline, printed in the third volume of Fox's Acts and Monuments. 14. Judgment on bowing at the Name of Jesus. Hamburgh, 1632, 8vo.

[1] *Memoirs*, 8vo. 1700, p. 38.

Abbot, *Robert*, elder brother to the former, was born at Guildford in 1560, and completed his studies at Baliol college, Oxford. In 1582, he took his degree of master of arts, and soon became a celebrated preacher; and to this talent he chiefly owed his preferment. Upon the first sermon at Worcester, he was chosen lecturer in that city, and soon after rector of All-saints in the same place. In 1597, he took his degree of doctor in divinity: and, in the beginning of King James's reign, was appointed chaplain in ordinary to his majesty; who had such an opinion of him as a writer, that he ordered the doctor's book *De Antichristo* to be printed, with his own commentary upon part of the Apocalypse. In 1609, he was elected master of Baliol college; which trust he discharged with the utmost care and assiduity, by his frequent lectures to the scholars, by his continual presence at public exercises, and by promoting temperance in the society. In November 1610, he was made prebendary of Normanton in the church of Southwell; and, in 1612, his majesty appointed him regius professor of divinity at Oxford. The fame of his lectures became very great; and those which he gave upon the supreme power of kings, against Bellarmine and Suarez, so much pleased his majesty, that when the see of Salisbury became vacant, he named him to that bishopric, and he was consecrated by his own brother at Lambeth, December 3. 1615. When he came to Salisbury, he found the cathedral falling to decay, through the avarice and negligence of the clergy belonging to it; however, he found means to draw five hundred pounds from the prebendaries, which he applied towards repairing it. Here he devoted himself to the duties of his function with great diligence and assiduity, visiting his whole diocese in person, and preaching every Sunday. But his sedentary life, and close application to study, brought upon him the gravel and stone; of which he died on the 2d of March 1618, in the 58th year of his age; having filled the see only two years and three months.

Abbot, *Charles, Lord Colchester*, the son of a clergyman at Colchester, was born October 14, 1757, and was educated at Westminster School, from which he was elected a student to Christ Church, Oxford, in 1775. He was called to the bar in 1795, and soon after published a legal work, in which he strongly recommended the abolition of the separate Welsh judicature, a measure which has since been carried out. The same year introduced him into Parliament, where his activity and habits of business soon brought him into notice, and he was proposed by Mr Pitt as chairman of the finance committee. In Mr Addington's administration, he filled the office of chief secretary of state for Ireland; and in 1802 he was elected speaker of the House of Commons, an office which he filled with dignity and general approbation, under successive administrations, till 1817, when a severe attack of erysipelas induced him to resign the laborious duties of the speaker's chair. While he held that situation, it was his lot, on April 8, 1805, to give the casting vote in a House of 433 members, which drove Henry Lord Melville from public life. On Abbot's retirement, he was created Lord Colchester, and obtained a pension of L.4000 a-year; but he afterwards took no very prominent part in public affairs, except in strenuous opposition to the Roman Catholic Emancipation. In 1828 he published six of his parliamentary speeches on that subject. He died May 8. 1829.

ABBOTSBURY, a parish and market-town on the coast of Dorsetshire. It has the ruins of an abbey, founded about the year 1044. In the vicinity is a Roman camp, a cromlech, and the ruins of St Catherine's chapel. Pop. in 1851, 1077.

ABBOTSFORD, two miles W. of Melrose, and 30 miles S.S.E. of Edinburgh, the celebrated residence of Sir Walter Scott, built by himself on the plan of a castellated Gothic mansion, on the south bank of the river Tweed, near the Abbot's ford.

ABBOTS-LANGLEY, a village of Herts, four miles from St Albans, famous as the birth-place of Pope Adrian IV. Population of parish in 1851, 2384.

ABBREVIATION, or ABBREVIATURE, a contraction of a word or passage, made by dropping some of the letters, or by substituting certain marks or characters in their place. Harris, in his treatise called *Hermes*, divides the parts of speech into words which are necessary for the communication of thought, as the noun and verb, and *abbreviations* which are employed for the sake of despatch. The latter, strictly speaking, are also parts of speech, because they are all useful in language, and each has a different manner of signification Mr Tooke, however, seems to allow that rank only to the necessary words, and to consider all others as merely substitutes of the first sort, under the title of abbreviations. They are employed in language in three ways—in terms, in sorts of words, and in construction. Locke in his *Essay on the Human Understanding* treats of the first class; numerous authors have written on the last; and for the second class of abbreviations, see the work of Mr Tooke entitled *Diversions of Purley*. Lawyers, physicians, &c. use many abbreviations, for the sake of expedition. But the Rabbis are the most remarkable for this practice, so that their writings are unintelligible without the Hebrew abbreviatures. The Jewish authors and copyists do not content themselves with abbreviating words like the Greeks and Latins, by retrenching some of the letters or syllables; they frequently take away all but the initial letters. They even take the initials of several succeeding words, join them together, and, adding vowels to them, make a sort of barbarous words, representative of all those which they have thus abridged. Thus, *Rabbi Moses ben Maimon*, in their abbreviature, is *Rambam*, &c.

Abbreviations ‖ Abchasia.

ABBREVIATORS, a college of 72 persons in the chancery of Rome, who draw up the pope's brieves, and reduce petitions, when granted by him, into proper form for being converted into bulls.

ABBS, St, a promontory on the eastern coast of Scotland, Lat. 55. 55. N. Long. 2. 8. 30. W. The shore around is steep and rocky, and there is a depth of 30 or 40 fathoms water not far from land. The tide runs by it with a strong current, and a little wind causes a great rolling sea.

ABCHASIA, or Abasia, a province of Asiatic Russia, on the border of the Black Sea, comprehended between Lat. 42. 30. and 44. 45. N. and between Long. 37. 3. and 40. 36. E. The high mountains of the Caucasus on the north and north-east divide it from Circassia; on the south-east it is bounded by Mingrelia; and on the south and west by the Black Sea. The country is generally mountainous, with some deep well-watered valleys, and the climate mild, being defended from the northerly winds by the lofty range of mountains. The land is fertile, and produces grain, grapes, and other fruits. Some of the inhabitants devote themselves to agriculture, some to the rearing of cattle and horses, and not a few support themselves by piracy, robbery, and the chase. These people still carry on a considerable slave trade, selling even their children to the Turks for slaves. This country, as bordering on the ancient Colchis, was early known to the ancients; and the Abasci, at least as early as the time of Herodotus, (lib. iii. 97.), carried on a considerable slave trade, especially in beautiful boys, whom they sold for eunuchs. In later times this country was subject to Colchis, until subdued by the Emperor Justinian, who introduced civilisation and Christianity. Afterwards the Persians, Georgians, Mongolians, and more recently the Turks, in turn, ruled over the country. Under the Turks Christianity gradually disappeared, and Mahomedanism was introduced in its stead. By the treaty of Akerman in 1826, a part, and by the treaty of Adrianople the rest of this country was ceded to Russia; but except the possession of a few commanding fortresses on the coast, it has very little authority over the people, and the chiefs have almost unlimited power. Mahomedanism is the religion of the higher classes, but the people generally are buried in idolatry.

ABCHERON, or APCHERON, or APSHERON. See BAKU.

ABDALLA, the son of Abdulmotalleb, was the father of the prophet Mahomet. He was the most beautiful and modest of the Arabian youth. Several other Arabians of eminence bore the same name.

ABDALLATIF, or ABDOLLATIPH, a celebrated physician and traveller, and one of the most voluminous writers of the East, was born at Bagdad, in the 557th year of the Hegira, being the 1179th of the Christian era. Of the life of this learned person there has fortunately been preserved a memoir, written by himself, together with some additions by a contemporary biographer, named Osaiba. The whole of this curious piece has been translated into French, and published with a work of Abdallatif's, of which we shall afterwards give some account. Long before the period of his birth, the empire of the Caliphs had begun to decline; but their capital still continued to enjoy those advantages for education which it had originally derived from their liberal patronage of learning and science. Abdallatif was carefully instructed in every branch of knowledge then taught in that renowned city; and the biographical piece just alluded to is not a little interesting, from the glimpses it affords of the studies which engaged the attention of the more aspiring of the Mussulman youth.

After learning to read, the rules of grammar appear to have been studied with a degree of care and earnestness, which has not perhaps been equalled in any other country. With the study of grammar was joined that of the Koran and the traditionary doctrines, and the whole of the sacred book was carefully committed to memory. This faculty seems, indeed, to have been severely taxed; for it was also thought necessary to be able to repeat several treatises on grammar and jurisprudence, besides some of the choicer collections of Arabian poetry. In these arduous exercises, Abdallatif says that he was for a considerable time accustomed to pass the greater part of the night.

Having attained to great proficiency in the usual studies, he afterwards applied to the natural philosophy of that day, and to medicine; and with the view of still further improving himself by converse with the learned of other places, he set out, when in his twenty-eighth year, to Mosul in Mesopotamia. Having resided about a year in this city, he next proceeded to Damascus, then a place of great resort to the learned of the surrounding countries. Abdallatif found here many of the most eminent men of that age, part of whom were busied in the chimerical pursuits of the Hermetic art, and part in philological and speculative inquiries. He seems always to have entertained great contempt for the sort of chemistry then in vogue, but he entered with eagerness into speculative discussions; and he at this time composed a treatise upon the Divine essence and attributes, in consequence of some discussions with Alkendi, a philosopher of eminence, who was not, however, thought to be quite orthodox in his faith.

The active curiosity of Abdallatif was next directed to Egypt; and he accordingly proceeded to Acre, where its sultan, the great Saladin, was at the time encamped, in order to solicit his permission to visit that country. This monarch was a liberal protector of the learned, and fond of their conversation; but having been lately defeated by the crusaders under Richard Cœur de Lion, he was too much occupied with the cares consequent upon this disaster, to admit Abdallatif to the expected honour of a personal interview. He was, however, received in a courteous manner by the Vizier Al Fadhel, whom he found in his tent writing and dictating at the same time to two secretaries; employments which he continued whilst he conversed with his visitor upon sundry points of grammar and philology. Having obtained the necessary credentials from this minister, he proceeded to Cairo; and the munificence which Saladin and his courtiers extended towards the learned, was strikingly exemplified in his reception and treatment in that city. He was provided with a house, with provisions, and money; and the vizier seldom failed to recommend him anew, in those letters of business which he had occasion to write to the governor of the place.

Here Abdallatif enjoyed the long wished-for opportunity of conversing with that *Eagle of the Doctors*, as he was called, the celebrated Maimonides, who had been for a considerable time settled in Egypt, and was physician to the sultan. Here, too, he was fortunate enough to meet with a sage, who weaned him of his admiration for the writings of Avicenna, by pointing out the superior value of the ancients. But the philosophers of Grand Cairo were not all of this stamp; for some of them were pretenders to the transmutation of metals, and one boasted that his art enabled him to fabricate a tent of the waters of the Nile. Having passed a considerable time in making various observations and collections in this interesting city, Abdallatif set out for Jerusalem, on learning that he would there see Saladin, who had at length concluded a truce with the crusaders.

Saladin received him with every mark of respect for his talents, and bestowed upon him a pension. He was then busied in repairing the walls of the Holy City, himself, says Abdallatif, often carrying stones upon his shoulders, to animate the undertaking. But in spite of all his cares and projects, he daily conversed with the learned men whom his bounty had drawn around him. Abdallatif mentions, that when first introduced, he found him in the midst of a circle of this description; and he adds, that upon all the various subjects which were discussed, the sultan spoke with the most agreeable address, as well as ingenuity. From Jerusalem, Abdallatif returned to Damascus; and, after a considerable interval, a fresh opportunity having occurred of revisiting Egypt, he again proceeded to Cairo, where he taught medicine and philosophy for several years.

During this period, Egypt was visited with a terrible famine and pestilence, of which, and the horrors and crimes that ensued, he has given a most appalling description in the last two chapters of his Account of this country. Human nature was scarcely ever presented to observation under so hideous an aspect; the wretched Egyptians were driven, not only to feed upon the bodies of those who had fallen victims to want or disease, but to seize upon children, whom they killed and devoured; and Abdallatif asserts, that they thus came to acquire such a relish for those inhuman repasts, that they with difficulty refrained from them after the famine had subsided. It was likewise during his second stay in Egypt that he witnessed an insane attempt to pull down the Pyramids; a project to which the reigning sultan (a son of Saladin's, who, after his death, succeeded to this part of his dominions) had been instigated by some of his favourites, and in which he persisted for eight months, without being able to make any sensible impression upon these indestructible monuments of the ancient world.

About the year 1207, Abdallatif left Egypt for his former residence, Damascus; and here he for some time practised as a physician, and lectured upon medicine with great success. But his love of new scenes, and desire of extending his knowledge and fame, still urged him to travel; and he seems to have passed the rest of his life in Aleppo, and various parts of Armenia and Asia Minor, acquiring both wealth and glory by his abilities as a physician and an author. Having returned to his native city, purposing to present some of his works to the caliph, and then to set out on a pilgrimage to Mecca, he was seized with illness soon after his arrival, and died there in the year 1231.

He was undoubtedly a person of great knowledge, and of an ardent, inquisitive, and penetrating mind. According to his Arabian biographer, to whom he was well known, he showed himself, in conversation, somewhat vain of his own attainments; and was accustomed to speak rather scornfully of most of his contemporaries. But it ought to be mentioned, to the credit of his understanding, that his derision seems partly to have flowed from his contempt of those chemical fooleries to which they were so much addicted, that, to use the words of Gibbon, "the reason and the fortune of thousands were evaporated in the crucibles of Alchemy."

Of that long list of treatises on medicine, philosophy, and literature, which Osaiba has appended to the account of Abdallatif's life, one only has found its way into Europe; nor do any of the others appear to be known at this day in the East. The work here alluded to is his *Account of Egypt*, which was fortunately discovered and brought to this country by our celebrated orientalist Pococke. The manuscript, which is a very old one, is still preserved in the Bodleian Library. Of this work, an elegant edition, with a Latin translation, notes, and a life of Abdallatif, was published in 1800, by Dr White, professor of Arabic in the University of Oxford. A French translation, with enlarged notes, was published at Paris in 1810, by M. Silvestre de Sacy; and to this, among other valuable illustrations, is appended a translation from an Arabic manuscript, of the curious biographical memoir to which we have above alluded.

This account of Egypt consists of two books; the first of which, in six chapters, gives a general view of the country, of its plants, animals, antiquities, buildings, and modes of navigating on the Nile; and the second, in three chapters, treats at large of this river, and of that terrible famine already mentioned, which was occasioned by a failure in the usual annual increase of its waters. The book undoubtedly is, upon the whole, one of the most interesting productions which has come to us from the East; inasmuch as it presents us with a detailed and authentic view of the state of Egypt during the middle ages, and thus supplies a link which was wanting between the accounts of ancient and of modern times.

See *Abdollatiphi Historiæ Ægypti Compendium, Arabice et Latine*, Lond. 1800, 4to. *Relation de l'Egypte, par Abdallatif*, traduite par M. Silvestre de Sacy, de l'Institut de France. Paris, 1810, 4to.

ABDALMALEK, or ABDULMELECH, the son of Mirvan, and the fifth caliph of the race of the Ommiades. He surpassed all his predecessors in power and dominion; for in his reign the Indies were conquered in the east, and his armies penetrated Spain in the west: he likewise extended his empire toward the south, by making himself master of Medina and Mecca. Under his reign the Greek language and characters were excluded from the accounts of the public revenue. If this change, says Gibbon, was productive of the invention or familiar use of the Arabic or Indian ciphers, which are our present numerals, a regulation of office has promoted the most important discoveries of arithmetic, algebra, and the mathematical sciences. He began his reign in the 65th of the Hegira, A.D. 684; reigned 15 years; and four of his sons successively enjoyed the caliphate.

ABDALMALEK. See AVENZOAR.

ABDALONYMUS, or ABDOLONYMUS, in classic history, of the royal family of Sidon, and descended from King Cinyras, lived in obscurity, and subsisted by cultivating a garden, while Strato was in possession of the crown of Sidon. Alexander the Great having deposed Strato, inquired whether any of the race of Cinyras was living, that he might set him on the throne. It was generally thought that the whole race was extinct; but at last Abdalonymus was thought of, and mentioned to Alexander, who immediately ordered some of his soldiers to fetch him. They found the good man at work, happy in his poverty, and entirely a stranger to the noise of arms, with which all Asia was at that time disturbed; and they could scarcely persuade him they were in earnest. Alexander was convinced of his high descent by the dignity of his person; and not only bestowed on him all that belonged to Strato, but augmented his dominions, and gave him a large present out of the Persian spoils. This story is related variously by different authors. See *Q. Curtius*, iv. c. i.; *Justin*, xi. c. x.

ABDALS, in the eastern countries, a kind of fanatics supposed to be inspired to a degree of madness. The word is perhaps derived from the Arabic, *Abdallah*, the servant of God. Hurried on by excess of zeal, especially in the Indies, they often run about the streets, and kill all they meet who are of a different religion. The English sailors call this *running a muck*, from the name of the instrument, a sort of poniard, which they employ on those desperate occasions. If they are killed, as it commonly happens before they have done much mischief, they reckon it highly meritorious; and are esteemed, by the vulgar, martyrs for their faith.

ABDERA, in *Ancient Geography*, a maritime town of Thrace, not far from the mouth of the river Nessus, on the east side. The Abderites, or Abderitani, were very much derided for their want of wit and judgment: yet their city has given birth to several eminent persons; as Protagoras, Democritus, Anaxarchus, Hecatæus the historian, Nicænetus the poet, and many others, who were mentioned among the illustrious men. In the reign of Lysimachus, Abdera was afflicted for some months with a most extraordinary disease:[1] this was a burning fever, whose crisis was always on the seventh day, and then it left them; but it so distracted their imaginations, that they fancied themselves players. After this, they were ever repeating verses from some tragedy, and particularly from the 'Andromeda' of Euripides, as if they had been upon the stage; so that many of these pale meagre actors were pouring forth their tragic exclamations in every street. This delirium continued till the following winter, which was a very cold one, and therefore fitter to remove it. Lucian, who has described this disease, endeavours to account for it in this manner: Archelaus, an excellent player, acted the 'Andromeda' of Euripides before the Abderites, in the height of a very hot summer. Several fell into a fever on coming out of the theatre; and as their imaginations were full of the tragedy, the delirium which the fever raised perpetually presented Andromeda, Perseus with the Medusa, and the several dramatic incidents, calling up the ideas of those objects, and the pleasure of the representation, so strongly, that they could not forbear imi-

[1] Lucianus, *quomodo Historia conscribenda sit, initio.*

tating Archelaus's action and declamation: and from these the fever spread to others by infection.

ABDERAHMAN, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had several successors of the same name. The first Abderahman, in the year 756, became Moorish sovereign of Spain, whither he had fled on the ruin of his family, in the battle of the Zab. He was born at Baghdad, and was a grandson of one of the Ommiad caliphs. A viceroy and captain-general of this name led the Saracens and their followers into France, ravaging the country wherever they came. At length he was met at Tours by Charles Martel, who had received reinforcements of Germans and Gepidæ. The Saracen army was totally routed in a general action, and Abderahman fell in the general slaughter, which the Monkish writers reckon at the exaggerated number of 370,000. This great event, which first broke the power of the Saracens, happened about the year 732 of the Christian era.

Abderahman III., the most eminent and accomplished of the Moorish sovereigns of Spain. See Spain.

ABDEST, a Persian word, properly signifying the water placed in a basin for washing the hands; but it is used to imply the legal purifications practised by the Mahometans before prayer, entering the mosque, or reading the Koran.

ABDIAS of Babylon, the supposititious author of a book, setting forth that he had seen Christ, that he was one of the 70 disciples, had been eye-witness of the actions and prayers of several of the apostles at their deaths, and had followed into Persia St Simon and St Jude, who, he said, made him the first bishop of Babylon. This book, entitled *Historia Certaminis Apostolici*, was published by Wolfgang Lazius, at Basil, 1551; and has passed through several editions in other places.

ABDICATION, properly speaking, is the act whereby a person renounces and gives up any right, office, or dignity, particularly the supreme power. By a nice distinction, abdication is supposed to differ from resignation, and to imply an unconditional surrender; whereas by resignation is meant relinquishment, as a free and voluntary act, usually in favour of another: but this distinction is rather conventional than real, and of so little practical utility, that many abdications have been called voluntary, while in fact they were the result of necessity, or of court intrigue. The flight of a sovereign from his dominions has usually been styled an abdication, which, although the act be virtually such, is a meaning not strictly proper, as nullifying its true sense of renunciation.

Since the Revolution of 1688, the throne of England can only lawfully be abdicated with consent of the two houses of Parliament; but by precedent it is established, that by actions subversive of the constitution, the sovereign virtually renounces the authority which he claims by that very constitution. The flight of James II. was declared by Parliament to be an abdication; and the power that could unmake a king, might easily invest a word with a new signification; for in a full assembly of the lords and commons, met in convention upon the supposed vacancy of the throne, both houses, in spite of James's protest, came to this resolution, "that King James the Second having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between king and people; and, by the advice of Jesuits and other wicked persons having violated the fundamental laws, and having withdrawn himself out of this kingdom, has abdicated the government, and that the throne is thereby vacant." See *Blackstone's Commentaries*, vol. i. p. 211; vol. iv. p. 78.

The Roman magistrates were said "to abdicate," when, from informality in the auspices, *utpote vitiosi*, or for any other reason, they quitted their office before the usual term had expired. Abdication was also used for the act whereby a father discarded or disclaimed his son, and expelled him from the family. See Rubino, *Römische Staatsverfassung*, p. 88.

Among the most memorable abdications of antiquity may be especially mentioned, that of Sylla the dictator, B. C. 79; and that of the Emperor Diocletian, the fierce persecutor of the Christians, A.D. 305. The following are the most important abdications of later times in chronological order:—

| | A.D. |
|---|---|
| Henry IV. of Germany, | 1080 |
| Stephen II. of Hungary, | 1114 |
| Albert of Saxony, | 1142 |
| Lestus V. of Poland, | 1200 |
| Vladislaus III. of Poland, | 1206 |
| Baliol of Scotland, | 1306 |
| Otho of Hungary, | 1309 |
| Eric IX. of Denmark, | 1439 |
| Eric XIII. of Sweden, | 1441 |
| Emperor Charles V., | 1556 |
| Christina of Sweden, | 1654 |
| John Casimir of Poland, | 1669 |
| James II. of England, | 1688 |
| Frederick Augustus II. of Poland, | 1704 |
| Philip V. of Spain, | 1724 |
| Victor Amadeus II. of Sardinia, | 1730 |
| Charles of Naples, | 1795 |
| Stanislaus of Poland, | 1795 |
| Victor of Sardinia, | June 4, 1802 |
| Charles IV. of Spain, | Mar. 19, 1808 |
| Joseph Buonaparte of Naples, | June 1, 1808 |
| Napoleon of France, | April 5, 1814 |
| Victor Emanuel of Sardinia, | Mar. 13, 1821 |
| Pedro of Portugal, | May 2, 1826 |
| Charles X. of France, | Aug. 2, 1830 |
| Pedro of Brazil, | April 7, 1831 |
| Don Miguel of Portugal, | May 26, 1834 |
| William I. of Holland, | Oct. 8, 1840 |
| Louis Philippe of France, | Feb. 24, 1848 |
| Louis Charles of Bavaria, | Mar. 21, 1848 |
| Ferdinand of Austria, | Dec. 2, 1848 |
| Charles Albert of Sardinia, | Mar. 26, 1849 |

ABDOMEN, in *Anatomy*, is that part of the trunk of the body which lies between the thorax and the bottom of the pelvis.

ABDOMINALES, or Abdominal Fishes, constitute the Fourth Order of the *Fourth Class* of Animals, in the Linnæan system.

ABDON, (*a servant*,) the son of Hillel, of the tribe of Ephraim, and tenth judge of Israel. He died B.C. 1112. See Judges xii. Three other persons of the same name are mentioned in 1 Chron. viii. 29; ix. 36; xxxiv. 20.

Abdon, a city of the tribe of Asher, which was given to the Levites of Gershom's family. See Job xxi. 30; 1 Chron. vi. 74.

ABDUCTION, in *Law*, is the forcible or fraudulent removal of a person. Custom has limited its general application to the case where a woman is the victim, with the view of her marriage or seduction. The forcible carrying off a woman constituted the *crimen raptus* of the Roman law, and was a capital offence, though unattended with violation of the person of the woman. In the case of men or children, it has been usual to substitute the term kidnapping. There are many old severe laws against abduction, generally contemplating its object as the possession of an heiress and her fortune. The offence was frequent at a comparatively late period in Scotland and in Ireland, an account of the feebleness of the law and the geographical facilities of these countries, and severe laws were directed against it in vain. So late as the Act of 10 Geo. IV. c. 34, in Ireland it was made punishable with death; but by 5 and 6 Vict. c. 28, § 16, this is reduced to transportation, the punishment which had been assigned to it in England fourteen years earlier, by Sir Robert Peel's Consolidation Act, 9 Geo. IV. c. 31. In Scotland, where there is no statutory adjustment, a similar punishment has been awarded by practice.

Abduction, in *Logic*, a kind of argumentation, by the Greeks called *apagoge*, wherein the greater extreme is evidently contained in the medium, but the medium not so evidently in the lesser extreme as not to require some farther medium or proof to make it appear. It is called *abduction*, because, from the conclusion, it draws us on to prove the proposition assumed.

ABDUCTOR, or Abducent, in *Anatomy*, a name given to several of the muscles, on account of their serving to withdraw, open, or pull back the parts to which they belong.

ABEDNEGO, *i.e.* servant of Nego or Nebo, the Chaldee name imposed by the king of Babylon's officer upon Azariah, one of the three companions of Daniel.

ABEL, properly Hebel, which means *grief*, the second son of Adam, who was slain by Cain his elder brother, (Gen. iv. 1-16,) while engaged in offering sacrifice, God having testified his acceptance of that of Abel, and his rejection of Cain's. Abel, it appears, brought two offerings, the one an oblation, the other a sacrifice. Cain brought but the former, a mere acknowledgment, it is supposed, of the sovereignty of God, neglecting to offer the sacrifice which would have been a confession of fallen nature, and typically an atonement for sin; it was not therefore the mere difference of feeling with which the two offerings were brought, which constituted the virtue of the one or the guilt of the other. God's righteous indignation against sin had been plainly revealed, and there can be no doubt that the means of safety, of reconciliation and atonement, were as plainly made known to Adam and his offspring; the refusal therefore of the sacrifice was a virtual denial of God's right to condemn the sinner, and at the same time a proud rejection of the proffered means of grace.

In ancient times heretics existed who represented Cain and Abel as embodying two spiritual powers, of which the mightier was that of Cain, and to which they accordingly rendered divine homage.

An obscure sect arose in the early church under the title of Abelites, which inculcated certain fanatical notions respecting marriage; but it was speedily lost amidst a host of more popular parties. See Abelians.

*Abel* is likewise employed as a prefix to the names of places, seemingly indicating their verdant appearance: thus in Scripture we read of Abel-Beth-Maacah, Abel-Carmaim, Abel-Shittim, &c.

Abel, *Carl Frederich*, a celebrated German musician, a pupil of Sebastian Bach, and highly praised by Burney for his adagio compositions in the age preceding Mozart, Haydn, Beethoven. He died in 1787.

Abel, *Niels Henri*, an eminent mathematician of Norway, who was born at Christiania in 1802, and died of consumption in 1829. His works, which were published by the Norwegian government in two 4to volumes in 1839, give the unfortunate author a high place among the mathematicians of his age.

Abel, *Thomas*. See Able.

ABELARD, Peter, an eminent scholastic philosopher of France, of noble descent, was born at Palais near Nantes in Bretagne, in the year 1079. Devoted to letters by his father's appointment, and by his own inclination, his literary attainments could at this time only be exhibited in the field of scholastic philosophy; and, that he might be fitted for his destined career of life, he was placed, after a previous course of grammatical studies, under the tuition of Rosceline, a celebrated metaphysician, and founder of the sect of the Nominalists. Under the instructions of this able master, at the early age of sixteen, he furnished himself with a large store of scholastic knowledge, and acquired a subtilty and quickness of thought, a fluency of speech, and facility of expression, which were necessary qualifications in scholastic disputation.

Having spent some time in visiting the schools of several provinces, in the twentieth year of his age he fixed his residence in the university of Paris, then the first seat of learning in Europe. The master, William de Champeaux, was at that time in high repute for his knowledge of philosophy, and his skill in the dialectic art; to him he committed the direction of his studies, and was at first contented with receiving instruction from so eminent a preceptor. De Champeaux was proud of the talents of his pupil, and admitted him to his friendship. But the aspiring youth ventured to contradict the opinions of his master, and in the public school held disputations with him, in which he was frequently victorious. The jealousy of the master and the vanity of the pupil naturally occasioned a speedy separation.

Elated by success, and confident of his own powers, Abelard, without hesitation, at the age of twenty-two, opened a public school of his own. Melun, a town ten leagues from Paris, where the court frequently resided, was the place which he chose for this bold display of his talents. But it was not without considerable difficulty that Abelard executed his plan; for De Champeaux, who regarded him as a rival, openly employed all his interest against him. Abelard at length prevailed, his school was opened, and his lectures were attended by crowded and admiring auditories. Emboldened by this success, and perhaps stimulated by unworthy resentment, Abelard resolved to maintain an open contest with his master, and for this purpose removed his school to Corbeil near Paris. The disputants frequently met in each other's schools; and the contest was supported on each side with great spirit, amidst crowds of their respective scholars. The young champion was in the end victorious, and his antagonist was obliged to retire.

Constant application and violent exertions had now so far impaired Abelard's health, that it was become necessary for him to interrupt his labours; and, with the advice of his physician, he withdrew to his native country. Two years afterwards, he returned to Corbeil, and found that De Champeaux had taken the monastic habit among the regular canons in the convent of St Victor; but that he still continued to teach rhetoric and logic, and to hold public disputations in theology. Returning to the charge, he renewed the contest, and his opponent was obliged to acknowledge himself defeated. The scholars of De Champeaux deserted him, and went over in crowds to Abelard. Even the new professor, who had taken the former school of De Champeaux, voluntarily surrendered the chair to the young philosopher, and requested to be enrolled among his disciples. A triumph so complete, while it gratified the vanity of Abelard, could not fail to provoke the resentment of his old master, who had influence to obtain the appointment of a new professor, and drive Abelard back to Melun. De Champeaux's motive for this violent proceeding was soon perceived; even his friends were ashamed of his conduct; and he retired from the convent into the country. When Abelard was informed of the flight of his adversary, he returned towards Paris, and took a new station at the abbey on Mount St Genevieve. His rival, the new professor, was unequal to the contest, and was soon deserted by his pupils, who flocked to the lectures of Abelard. De Champeaux, too, returning to his monastery, renewed the struggle; but so unsuccessfully, that Abelard was again victorious.

During a short absence, in which Abelard visited his native place, De Champeaux was preferred to the see of Chalons. The long and singular contest between these philosophers terminated; and Abelard, perhaps for want of a rival to stimulate his exertions, or possibly through envy of the good fortune of his rival, determined to exchange the study and profession of philosophy for that of theology. He therefore quitted his school at St Genevieve, and removed to Laon, to become a scholar of Anselm. From this celebrated master he entertained high expectations; but they were soon disappointed. On attending his lectures, he found that, though he possessed uncommon fluency of language, he left his auditors without instruction. Abelard gradually retired from these unprofitable lectures, but without offering offence either to the veteran professor or his scholars. In conversation one of them asked him, what he thought of the study of the Scriptures? Abelard replied that he thought the explanation of them a task of no great difficulty; and to prove his assertion, he undertook to give a comment, the next day, upon any part of the Scriptures they should mention. They fixed upon the beginning of the prophecy of Ezekiel; and the next morning he explained the passage in a theological lecture, which was heard with admiration. For several successive days, the lectures were, at the request of the audience, continued; the whole town pressed to hear them; and the name of Abelard was echoed through the streets of Laon. Anselm, jealous of the rising fame of this young theologian, prohibited his lectures, under the pretence that so young a lecturer might fall into mistakes, which would bring discredit upon his master. Abelard, whose ambition required a wider field than that of Laon, obeyed the prohibition, and withdrew. He returned to Paris, whither the fame of his theological talents had arrived before him, and opened his school with his lectures on the prophecy of Ezekiel. His auditors were delighted; his school was crowded with scholars; and he united in his lectures the sciences of theology and philosophy with so much success, that multitudes repaired to him from various parts of France, from Spain, Italy, Germany, Flanders, and Great Britain.

Hitherto Abelard has appeared with high distinction, as an able disputant, and a popular preceptor: we must now view him under a different character, and when nearly arrived at the sober age of forty, see him, on a sudden, exchanging the school of philosophy for the bower of pleasure, and even disgracing himself, as will too plainly appear in the sequel, by forming and executing a deliberate plan for the seduction of female innocence. It happened that there was at this time, resident in Paris, Heloise, the niece of Fulbert, one of the canons of the cathedral church, a lady about eighteen years of age, of great personal beauty, and highly celebrated for her literary attainments. Abelard, whose vanity had been satiated with fame, and the vigour of whose mind was now enervated by repose, found himself inclined to listen to the voice of passion. He beheld with ardent admiration the lovely Heloise, and confident that his personal attractions were still irresistible, he determined to captivate her affections. Fulbert, who doubtless thought himself honoured by the visits of so eminent a scholar and philosopher, received him into his house as a learned friend. He was soon afterwards prevailed upon, by a handsome payment which Abelard offered for his board, to admit him into his family; and, apprehending no hazard from a man of Abelard's age and profession, requested him to undertake the instruction of Heloise. Abelard accepted the trust, but, as it seems, without any other intention than to betray it. The hours of instruction were employed in other lessons than those of learning and philosophy; but Fulbert's respectful opinion of the philosopher, and his partiality for his niece, long concealed from him an amour, which was become the subject of general conversation. Upon discovering her pregnancy, it was thought necessary for her to quit her uncle's house; and Abelard conveyed her to Bretagne, where his sister was prepared to receive them. Here Heloise was delivered of a son, to whom they gave the whimsical name of Astrolabus. Abelard, upon the birth of the child, proposed to Fulbert to marry his niece, provided the marriage might be kept secret: Fulbert consented, and Abelard returned to Bretagne to fulfil his engagement. Heloise, partly out of regard to the honour of Abelard, whose profession bound him to celibacy, and partly from a romantic notion that love like hers ought not to submit to ordinary restraints, at first gave Abelard a peremptory refusal. He, however, at last prevailed, and they were privately married at Paris. Heloise from this time met with severe treatment from her uncle, which furnished Abelard with a plea for removing her from his house, and placing her in the abbey of Benedictine nuns, in which she had been educated. Fulbert concluded, perhaps not without reason, that Abelard had taken this step, in order to rid himself of an encumbrance which obstructed his future prospects. Deep resentment took possession of his soul, and he meditated revenge. He employed several ruffians to enter his chamber by night, and inflict upon his person a disgraceful and cruel mutilation. The deed was perpetrated; the ruffians were taken, and suffered, according to the *Lex Talionis*, the punishment they had inflicted; and Fulbert, for his savage revenge, was deprived of his benefice, and his goods were confiscated. Unable to support his mortifying reflections, Abelard resolved to retire to a convent. At the same time he formed the selfish resolution, that, since Heloise could no longer be his, she should never be another's, and ungenerously demanded from her a promise to devote herself to religion; and even insisted upon her taking the holy vow before him, suspecting, as it seems, that if he first engaged himself, she might violate her promise, and return to the world.

A few days after Heloise had taken her vows, Abelard assumed the monastic habit in the abbey of St Denys, determined, as it seems, to forget, in hope of being forgotten by the world. However, his admirers and scholars in Paris were unwilling that the world should lose the benefit of his labours, and sent deputies to entreat him to return to his school. After some deliberation, he again yielded to the call of ambition; and at a small village in the country, he resumed his lectures, and soon found himself surrounded with a numerous train of scholars. The revival of his popularity renewed the jealousy of other professors, who took the first opportunity of bringing him under ecclesiastical censure. A treatise which he published at this time, entitled, *The Theology of Abelard*, was supposed to contain some heretical tenets. A synod was called at Soissons in the year 1121; the work was condemned to be burnt, and Abelard was commanded to throw it into the flames. After being involved in other controversies, new charges were brought against him, and he fled to the convent of St Ayoul at Provins in Champagne, the prior of which was his intimate friend. The place of his retreat was soon discovered, and threats and persuasions were in vain employed to recal him: at last he obtained permission to retire to some solitary retreat, on condition that he should never again become a member of a convent.

The spot which he chose was a vale in the forest of Champagne, near Nogent upon the Seine. Here Abelard, in 1122, erected a small oratory, which he dedicated to the Trinity, and which he afterwards enlarged, and consecrated to the Third Person, the Comforter, or Paraclete. Here he was soon discovered, and followed by a train of scholars. A rustic college arose in the forest, and the number of his pupils soon increased to six hundred. Jealousy again provoked the exertions of his enemies, and he was meditating his escape, when, through the interest of the duke of Bretagne, and with the consent of the abbot of St Denys, he was elected superior of the monastery of St Gildas, in the diocese of Vannes, where, though not without frequent and grievous vexations, he remained several years.

About this time, Suger, the abbot of St Denys, on the

Abelard.

plea of an ancient right, obtained a grant for annexing the convent of Argenteuil, of which Heloise was now prioress, to St Denys; and the nuns, who were accused of irregular practices, were dispersed. Abelard, informed of the distressed situation of Heloise, invited her, with her companions, eight in number, to take possession of the Paraclete.

It was during Abelard's residence at St Gildas that the interesting correspondence passed between him and Heloise, which is still extant. The letters of Heloise, in this correspondence, abound with proofs of genius, learning, and taste, which might have graced a better age. Upon these letters Pope formed his celebrated Epistle from Eloisa to Abelard. Here, too, Abelard probably wrote his *Theology*, which again subjected him to persecution. His opinions were pronounced heretical by a council; and although he appealed to Rome, the judgment of the council was confirmed by the pope; and he was sentenced, unheard, to perpetual silence and imprisonment. By the interposition of some friends, however, and by a submissive apology, he obtained his pardon, with permission to end his days in the monastery of Cluny.

At Cluny he was retired, studious, and devout. The monks of the convent importuned him to resume his instructions. In a few occasional efforts he complied with their solicitations; and his lectures were heard with undiminished applause. But his health and spirits were much enfeebled, and gradually declined till he died, in the 63d year of his age, on the 21st of April 1142. His body was sent to Heloise to be interred in the convent of the Paraclete. Heloise survived her husband 21 years, a pattern of conjugal affection and monastic virtue; and was buried in the same grave. An elegant Gothic monument to their memory, constructed out of the ruins of the abbey of the Paraclete, forms one of the most interesting objects in the cemetery of Père la Chaise.

The writings of Abelard do not give a high idea of his genius or taste; but it cannot be questioned, that the man who could foil the first masters of the age at the weapons of logic, draw round him crowded and admiring auditors, and collect scholars from different provinces and countries wherever he chose to form a school, must have possessed extraordinary talents. Had his love of truth been equal to his thirst of fame, and his courage in adhering to his principles equal to his ingenuity in defending them, his sufferings and persecutions might have excited more regret, and his title to honourable remembrance would have been better established.

His principal works, written in Latin, are, An Address to the Paraclete on the Study of the Scriptures; Problems and Solutions; Sermons on the Festivals; A Treatise against Heresies; An exposition of the Lord's Prayer; A Commentary on the Romans; A System of Theology; and his Letters to Heloise and to others. Of some of those letters, and the answers, there are translations in Berrington's *History of the Lives of Abelard and Heloise.* Besides these, there was published for the first time, from ancient MSS., by M. V. Cousin, in 1836, a quarto volume, entitled "*Ouvrages inédits d'Abélard,*" containing, with some smaller pieces, his celebrated treatise, *Sic et Non*, and his Dialectics. The most perfect edition of the complete works of Abelard is from the same eminent hand, Paris, 4to, 1849–50.

ABELIANS, Abelites, or Abelonians, in *Church History*, a sect of heretics mentioned by St Augustin, which pretended to follow the example of Abel; who, they alleged, had died without ever having known his wife.

ABELLA, now Avella, anciently a town of Campania, near the river Clanius. The inhabitants were called Abellani, and said to have been a colony of Chalcidians. The nux Avellana, called also *Prænestina*, or the *hazel-nut*, takes its name from this town, according to Macrobius.

ABELLINUM. See Avellino.

ABELLIO, a name of Apollo, from Ἀβέλιος, his name in Crete and elsewhere.

ABENBERG, chief town of the district of the same name in Bavaria, about 16 miles S.S.W. of Nuremberg. It has a population of 1100, and manufactories of lace and needles.

ABEN-BITAR (Abdalla ben Ahmed), a celebrated naturalist and physician of Spain, who wrote a very useful work on all the herbs, animals, minerals, &c. used in medicine. He died at Damascus A.D. 1248.

ABENCERRAGES, and Zegris, the names of two noble families, frequently mentioned by the Spanish chroniclers and romance writers. See *Guerras Civiles de Granada* by Guies Perez de Hyta, part of which has been translated by T. Rodd; and Conde's *Hist. de la Dominacion de los Arabes en Espagna*, vol. iii.

ABEN-EZRA, Abraham, a celebrated rabbi, born at Toledo in Spain, called by the Jews the wise, great, and admirable Doctor, was a very able interpreter of the Holy Scriptures; and was well skilled in grammar, poetry, philosophy, astronomy, and medicine. He was also a perfect master of the Arabic. His principal work, *Commentaries on the Old Testament*, is printed in Bomberg's and Buxtorf's Hebrew Bibles, and is much esteemed. His style is clear, elegant, and concise: he almost always adheres to the literal sense, and everywhere gives proof of his genius and good sense. The scarcest of all his books is entitled *Jesud Mora*, which is a theological work, intended as an exhortation to the study of the Talmud. He also wrote *Elegantiæ Grammaticæ*, printed in octavo at Venice in 1548. He died in 1194, aged 75, or, according to De Rossi, in 1168.

ABENHEIM, a market town in the bailiwick of Alzey, and province of the Rhine, in the grand duchy of Hesse Darmstadt, with 940 inhabitants, who make excellent wine.

ABENMELECH, Solomon, a learned rabbi, a native of Spain, who flourished in the sixteenth century. He wrote Scholia on the whole of the Old Testament, in which he has interspersed the best of Kimchi's grammatical observations. His Commentaries are inserted in the Biblia Rabbinica, Ven. 1518.

ABENSBERG, a small city, capital of the bailiwick of the same name, in the circle of Regen in Bavaria, containing, in 1847, 254 houses and 1200 inhabitants. It was formerly the seat of the Counts Abenberg. Here Napoleon defeated the Austrians in a great battle on the 20th of April 1809. It is the Abusina of the Romans; and ancient ruins exist in its neighbourhood.

ABENSPERG, a small town of Germany, in the kingdom of Bavaria, and in the government of Munich. It is seated on the river Abentz, near the Danube. Long. 11. 38. E. Lat. 48. 45. N.

ABERAVON, a borough town of Glamorganshire, in Wales, at the mouth of the Avon, 192 miles west of London. Long. 3. 35. W. Lat. 51. 40. N. Until lately, Aberavon was a mere village; but has recently increased rapidly, from the extension of the mines of coal and iron in its vicinity, and the establishment of extensive works for the smelting of copper and zinc. At Port Talbot, about a mile distant, is an excellent float dock, much frequented by numerous coasting vessels. It unites with Swansea in returning a member to parliament. Pop. in 1841, 3665; in 1851, 6567.

ABERBROTHICK. See Arbroath.

ABERCONWAY, or Conway, a town of Caernarvonshire in North Wales, at the mouth of the Conway, as its name implies. It is finely situate on a steep slope, and is entirely enclosed by its lofty old walls of more than a mile in circuit, forming a triangle, and fenced with 24 round towers. It is a fine example of the style of fortification in

Abercrombie. the reign of Edward I.; and contains some curious half-timber houses of Elizabeth's time, with the ruins of a Cistertian priory, and other objects of interest. The castle, which exhibits very extensive ruins, was built in 1284 by Edward I., and must have been one of the noblest fortresses in Britain. An elegant suspension-bridge across the river (constructed by Telford), was opened in 1826; and the tubular bridge by Stevenson, the first of its kind, for the Chester and Holyhead Railway, was completed in 1848. The population in 1851 was 2105, chiefly occupied in the coasting trade and in ship-building. The pearl-mussel fishery which subsisted for a long period has been lately abandoned. It is one of the contributory boroughs to Caernarvon in returning a member to parliament. Distance from London, 224 miles. It is the ancient *Conovium.*

ABERCROMBIE, John, M.D., an eminent physician of Edinburgh, and most estimable man, was the son of the Rev. George Abercrombie of Aberdeen; in which city he was born in 1780.

Young Abercrombie received his elementary education at the grammar school of his native place, and his literary and philosophical education in Marischal College; but his medical studies were commenced at Edinburgh in 1800; where, after the usual academical curriculum, he obtained his degree of M.D. in 1803. Soon afterwards he went to London, and for about a year gave diligent attention to the medical practice and lectures in St George's Hospital. In 1804, Dr Abercrombie returned to Edinburgh, became a Fellow of the College of Surgeons, and commenced as general practitioner in that city; where, in dispensary and private practice, he laid the foundation of that character for sagacity as an observer of disease, and judgment in its treatment, that eventually elevated him to the head of his profession. He early began the laudable practice of preserving accurate notes of the cases that fell under his care; and at a period when pathological anatomy was far too little regarded by practitioners in this country, Abercrombie had the merit of sedulously pursuing it, and collecting a body of most important facts on the changes produced by disease on different organs; so that, before the year 1824, he had more extended experience, and more correct views in this interesting field, than most of his contemporaries engaged in extensive practice. From 1816 to 1824, he occasionally enriched the pages of the *Edinburgh Medical and Surgical Journal* with various essays, that display originality and industry, particularly those "on the diseases of the spinal cord and brain," and "on diseases of the intestinal canal, of the pancreas, and spleen." The first of these subjects formed the basis of his great and very original *Pathological and Practical Researches on Diseases of the Brain and Spinal Cord*, which appeared at Edinburgh in 1828, and a second edition in 1830. This work is illustrated by interesting cases, and the admirable observations of the author. Besides these works, he contributed to the Journal "An Essay on the Pathology of Consumptive Diseases," "Observations on Ischuria Renalis;" and to the *Transactions of the Edinburgh Medico-Chirurgical Society* a valuable paper "on Diseases of the Heart."

In 1823, he had become a Licentiate of the College of Physicians; in 1824 a fellow of that body; and from the death of Dr Gregory in 1822, Dr Abercrombie was considered as the first physician in Scotland. His practice was very extensive and lucrative; yet he found time for other speculations and occupations. In 1830, he published his *Inquiries concerning the Intellectual Powers of Man, and the Investigation of Truth.* This work, though far less original and profound than his medical speculations, contains a popular view of an interesting subject, and was very extensively read, from the simplicity of diction, and integrity of purpose. It was followed in 1833 by his *Philosophy of the Moral Feelings*, a sequel to the former, the object of which, as stated in the preface, "was to divest the subject of all improbable speculations," and to shew "the important relation which subsists between the science of mind and the doctrines of revealed religion." Though less profound even than the last, soon after its publication, the University of Oxford conferred on the author the honorary degree of *Doctor* of Medicine; and in 1833 his first *alma mater* elected him its *Lord Rector.*

Abercromby.

Dr Abercrombie continued in good health until 1841, when he suffered from an alarming irregularity in the circulation of his brain, which induced him to consider it as the forerunner of paralysis, for which he insisted on being profusely bled. This was followed by extreme debility, approaching to syncope; but he eventually recovered, after about a fortnight's illness, and continued his professional duties, until the 14th November 1844; when he was found on the floor of his room in a state of insensibility, and almost immediately expired. The examination of his body showed that the immediate cause of his death was a very uncommon disease of the *heart*—softening of its muscular substance, which induced a separation of the fibres of the left ventricle, with laceration of the coronary vessels, by which the pericardium was filled with blood.

In private life, Dr Abercrombie was much beloved by numerous friends, for the suavity and kindness of his manners, and esteemed by all for his well-directed talents and unaffected piety. (T. S. T.)

ABERCROMBY, The Honourable Alexander (Lord Abercromby), a Judge in the Courts of Session and Justiciary in Scotland, was the youngest son of George Abercromby of Tullibody, Esq., of a respectable family in Clackmannanshire, and was born on the 15th October 1745. Mr Abercromby was early destined for the profession of the law, and with this view he was educated at the university of Edinburgh, where he passed through the requisite course of languages, philosophy, and law, and was admitted advocate in the year 1766. In 1780 he resigned the office of sheriff-depute of Stirlingshire, which he had held for several years, and accepted that of depute-advocate, with the hope of extending his employment in the line of his profession. In this step he was not disappointed; for his reputation and business rapidly increased, and soon raised him to the first rank at the Scottish bar. But he still retained a taste for the elegant amusements of polite literature, and was one of that society who set on foot two periodical papers, the *Mirror* and *Lounger*, published at Edinburgh; the former in 1779, and the latter in 1785. To the *Mirror* he contributed ten papers, and to the *Lounger* nine. The names of the authors have been published in the late editions of these works, which renders it unnecessary to point out those papers of which Mr Abercromby was the author. In May 1792, he was appointed one of the Judges of the Court of Session, and in December following he was called to a seat in the Court of Justiciary. Lord Abercromby continued to discharge the arduous duties of these important offices till summer 1795, when he was seized with a pectoral complaint, of which he died on the 17th November the same year, at Exmouth in Devonshire, where he had gone for the recovery of his health.

Abercromby, *Sir Ralph*, knight of the Bath, and a lieutenant-general in the British army, an elder brother of the preceding, was born in the year 1738. Being destined for the army, he obtained, in May 1756, a cornet's commission in the 2d dragoon guards; and rose, April 24. 1762, to the rank of a captain in the 3d regiment of horse. Ascending through the intermediate gradations of rank, he was appointed, November 3. 1781, to the colonelcy of the 103d infantry. September 28. 1787, he was promoted to the rank of major-general. November 5. 1795 he obtained the command of the 7th regiment of dragoons. Having been nearly 40 years in the army, having served with honour in two wars, and being esteemed one of the ablest, coolest, and most intrepid officers in the whole British forces, he was employed on the continent under his Royal Highness the Duke of York, in the commencement of the war against the French republic. In the action on the heights of Cateau, he commanded the advanced guard, and was wounded at Nimeguen. He conducted the march of the guards from Deventer to Oldensal, in the retreat of the British out of Holland, in the winter of 1794–5. In August 1795, he was appointed to succeed Sir Charles Grey, as commander-in-chief of the British forces in the West Indies. March 24. 1796, Grenada was suddenly attacked and taken by a detachment of the army under his orders. He afterwards obtained possession of the settlements of Demerara and Essequibo, in South America. St Lucia was next taken by more difficult exertions, in which his ability was signally displayed. St Vincent was, by the middle of June, added to the British conquests. Trinidad, in February 1797, shared the same fate. He returned the same year to Europe, and, in reward for such important services, was invested with the red ribbon, appointed to the command of the regiment of Scots Greys, intrusted with the governments of the Isle of Wight, Fort George, and Fort Augustus, and raised to the rank of lieutenant-general. He held, for a time, the chief command of the forces in Ireland. In that command, he laboured to maintain the discipline of the army, to suppress the rising rebellion, and to protect the people from military oppression, with a care worthy alike of the great general and the enlightened and beneficent statesman. When Sir Ralph was appointed to the command in Ireland, an invasion of that country by the French was confidently anticipated by the English Government. He used his utmost efforts to restore the discipline of an army that was utterly disorganized; and, as a first step, he anxiously endeavoured to protect the people, by re-establishing the supremacy of the civil power, and not allowing the military to be called out, except when it was indispensably necessary for the enforcement of the law and the maintenance of order. Finding that he received no adequate support from the head of the Irish Government, and that all his efforts were thwarted and opposed by those who presided in the councils of Ireland, he resigned the command. His departure from Ireland was deeply lamented by all the reflecting portion of the people, and was speedily followed by those disastrous results which he had anticipated, and which he so ardently desired to prevent.

It is known that in after life there was no part of his public conduct on which he reflected with such entire satisfaction as on those efforts which he made to protect the country from the threatened invasion. From Ireland he was called to the chief command of the forces in Scotland. When the enterprise against Holland was resolved upon, Sir Ralph Abercromby was called again to command, under his Royal Highness the Duke of York. The difficulties of the ground, the inclemency of the season, delays, though inconvenient, yet unavoidable, the disorderly movements of the Russians, and the timid duplicity of the Dutch, disappointed our hopes of that expedition. But by the Dutch, the French, the British, it was confessed, that even victory the most decisive could not have more conspicuously proved the talents of this distinguished officer. His country applauded the choice, when, in 1801, he was sent with an army to dispossess the French of Egypt. His experience in Holland and Flanders, and in the climate of the West Indies, particularly fitted him for this new command. He accomplished some of the first duties of a general, in carrying his army in health, in spirits, and with the requisite intelligence and supplies, to the destined scene of action. The landing in Egypt may be justly ranked among the most daring and brilliant exploits of the English army. The incidental capture of two English officers, who were reconnoitering the camp, indicated the point at which the attempt to land would be made. The French prepared to meet it with a body of 2000 infantry, a detachment of cavalry, and 15 pieces of artillery. The Turks were exposed to the concentrated fire of the enemy, while they were transported for a considerable distance in open boats to the coast. When they reached the shore, they had to land and form in the face of an enemy prepared to meet them, and with the additional disadvantage of sinking deep at each step in the loose sand. Sir Ralph was not discouraged by these severe difficulties, because he had been fully apprised of the very great importance which was attached even to the partial success of the enterprise, as a prelude to the negotiations for peace which were then impending; but he at the same time made arrangements for desisting, if he saw that the sacrifice of life would be greater than it was justifiable to make. The landing, the first dispositions, the attack, and the superiority over the French which the British infantry under his command evinced, all bear testimony to the high military talents of this commander. It was his fate to fall in the moment of victory. General Lord Hutchinson, who succeeded him in the command, in the dispatches with the account of his death, has given a fine eulogium on his character as a soldier, and strongly expressive of the high estimation in which he was held. "We have sustained an irreparable loss in the person of our never sufficiently to be lamented commander-in-chief, Sir Ralph Abercromby, who was mortally wounded in the action (of the 21st), and died on the 28th of March. I believe he was wounded early, but he concealed his situation from those about him, and continued in the field, giving his orders with that coolness and perspicuity which had ever marked his character, till long after the action was over, when he fainted through weakness and loss of blood. Were it permitted for a soldier to regret any one who has fallen in the service of his country, I might be excused for lamenting him more than any other person; but it is some consolation to those who tenderly loved him, that, as his life was honourable, so was his death glorious. His memory will be recorded in the annals of his country—will be sacred to every British soldier—and embalmed in the recollection of a grateful posterity." His remains were conveyed on board Admiral Lord Keith's flag-ship to Malta, attended by Colonel Sir John Dyer, and were interred in the commandery of the grand master, with the highest military honours. A monument to his memory was erected in St Paul's church, London, in pursuance of a vote of the House of Commons. His widow was created a peeress, and a pension of L.2000 a-year for her and other two lives settled on the family. For a detailed account of the military transactions in which Sir Ralph Abercromby was engaged, see BRITAIN.

ABERDARE, a parish and large village of South Wales, in the county of Glamorgan. The village is situate in a beautiful valley, watered by the river Cynon, an affluent of the Taaf, about 4½ miles south-west of Merthyr-Tydvil. In 1831, the population was only 3961; but, owing to the rapid and enormous extension of the iron-trade, the number has increased more than threefold, mostly employed in the manufacture of iron, and the raising of coal.

ABERDEEN, *Old*, is a place of great antiquity. In 1004, Malcolm II. founded a bishopric at a place called Mortlach in Banffshire, in memory of a signal victory which he there gained over the Danes: which bishopric was translated to Old Aberdeen by David I.; and in 1153, the then bishop of Aberdeen obtained a new charter from Malcolm IV. The town lies about a mile to the north of the New Town, near the mouth of the river Don, which is spanned by a fine Gothic bridge, of a single arch, resting on a rock on each side. This arch, said to have been built by a bishop of Aberdeen about the beginning of the 14th century, is 67 feet wide, and 34½ feet high above the surface of the river, which at ebb tide is here 19 feet deep. The town, which consists chiefly of one long street, was formerly the see of a bishop, and had a large cathedral dedicated to St Machar. The only remains of it are two lofty spires, and the nave, which is in a state of complete repair, and used as a church. The present cathedral, the third from the original translation of the see, was commenced about the end of the 14th century, and required 150 years for its completion, but did not remain entire above one-third of that time. It was greatly injured at the Reformation: and Cromwell's troops, time, and storms, did the rest. What remains is the oldest part, and is built chiefly of granite (*out-layer*), a remarkable, if not, as is most probable, a unique circumstance for its age. The principal structure is the King's College, on the south side of the town, which is a large and stately fabric. It is built in form of a square, with cloisters on the south side. In the chapel, which has been thoroughly repaired, and is used for public worship during session, there still remain the original fittings of the choir, of most tasteful design, and executed with a precision and delicacy not surpassed by the oak-carving of any ancient church in Europe. This was preserved by the spirit of the Principal at the time of the Reformation, who armed his people, and checked the blind zeal of the barons of the Mearns, when, after stripping the cathedral of its roof, and robbing it of the bells, they were about to violate this seat of learning. The steeple is vaulted with a double cross arch; above which is an imperial crown, supported by eight stone pillars, and closed with a globe and two gilded crosses. In the year 1631, this steeple was thrown down by a storm, but was soon after rebuilt, in a style resembling that of the cathedrals of Edinburgh and Vienna. This college was founded in 1494, by William Elphinston, bishop of Aberdeen, lord chancellor of Scotland in the reign of James III. and lord privy seal in that of James IV.; but James IV. claimed the patronage of it, and it has since been called the *King's College*. The library is considerable, and now contains upwards of 50,000 volumes. Hector Boethius was the first principal of the college, and was invited from Paris for that purpose, on an annual salary of forty merks Scots, L.2, 3s. 4d. sterling. The professorships are Divinity, Medicine, Civil Law, Moral Philosophy, Mathematics, Natural Philosophy, Greek, Humanity, and Oriental Languages. There are numerous bursaries, of which about thirty are bestowed annually by public competition, various patrons presenting to the rest, being in all about forty. (*See Marischal College, in next Article.*) The yearly amount of bursaries and prizes is about L.2000. The number of students, both at King's College and at Marischal College, but particularly the former, has been increasing of late years. In 1852, the number who graduated in arts at King's College was 35; in medicine 24; and in divinity 2. Pop. in 1853, about 2000.

Aberdeen, *New*, the capital of the county of Aberdeen. It is situate on the German Ocean, at the mouth of the river Dee, and in point of population, wealth, and commerce, ranks as the chief town and seaport in the north of Scotland. As early as 1179, it received a charter from William the Lion, who is said to have had a residence here; and it seems to have been even then a place of some importance. In 1800, an act was obtained for the general improvement of the city; and since that period its whole appearance and plan have been changed. New and spacious streets have been opened, bridges of communication have been built, and other improvements executed, ornamental as well as useful. Union street, which affords a splendid access from the south and west, extends from the market-place 1350 yards, and is 70 feet wide. The houses are built of dressed granite; and the street, being now almost filled up with handsome private dwellings, besides various public buildings, has a very imposing appearance. To facilitate the access into the town by means of this street, an elegant bridge of a single arch, the span of which is 132 feet, was erected at an expense of L.13,000. A new opening to the north has been made by King's street; and on the line of this street is a bridge over the Don, constructed at an expense of L.14,000. It consists of five arches, each with a span of 75 feet. Since 1800, numerous other new streets have been opened, and many of them completed. In consequence of these improvements, Aberdeen may be considered as a spacious, elegant, and well-built city. The public buildings are numerous. There are about 50 places for divine worship. Connected with the Established religion are the East and West churches, forming a continuous building 170 feet in length, and adorned with a spire 150 feet in height, besides four other parish churches. There are four *quoad sacra* churches; three Episcopal chapels; six connected with the United Secession; fifteen with the Free Church; eight with Congregationalists and Baptists; one with the Methodists; a Unitarian chapel; one for Roman Catholics; and a Quaker meeting-house. At the Disruption, all the Established ministers of Aberdeen seceded, carrying with them about 10,000 lay-members. The West church was planned by the architect Gibbs; the East by Mr Archibald Simpson; the North and South by Mr John Smith, all natives of Aberdeen.

The charitable institutions are numerous, and, on the whole, well managed and prosperous. The royal infirmary was lately rebuilt at an expense of nearly L.20,000, from a plan by Mr Simpson. It is large, commodious, and well-situated, and imposing in point of architectural effect. The managers were originally incorporated by royal charter in 1773; but a new charter, greatly extending the management, was obtained in 1852. The institution is supported, partly by funds invested in land, and partly by donations and contributions. The number of patients, at the end of 1852, was 134. There is a large and efficient staff of medical officers, with a numerous attendance of pupils. The lunatic asylum was opened in 1800. It is under the same management as the infirmary, and is capable of accommodating 300 patients. The average number, in 1852, was 268.

Gordon's hospital was founded by Robert Gordon (of the Straloch family) by deed of mortification, dated 1729. The president and governors were incorported by royal charter, in 1772. The institution, which was avowedly framed after the model of Heriot's hospital, is for the maintenance and education of the sons and grandsons of decayed burgesses of Aberdeen. There are at present 150 boys in the house, who are instructed in the ordinary branches of education, besides mathematics, natural philosophy, French, Latin, drawing, and music. They are admitted from 8 to 11 years of age, and may continue in the hospital until 15. On leaving, each boy is entitled to L.10, in shape of apprentice-fee, or to L.7, 10s., if allowed to go abroad. The female orphan asylum, instituted in 1840, at a cost of L.30,000, is a private endowment, for maintaining and educating orphan daughters of parents who have lived in the city of Aberdeen, and the adjoining parishes of Old Machar and Nigg, for three years previous to their decease; admitted from the age of 4 to 8, and trained chiefly for domestic service.

The other charitable institutions are,—a general dispensary, lying-in, and vaccine institution, founded in 1823, and supported by voluntary contribution; two ophthalmic institutions; an asylum for the blind, established in 1843, on the foundation of the late Miss Cruickshank; an hospital for orphan and destitute female children, endowed by the late

Aberdeen. Dr John Carnegie; the Midbeltie fund, founded in 1848, by the late James Allan, Esq. of Midbeltie, for pensions, ranging from L.5 to L.15 annually, to widows of good character and reduced circumstances. A commodious poorhouse, according to act of Parliament, was opened four years ago. The number of paupers in the house, in 1852, was 212, besides 902 on the permanent roll. The gross assessment amounted to L.6627. The cost per head of the out-door paupers was L.4, 3s. 6d. per annum; of the in-door L.7, 3s. per annum. In the four years ending 1852, the number of paupers had decreased by 231. In Old Machar parish the total number of out and in door paupers, including children and lunatics, in 1852, was 969; the average cost of each inmate of the poorhouse being L.5, 12s. per annum.

Marischal College was founded by George Keith, Earl Marischal, in 1593. It was lately rebuilt at a cost of about L.30,000,—half of which was a grant from government and the rest raised by subscription,—and has been occupied since 1840. There are professors of Humanity, Greek, Natural History, Mathematics, Natural Philosophy, Moral Philosophy, Divinity, Oriental Languages, Chemistry, Medicine, Anatomy, and Surgery, with lecturers on Materia Medica, Midwifery, Scots Law, &c. It has a good library, observatory, museum, and an excellent collection of philosophical instruments. The session commences in the first week of November, and ends in the first week of April. The curriculum of arts extends over four sessions; and a student's expenses, during each session, may be from L.35 to L.40. The fees for each of the classes are mostly from two to three guineas. Connected with the college are numerous bursaries founded for the purpose of assisting students in poor circumstances. About thirty bursaries are bestowed annually, some by competition and others by presentation, and are continued during the four sessions of the curriculum. There are sixteen competition bursaries, varying from L.16 to under L.5 each; and in the case of bursars, the fees of the session are so restricted as to be more than covered by the bursary. The annual sum expended in prizes and bursaries is about L.1500. In 1852, the number of graduates in A.M. was 21; in M.B. 7; in M.D. 12; and in LL.D. 1. In the west end of the town is the Free Church Divinity Hall. The grammar school, which is mentioned as being in existence in 1418, is a preparatory school to the colleges, and is under a rector and three masters. There are several academies, and a number of parish and other schools, including two on Dr Bell's foundation; one for boys and the other for girls. The industrial or ragged schools, which owe their establishment mainly to Sheriff Watson, are thriving, and have been the means of doing great good, as proved by the remarkable diminution of juvenile crime in the city. The average number on the roll for 1852, was 297. The average annual cost of each child, about L.3, 4s.

On the north side of Castle Street are the town-house and the old tolbooth, which is surmounted by a handsome spire 120 feet in height; and connected with it there has been erected a new court-house, which combines the advantages of elegance, convenience, and comfort; with a prison in the rear. Bridewell, now called the west prison, was built in 1809, at an expense of L.12,000. The cross, a singularly beautiful erection at the east end of Castle Street, is adorned with medallions cut in stone, in very high relief, of all the royal family of Scotland, from James I. to James VII. inclusive, with a fine column of the composite order, surmounted by the royal unicorn rampant rising from the centre. It was planned and executed about 1682, by John Montgomery, a native architect. Near it is a fine granite colossal statue of the late Duke of Gordon. The assembly-rooms, in Union Street, were built in 1821, by subscription. They are constructed of beautiful granite, handsomely ornamented. The rooms, which are ninety feet in front, and 156 feet at the back of the edifice, are splendidly finished in the interior. It has military barracks, erected in 1796, a neat theatre, and public baths. Aberdeen.

The commerce and manufactures of Aberdeen are extensive and flourishing. One of the most important branches of manufacture is the cotton, which was introduced about the year 1779, and has given rise to several large establishments, in the greater number of which steam-engines are employed. There are other smaller works, which manufacture stripes, winseys, druggets, &c. The whole, when in full work, give employment to about 4000 hands. There are two large houses engaged in the woollen trade, and four or five small ones. In these are manufactured broad and narrow cloths, blankets, serges, stockings, &c., but chiefly worsted yarns. They give employment to about 3500 persons. The manufacture of carpeting for the London, but particularly the American markets, has been carried on with success for upwards of twenty years. The linen manufacture, particularly that of thread, is carried on in all its branches to a great extent. The number of persons employed, when all the mills are on full work, is about 8000, of whom nearly one-third are engaged at the bleach-fields, or as out-door weavers. There are breweries of porter and ales, of which considerable quantities are annually exported to America and the West Indies. There are likewise several distilleries, the number of which has been increased since the reduction of the duty on spirits. Some extensive iron-works have also been established, in which are manufactured every kind of spinning machinery, and both land and marine steam-engines. Boiler-making, chain-making, and the forging of anchors employ about 1500 men. Iron ship-building was introduced about sixteen years ago, and has since been successfully carried on. The quantity of iron imported in 1852 was 3861 tons. There are also manufactories of soap, candles, leather, &c. The granite stones, so famous for their durability, which are quarried, dressed, and shipped from this port, form a staple commodity for exportation, and are a great source of wealth to the place, by giving employment to many thousands of industrious labourers. These stones are chiefly used for paving streets; for building bridges, wharfs, and docks; and for erecting lighthouses, and other works. At the extensive granite works of Messrs Macdonald and Leslie, that stone is manufactured into exquisitely polished vases, tables, chimney-pieces, fountains, funeral monuments, and columns, with a skill and elegance hitherto unrivalled in Great Britain; and in execution quite equal to the famous granite sculptures of Sweden or of Russia. Among their other works, we may mention the magnificent granite columns of St George's Hall in Liverpool, and the colossal statue of the last Duke of Gordon, that ornaments Castle Street in Aberdeen, sculptured in the same stubborn material. Comb-making has been, since 1830, an important branch of local industry, employing about 450 hands. The whale-fishery, once carried on to a great extent, has much declined. Forty years ago, it employed 17 vessels; now there are only two. Salmon-fishing formerly carried on with much spirit and remarkable success, has continued declining for a good many years. The quantity exported in 1852 was 1014 barrel-bulk. Herring-fishing has been prosecuted with considerable success for about 17 years.

There are now three paper-mills in the vicinity of Aberdeen, all in a very flourishing condition, and giving employment to between 500 and 600 hands. Another prosperous branch of local industry is ship-building, for which the city has lately become famous. Within the last 15 years many fine sailing and steam vessels have been built here. A ship of 1200 tons was lately (1852) launched, and another of 1500 is being built. There are eight banking establishments in Aberdeen, besides a savings bank, established in 1815. The amount at the credit of depositors in the savings bank on 12th February 1853 was L.133,484.

The aggregate tonnage of the vessels belonging to the port of Aberdeen in 1852 was 52,868 tons. They trade to North and South America, the West Indies, the Mediterranean, the Baltic, Davis' Straits, and most of the ports of the united kingdom. The want of a proper harbour was long a detriment to the trade of Aberdeen, and occasioned the loss of many lives and of much property. To remedy this defect a pier was built in 1776, by Smeaton, on the north side of the old harbour, extending a considerable way into the German Ocean; and by an act obtained in 1810, it was still farther enlarged. This extensive work is built of large masses of dressed granite, and measures in length 2300 feet. In consequence of this improvement the depth of water on the bar is at spring-tides upwards of nineteen feet, and at neap-tides fourteen feet, where there was formerly only a few feet. The flood-gates, and other works necessary for the completion of Telford's plan of 1810, were completed in 1848. The wet dock, where the largest vessels may float in safety, has a surface of nearly 40 acres, and about 9000 feet of quay-room. It is called the Victoria Dock, in honour of her Majesty's visit in 1848. The harbour dues which, in 1765, produced only L.126—amounted in 1800 to L.1300. The shore-dues for the year ending 30th Sept. 1852, were L.15,236; revenue, L.19,953; expenditure, L.18,376; debt, L.282,263. The registered tonnage charged inwards, was 298,418 tons; outwards 33,343 tons; for wintering, 16,106 tons. Commodious steam-vessels sail statedly to London, Leith, Inverness, &c. The introduction of steam-navigation in 1821 effected a complete and beneficial revolution in various branches of industry, more especially in the cattle-trade; and the benefits have been greatly increased by the recent introduction of railways. The bay affords safe anchorage with off-shore winds, but not with those from E. or N.E. A lighthouse has been erected on Girdleness, the south point of the bay, having two fixed lights, one above the other, 115 and 185 feet above high-water spring-tides, in Lat. 57. 8. N. Long. 2. 3. W. On the north pier head, there is also a tidal fixed red light, seen at the distance of four miles, and two leading lights further up the harbour on its south side. The affairs of the harbour are managed by a board of Commissioners.

No place in the empire is better supplied with water and gas. The former is brought from the Dee, a little above the bridge. It is filtered through a bed of gravel, conveyed in a tunnel to a well, whence it is pumped by steam, and propelled into a reservoir at the west end of Union Place. The quantity of water raised in twenty-four hours is about 900,000 gallons.

Aberdeen possesses a very complete public market, built by a company established by act of parliament in 1839. The building was designed by Mr Archibald Simpson, and consists of two floors of about 300 by 100 feet, with galleries going round the whole building. The upper and lower floors are fitted up with shops for the sale of butcher-meat, fish, fowls, &c. On the upper floor is a fountain of polished granite, the principal basin of which is 7 feet 3 inches diameter, cut out of a single block of stone. Connected with this undertaking was the laying out of a new street leading from Union Street to the quay, an improvement of great importance. In this street are the Post-Office and Mechanics' Hall, both handsome buildings of recent erection. The Aberdeen Railway Company was incorporated in 1845, with a capital (including additions) of L.1,256,000; the total number of shares being 78,600. The main line is 65 miles in length, with 7 miles of branches. The total receipts for the week ending 1st January 1853, were L.1647: and for the corresponding week of 1852, L.1560. In 1846, the Great North of Scotland Railway Company was incorporated, with a capital of L.1,107,440, divided into 110,744 shares. The works were not commenced until last year (1852), but are now in steady progress, with every prospect of early completion. The line will reach from Aberdeen to Elgin, in the first instance, and will be of immense importance to the northern counties. A railway, reaching from Aberdeen to Banchory-Ternan, along the north side of the river Dee, has also been recently commenced.

The oldest charter extant held by Aberdeen is from William the Lion, and of the probable date of 1178. Reference, however, is made in it to certain privileges conferred on the burgesses of Aberdeen, in common with all those north of the "mounth," by David I. The records of the burgh commence in 1398, and are complete to the present time, with the exception of a short break about the beginning of the 15th century. An interesting selection from these records has been published by the Spalding Club, the establishment of which has been the means of amply illustrating many other matters of local antiquity. The town is governed by a magistracy, consisting of a provost, four bailies, a dean of guild, and a treasurer. The other members of the council amount to twelve, all being chosen by the electors within the parliamentary bounds. In 1333 and 1336 the town was burnt by a fleet of Edward III.; but it was speedily afterwards rebuilt, and was thereafter known by the name of New Aberdeen. The total revenue of the burgh for 1852 was L.19,780; the total expenditure, for the same period, L.18,100; surplus, L.1680. In 1817, the affairs of the burgh became embarrassed to a great extent, and were placed under trust. By prudent management, however, they gradually recovered, and all liabilities were paid in full. The population of Aberdeen, in 1396, was about 3000; in 1643, 8750; in 1708, 5556; in 1801, 27,608; in 1831, 58,019; in 1841, 63,262; and in 1851, 71,945. The number of parliamentary electors is 2947; of municipal electors, 2413. It returns one member to parliament. Aberdeen is distant 108 miles north of Edinburgh, and 118 from Inverness. Long. 2. 5. 42. W. Lat. 57. 8. 58. N.

ABERDEENSHIRE, a county in Scotland, situate in the north-east, between 56. 52. and 57. 42. north latitude, and between 1. 49. and 3. 48. of longitude west from Greenwich. It is bounded by the German Ocean on the north and east; by the counties of Kincardine, Forfar, and Perth, on the south; and by those of Inverness and Banff on the west. Its greatest length is 87, and breadth 36 miles; with a circuit of about 200 miles, of which 60 are on the sea-coast. It has an area of 1985 square miles, or 1,270,740 acres, of which somewhat more than one-third is under cultivation; and contains 83 parishes, with parts of six others. This county is popularly divided into five districts. First, *Marr*, which is a mountainous district, particularly Braemar, the highland part of it; and is much frequented by tourists, on account of its wild and majestic beauties. Ben Macdhui, the highest mountain in Scotland, rises here to the height of 4299 feet, and in the vicinity are Cairntoul, Ben Avon, and Cairngorum, which attain respectively the height of 4245, 3967, and 4050 feet. The last is famous for a peculiar kind of rock crystals, known as *Cairngorum stones.* A few miles below Braemar is "dark Lochnagar," which rises to the height of 3800 feet. Second, *Formartin*, of which the land on the sea-coast is low and fertile; but hills and mosses are spread over the interior. Third, *Buchan*, the most extensive division next to Marr, having a bold precipitous shore of 50 miles, but generally a flat surface, the soil of which has been greatly improved. The Bullers of Buchan, about 6 miles south from Peterhead, is a natural curiosity, which has been often described by tourists. Fourth, *Garioch*, a large and beautiful valley, naturally very fertile. Before the introduction of modern husbandry, it was termed the granary of Aberdeen. Fifth, *Strathbogie*, the greater part of which consists of hills, mosses, and moors. On a comprehensive review, it may be said, that, with the exception of the low grounds of Buchan, and the highlands of the south-west division, Aberdeenshire consists for the most part of tracts nearly level, but often bleak, naked and unfertile, though interspersed with many rich spots in a high state of cultivation. In extent, it is very nearly one-sixteenth part of Scotland.

The chief mineral wealth of the county is its granite, for which it has long been famous, and which has brought considerable sums into the county, besides supplying the inhabitants with excellent stones for building and other purposes. As many stones have been raised from an acre of land under preparation for tillage, as brought from L.30 to L.50, for paving the streets of London. The exportation of granite to the capital employed at one time about 70 vessels of 7000 tons, and 400 men; and the value of all the stones exported yearly was stated at L40,000. The quantity exported in 1852, was 38,595 tons. Gneiss, grauwackè, and old red sandstone, are also abundant; limestone, basalt, trap, and clay-slate, are found in various parts; sandstone, and millstone are quarried at Aberdour, slate at Culsalmond and Lambhills; blacklead has been found near Huntly; and there is a manganese quarry in the vicinity of Aberdeen.

The principal rivers are the Dee and the Don. The Ythan and Ugie within the county, and the Deveron and Bogie on its boundaries, are also considerable streams. Mussels are plentiful near the mouth of the Ythan; and pearl mussels have been sometimes discovered at its lower extremity. One of the jewels of the ancient crown of Scotland, a valuable pearl, is said to have been found here. There are also several lakes well stored with pike, trout, eels, and other kinds of fish. The county is noted for its chalybeate springs at Peterhead, Fraserburgh, and at Pananich on the Dee, near Ballater.

The climate of Aberdeenshire, except in the mountainous districts, is rendered comparatively mild by its being bounded on two sides by the sea. The winters are not so severe as in some of the southern counties, but the springs are late, owing to the prevalence of easterly winds; and in autumn the weather is often wet and stormy. Wheat, however, and all the other crops cultivated in Scotland, come to perfection; and the inhabitants, who are not subject to any organic diseases, sometimes live to a great age.

The district of Marr, containing almost half the county, abounds in natural woods, which are a source of wealth to their proprietors, and of profitable employment to the inhabitants. This county is so well adapted to the growth of trees, that it is only necessary to shut out the cattle by inclosures, and the birds and winds supply it with seeds that soon rise into vigorous plants. These woods consist chiefly of Scotch fir; and the timber, especially what grows in the forests of Braemar, has been thought superior to any that Scotland has imported from the north of Europe. About a tenth part of the whole surface of the county is under wood; and the trees found in the peat mosses indicate the existence of still more extensive forests in former ages. The forests abound in deer and grouse; and partridges, and other kinds of game, are plentiful in all the higher parts of the county.

Ruins of ancient edifices are seen in different parts of the county. In the Garioch district, on the summit of a conical hill called Dun-i-deer, are the remains of a castle, supposed to be about 700 years old. They stand within a still older vitrified wall, which encircles the summit of the hill, and formed a British fort of unascertainable antiquity. Such forts would seem to have been rather places of temporary refuge than of permanent residence. The ruins of two buildings, supposed to have belonged to Malcolm Canmore, King of Scotland, are still pointed out. One of them, situate at Castletown of Braemar, was his hunting seat; the other stands in a small island in the Loch of Kinnoir. A wooden bridge, which connected it with the land, has been found in the lake. The castle of Kildrummy, which in 1150 was the property of David Earl of Huntingdon, must have been a princely edifice, covering nearly an acre of ground; and its venerable remains still show the power and grandeur of the chieftains by whom it was inhabited. In the same district are some ancient subterraneous retreats, supposed to have been used by the Picts as places of refuge from an invading enemy.

The agriculture of Aberdeenshire has been very greatly improved of late years: potatoes, turnips, and clover, as well as wheat and other crops, are now cultivated according to the best courses of modern husbandry. Farms, however, are still generally of a small size, compared with those of the south-eastern counties; and the buildings, though much improved, are for the most part less convenient and comfortable. Here, as in every other part of Scotland, a lease for nineteen years is the most common bond of connection between the landholder and farmer.

In most parts of Aberdeenshire, cattle are a more important object to the tenantry than corn. Great numbers of cattle are now sent to London, the annual value of which is estimated at L360,000. The whole value of agricultural exports is estimated at L.750,000 a-year. The productive qualities of the county have been greatly enhanced by general drainage, and the introduction of bone-dust and guano. Of the former, there were imported in 1852, 3861 tons, and of the latter, 5508 tons. During the same year, there were exported, of oats, barley, and bear, 56,132 quarters; of butter, 2568 cwt.; eggs, 7273 barrel-bulk; pork, 6950 cwt.; sheep and lambs, 5240. About two-thirds of the population depend entirely on agriculture; oatmeal, prepared in different ways, is the principal food of the labouring classes.

The sea-fishing employs a number of hands. The Greenland whale-fishery is carried on by ships fitted out from Peterhead and Aberdeen.

The old staple manufacture, the knitting of stockings, has declined greatly for many years; but those in wool, cotton, and flax, are upon an extensive scale, and employ a large proportion of the inhabitants. There are also establishments for making sail-cloth, twine, paper, &c.; and, from the characteristic ingenuity and enterprise of the people, Aberdeenshire has been gradually assuming a high rank among the manufacturing counties of Britain.

A share of our foreign trade, chiefly with the north of Europe, has been long enjoyed by this county; and the recent improvements on the harbour of Aberdeen must contribute essentially to the extension of its commerce. In 1807 a canal was opened from the harbour of Aberdeen to the town of Inverury, a distance of 18¼ miles, the expense of which was about L.44,000. The facilities which this canal affords for the conveyance of coal, lime, and the excellent stone so abundant in the tract of country through which it is cut, have already proved highly beneficial to the agriculture of the county, as also to the prosperity of Aberdeen; but it will be superseded by the North of Scotland Railway.

The *valued rent* of the county is L.235,665, 8s. 11d. Scots; but the *real rent* for the lands and houses is probably not less than L.800,000 sterling.

The principal seats in Aberdeenshire are, Aboyne Castle, the Earl of Aboyne; Haddo House, the Earl of Aberdeen; Huntly Lodge, the Duke of Richmond; Keith Hall, the

Earl of Kintore; Marr Lodge, the Earl of Fife; Philorth House, Lord Saltoun; Strichen, Lord Lovat; Castle Forbes, Lord Forbes; Skene House, Duff; Slaines Castle, the Earl of Errol. Her Majesty has lately purchased, from the Fife trustees, the lands and house of Balmoral, in the parish of Crathie, Braemar, which is the residence of the Court for a few weeks towards the end of summer. This year (1853) will see the commencement of a palace, every way suitable for "the royal dwelling." The prevailing names among the proprietors are, Gordon, Forbes, Grant, Fraser, Duff, and Farquharson. The county has four parliamentary burghs, which, with their respective populations in 1851, are as follows: Aberdeen, 71,945; Peterhead, 7242; Inverury, 2264; and Kintore, 476. The first returns a member to parliament, and the other three are contributory burghs to Elgin. The county also sends a member to parliament. The parliamentary constituency is 4022. Besides a sheriff, the county has two sheriffs-substitute, one at Aberdeen, the other at Peterhead; and circuit courts are held at Tarland, Inverury, Huntly, Turriff, Old Deer, and Fraserburgh. There are about 450 schools in the county, and, along with Banff and Elgin, it participates in Dick's bequest for parish schools. Five miles from Aberdeen, on the river Dee, is the Roman Catholic College of Blairs. By the census of 1851, there were 32,110 inhabited houses, 768 uninhabited, and 179 building. In that census the county is divided into eight districts, with populations as under.

ABERDOUR, a small town in Fifeshire, Scotland, on the northern shore of the Firth of Forth, about ten miles north-west of Edinburgh, with which there is now a frequent and easy communication by steam-boats. In old times it belonged to the Viponts; in 1126 it was transferred to the Mortimers by marriage, and afterwards to the Douglases. William, lord of Liddesdale, surnamed the *Flower of Chivalry*, in the reign of David II. conveyed it by charter to James Douglas, ancestor of the present noble owner, the Earl of Morton. The monks of Inchcolm had a grant for a burial-place here from Allen de Mortimer, in the reign of Alexander III. It is a pleasantly situated town, and is greatly resorted to in summer for sea-bathing. Coarse cloths are manufactured to a small extent in the village. Pop. in 1851, 1945.

Aberdour is also the name of a parish in Aberdeenshire, containing 1857 inhabitants. It lies six miles west of Fraserburgh.

ABERFELDIE, a village in Perthshire, celebrated in Scottish song, one mile from the falls of Moness.

ABERFFRAU, a small seaport and parish in Anglesey, in Wales, with a population of 1336, chiefly engaged in fisheries.

ABERFORD, a market-town in the west riding of Yorkshire, about a mile in length, and pretty well built. In the vicinity is a Roman road, considerably elevated; and not far off flows the river Cock, between which and the town the foundation of an old castle is still visible. It is 181 miles north by west from London. Pop. in 1851, 996.

ABERFOYLE, a village and parish, eight miles S.W. of Callender, on one of the gorges leading into the highlands of Perthshire.

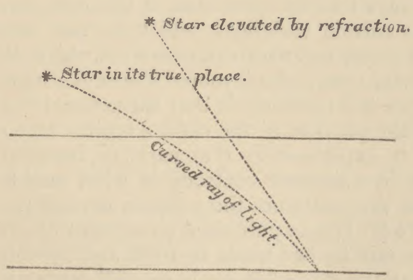
ABERGAVENNY, a decayed corporate town in Monmouthshire, 14 miles west of Monmouth, at the confluence of the Usk and Gavenny. It was once a walled town, and has the remains of a castle built at the time of the Conquest. The river Usk is here spanned by a noble stone bridge of fifteen arches. It has a town-hall, two banks, gas-works, and a free grammar school, with a fellowship and exhibitions at Jesus College, Oxford. The rich coal and iron mines in the vicinity afford employment to the people, who also engage in the weaving of flannel, &c. Abergavenny appears to have been the *Gobannium* of Antoninus, and the town of Usk his *Burrium*. Pop. in 1851, 4797.

ABERNETHY, John, an eminent dissenting minister, was the son of Mr John Abernethy, a dissenting minister in Coleraine, where he was born on the 19th of October 1680. When about nine years of age he was separated from his parents, his father being obliged to attend some public affairs in London; and his mother, to shelter herself from the fury of the Irish rebels, retiring to Derry, a relation who had him under his care, having had no opportunity of conveying him to her, carried him to Scotland; and thus he escaped the hardships and dangers of the siege of Derry, in which Mrs Abernethy lost all her other children. He afterwards studied at the University of Glasgow, where he remained till he took the degree of master of arts; and, in 1708, he was chosen minister of a dissenting congregation at Antrim, in which situation he continued above 20 years. About the time of the Bangorian controversy (for which see Hoadly), a dissension arose among his brethren in the ministry at Belfast, on the subject of subscription to the Westminster Confession of Faith. In this controversy he became a leader on the negative side, and incurred the censure of a general synod. The agitation of parties on this occasion induced him to accept of an invitation to settle in Dublin, where his preaching was much admired. Here he continued for ten years, respected and esteemed; and died in December 1740, in the 61st year of his age. His writings, like his character, are distinguished for candour, liberality, and manly sentiment. He published a volume of sermons on the Divine Attributes; after his death a second volume was published by his friends; and these were succeeded by four other volumes on different subjects.

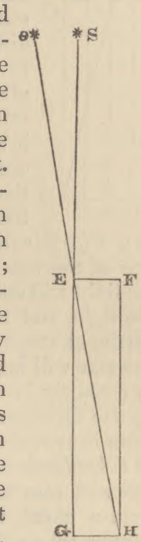
Abernethy, *John*, an eminent surgeon, was born in London in 1765. His professional studies and career began and terminated in the metropolis, where he obtained a high reputation. He was an apprentice to Sir Charles Blick; and succeeded the celebrated Mr Pott in 1787, as assistant-surgeon in St Bartholomew's Hospital. Not long after, Abernethy was also his successor as Lecturer on Anatomy and Surgery; an office in which he acquired just celebrity, from an easy, impressive manner, and a style of illustration at once amusing and instructive. On the death of Blick, he was elected surgeon to St Bartholomew's Hospital, of which he was long a distinguished member. His reputation began with his success as a teacher; but it rested on the more solid foundation of his efforts for the practical improvement of surgery. The philosophic views developed in his work entitled "The Constitutional Origin and Treatment of Local Diseases," are of great practical importance, and are founded on two general principles;—1st, That topical diseases are often mere symptons of constitutional maladies, and then can only be removed by general remedies; 2d, That the disordered state of the constitution very often originates in, or is closely allied to deranged states of the stomach and bowels; and can only be remedied by means that beneficially affect the functions of those organs. Besides these essays, we are indebted to Mr Abernethy for the original suggestion and practice of the daring operation of securing by ligature the carotid and external iliac arteries. This eminent surgeon had one peculiar eccentricity, which candour compels us to notice. In the private circle of his family and of his friends he was kind, courteous, and affectionate, was just and honourable in his intercourse with all; but, in his latter days, especially with his patients, he was often rude and capricious, and sometimes assumed an offensive coarseness, at variance with a character otherwise estimable. (T.S.T.)

Abernethy, a town in Scotland, in Perthshire, situated at a short distance to the southward of the right bank of the river Tay, a little above the mouth of the Earne. It is of very ancient date, and is said to have been the seat of the Pictish kings; and there are some uncertain traditions of its existence prior to this period. It is distinguished by a curious piece of antiquity, a circular tower, 74 feet high and 16 feet in diameter, consisting of 64 courses of hewn stone. It continued long to be the see of an archbishop, which was afterwards transferred to St Andrews. The inhabitants are engaged in the manufacture of linen. The population in 1851, 2026. Abernethy is seven miles from Perth.

ABERRATION, in *Astronomy*, a remarkable phenomenon, by which all the stars appear, at certain seasons of the year, to deviate in a slight degree from their true situation in the heavens, in consequence, as is now ascertained, of the motion of the light from every star combining itself with the motion in the eye of the observer, caused by the earth's annual revolution round the sun. All vision, it is well known, is performed by the particles or rays of light from any object striking against the eye, and the object invariably appears in that direction in which the rays finally impinge. Hence, for example, arise the effects of refraction, by which the heavenly bodies appear more elevated in the horizon than they really are; the rays of light, as they penetrate the atmosphere, bending gradually downwards towards the surface of the earth, so as at last to reach the eye of the spectator in a direction more inclined from the horizon than that in which they issue from the object: and thus the latter appears more elevated in the sky than it really is, as in the annexed sketch.



In a similar manner the rays of light which fall directly from the stars, in certain circumstances, owing to the motion of the earth, really impinge on the eye of a spectator in a direction somewhat oblique, so that they appear on this account in a situation different from what they really occupy; and this constitutes the aberration. Suppose, for example, the earth is moving in a direction at right angles to that of the light from any star, then it is evident there will be a mutual collision between them; the light will not only strike the eye of a spectator, but the eye will also strike the light; the effect will be exactly the same as if the eye had been at rest, and the light had been endowed with an equal motion in the contrary direction; so that in addition to its direct motion, it has also a slight motion laterally; and the true direction of the impact, therefore, or of the compound motion of the light, according to the well-known laws of the composition of forces, will be the diagonal of the rectangle, the sides of which represent the directions and velocities of the light and of the eye, as in the annexed sketch, where S E represents the direction and velocity of the light, F E the direction and velocity of the motion of the earth, and E F, therefore, the direction and velocity of the contrary motion in the light, the earth being supposed at rest. When the light arrives at the eye therefore at E, it has not only the direct motion S E or E G, which is made by construction equal to S E, but also a lateral motion E F; so that the compound motion will be represented by the diagonal E H, which is the true direction in which the light will really impinge on the eye; so that the star, instead of appearing at S, will appear at *s*, as far in advance of its true position as the earth has moved in the time the light travels from the star to the eye. To determine the amount of this aberration, therefore, we have only to compare the motion of light with that of the earth in its orbit. Now, from the celebrated discovery of the Danish astronomer Roemer, regarding the successive propagation of light, as found by the observations of the eclipses of Jupiter's satellites at different seasons of the year, it appears that light actually employs about 15 minutes to travel from the one circumference to the other of the earth's orbit; and from other still more accurate observations, its velocity has been determined at about 194,000 miles per second, while the mean velocity of the earth in her orbit does not exceed 19 miles. Hence it is easy to calculate that the aberration in this case will amount to an angle of about 20″ of a degree; and this case in which the earth's motion is perpendicular to that of the light is that in which the aberration is the greatest of all; for, as the motion of the earth becomes oblique to that of the light, the aberration gradually diminishes, until at last it disappears altogether, when the two motions become in one straight line, that is, when the earth is moving either directly from or directly towards the stars. In all cases the apparent direction of the stars will be in the diagonal of the parallelogram, the sides of which represent the direction and the relative motions of the light and of the earth.



The aberration of light having been discovered by means of the telescope, this has given rise to a familiar illustration of the subject, which it may be proper to state. It is evident, that before the star can be visible in the telescope, the light in its progress through it must be continually in the axis. Were the telescope, therefore, affected with any considerable lateral motion, this could not take place if the telescope were held directly up to the star; because, though the light might enter the telescope in the axis, the lateral motion would quickly withdraw the axis from the line of the light, which would strike against the side of the telescope and never reach the eye. If, for example, the light moved successively to the points A, B, C, D, E, while the telescope or tube moved successively parallel to itself into the positions E A, F *f*, G *g*, H *h*, I *i*; then the light entering at A, by the time it reaches B the tube is off into the position F *f*, and by the time it could reach E the tube is removed to I *i*; so that it is evident the star will not be visible at all in the true direction of the light. In order that this may always remain in the telescope, and traverse it from end to end, this must be set in the position E *i*, oblique to E A; then the light entering at *i*, *Fig.* 2. will advance to *b* in the same time that the axis of the tube advances parallel to itself to F *f*; so that the light will still remain in the axis. In the same manner the light and the tube will continue to advance by proportional steps till the former reaches the eye, where the star will appear in the direction of the tube, and that as formerly in the diagonal of the parallelogram formed by the directions and velocities of the two motions. Another illustration was suggested by Clairaut in the *Mémoires de l'Académie des Sciences* for the year 1746, by supposing drops of rain to fall rapidly and quickly after each other from a cloud, under which a person moves with a very narrow tube; in which case, it is evident that the tube must have a certain inclination, in order that a drop which enters at the top may fall freely through the axis of the tube, without touching the sides of it; which inclination must be more or less, according to the velocity of the drops in respect to that of the tube: then the angle made by the direction of the tube and of the falling drops is the aberration arising from the combination of those two motions.

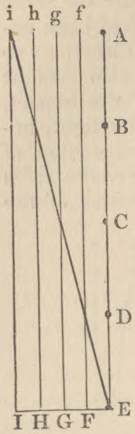


Fig. 2.

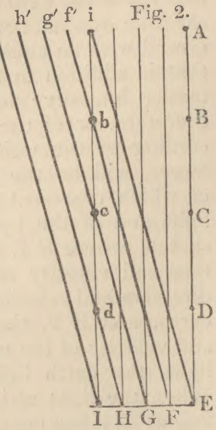
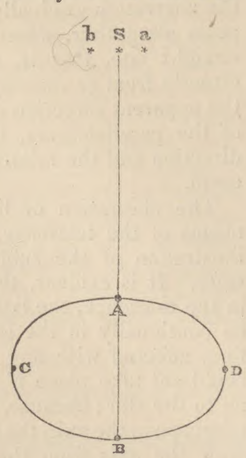


In all cases it will be observed the aberration takes place in the direction of the earth's motion. Hence it is easy to deduce, from what we have stated, the effects on the different stars. Consider, for example, those situated in the pole of the ecliptic. To the rays of light from these, the earth's motion will always be at right angles; the aberration on them, therefore, will always be of the same amount, viz. about 20″; but as the earth changes the direction of its motion along the ecliptic, the aberration will change its direction also, so that the star will appear to move in a little orbit, similar to, and parallel with the ecliptic; the apparent situation of the star revolving annually round the true place, as the earth revolves round the sun. Consider again the stars situated in the plane of the ecliptic. To the rays of light from these, the earth's motion will be at one time at right angles, as at A and B in the annexed sketch, and at another in the same direction, as at C and D; for in all these cases we may hold the dimensions of the earth's orbit as nothing compared with the distance of the star. At A, therefore, the earth being supposed to move in the direction A D B, so as to make the star appear at *a*, the aberration will be 20″ in the direction S *a*, and at B 20″ in the direction S *b*, so as to make the star appear at *b*, while at C and D it will be nothing, and the star will appear in its true place at S. The apparent situation will, therefore, appear annually to oscillate on each side of the true, to the extent of 20″. Between the two extremes therefore, namely, the *pole* of the ecliptic, where the aberration causes the star to revolve in a circle, and the *plane* of the ecliptic, where it causes it to oscillate in a straight line, the stars will all describe elliptic curves, elongated 40″ in a direction parallel to the plane of the ecliptic, and the breadth or lesser axis diminishing continually from the pole towards the plane of the ecliptic, where the curve passes into a straight line. These motions in the stars are confirmed by the observations of astronomers, (see ASTRONOMY,) and they furnish one among many other beautiful examples of that remarkable and perfect accordance which in this science subsists everywhere between theory and fact. The effects of aberration also present a striking, and one of the few direct proofs which astronomy furnishes of the motion of the earth, these being quite unaccountable on any other hypothesis.



Such are the principal phenomena of aberration. This great discovery, one of the finest in modern astronomy, we owe to the accuracy and ingenuity of the distinguished astronomer Dr Bradley, who was led to it in the year 1727, by the result of some observations which he made, with a view of determining the annual parallax of the fixed stars. See PARALLAX.

The annual motion of the earth about the sun had been much doubted and warmly contested. The defenders of that motion, among other proofs of the reality of it, conceived the idea of adducing an incontestible one from the annual parallax of the fixed stars, if the stars should be within such a distance, or if instruments and observations could be made with such accuracy, as to render that parallax sensible. And with this view various attempts have been made. Before the observations of M. Picard, made in 1672, it was the general opinion that the stars did not change their position during the course of a year. Tycho Brahe and Ricciolus fancied that they had assured themselves of it from their observations; and from thence they concluded that the earth did not move round the sun, and that there was no annual parallax in the fixed stars. M. Picard, in the account of his *Voyage d'Uranibourg*, made in 1672, says that the pole star, at different times of the year, has certain variations, which he had observed for about 10 years, and which amounted to about 40″ a year: from whence some, who favoured the annual motion of the earth, were led to conclude that these variations were the effect of the parallax of the earth's orbit. But it was impossible to explain it by that parallax, because this motion was in a manner contrary to what ought to follow only from the motion of the earth in her orbit.

In 1674 Dr Hooke published an account of observations which he said he had made in 1669, and by which he had found that the star $\gamma$ Draconis was 23″ more northerly in July than in October; observations which, for the present, seemed to favour the opinion of the earth's motion, although it be now known that there could not be any truth or accuracy in them.

Flamsteed having observed the pole star with his mural quadrant, in 1680 and the following years, found that its declination was 40″ less in July than in December; which observations, although very just, were yet, however, improper for proving the annual parallax; and he recommended the making of an instrument of 15 or 20 feet radius, to be firmly fixed on a strong foundation, for deciding a doubt which was otherwise not soon likely to be brought to a conclusion.

In this state of uncertainty and doubt, then, Dr Bradley, in conjunction with Mr Samuel Molineux, in the year 1725, formed the project of verifying, by a series of new observations, those which Dr Hook had communicated to the public almost 50 years before. And as it was his attempt that chiefly gave rise to this, so it was his method in making the observations, in some measure, that they followed; for they made choice of the same star, and their instrument was constructed upon nearly the same principles: but had it not greatly exceeded the former in exactness, they might still have continued in great uncertainty as to the parallax of the fixed stars. For this, and many other convenient and useful astronomical instruments, philosophers are indebted to the ingenuity and accuracy of Mr Graham.

The success of the experiment evidently depending so much on the accuracy of the instrument, this became a leading object of consideration. Mr Molineux's apparatus then having been completed, and fitted for observing, about the end of November 1725, on the third day of December following, the bright star in the head of Draco, marked $\gamma$ by Bayer, was for the first time observed, as it passed near the zenith, and its situation carefully taken with the instrument. The like observations were made on the fifth, eleventh, and twelfth days of the same month; and there appearing no material difference in the place of the star, a further repetition of them, at that season, seemed needless, it being a time of the year in which no sensible alteration of parallax, in this star, could soon be expected. It was therefore curiosity that chiefly urged Dr Bradley, who was then at Kew, where the instrument was fixed, to prepare for observing the star again on the 17th of the same month; when, having adjusted the instrument as usual, he perceived that it passed a little more southerly this day than it had done before. Not suspecting any other cause of this appearance, it was ascribed to the uncertainty of the observations, and that either this or the foregoing was not so exact as had been supposed. For which reason they proposed to repeat the observation again, to determine from what cause this difference might proceed: and upon doing it, on the 20th of December, the doctor found that the star passed still more southerly than at the preceding observation. This sensible alteration surprised them the more, as it was the contrary way from what it would have been had it proceeded from an annual parallax of the star. But being now pretty well satisfied that it could not be entirely owing to the want of accuracy in the observations, and having no notion of any thing else that could cause such an apparent motion as this in the star, they began to suspect that some change in the materials or fabric of the instrument itself might have occasioned it. Under these uncertainties they remained for some time; but being at length fully convinced, by several trials, of the great exactness of the instrument, and finding, by the gradual increase of the star's distance from the pole, that there must be some regular cause that produced it, they took care to examine very nicely, at the time of each observation, how much the variation was; till about the beginning of March 1726, the star was found to be 20″ more southerly than at the time of the first observation: it now indeed seemed to have arrived at its utmost limit southward, as in several trials, made about this time, no sensible difference was observed in its situation. By the middle of April it appeared to be returning back again towards the north; and about the beginning of June it passed at the same distance from the zenith as it had done in December, when it was first observed.

From the quick alteration in the declination of the star at this time, increasing about one second in three days, it was conjectured that it would now proceed northward, as it had before gone southward, of its present situation; and it happened accordingly; for the star continued to move northward till September following, when it again became stationary; being then near 20″ more northerly than in June, and upwards of 39″ more northerly than it had been in March. From September the star again returned towards the south, till, in December, it arrived at the same situation in which it had been observed twelve months before, allowing for the difference of declination on account of the precession of the equinox.

This was a sufficient proof that the instrument had not been the cause of this apparent motion of the star; and yet it seemed difficult to devise one that should be adequate to such an unusual effect. A nutation of the earth's axis was one of the first things that offered itself on this occasion; but it was soon found to be insufficient; for though it might have accounted for the change of declination in $\gamma$ Draconis, yet it would not at the same time accord with the phenomena observed in the other stars, particularly in a small one almost opposite in right ascension to $\gamma$ Draconis, and at about the same distance from the north pole of the equator: for though this star seemed to move the same way as a nutation of the earth's axis would have made it, yet changing its declination but about half as much as $\gamma$ Draconis in the same time, as appeared on comparing the observations of both made on the same days, at different seasons of the year, this plainly proved that the apparent motion of the star was not occasioned by a real nutation; for had this been the case, the alteration in both stars would have been nearly equal.

The great regularity of the observations left no room to doubt, but that there was some uniform cause by which this unexpected motion was produced, and which did not depend on the uncertainty or variety of the seasons of the year. Upon comparing the observations with each other, it was discovered that, in both the stars above mentioned, the apparent difference of declination from the *maxima* was always nearly proportional to the versed sine of the sun's distance from the equinoctial points. This was an inducement to think that the cause, whatever it was, had some relation to the sun's situation with respect to those points. But not being able to frame any hypothesis sufficient to account for all the phenomena, and being very desirous to search a little further into this matter, Dr Bradley began to think of erecting an instrument for himself at Wanstead; that, having it always at hand, he might with the more ease and certainty inquire into the laws of this new motion. The consideration likewise of being able, by another instrument, to conform the truth of the observations hitherto made with that of Mr Molineux, was no small inducement to the undertaking; but the chief of all was, the opportunity he should thereby have of trying in what manner other stars should be affected by the same cause, whatever it might be. For Mr Molineux's instrument being originally designed for observing $\gamma$ Draconis, to try whether it had any sensible parallax, it was so contrived as to be capable of but little alteration in its direction; not above seven or eight minutes of a degree: and there being but few stars within half that distance from the zenith of Kew bright enough to be well observed, he could not, with his instrument, thoroughly examine how this cause affected stars that were differently situated with respect to the equinoctial and solstitial points of the ecliptic.

These considerations determined him; and by the contrivance and direction of the same ingenious person, Mr Graham, his instrument was fixed up the 19th of August 1727. As he had no convenient place where he could make use of so long a telescope as Mr Molineux's, he contented himself with one of but little more than half the length, namely of 12 feet and a half, the other being 24 feet and a half long, judging from the experience he had already had, that this radius would be long enough to adjust the instrument to a sufficient degree of exactness: and he had no reason afterwards to change his opinion; for by all his trials he was very well satisfied, that when it was carefully rectified, its situation might be securely depended on to half a second. As the place where his instrument was hung in some measure determined its radius, so did it also the length of the arc or limb, on which the divisions were made, to adjust it; for the arc could not conveniently be extended farther, than to reach to about $6\frac{1}{4}$ degrees on each side of the zenith. This however was sufficient, as it gave him an opportunity of making choice of several stars, very different both in magnitude and situation; there being more than two hundred, inserted in the British Catalogue, that might be observed with it. He needed not, indeed, to have extended the limb so far, but that he was willing to take in *Capella*, the only star of the first magnitude that came so near his zenith.

His instrument being fixed, he immediately began to observe such stars as he judged most proper to give him any light into the cause of the motion already mentioned. There was a sufficient variety of small ones, and not less than twelve that he could observe through all seasons of the year, as they were bright enough to be seen in the day-time, when nearest the sun. He had not been long observing, before he perceived that the notion they had before entertained, that the stars were farthest north and south when the sun was near the equinoxes, was only true of those stars which are near the solstitial colure. And after continuing his observations a few months, he discovered what he then apprehended to be a general law observed by all the stars, namely, that each of them became stationary, or was farthest north or south, when it passed over his zenith at six of the clock, either in the evening or morning. He perceived also, that whatever situation the stars were in with respect to the cardinal points of the ecliptic, the apparent motion of every one of them tended the same way when they passed his instrument about the same hour of the day or night; for they all moved southward when they passed in the day, and northward when in the night: so that each of them was farthest north when it came in the evening about six of the clock, and farthest south when it came about six in the morning.

Though he afterwards discovered that the maxima, in most of these stars, do not happen exactly when they pass at those hours; yet, not being able at that time to prove the contrary, and supposing that they did, he endeavoured to find out what proportion the greatest alterations of declination, in different stars, bore to each other; it being very evident that they did not all change their inclination equally. It has been before noticed, that it appeared from Mr Molineux's observations, that $\gamma$ *Draconis* changed its declination above twice as much as the before-mentioned small star that was nearly opposite to it; but examining the matter more nicely, he found that the greatest change in the declination of these stars was as the sine of the latitude of each star respectively. This led him to suspect that there might be the like proportion between the *maxima* of other stars; but finding that the observations of some of them would not perfectly correspond with such an hypothesis, and not knowing whether the small difference he met with might not be owing to the uncertainty and error of the observations, he deferred the further examination into the truth of this hypothesis till he should be furnished with a series of observations made in all parts of the year; which would enable him not only to determine what errors the observations might be liable to, or how far they might safely be depended on, but also to judge whether there had been any sensible change in the parts of the instrument itself.

When the year was completed, he began to examine and compare his observations; and having satisfied himself as to the general laws of the phenomena, he then endeavoured to find out the cause of them. He was already convinced that the apparent motion of the stars was not owing to a nutation of the earth's axis. The next circumstance which occurred to him, was an alteration in the direction of the plumb-line, by which the instrument was constantly adjusted; but this, upon trial, proved insufficient. Then he considered what refraction might do; but here also he met with no satisfaction. At last, in a state of great perplexity, the discovery of Roëmer occurred to him, that the motion of light, however incredibly swift, was not altogether instantaneous, but took a certain interval in passing from the sun to the earth; and then the truth flashed on his mind. He immediately perceived that the motion of the earth being also extremely rapid, might have though a small yet a perceptible relation to that of light. and might thus come by combining its influence to affect the direction of the visual rays, and with them the apparent situation of the stars, in the manner above explained. Pursuing this happy idea, he calculated the aberration from the relative velocities of the earth and of light, and comparing it with his own observations, was delighted to find them agree in every particular; so that no doubt could remain of the truth of his discovery. For further information on this subject, see ASTRONOMY, in this Encyclopædia; and also the following works, *Phil. Transactions*, vol. xxxv.; vol. lxxii. *Mem. Acad. Paris*, 1737; *Mem. Acad. Berlin*, tom. ii.; *Nov. Acad. Petrop.* tom. i.; *Connoissances des Temps*, 1788; T. Simpson's *Essays on Several Subjects*, 1740; *Boscovichii Opera*, tom. v. 1785; *Traité sur l'Aberration*, par Fontaines des Crutes; Cagnoli's *Trigonometrie;* Vince's *Astronomy*, vol. i.; Delambre, *Astronomie;* Woodhouse's *Astronomy.* (G. B.)

ABERRATION *of the Planets.* This is quite of the same nature with that of the stars, only that its amount and direction are greatly affected by the motion of the planet itself combining itself with that of the earth, and producing on the whole a more complex result. When the planet is stationary, the aberration disappears altogether, because the light itself, participating of the motion of the planet, strikes the earth not only with its usual direct motion, but also with a lateral motion exactly the same as that of the earth itself. The eye of the spectator, therefore, and the light have the same motion laterally; and thus the effect is quite the same as if they had relatively no lateral motion at all. It is the same as if both the earth and the planet were at rest, and therefore there cannot be any aberration. In every other case, the aberration is determined by combining the motion of light not only with the earth's, but with the planet's motion also; and doing this it is found, that in every case the aberration is equal to the motion of the planet about the earth or its geocentric motion, during the interval that light employs in passing from the planet to the earth. Thus, in the sun, the aberration in longitude is constantly 20″, that being the space moved by the sun, or, what is the same thing, by the earth, in 8′ 7″, the time in which light passes from the sun to the earth. In like manner, knowing the distance of any planet from the earth, by proportion it will be, as the distance of the sun is to the distance of the planet, so is 8′ 7″ to the time of light passing from the planet to the earth: then computing the planet's geocentric motion in this time, that will be the aberration of the planet, whether it be in longitude, latitude, right ascension, or declination.

Since the motion of the planets affects so much the aberration, ought not the motion of the fixed stars relatively to our system, if they have any, as some have suspected, be rendered sensible in this manner? Their prodigious distance has hitherto rendered these motions, if they do exist, almost insensible. But this would not affect the motion of light. This element flies through the remotest parts of the system; and if it be really material, the motion with which it is propelled from one point must continue for ever afterwards to affect it, unless opposed or modified by extraneous influence. If the stars, therefore, have any motion laterally in respect of the earth, so will the light which issues from them, and which, preserving undiminished its original impulse, must strike the eye of a spectator on the earth not only with a direct motion, but also with one to the right or left similar to that of the star; and this ought to affect the aberration just in the same manner as if the star were no farther off than any of the planets. The same thing would be observed if the earth, along with the whole solar system, as the late Dr Herschel and other astronomers have attempted to prove, be advancing forward among the stars. Since, however, no such effect has ever been noticed, it would seem to follow, that the stars, as well as the sun, are really at rest; or if they have any motion, it is but a slow one, even compared with that of the earth or the planets round the sun. This is certainly a curious speculation, which we have never seen discussed by astronomers. See ASTRONOMY. (G. B.)

ABERRATION, in *Optics*, a certain deviation in the rays of light, from the true or geometrical focus of reflection or refraction in curved specula or lenses, arising from two causes, viz. 1*st*, the figure of the speculum or lens, giving rise to what is called the *spherical* aberration; and, 2*d*, the unequal refrangibility of the rays of light giving rise, in lenses only however, to a far more material, and in other respects inconvenient aberration, termed the *chromatic*, or the aberration of *colour*, or of *refrangibility*. The object of all specula or lenses, is to collect the rays of light proceeding from any object into a single point, so as to form there a distinct image of the object, either enlarged or diminished, according as our purposes may require: and on this principle depends the whole operation of the telescope, the microscope, and other optical instruments. The more completely the rays can be collected into a focus, so much the more distinctly, in every case, does the image of the object appear at that point, and so much the more perfect is the operation of the instrument. But there are certain curves or figures in the speculum or lens, which are necessary to produce this effect. Parallel rays, for example, can only be collected into one focus by a reflecting speculum of a parabolic form, or by a refracting lens of parabolic or hyperbolic, combined with spherical curves: all other forms cause more or less a dispersion or aberration of the rays from the focus. In practice, however, it is extremely difficult to form the lenses into these complex curves; and as the spherical form is much more easily constructed, and as the aberration from it is not generally attended with serious inconvenience, this form has been universally adopted. The amount of the aberration is measured either by the distance *longitudinally* at which the rays meet from the true focus, or by the distance *laterally* by which they are dispersed from it. In all double convex lenses of equal spheres, the longitudinal aberration of the extreme ray is $1\frac{2}{3}$ of the thickness of the lens. The smallest aberration takes place when the radii of the spheres are as 1 to 6, the more convex surface being exposed to the rays; in that case, it is only $1\frac{1}{14}$th of the thickness of the lens. See OPTICS.

The aberration of refrangibility is of far more importance. It arises from this circumstance, that in a homogeneous lens of glass the violet rays are greatly more refracted than the red. The latter are therefore thrown to a greater distance, and the others in proportion almost all deviating from the true focus: hence arises that confusion of images, and that fringe of extraneous colour with which objects are surrounded when seen through glasses of this description, which has ever formed the great obstacle to the perfection of the refracting telescope; so much so, that Sir Isaac Newton, misled at the time by a partial view of the subject, and others after him, were led to despair of success in correcting this defect, and thus directed their chief attention to those of the *reflecting* kind. Subsequent discoveries, however, led to the invention of *achromatic* glasses, by which the refracting telescope has been wonderfully improved; and some important experiments, we understand, are now going on at the Royal Institution in London, by M. Faraday, under the direction of the Board of Longitude, in the manufacture of a more perfect glass than has hitherto been used, from which we may hope to see these instruments carried to a yet higher degree of perfection. See ACHROMATIC GLASSES; also *Phil. Trans.* vols. xxxv. xlviii., and from l. to lv.; *Mem. Acad. Par.* from 1737 to 1770; *Mem. Acad. Berlin*, from 1746 to 1798; *Nov. Comment. Petrop.* 1762; *Mem. Irish Academy*, vol. iv.; *Edinb. Trans.* vol. iii.; *Comment. Gottingen*, vol. xiii.; *Huygenii Dioptrica; Boscovichii Opera; Klingensteirna de Aberrationibus Luminis*, &c. (G. B.)

ABERYSTWITH, a market-town of Cardiganshire, in Wales, seated on the Rheidol, near its confluence with the Ystwith, where it falls into the sea. It has a considerable trade in lead, flannels, oak bark (which is mostly sent to Liverpool); and the fishery of whiting, cod, and herrings is valuable. It was formerly surrounded with walls, and fortified with a castle of great strength, the ruins of which occupy the summit of a *bluff* promontory on the S.W. of the town. The harbour has been of late much improved; and the picturesque situation of the place draws many visitors, especially for sea-bathing. The municipal government consists of a mayor, four aldermen, and twelve councillors. Pop. in 1841, 4916; in 1851, 5231.

ABESTA, or AVESTA, the name of one of the sacred books of the Persian magi, which they ascribe to their great founder Zoroaster. The Abesta is a commentary on two others of their religious books, called *Zend* and *Pazend;* the three together including the whole system of the Ignicolæ or worshippers of fire.

ABETTOR, a law term implying one who encourages another to the performance of some criminal action, or assists in the performance itself. Treason is the only crime in which abettors are excluded by law, every individual concerned being considered as a principal. It is the same with *art-and-part* in the Scottish law.

ABEX, a country of Africa, bordering on the Red Sea, by which it is bounded on the east. It has Nubia or Sennaar on the north; Sennaar and Abyssinia on the west; and Abyssinia on the south. Its principal towns are Suakim and Arkeko. It is subject to the sheriffe of Mea, and has the name of the beglerbeglik of Habeleth. It is about 500 miles in length and 100 in breadth; is a mountainous country, sandy, barren, and unhealthy, much infested with wild beasts; and the forests abound with ebony trees.

ABEYANCE, in *Law*, the expectancy of an estate. Thus, if lands be leased to one person for life, with reversion to another for years, the remainder for years is in abeyance till the death of the lessee.

ABGAR, or Abgarus, a name given to several of the kings of Edessa in Syria. The most celebrated of them was one, who, it is said, was contemporary with Jesus Christ; and who, having a distemper in his feet, and hearing of Jesus's miraculous cures, requested him by letter to come and cure him. Eusebius,[1] who believed that this letter was genuine, and also an answer our Saviour is said to have returned to it, has translated them both from the Syriac, and asserts that they were taken out of the archives of the city of Edessa. The first is as follows:—"Abgarus, prince of Edessa, to Jesus the holy Saviour, who hath appeared in the flesh in the confines of Jerusalem, greeting. I have heard of thee, and of the cures thou hast wrought without medicines or herbs. For it is reported thou makest the blind to see, the lame to walk, lepers to be clean, devils and unclean spirits to be expelled, such as have been long diseased to be healed, and the dead to be raised; all which when I heard concerning thee, I concluded with myself, that either thou wast a God come down from heaven, or the Son of God sent to do these things. I have therefore written to thee, beseeching thee to vouchsafe to come unto me and cure my disease. For I have also heard that the Jews use thee ill, and lay snares to destroy thee. I have here a little city, pleasantly situated, and sufficient for us both. Abgarus." To this letter Jesus, it is said, returned an answer by Ananias, Abgarus's courier, which was as follows:—"Blessed art thou, O Abgarus! who hast believed in me whom thou hast not seen; for the Scriptures say of me, 'They who have seen me have not believed in me, that they who have not seen may, by believing, have life.' But whereas thou writest to have me come to thee, it is of necessity that I fulfil all things here for which I am sent; and having finished them, to return to Him that sent me: but when I am returned to Him, I will then send one of my disciples to thee, who shall cure thy malady, and give life to thee and thine. Jesus." After Christ's ascension, Judas, who is also named Thomas, sent Thaddeus, one of the seventy, to Abgarus; who preached the gospel to him and his people, cured him of his disorder, and wrought many other miracles: which was done, says Eusebius, A.D. 43.—Though the above letters are acknowledged to be spurious by the candid writers of the church of Rome, several Protestant authors, as Dr Parker, Dr Cave, and Dr Grabe, have maintained that they are genuine, and ought not to be rejected.

[1] *Hist. Eccl.* lib. i. cap. 13.

ABGILLUS, John, surnamed Prester John, was son to a king of the Friscii; and, from the austerity of his life, obtained the name of *Prester*, or Priest. He attended Charlemagne in his expedition to the Holy Land; but instead of returning with that monarch to Europe, it is pretended that he gained mighty conquests, and founded the empire of the Abyssines, called, from his name, the empire of Prester John. He is said to have written the history of Charlemagne's journey into the Holy Land, and his own into the Indies; but they are more probably trifling romances, written in the ages of ignorance.

ABHEBBAD, or the Lake of Ausa, in the country of Adel, is the receptacle of the great river Hawash, which drains the eastern regions of Abyssinia. During the rains the lake acquires a superficial extent of about 50 leagues in circumference. It has no outlet.

ABIA, in *Ancient Geography*, a town of Messenia, on the Messenian Gulf, supposed to be the Ire of Homer, *Il.* ix. 292.

ABIAD, Bahr el, a great river of interior Africa, which, at Halfaia, below Sennaar, joins the Bahr-el-Azrek, or river of Abyssinia; and these unite at Khartoum and form the true Nile. The Abyssinian river was long considered by Europeans as the main stream; but more accurate observation has now clearly determined, that the Abiad, both as to magnitude and length of course, is entitled to the pre-eminence. Its sources, however, and the upper part of its course, have not been reached by any European. The nearest approaches to the source that have been made were in 1842, when an expedition from Egypt reached so far south as 4. 42. N. Lat., nearly in the meridian of Cairo; and in January 1850, when Dr Knoblicher, the Pope's vicar-general in Central Africa, reached about six miles farther south. The former saw no mountains, though they had passed the latitude commonly assigned to the Mountains of the Moon; on the contrary, they observed immense marshes and large islands. Dr Knoblicher twice ascended a mountain in the latitude above mentioned, and saw the river trending away in a southerly direction, till it vanished between two mountains. The last natives he met with, the Bary negroes, informed him that beyond those mountains the river came straight from the south.

ABIANUS, a river of ancient Scythia, falling into the Euxine; on which the Abii dwelt, a nation who subsisted on milk, and the flesh of their herds and flocks.

ABIATHAR, (*the Father of abundance*,) high priest of the Jews, son to Ahimelech, who had borne the same office, and received David into his house. This so enraged Saul, who hated David, that he put Ahimelech to death, and 81 priests; Abiathar alone escaped the massacre. He afterwards was high priest, and often gave King David testimonies of his fidelity, particularly during Absalom's conspiracy, at which time Abiathar followed David, and bore away the ark. But after this he conspired with Adonijah, in order to raise him to the throne of King David his father; which so exasperated Solomon against him, that he divested him of the priesthood, and banished him, A.M. 3021, before Christ 1014.

ABIB, signifying an ear of corn, a name given by the Jews to the first month of their ecclesiastical year, afterwards called *Nisan*. It commenced at the vernal equinox; and according to the course of the moon, by which their months were regulated, answered to the latter part of our March and beginning of April.

ABIES, the Fir-Tree. See Planting.

ABIGAIL, the wife of Nabal, on whose death she became the wife of King David, to whom she bare a son named both Chileab and Daniel, which has given rise to the idea that she had two sons by David. 2 Sam. iii. 3; 1 Chron. iii. 1.

ABIHU, (*the Father of Him*,) the second son of Aaron, with his brothers consecrated for the priesthood; but who with his brother Nadab, disregarding the divine injunction as to offering incense, and kindling their censers with unhallowed fire, were struck dead by lightning before the altar they had profaned.

ABILA, a city of ancient Syria, the capital of the tetrarchy of Abilene. Its site is indicated by some ruins and inscriptions, near the village of Souk, on the banks of the river Barrada, on the road between Baalbec and Damascus, a little to the east of the range of Esh Sharki, or Anti-libanus, 33. 40. N. Lat., 36. 91. E. Long. It was the capital of the Abilene of which Lysanias was tetrarch in the time of John the Baptist (Luke iii. 1). From the tradition of this being the scene of Abel's murder, it is now called Nebi-Abel. It lies between Baalbec and Damascus, in Lat. 33. 38. N., Long. 36. 18. E.

ABILDGAARD, Nicolas, a modern Danish historical painter, and a writer on art. Born in 1744, died in 1809. Thorwaldsen was one of his pupils.

ABIMELECH, signifying *Father of the King,* the name of the Philistine king of Gerar, in the time of Abraham; but from its recurrence among that people it was perhaps rather a titular distinction than a proper name, like *Pharaoh* among the Egyptians. After the destruction of "the cities of the plain," Abraham removed into his territory; and fearing that the beauty of Sarah might bring him into difficulties, he declared her to be his sister: whereupon Abimelech, in virtue of the royal prerogative to appropriate any unmarried female that pleased him, placed Sarah in his harem. But, in obedience to a divine warning, he forthwith restored her to her husband, with a strong and merited reproof for the deceit he had practised. Abimelech, however, made a league of peace and amity with Abraham, the first recorded in the Scriptures, and confirmed by a mutual oath. (Gen. xx.)

Abimelech, another king of Gerar, probably the son of the former, in the time of Isaac. During a famine Isaac sought refuge in this king's territories; and Rebekah's beauty induced her husband to employ the same subterfuge as his father had done in the case of Sarah; which deceit met with a similar rebuke from the king.

In that country, wells were of such vast importance, that the digging of them conferred a proprictary right to the soil not previously appropriated. During his sojourn there Abraham had dug wells, which were again cleared out by Isaac, who proceeded to cultivate the ground to which they gave him a right. This gave rise to disputes between the herdsmen of Isaac and Abimelech, which ended in the removal of the patriarch to Beersheba, where he concluded a treaty of amity with the king. (Gen. xxvi.)

Abimelech, the natural son of Gideon, by his concubine. His violent acts and death (A.M. 2769) are recorded in Judges, chap. ix.

ABINGDON, a market-town in Berkshire, on a branch of the Thames, derives its name from an ancient abbey. The streets, which are well paved, terminate in a spacious area, in which the market is held. In the centre of this area stands the market-house, supported on lofty pillars, with a large hall of freestone above, appropriated to the summer assizes for the county, and the transaction of other public business; the Lent assizes being held at Reading. It has two churches, which are said to have been erected by the abbots of Abingdon, one dedicated to St Nicholas, and the other to St Helena, the latter adorned with a spire: two hospitals, one for six, and the other for thirteen poor men, and as many poor women; a free grammar school, with ten scholarships at Pembroke College, Oxford; charity schools; a mechanics' institution, &c., and two banks. The town was incorporated by Queen Mary. It sends one member to parliament, and is governed by a mayor, four aldermen, and twelve councillors. During the war it manufactured much sail-cloth and sacking; but its chief trade now is in corn and malt, with a few carpets and coarse linen. It is seven miles south of Oxford, 47 east of Gloucester, and 55 W.N.W. of London. This town is supposed by Bishop Gibson to be the place called in the Saxon annals *Cloveshoo.* Population in 1841, 5585; in 1851, 5954.

ABINTESTATE, in *Law,* is applied to a person who inherits the right of one who died intestate, or without making a will.

ABIPONIANS, a tribe of American Indians, who formerly inhabited the district of *Chaks* in Paraguay; but the hostilities of the Spaniards have now obliged them to remove southward into the territory lying between Santa Fe and St Jago. M. Dobrizhoffer, who lived seven years in their country, informs us, in his account of them published in 1785, that they are not numerous, the whole nation not much exceeding 5000; for which he assigns as a reason an unnatural custom among their women of sometimes destroying their own children, from motives of jealousy lest their husbands should take other mates during the long time they give suck, which is not less than two years. They are naturally white, but, by exposure to the air and smoke, become of a brown colour. They are a strong and hardy race of people, which our author attributes to their marrying so late, an Abiponian seldom or never thinking of marriage till 30 years of age. They are greatly celebrated on account of their chastity and other virtues; though, according to our author, they have no knowledge of a Deity. They make frequent incursions into the territories of the Spaniards, mounted on the horses which run wild in those parts. They have a kind of order of chivalry for their warriors; and are so formidable, that 100 of their enemies will fly before ten of these horsemen. The hatred which these savages, whose manners, though rude and uncultivated, are in many respects pure and virtuous, bear to the Spaniards, is invincible. "These pretended Christians," says our author, "who are the scum of the Spanish nation, practise every kind of fraud and villany among these poor barbarians; and their corrupt and vicious morals are so adapted to prejudice the Abiponians against the Christian religion, that the Jesuit missionaries have, by a severe law, prohibited any Spaniard from coming, without a formal permission, into any of their colonies." From his account of the success of the Jesuits in converting them to Christianity, however, it does not appear that they have been able to do more than bribe them to a compliance with the ceremonies of the Popish religion; so that in general they are quite ignorant and uncivilized; a most striking instance of which is, that in counting they can go no further than three; and all the art of the Jesuits to teach them the simplest use and expression of numbers has proved unsuccessful. Dobrizhoffer's account of this people was translated into English by Mr Southey, and published in 1822, in 3 vols. 8vo.

ABIRAM, a seditious Reubenite, who, in concert with Korah and Dathan, rebelled against Moses and Aaron, in order to share with them in the government of the people; when Moses ordering them to come with their censers before the altar of the Lord, the earth suddenly opened under their feet, and swallowed up them and their tents; and at the same instant fire came from heaven and consumed 250 of their followers. (Numb. xvi.)

ABISHAI, son of Zeruiah, and brother to Joab, was one of the celebrated warriors who flourished in the reign of David: he killed with his own hand 300 men, with no other weapon but his lance; and slew a Philistine giant, the iron of whose spear weighed 300 shekels. (1 Sam. xxvi.; 2 Sam. xxiii.)

ABJURATION, in our ancient customs, implied an oath taken by a person guilty of felony, and who had fled to a place of sanctuary, whereby he solemnly engaged to leave the kingdom for ever.

Abjuration was used also to signify the renouncing, disclaiming, and denying upon oath, the Pretender to have any kind of right to the crown of these kingdoms.

*Abjuration of Heresy,* the solemn recantation of any doctrine as false and wicked.

ABLACTATION, (*ab* and *lacto,* I suck,) the ancient term for what is now called *Grafting by approach,* a method of ingrafting, by which the scion of one tree being for some time united to the stock of another, is afterwards cut off, and, as it were, weaned from the parent tree.

ABLAIKET, in the government of Orel. It is situated on a river of the same name which flows into the Irtysch, and contains the remains of a temple built in the 17th century, by the Kalmuck Prince Ablai.

ABLAQUEATION, (*ab* and *laquear,* a roof or covering,) an old term in *Gardening*, signifies the operation of removing the earth, and baring the roots of trees in winter, to expose them more freely to the air, rain, snow, &c.

ABLATIVE, in *Grammar*, the sixth case of Latin nouns. The word is formed from *ablatus*, the participle of *auferre*, "to take away." Priscian calls it also the *comparative case;* as serving among the Latins for comparing, as well as taking away.

The ABLATIVE is opposite to the DATIVE; the first expressing the action of taking away, and the latter that of giving.

In English, French, &c., there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term from analogy to the Latin.

The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians, Frischlin and Crusius; the former maintaining, and the latter opposing, its existence. The dispute still subsists among their respective followers. The chief reason alleged by the former is, that the Roman writers often joined Greek words with the Latin prepositions which govern ablative cases, as well as with nouns of the same case. To which their opponents answer, that the Latins anciently had no ablative themselves, but instead thereof made use, like the Greeks, of the dative case; till at length they formed an ablative, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same termination, as they still have in many instances; but that this was afterwards changed in certain words. It is no wonder, then, that the Latins sometimes join prepositions which govern an ablative case, or nouns in the ablative case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablative.

ABLATIVE ABSOLUTE, in *Grammar*, is applied to a noun with a participle in the ablative case detached or independent of the other parts of a sentence or discourse. In the Latin language it is frequent, and it has been adopted by the moderns.

ABLAVIUS, a Roman who wrote a history of the Goths, quoted by Jornandes, *De Reb. Getic.* iv. 14. 23.

ABLAY, a country of Great Tartary, governed by a Kalmuck chief, but subject to Russia, in return for its protection. It lies east of the river Irtysch, and extends 400 leagues along the southern frontiers of Siberia.

ABLE, or ABEL, THOMAS, chaplain to Queen Catherine, consort to Henry VIII., distinguished himself by his zeal in opposing the proceedings against that unfortunate princess for a divorce. For this purpose he wrote a piece entitled *Tractatus de non dissolvendo Henrici et Catharinæ matrimonio.* But the title of the book, according to Bishop Tanner, was *Invicta Veritas.* He took the degree of bachelor of arts at Oxford on the 4th of July 1513, and that of master of arts on the 27th July 1516. In 1534 he fell under a prosecution for being concerned in the affair of Elizabeth Barton, called the *Holy Maid of Kent.* This was an infamous impostor, suborned by the monks to use strange gesticulations, exhibit fictitious miracles, and to feign the gift of prophecy; and so well did she act her part, that she drew some persons of respectability to her interest: but being detected, she was condemned and executed, after discovering the names of her principal accomplices and instigators. On her account Able was charged with misprision of treason; and being also one of those who denied the king's supremacy over the church, he was apprehended and imprisoned. He was afterwards hanged, drawn, and quartered, at Smithfield, in 1540.

ABLECTI, in Roman antiquity, a select body of soldiers chosen from among those called EXTRAORDINARII.

ABLEGMINA, in Roman antiquity, those choice parts of the entrails of victims which were offered in sacrifice to the gods. They were sprinkled with flour, and burnt upon the altar; the priests pouring some wine on them.

ABLUTION, a ceremony in use among the ancients, and still practised in several parts of the world: it consisted in washing the body, which was always done before sacrificing, or even entering their houses. Ablutions appear to be as old as any ceremonies, or as external worship itself. Moses enjoined them, the heathens adopted them, and Mahomet and his followers have continued them; thus they have got footing among most nations, and make a considerable part of many established religions. The ceremony of ablution, the symbol of spiritual purity, was at first, perhaps, graciously designed as an incitement to personal cleanliness; and there can scarce be a doubt that this salutary end chiefly was proposed in its adoption by the legislators of succeeding times. In the desert, when no water is to be found, the Arabs perform this rite, according to Mohammedan law, with sand.

ABNER, the cousin of Saul (being the son of his uncle Ner), and the commander-in-chief of his army. When Saul was slain in the battle of Gilboa, David was made king over his own tribe of Judah, and reigned in Hebron. In the other tribes an influence adverse to Judah existed, and was controlled chiefly by the tribe of Ephraim. Abner availed himself of this state of feeling, and took Ishbosheth, a surviving son of Saul, whose known imbecility had excused his absence from the fatal fight in which his father and brothers perished, and made him king over the tribes, and ruled in his name. A sort of desultory warfare arose between them, in which the advantage appears to have been always on the side of David. In one of the engagements, Abner was beaten and fled for his life; and when pursued by Asahel, the brother of Joab, slew him by a back thrust with the pointed heel of his spear (2 Sam. ii. 8-32). This put a strife of blood between Abner and Joab; for the law of honour which in early times existed among the Hebrews, and which still prevails in Arabia, rendered it the conventional duty of Joab to avenge the blood of his brother upon the person by whom he had been slain.

As time went on, Abner had occasion to feel more strongly that he was himself not only the chief, but the only remaining prop of the house of Saul: and this conviction, acting upon a proud and arrogant spirit, led him to more presumptuous conduct than even the mildness of the feeble Ishbosheth could suffer to pass without question. Abner having taken into his harem a woman who had been a concubine-wife of Saul, was rebuked by the nominal king for his presumption. Being offended by the language of Ishbosheth, Abner resolved to abandon his cause and transfer his allegiance to the son of Jesse. He repaired to Hebron where he made certain overtures to David, which were gladly received, and David in return agreed that he should have the command of the combined armies on the union of the kingdoms. Abner had just left Hebron as Joab who had been absent returned to it, and learning what had taken place between Abner and David, he determined, under the influence of revenge and jealousy, to avenge himself of his adversary. Without the knowledge of the king, he treacherously sent a messenger to call Abner back, under the pretence that he wanted to confer peaceably with him, and while engaged in this conference, Joab led him aside and suddenly plunged his sword into his side. This assassination of Abner might have been dangerous to David, but his deep and genuine grief and lamentation over the cruel and treacherous act of Joab obviated the dangers which it might have produced.

ABNOBA, now ABENAU, in *Geography*, a long range of mountains in Germany, extending from the Rhine to the Neckar, having different names in the different countries through which they stretch. About the river Maine they are called the *Oden* or *Otenwald;* between Hesse and Franconia, the *Spessart;* and about the duchy of Wirtemberg, where the Danube takes its rise, they receive the name of *Baar.*

ABNORMAL, (*ab* and *norma*, a rule or pattern,) is employed, in physical science, to denote any state of irregularity or deviation from the general form, or law, of nature.

ÅBO, a district in the province of Finland, in 1809 transferred to Russia from Sweden. By the new division, it extends over 12,145 square miles, between Lat. 59. 50. and 62. 20. N., and Long. 19. 10. and 23. 46. E. It is bounded on the north by the circle of Wasa; on the east by Tavastehus; on the south by the Gulf of Finland; on the south-east by the Baltic Sea; and on the west by the Gulf of Bothnia, in which the Aland group of islands comprehended in this circle are situated. It contains 6 cities, and 4980 hamlets. The number of inhabitants may be estimated at 208,000; of whom about 20,000 live in cities, and the remainder in the country places. On the sea-coast, and on the eastern side of the circle, it is rather hilly; but the centre is chiefly a level country. The land is of medium fertility, producing rye, potatoes, hemp, flax, hops, and tobacco. The forests produce plants, pitch, and tar, and some potash. The coasts yield abundance of fish. It is divided into nine horads or baronies.

Åbo, a city in the Russian province of Finland, and chief town of the circle of the same name. It is situated near the extremity of the promontory, formed by the gulfs of Bothnia and Finland, and is divided into two parts by the river Aurajoki. Åbo is the seat of a Lutheran archbishop, and of the supreme court of justice for South Finland; and was the chief place of export from Finland to Sweden. It has a bank and gymnasium, carries on several manufactures of sailcloth, linen, glass, leather, tobacco, &c.; and its ship-building is considerable. Previous to 1819, Åbo was the capital of Finland; in 1743, the peace between Russia and Sweden was concluded here. By a most extensive fire in November 1827, nearly the whole city was destroyed, including the university and its valuable library. Immediately before this calamity, Åbo contained 1100 houses, and 13,000 inhabitants; and its university had 40 professors, more than 500 students, and a library of upwards of 30,000 volumes, together with a botanical garden, an observatory, a chemical laboratory, &c. The university has since been removed to Helsingfors. The entrance of the Aurajoki is defended by a castle. Vessels drawing 9 or 10 feet water go up to the town; but those drawing more, anchor 3 miles south-west of the river, where there is a good harbour; and thence the goods are sent by small craft to Åbo. Population in 1846, 12,000. The great church is in Lat. 60. 27. 14. N. and in Long. 22. 18. 10. E.

ABOARD, the inside of a ship. Hence any person who enters a ship is said to *go aboard:* but when an enemy enters in the time of battle, he is said to *board;* a phrase which always implies hostility.—To *fall aboard of*, is to strike or *encounter* another ship when one or both are in motion, or to be driven upon a ship by the force of the wind or current. —*Aboard-main-tack*, the order to draw the main-tack, *i.e.* the lower corner of the mainsail, down to the CHESS-TREE.

ABOLITION, the act of abolishing or annulling, abrogation. The putting an end to slavery; emancipation.

ABOLITIONIST, a person who favours abolition of slavery, or the immediate emancipation of slaves.

This term is usually applied to the members of the American Anti-Slavery Society. The condition of the negro population of the United States had, at an early period, attracted the attention of some of its philanthropic citizens, and a society was organized for the purpose of planting colonies of liberated American slaves on the western coast of Africa, where it was anticipated they would open the way for the introduction of Christianity, and operate as an effectual check upon the slave-trade. The spirit and tendency of this colonization scheme, however, soon began to be viewed with suspicion and dislike by the more earnest and uncompromising opponents of slavery, and on the 1st of January 1832, William Lloyd Garrison, and a few other ardent emancipationists, formed themselves at Boston into a society, which became the nucleus of a larger and more influential association, subsequently organized at Philadelphia, under the name of the "American Anti-Slavery Society;" on the principle of immediate and unconditional emancipation. Its members include persons of both sexes, and of all diversities of sentiment on religious and political questions, who agree in the opinion that slavery is a sin, and should be immediately abandoned. The measures adopted by the Abolitionists to promote the object which they have in view, have been prosecuted with untiring energy and zeal, in the face of the most virulent opposition; and the question which they have stirred has awakened great excitement, not only in the United States, but also in Great Britain. Their movements, however, have been weakened by divisions in their own ranks. In 1839, what is called the "Women's Rights Question" was raised, and a large majority of the members of the Anti-Slavery Society having decided that females as well as males should sit on the Committee, the minority immediately seceded, and organized a new association, under the name of the "American and Foreign Anti-slavery Society." In connection with this movement, another element of discord arose. The new society is composed of persons holding evangelical sentiments, and they have made it matter of charge against the original association that many of its members and most prominent office-bearers are the enemies of Christianity, and have mingled infidel arguments and appeals with their advocacy of emancipation.

Mr Garrison and his friends decline to vote or hold office under the present constitution of the United States, on the ground that it sanctions slavery—ordains that fugitive slaves shall be returned to their masters, on proof of their condition; that slave insurrections shall be suppressed by the strong arm of the nation; and that the slaveholders shall virtually have three votes for every five slaves they hold. A preliminary oath to support the constitution is required of every person holding public office in the country, and as the members of the Anti-Slavery Society do not mean to support the constitution in these particulars, they refuse to hold office under such an oath, or to appoint others by their votes to do so.

There are several other Anti-Slavery Societies in the United States, such as the "Liberty Party;" the "Free Soil Party;" and the "Christian Anti-Slavery Association." The "Liberty Party" had its origin in the unconquerable passion of the Americans for political action. Its members aim to be "a Third Party" with the abolition of slavery for their gathering cry. They enter into direct competition with the Whigs and Democrats, they nominate candidates for office, and adopt the usual tactics of party warfare to carry the election of their nominees. The object of the "Free Soil Party" is chiefly to maintain the balance of power in favour of the free states, by preventing the intrusion of slavery into the territories of the union which may eventually become States, and as such, exercise an influence on Congress in favour of the North or the South, as they happen to reject or retain the institution of slavery. The "Christian Anti-Slavery Association" was established at a convention held in Chicago in July 1851. Its name sufficiently explains its constitutional object. (J. T.)

Abolla || Abortion.

ABOLLA, in antiquity, a warm kind of garment, lined or doubled, worn by the Greeks and Romans, chiefly out of the city, in following the camp. Critics and antiquaries are greatly divided as to the form, use, kinds, &c. of this garment.

ABOMEY, capital of the kingdom of Dahomey, 7. 30. N. Lat. 2. 17. E. Long.

ABON, Abona, or Abonis, in *Ancient Geography*, a town and river of Albion, probably Abingdon.

ABONI-TEICHOS, afterwards Ionopolis, now Ineboli, a town of Paphlagonia, on the Black Sea, the birth-place of the impostor Alexander, of whom Lucian gives an amusing account.—(Lucian. *Alex.*)

ABOO, (Abu, Abuje, Abughad,) a celebrated mountain of Rajpootana, in India, rising from a very broad base, to an elevation of 5000 feet above the level of the sea, N. Lat. 42. 40. E. Long. 72. 48. Its elevations and platforms are covered with shrines, temples, castles, and tombs, adorned with sculptures and statues, relieved at intervals by wild and beautiful scenery. On the very top is a small round platform containing a cavern, with a block of granite, bearing the impression of the feet of Data-Briga, (an incarnation of Vishnu,) which is the grand object of pilgrimage to the Jains, Shrawaks, and Banians. But in that part of the mountain called Dailwarra, or Dewulwarra, (the region of temples,) are four Jain temples, all of marble, and two of them of the richest kind. One of these, indeed, is considered the most superb of all the temples of India, to which no edifice but the Taj-Mahal, at Agra, can be compared. It is sacred to Vrishabdeva, the first of the Jains, was erected by Bimul Sal, a merchant of Auhulwarra, and attracts pilgrims from every part of India. The principal building is surrounded by numerous smaller temples, the chief features of which are not mere vastness and solidity. Their merits consist rather in the proportions, the endless variety and richness of their sculptures, their long colonnades and vaulted roofs, which bear evidence not only of unbounded wealth in the founders, but also of high refinement in the arts.—*Colonel Todd's Travels in Western India.*

ABORIGINES, in *History*, originally a proper name, given to a certain people in Italy, who inhabited the ancient Latium, or country now called *Campagna di Roma*. Whence this people came by the appellation is much disputed. St Jerome says, they were so called, as being *absque origine*, the primitive planters of the country after the flood: Dionysius of Halicarnassus accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them so called as being originally Arcadians, who claimed to be earth-born, and not descended from any people. The term *Aborigines*, in modern geography, is applied to the primitive inhabitants of a country, in contradistinction to colonies, or new races of people.

ABORRHAS, in *Ancient Geography*, a branch of the Euphrates which joins that river on the east side, near Arcesium. It is called Araxes by Xenophon. Its modern name is Khabur. Xen. *Anab.* i.; Strabo, xvi.

ABORTION, in *Midwifery*, the premature exclusion of a fœtus. It has sometimes been doubted whether this unnatural practice was ranked as a crime in the laws of Greece and Rome. This question has been revived, and elaborately discussed in France, by some members of the Institute. The subject, it seems, had been incidentally alluded to in a discourse of Gregoire's upon the influence of Christianity on the condition of the female sex, read in the early part of 1814. This produced two dissertations, one by M. Clavier, and the other by M. Boissonade; the first maintaining the impunity of the practice among the ancients, the last, that it was on the contrary viewed as a penal office.

We find, says M. Clavier, that in one of Plato's dialogues (*Theæt.*) Socrates is made to speak of artificial abortion, as a practice not only common, but allowable; and Plato himself authorises it in his *Republic*, (lib. v.). Aristotle (*Polit.* lib. vii. c. 17) gives it as his opinion, that no child ought to be suffered to come into the world, the mother being above forty, or the father above fifty-five years of age. Lysias maintained, in one of his pleadings quoted by Harpocration, that forced abortion could not be considered homicide, because a child *in utero* was not an animal, or separate existence. M. Clavier admits, that, in a treatise ascribed to Galen, (*An animal sit quod in utero est?*) there is mention made of enactments by Solon and Lycurgus against this crime; but he maintains that this is a spurious production, and that, at any rate, his testimony cannot be opposed to that of so many writers who lived long before his age. Among the Romans, Ovid (*Amor.* lib. ii), Juvenal (*Sat.* vi. 594), and Seneca (*Consol. ad Helv.* 16), though they lament in strong terms the frequency of this enormity, yet they never allude to any laws by which it might be suppressed. Various other writers, it is said, preserve the same silence on this point whilst joining in general reprobation of the crime.

Abortion.

On the other hand, M. Boissonade appeals not only to the authority of Galen, but of Cicero (*Pro Cluentio*), as placing it beyond a doubt, that, so far from being allowed to pass with impunity, the offence in question was sometimes punished with death. With regard to the authority of Lysias, he states, that the pleading referred to is quoted by Harpocration himself as of dubious authenticity; and, as to Plato and Aristotle, he observes, that their speculative reasonings, in matters of legislation, ought not to be confounded with the actual state of the laws. And he adds, that Stobæus (*Serm.* 73) has preserved a passage from Musonius, in which that philosopher expressly states, that the ancient lawgivers inflicted punishments on females who caused themselves to abort.

It seems indeed difficult to believe, that the practice in question should have been allowed to prevail without being denounced as criminal by the lawgivers of Greece and Rome; but it is not so clear that there was any law which punished it with death. Those readers who have any curiosity to enter more deeply into the inquiry, will be enabled to do so by consulting the various authorities to which M. Clavier and M. Boissonade have appealed, in support of their respective views of the question. The notorious frequency of the practice forms an odious feature in the manners of ancient times. Seneca makes it a ground of distinction for Helvia, that she had never, like others of her countrywomen, destroyed the child in her womb, in order to preserve her shape.

By the law of England till lately, the only party held to be guilty of murder in forcing abortion was the woman, when she was proved to have taken means to destroy a child *quick* in the womb, and actually to have thereby destroyed it. But in 1803, an act was passed, inflicting the punishment of death upon *all* concerned in *administering* any noxious substance with the *intent* to procure the miscarriage of any woman *quick* with child. The procuring or attempting it before the child had quickened, was punishable only with imprisonment or transportation. This law was evidently grounded upon a false hypothesis, that the fœtus is not quick or alive till its motion in the womb becomes perceptible to the mother; and, what is of more importance, it made no provision against the attempt to procure abortion by *manual* application. The reader will find a curious illustration of this defect, in a trial which occurred at the assizes held at Bury St Edmunds in 1808. See *Trial of William Pizzy*, &c. Ipswich, 1808. An act however was passed in Will. IV. 7, & Vict. 1. to remove all those anomalies; and pronounces as guilty of felony all who shall procure the miscarriage of a female by administering to her medicaments or poisons, or by any manual operation, in any period of her pregnancy.

The case of John Fenton, tried at Perth in 1763, was the first instance of a criminal prosecution for this offence in Scotland; and here the public prosecutor restricted the libel to an arbitrary punishment. Our writers indeed agree, that, by the law of Scotland, the forcing of abortion was not homicide, whether the child be quick or not, except where the mother is killed in the process.

*Abortive Vellum*, is made of the skin of an abortive or immature calf.

ABOUKIR, a small town of Egypt, with a castle and a little island adjoining, with which it is connected by a chain of rocks. It stands at the eastern extremity of the long neck of land between the sea and the lakes Mareotis and Maadie, upon which Alexandria, about twelve miles to the westward, is also situated. Eastward lies the spacious bay of Aboukir, reaching to the mouth of the Nile. This vicinity was the scene of some of the greatest events which distinguished the late war between Britain and France. In the bay of Aboukir, Nelson found the French fleet which had conveyed Buonaparte to Egypt, and on the 1st of August 1798, gained that signal victory usually called the "Battle of the Nile," in which the whole of the enemy's fleet, with the exception of two vessels, were destroyed or captured. It was at Aboukir also that Sir Ralph Abercromby, in 1801, effected his landing, and having driven the enemy up the sand hills, took possession of the place. In other respects Aboukir is not of much importance. Lat. 31. 20. N. Long. 30. 5. E. It is said to be the ancient *Canopus*.

ABOULFEDA, or ABULFEDA, the most celebrated of the Arabian writers on history and geography. Among his contemporaries he was also distinguished both as a ruler and a warrior. His descent was in a direct line from Ayoub, father to Saladin, and from whom the house of that conqueror received the appellation of Ayoubites. Omar, the grandson of Ayoub, was one of Saladin's most distinguished generals, and enjoyed the privilege, which he transmitted to his posterity, of being placed always on the right of the army. In reward of his services, he was created Prince of Hamah, the ancient Apamea, which, with some territories adjoining, became hereditary in his family. They were transmitted, in the course of succession, to Mahommed Mahmoud, and to Mahommed, the uncle of Aboulfeda. Although none of these princes equalled the military glory of Omar, they were yet distinguished both in arms and letters. Continually engaged in military expeditions, their court was at the same time open to learned men. It is mentioned, among the proofs of their zeal for science, that Mahmoud caused to be constructed at Hamah, a gilded sphere of great magnitude, on which all the stars then known were represented.

Aboulfeda was son to Ali, the brother of Mahommed. He was born at Damascus in the year 672 of the Hegira, (1273 A. D.) His early years were spent in the study of the Koran and of the sciences. By the age of twelve, however, he was summoned to the field, and was present at the attack of Marcab, a castle belonging to the knights of St John. Syria was then shaken by continual war, and thus scarcely a year elapsed, in which the young prince was not called out upon some military expedition. He successively assisted at the sieges of Tripoli, Acre, and Roum. In 1298, Prince Mahmoud, his cousin, who held the sovereignty, died, and left Aboulfeda his heir. The succession, however, being violently disputed by his two brothers, the court, in consequence of their dissensions, took occasion to supersede all the three; and the Ayoubites lost the principality which they had enjoyed for more than a century. Aboulfeda, however, by his valour and other eminent qualities, soon recommended himself to the favour of the Sultan Melik-el-Nassir. He was present, and took an active part in the victory gained at Alkoroum in 1302, and in the still more signal one near Damascus in 1303, by which Syria was for the time delivered from the incursions of the Tartars. But peace was soon followed by internal dissensions. The throne of Egypt was disputed with Melik-el-Nassir by Bibars, who at first succeeded in obtaining possession of it. His rival, however, being supported by the great men of Syria, among whom Aboulfeda took a conspicuous part, finally triumphed. Aboulfeda, who had always stood well with Melik-el-Nassir, rose then into peculiar favour. The sultan took the first opportunity of establishing him in his patrimonial dignity of Prince of Hamah. Honours continued to shower upon him; he was invested with the distinctive marks of sovereignty, which consisted in the power of coining money, and in having prayers said in his name. The epithet *Melik Mowayyad*, victorious Prince, was conferred upon him; and it is stated by an Arabian author, that the sultan, in writing, addressed him by the appellation of brother.

The rest of Aboulfeda's life was spent in splendour and tranquillity, devoted to the government of his territory, and to the pursuits of science. Besides cultivating, he patronised literature; and his court became the rendezvous of all the learned men of the East. He conversed with them familiarly, bestowed upon them honours and pensions, and being himself superior to all in learning, felt no jealousy of their acquirements. During the same period he composed the works which have transmitted his name to posterity. In this enviable manner he spent the period of twenty years, when an illness, of which the particulars are not related, carried him off on the 26th October 1331. He was succeeded by his son Melik-el-Afdhal, of whom little is recorded, and who was the last Prince of Hamah.

The two works by which Aboulfeda is known in Europe, are his *Geography* and his *History*. The former ranks at least equal to any composed upon that subject by the Arabian writers. It partakes indeed of their general defects; for, although he seems to have paid more attention to the latitudes and longitudes than the rest of his countrymen, yet the imperfect application of astronomy, and the obscurity of his notation, have much diminished the value of this part of his labours. It is chiefly in the historical and descriptive parts that he can now be regarded as an authority. Here, too, his knowledge, as he himself candidly confesses, is chiefly confined to the circle of Moslem dominion; but within those limits, the information conveyed by him is undoubtedly valuable.

His *History* possesses still higher claims to distinction. His method, as was usual with his countrymen, is entirely that of annals, and is in many parts too much abridged; but the work contains much valuable information with regard to the Saracen, and even to the Greek empire. It is divided into five parts, beginning at the creation of the world, and ending with the year 1328.

There are copies of his *Geography* in manuscript in the national library of France, in that of the university of Leyden, and in the Bodleian. It has hitherto been published only in fragments, of which the following are the principal. *Chorasmia et Mawaralnahra* a Joan. Gravio, Londini; reprinted along with *Arabia*, in Hudson's *Geographi Græci Minores*, Oxford, 1698–1712.—*Tabula Syri*, Arab. et Lat. by Koehler and Reiske, 4to. Leipsic, 1766.—*Descriptio Ægypti*, Arab. et Lat. Michaelis, Gotting. 8vo, 1776.—*Africa Arab. cum notis J. G. Eichhorn*, Gotting. 1791.—*Arabia cum commentario*, Chr. Rommel, Gotting. 4to. 1801. Complete editions were undertaken by Bishop Hyde, by D'Arvieux in conjunction with Thevenot, and by Gagnier, the translator of the life of Mahomet: but different circumstances prevented their execution.

The *History* of Aboulfeda is also found in manuscript in the French, Bodleian, and Escurial libraries. A great part of the copy preserved in the first is believed to be autograph. This work has been published only in fragments. *Life of Mahomet*, Arab. et Lat. Gagnier, fol. Oxoniæ, 1723. *Annales Moslemici*, Lat. Reiske, Lipsiæ, 1754.—*Annales Moslemici*, sumptibus P. F. Suhmii, 5 tom. 4to. Hafniæ, 1789–94. Sulim was historiographer and chamberlain to the King of Denmark. The edition is excellent, and enriched with notes by Reiske.

ABOUTIGE, a town of Upper Egypt, in Africa, near the Nile, where they made the best opium in all the Levant. It was formerly a large, but now is a mean place. N. Lat. 26. 50.

ABRABANEL, Abarbanel, or Avravanel, Isaac, a celebrated rabbi, claiming descent from King David, was born at Lisbon, A.D. 1437. He became counsellor to Alphonso V., king of Portugal, and afterwards to Ferdinand the Catholic; but in 1492 was obliged to leave Spain with the other Jews. In short, after residing at Naples, Corfu, and several other cities, he died at Venice in 1508, aged 71. Abrabanel passed for one of the most learned of the rabbis; and the Jews gave him the names of the Sage, the Prince, and the Great Politician. We have a commentary of his on all the Old Testament, which is pretty scarce: he there principally adheres to the literal sense; and his style is clear, but a little diffuse. His other works are, A Treatise on the Creation of the world; in which he refutes Aristotle, who imagined that the world was eternal: A Treatise on the Explication of the Prophecies relating to the Messiah, against the Christians: A book concerning Articles of Faith; and some others less sought after. Though Abrabanel discovers his implacable aversion to Christianity in all his writings, yet he treated Christians with politeness and urbanity in the common affairs of life.

ABRACADABRA, a magical word, recommended by Serenus Samonicus as an antidote against agues and several other diseases. It was to be written upon a piece of paper as many times as the word contains letters, omitting the last letter of the former every time, as in the margin,[1] and repeated in the same order; and then suspended about the neck by a linen thread. *Abracadabra* was the name of a god worshipped by the Syrians, the wearing of whose name was a sort of invocation of his aid.

ABRADATAS, a King of Susa, whose wife, Panthea, was taken captive on the conquest of the Assyrian camp by Cyrus. In consequence of the honourable treatment which she received, Abradatas joined Cyrus with all his forces, but soon after perished in battle; and Panthea, inconsolable for her loss, put an end to her life. Xen. *Cyropæd.*; Lucian, *Imag.*

ABRAHAM, the founder of the Hebrew nation. Up to Gen. xvii. 4, 5, he is uniformly called Abram (אברם *father of elevation*, or *high father*; Sept. Ἄβραμ), and this was his original name; but the extended form, which it always afterwards bears, was given to it to make it significant of the promise of a numerous posterity which was at the same time made to him.

Abraham was descended through Heber, in the ninth generation, from Shem the son of Noah. His father was Terah, who had two other sons, Nahor and Haran. Haran died prematurely "before his father," leaving a son Lot, and two daughters, Milcah and Iscah. Lot attached himself to his uncle Abraham; and Milcah became the wife of her uncle Nahor.

Abraham was born A.M. 2008, B.C. 1996 (Hales, A.M. 3258, B.C. 2153), in "Ur of the Chaldees." The concise history in Genesis states nothing concerning the portion of his life prior to the age of 60. He took to wife Sarai, who was his sister by the father's side (Gen. xx. 12), though some suppose that Iscah and Sarai were the same person.

Although Abraham is, by way of eminence, named first, it appears probable that he was the youngest of Terah's sons, and born by a second wife, when his father was 130 years old. Terah was seventy years old when the eldest son was born (Gen. xi. 32; xii. 4; xx. 12: comp. Hales ii. 107). It is shown by Hales (ii. 107), that Abraham was 60 years old when the family quitted their native city of Ur, and went and abode in Charran. The reason for this movement does not appear in the Old Testament; but the real cause transpires in Acts. vii. 2–4: "The God of glory appeared to our father Abraham while he was (at Ur of the Chaldees) in Mesopotamia, *before he dwelt in Charran*, and said unto him, Depart from *thy land*, and from thy kindred, and come hither to *a land* (γῆν) which *I will* shew thee. Then departing from the land of the Chaldees, he dwelt in Charran." This *first* call is not recorded, but only implied in Gen. xii.: and it is distinguished by several pointed circumstances from the *second*, which alone is there mentioned. Accordingly Abraham departed, and his family, including his aged father, removed with him. They proceeded not at once to the land of Canaan, which indeed had not been yet indicated to Abraham. At that convenient station he tarried fifteen years, until Terah died, at the age of 205. Abraham, now 75 years old, received a second and more pointed call to pursue his destination: "Depart from thy land, and from thy kindred, and *from thy father's house, unto the land* which I will shew thee" (Gen. xii. 1). The difference of the two calls is obvious: in the former the *land* is indefinite, being designed only for a temporary residence; in the latter it is definite, intimating a permanent abode. He went forth "not knowing whither he went" (Heb. xi. 8), but trusting implicitly in the Divine guidance, taking with him his nephew Lot, whom, having no children of his own, he appears to have regarded as his heir.

On arriving in the land of Canaan, the rich pastures tempted Abraham to form his first encampment in the vale of Moreh, which lies between the mountains of Ebal and Gerizim. Here the strong faith which had brought him thus far from his home was rewarded by the grand promise:—"I will make of thee a great nation, and I will bless thee and make thy name great, and thou shalt be a blessing; and I will bless them that bless thee, and curse them that curse thee: and in thee shall all the families of the earth be blessed' (Gen. xii. 2, 3). He soon after removed to the district between Bethel and Ai, where he also built an altar to that "Jehovah" whom the world was then hastening to forget. His farther removals tended southward, until at length a famine in Palestine compelled him to withdraw into Egypt, where corn abounded. Here, apprehending that the beauty of his wife Sarai might bring him into danger with the Egyptians, he concealed the fact that she was his wife, and gave out that she was his sister; whereupon she was carried to the king's harem. A grievous disease inflicted on Pharaoh and his household relieved Sarai from her danger, by revealing to the king that she was a married woman; on which he sent for Abraham, and, after rebuking him for his conduct, restored his wife to him, and recommended him to withdraw from the country. He accordingly returned to the land of Canaan, much richer than when he left it "in cattle, in silver, and in gold" (Gen. xii. 8; xiii. 2). Not long after, he removed to the pleasant valley of Mamre, in the neighbourhood of Hebron (then called Arba), and pitched his tent under a terebinth tree (Gen. xiii).

It appears that fourteen years before this time the south and east of Palestine had been invaded by a king called Chedorlaomer, from beyond the Euphrates, who brought several of the small disunited states of those quarters under tribute. Among them were the five cities of the Plain of Sodom, to which Lot had withdrawn. This burden was borne impatiently by these states, and they at length withheld their tribute. This brought upon them a ravaging visitation from Chedorlaomer and four other (perhaps tributary) kings, who scoured the whole country east of the Jordan, and ended by defeating the kings of the plain, plundering their towns, and carrying the people away as slaves. Lot was among the sufferers. When this came to the ears of Abraham, he immediately armed such of his slaves as were fit for war, in number 318, and being joined by the friendly Amoritish chiefs, Aner, Eschol, and Mamre, pursued the retiring invaders. They were overtaken near the springs of the Jordan; and their camp being attacked on opposite sides by night, they were thrown into disorder, and fled. Abraham and his men pursued them as far as the neigbourhood of Damascus, and then returned with all the men and goods which had been taken away.

After ten years' residence in Canaan (B.C. 1913), Sarai, being then 75 years old, persuaded Abraham to take her handmaid Hagar, an Egyptian, as a secondary or concubine wife. The son who was born to Abraham by Hagar, received the name of Ishmael, and was brought up as the heir of his father and of the promises (Gen. xvi.). Thirteen years after, when Abraham was 99 years old, he was favoured with still more explicit declarations of the Divine purposes, and his name was now changed from *Abram* to *Abraham.* The Lord then solemnly renewed the covenant to be a God to him and to the race that should spring from him; and in token of that covenant directed that he and his should receive in their flesh the sign of circumcision. It was then first announced, in distinct terms, that the heir of the special promises was not yet born, and that Sarai, then 90 years old, should twelve months thence be his mother. Then also her name was changed from Sarai to Sarah (*the princess*); and to commemorate the joy with which the patriarch received such strange tidings, it was directed that the name of Isaac (*he laughed*) should be given to the future child. After the destruction of Sodom, Abraham removed into the territories of Abimelech, king of Gerar, where he allowed himself to stoop to the same foolish prevarication in denying his wife, which, twenty-three years before, had occasioned him so much trouble in Egypt, and with a similar result.

The same year Sarah gave birth to the long-promised son, and according to previous direction, the name of Isaac was given to him. This greatly altered the position of Ishmael, who with Hagar his mother, was sent to a distance from his paternal home.

When Isaac was about twenty years old (B.C. 1872) it pleased God to subject the faith of Abraham to a severe trial. He was commanded to go into the mountainous country of Moriah (probably where the temple afterward stood), and there offer up in sacrifice the son of his affection, and the heir of so many hopes and promises. But Abraham's faith shrunk not, assured that what God had promised he would certainly perform, and that he was able to restore Isaac to him "even from the dead" (Heb. xi. 17–19). When Abraham's hand was uplifted to slay his son, the angel of Jehovah interposed at the critical moment and arrested the fatal stroke.

Twelve years after (B.C. 1860) Sarah died at the age of 127 years, being then at or near Hebron; and Abraham purchased for a family sepulchre the cave of Machpelah, with the field in which it stood and the trees that grew thereon. This was the only possession he ever had in the Land of Promise (Gen. xxiii). Some time after Abraham took a wife named Keturah, by whom he had several children. These, together with Ishmael, seem to have been portioned off by their father in his lifetime, and sent into the east and south-east, that there might be no danger of their interference with Isaac, the divinely appointed heir. There was time for this: for Abraham lived to the age of 175 years, 100 of which he had spent in the land of Canaan. He died in B.C. 1822 (Hales 1978), and was buried in the family sepulchre which he had purchased of the Hittites (Gen. xxv. 1–10).

ABRAHAM, *Ben Chaila*, a Spanish rabbi, in the 13th century, who professed astrology, and assumed the character of a prophet. He pretended to predict the coming of the Messiah, which was to happen in the year 1358; but fortunately he died in 1303, fifty-five years before the time when the prediction was to be fulfilled. He wrote a book, *De Nativitatibus*, which was printed at Rome in 1545.

ABRAHAM, *Usque*, a Portuguese Jew, who, in conjunction with Tobias Athias, translated the Hebrew Bible into Spanish. It was printed at Ferrara in 1553, and reprinted in Holland in 1630. This Bible, especially the first edition, which is most valuable, is marked with stars at certain words, which are designed to shew that these words are difficult to be understood in the Hebrew, and that they may be used in a different sense.

ABRAHAM, or ABRAM, *Nicholas*, a learned Jesuit, born in the diocese of Toul, in Lorrain, in 1589. He obtained the rank of divinity professor in the university of Pont-a-Mouson, which he enjoyed 17 years, and died September 7, 1655. He wrote Notes on Virgil and on Nonnius; A Commentary on some of Cicero's Orations, in two vols. folio; an excellent collection of theological pieces in folio, entitled *Pharus Veteris Testamenti;* and a Hebrew Grammar in verse.

ABRAHAMITES, an order of monks exterminated for idolatry by Theophilus in the ninth century. Also the name of another sect of heretics who had adopted the errors of Paulus.

ABRALHOS, a cluster of islets and sand-banks on the coast of Brazil, between 17 and 18 degrees S. Lat. The islets are low, covered with grass and a little scattered brushwood. They consist of gneiss and sandstone in horizontal strata, and their highest point rises about 100 feet above the level of the sea.

ABRANTES, a town of Portugal, province of Estremadura, on the Tagus, near its junction with the Zezare, which is navigable for barges. Lat. 39. 26. N. Long. 8. 15. W. Situation delightful, on the upper part of a sloping hill, with a country below it covered with olive trees, and interspersed with vineyards. Junot, one of Napoleon's marshals, was created duke of Abrantes. It has an hospital and poor-house. Pop. 4500.

ABRASAX, or ABRAXAS, the supreme god of the Basilidian heretics. It is a mystical or cabalistic word, composed of the Greek letters, α, β, ρ, α, ξ, α, ς, which, together, according to the Grecian mode of numeration, make up the number 365. For Basilides taught, that there were 365 heavens between the earth and the empyrean; each of which heavens had its angel or intelligence, which created it; each of which angels likewise was created by the angel next above it; thus ascending by a scale to the Supreme Being, or first Creator. The Basilidians used the word *Abraxas* by way of charm or amulet.

ABRASION is sometimes used among medical writers for the effect of sharp corrosive medicines or humours in wearing away the natural mucus which covers the membranes, and particularly those of the stomach and intestines. The word is composed of the Latin *ab* and *rado, to shave* or *scrape off.*

*ABRASION* is also used to denote the wear and tear of Coins. The deficiency in the weight of the old worn coins, on their being called in to be recoined, falls upon the public. Mr M'Culloch reckons, that if the currency of the United Kingdom consisted wholly of gold, it would amount to at least sixty millions of sovereigns, and that the loss sustained by abrasion, including what results from shipwreck, fire, and other accidents, would amount to a hundredth part of the sum in circulation, or £600,000 annually.—*M'Culloch's Treatises and Essays on Economical Policy*, p. 33.

ABRAUM, a name that has been given by some writers to a species of red clay, used in England by the cabinet-makers, &c., to give a red colour to new mahogany wood. We have it from the Isle of Wight; but it is also found in Germany and Italy.

ABRAVANNUS, in *Ancient Geography*, the name of a promontory and river of Galloway in Scotland, so called from the Celtic term *Aber*, signifying either the mouth of a river or the confluence of two streams, and *Avon*, a river.

ABRAXAS, an antique stone with the word *abraxas* engraven on it. They are of various sizes, and most of them as old as the third century. They are frequent in the cabinets of the curious; and a collection of them, as complete as possible, has been desired by several. There is a fine one in the abbey of St Genevieve, which has occasioned much speculation. Most of them seem to have come from Egypt; whence they are of some use for explaining the antiquities of that country. Sometimes they have no other inscription besides the word: but others have the names of saints, angels, or Jehovah himself annexed; though most usually the name of the Basilidian god. Sometimes there is a representation of Isis sitting on a lotus, or Apis surrounded with stars; sometimes monstrous compositions of animals, obscene images, Phalli and Ithyphalli. The engraving is rarely good, but the word on the reverse is sometimes said to be in a more modern style than the other. The characters are usually Greek, Hebrew, Coptic, or Hetrurian, and sometimes of a mongrel kind, invented, as it would seem, to render their meaning the more inscrutable. It is disputed whether the Veronica of Montreuil, or the granite obelisk mentioned by Gori, be *Abraxases*.

ABRAZITE, a crystallized mineral, a silicate of lime and alumina, called also Gismondine, and Zeagonite.

ABRESCH, Frederic Louis, a celebrated critic born at Hamburg in 1699. His scholia on Greek authors are greatly esteemed. He died in 1782.

ABRIDGMENT, in *Literature*, is the reduction of a book into a smaller compass; the book so reduced is sometimes called also an epitome, or compendium. To condense a work, without detriment to the symmetry and connection of the whole, demands the exercise of both judgment and skill, and not unfrequently of taste; to the absence of which requisites must be imputed the frequent imperfection of this class of works. The advantage of epitomes or abridgments, when ably executed, can scarcely be too highly estimated, for, by the enormous increase of literature, they are yearly growing more important, and will eventually become a matter of necessity. "The universal progress of science during the last two centuries," says Robertson, "the art of printing, and other obvious causes, have filled Europe with such a multiplicity of histories, and with such vast collections of historical materials, that the term of human life is too short for the study or even the perusal of them."—*Charles V.; preface to edit.* 1796. The Reviews and periodicals of the day may be said in a manner to have commenced the great era of abridgment; but whether this system may not tend to superficialness, remains to be seen.

The art of abridgment, though practised before, first came into general use among the Romans about the fifth century; and posterity owes a debt of gratitude to those authors who thus preserved, among less important materials, many valuable fragments of antiquity which otherwise had been lost. Among these abridgments and collections may be noticed the histories of *Lucius A. Florus*, and of *C. Vell. Paterculus*; the *Epitome de Cæsaribus of S. Aur. Victor*; the *Breviarium* of *S. Ruf. Festus*; that of *Eutropius*; and the *Chronicon of Mag. Aur. Cassiodorus*. As examples of excellence in the art of abridgment, may be cited—*Mezeray's Abrégé Chronologique de l'Histoire de France, by the author; Henault's Nouvel Abrégé Chronologique de l'Histoire de la France; Nouvel Abrégé Chronologique de l'Histoire d'Allemagne, by Pfeffel; Hazlitt's Abridgment of Tucker's Light of Nature*; and the *Epitome Historiarum of Tursellinus.*

ABROGATION, the act of abolishing a law, by authority of the maker; in which sense the word is synonymous with abolition, repealing, and revocation.

ABROTONUM, in *Ancient Geography*, a town and harbour on the Mediterranean, one of the three cities that formed Tripolis; called also *Sabrata* and *Neapolis*.

ABRUD-BANYA, a town of Austria, province of Transylvania, and circle of Unter-Weissenburg. It is situate on the river Ampoy, has one Reformed and one Greek church, is the seat of a board of mining, and in its vicinity mines of gold and of silver are wrought. Lat. 46. 14. 9. N. Long. 23. 49. 3. E. Population 4100.

ABRUS, in *Botany*, a genus of diadelphia.

ABRUZZO, one of the four provinces into which the continental part of the kingdom of Naples, or of the two Sicilies, was formerly divided, but now the name given to three out of the 15 provinces of the later division of that country. It is the most northern part of the kingdom of Naples, being bounded on the north and west by the States of the Church, east by the Adriatic, and south by the provinces of Terra di Lavoro, Molise, and Capitanata. It has an area of somewhat more than 5000 square miles, extending from Lat. 41. 40. to 42. 55. N.; and though presenting to the Adriatic a coast of about 80 miles in length, yet it has not a single good port.

This territory is mostly rugged, mountainous, and covered with extensive forests, but contains also many fertile and well-watered valleys. The Apennines traverse its whole extent, running generally from N.W. to S.E., and here they attain their greatest elevation. Near Aquila is Monte Corno, the loftiest peak of that chain, called *Il gran Sasso d'Italia*, or the great rock of Italy, which rises to the height of 9521 feet. Monte Majella and Monte Velino attain the height of 8500 and 8397 feet respectively. From the main range of the Apennines numerous smaller branches run off towards the west. The country is watered by numerous rivers and streams, most of which fall into the Adriatic. They are often suddenly swollen by the rains, especially in the spring, and thus cause considerable damage to the lands through which they pass. The principal rivers are the Tronto, Trentino, Pescara, and the Sangro. A little to the south of the village of Albi in Abruzzo Ulteriore Seconda is lake Celano, the Lacus Fucinus of the Romans; see Fucinus Lacus. The climate differs considerably with the elevation of the soil, but generally speaking, it is temperate and healthy; on the mountains it is cold and bracing, and in the valleys comparatively hot.

Agriculture is but little attended to or understood, although in many of the lower parts of the country the land is of considerable fertility. The art of irrigation is not understood, nor the embankment of the rivers practised, so that the best of the land is frequently rendered useless. Its principal productions are corn, hemp, flax, almonds, olives, figs, grapes, and chestnuts. In the neighbourhood of Aquila, saffron is extensively cultivated, although not to such an extent now as formerly. The rearing and tending of sheep is the principal occupation of the inhabitants of the highlands. The wool, which is of a superior quality, is an important article of commerce, and the skins are sent in large quantities to

Abruzzo Citeriore. the Levant. On the approach of winter, the shepherds with their flocks and families migrate to the more temperate territories on the south. Bears, wolves, and wild boars inhabit the mountain fastnesses; and in the extensive oak forests numerous herds of swine are fed, the hams of which are in high repute. The manufactures are very inconsiderable, being chiefly woollen, linen, and silk stuffs, and earthen and wood wares.

"Abruzzo," says Sir R. C. Hoare, "has been represented as a country uncivilised with regard to society, infested by robbers, inaccessible from mountains, and fitter for the residence of wild beasts than of rational beings. But I must here repeat with gratitude, that in these romantic unfrequented tracts, we met with that genuine and cordial hospitality which is too seldom to be found in more favoured and more populous countries." The inhabitants are a stout, well-built, brave, and industrious race. Many of them emigrate annually to the States of the Church to work during the harvest, and return home in winter with their wages. Their houses are generally miserable dirty huts; their food principally maize, and their beverage bad wine. Abruzzo is of great importance to the kingdom of Naples, as being its chief defence on the north. It has only three roads through which a hostile army could pass, only one of these being practicable for artillery; and they all afford such facilities for defence, that a passage could only be effected at a great loss, in the face of even a small body of defenders. The three provinces into which it is now divided are Abruzzo Ulteriore Prima, Abruzzo Ulteriore Seconda, and Abruzzo Citeriore, being so named from their position relative to Naples.

Abruzzo Ulteriore I., is the most northern of the three provinces, and has an area of 1239 square miles, with a population in 1845 of 216,486. The western part of the province is very mountainous; the highest crest of the Apennines divides it from Abruzzo Ulteriore Seconda, and extends towards the sea. The district on the sea-coast is flat, but everywhere else hilly. The valleys between the hills possess a rich soil, well watered by rivulets and brooks in the winter and spring, but which are generally dried up in the summer months. These streams either run into the Pescara, which bounds the province towards Abruzzo Citeriore, or into the Tronto, which is the boundary on the Papal frontier. The province is divided into two districts, Teramo and Civita di Penne. The city of Teramo is the capital of the province.

Abruzzo Ulteriore II., is an inland district, bounded on the north and west by the Papal States, on the north-east by Abruzzo Ulteriore I., on the south-east by Abruzzo Citeriore, and on the south by the province Terra di Lavoro. The whole province is nearly covered with mountains of various heights, one of which is the *Gran Sasso d'Italia*. There are no plains; but among these mountains some beautiful and fruitful valleys have been formed by the various streams that run through them. None of the rivers are navigable, but all of them have abundance of water, except in the hottest of the summer months. It has an area of 2523 square miles, and in 1845 contained 307,708 inhabitants. Its chief town is Aquila.

Abruzzo Citeriore is bounded on the north-west by Abruzzo Ulteriore I., on the north-east by the Adriatic Sea, on the south-west by the province Molise, and on the west by that of Abruzzo Ulteriore Seconda. This province is less hilly than the other two Abruzzi, but the Apennines are extended through the south-west part. They, however, gradually decline in height, and extend themselves in wide plains of sand and pebbles. The rivers all run to the Adriatic, and are very deficient in water during the summer months. Agriculture is in a very backward state, and the soil is rather ungrateful when labour is bestowed upon it; but the inhabitants prefer the chase and the fishery. It contains 1245 square miles, with a population of 301,746 in 1845. Its chief town is Civita di Chieti.

Absalom. ABSALOM, the third son of David, and his only son by Maachah, daughter of Talmai, king of Geshur (2 Sam. iii. 3). He was deemed the handsomest man in the kingdom; and was particularly noted for the profusion of his beautiful hair. David's other child by Maachah was a daughter named Tamar, who was also very beautiful. She became the object of lustful regard to her half-brother Amnon, David's eldest son; and was violated by him. In all cases where polygamy is allowed, we find that the honour of a sister is in the guardianship of her full brother, more even than in that of her father, whose interest in her is considered less peculiar and intimate. It was not until two years had passed, and when this wound seemed to have been healed, that Absalom found opportunity for the bloody revenge he had meditated. He then held a great sheep-shearing feast at Baal-hazor near Ephraim, to which he invited all the king's sons; and, when they were warm with wine, Amnon was set upon and slain by the servants of Absalom, according to the previous directions of their master. Absalom, after this bloody deed, hastened to Geshur, and remained there three years with his grandfather, king Talmai; at the end of which time, through the contrivance of Joab, he was permitted to return; but David, still mindful of his duties as a king and father, controlled the impulse of his feelings, and declined to admit him to his presence. After two years, however, Absalom, impatient of his disgrace, found means to compel the attention of Joab to his case; and through his means a complete reconciliation was effected, and the father once more indulged himself with the presence of his son. (2 Sam. xiii. xiv.)

Absalom was the third son of David, Amnon and Chileab being his elder brothers. But he alone was of royal descent by the side of his mother; and royal or noble descent by the mother is even now (as we see by the recent instance of Abbas Meerza in Persia) of itself a sufficient ground of preference over an elder brother whose maternal descent is less distinguished. This circumstance may suggest that he early entertained a design upon the succession to the throne, and that the removal of Amnon was quite as much an act of policy as of revenge. His position must have been greatly strengthened when, on his return from exile, he found himself the eldest surviving son, and according to the ordinary laws of primogeniture, the heir apparent of the crown; and there is every reason to think that David, if left to himself, would have been glad to have seen the rule of succession take its *ordinary* course in favour of his best loved son. But then, under the peculiar theocratical institutions of the Hebrews, the Divine king reserved and exercised a power of dispensation, over which the human king, or viceroy, had no control. The house of David was established as a reigning dynasty; and although the law of primogeniture was allowed eventually to take in general its due course, the Divine king reserved the power of appointing any member of that house whom he might prefer. David had known many years before that his dynasty was to be established in a son not yet born (2 Sam. vii. 12); and when Solomon was born, he could not be ignorant, even if not specially instructed, that *he* was the destined heir. This fact must have been known to many others as the child grew up, and probably the mass of the nation was cognizant of it. In this we find a clear motive for the rebellion of Absalom—to secure the throne which he deemed to be his right by the laws of primogeniture, during the lifetime of his father; lest delay, while awaiting the natural term of his days, should so strengthen the cause of Solomon with his years, as to place his succession beyond all contest.

Four years after his return from Geshur, he repaired to Hebron and there proclaimed himself king. The great body of the people declared for him; and so strong ran the tide of opinion in his favour, that David found it expedient to quit Jerusalem and retire to Mahanaim, beyond the Jordan.

When Absalom heard of this, he proceeded to Jerusalem and took possession of the throne without opposition. The king soon raised a large force, which he properly organised and separated into three divisions, commanded severally by Joab, Abishai, and Ittai of Gath. A battle took place in the borders of the forest of Ephraim; and the tactics of Joab, in drawing the enemy into the wood, and there hemming them in, so that they were destroyed with ease, eventually decided the action against Absalom. Twenty thousand of his troops were slain, and the rest fled to their homes. Absalom himself fled on a swift mule; but as he went, the boughs of a terebinth tree caught the long hair in which he gloried, and he was left suspended there. The charge which David had given to the troops to respect the life of Absalom prevented any one from slaying him: but when Joab heard of it, he hastened to the spot, and pierced him with three darts. His body was then taken down and cast into a pit in the forest, and a heap of stones was raised upon it.

Absalom's Tomb, a remarkable monument in the valley of Jehoshaphat, near Jerusalem, and close by the lower bridge over the Kedron. The identity of this monument with that mentioned in 2 Sam. xviii. 18, insisted on by some, is disproved by the character of the architectural ornaments; and neither this nor the adjoining monument called that of Zecharias, have any connection with the era of the persons whose names they bear.

Absalom, archbishop of Lund in Denmark, an eminent statesman and warrior, a patron of learning, and the counsellor and friend of Waldemar, his sovereign. By the vigour of his administration, and his successes in the field, he gave a lustre to the Danish name, and he is said to have been the founder of the city of Copenhagen. He was born A.D. 1128, and died in 1191.

ABSCESS, in *Surgery;* from *abscedo*, to separate; a cavity containing *pus*, or a collection of puriform matter in a part: so called, because the parts which were joined are now separated; one part recedes from another, to make way for the collected matter.

ABSCISSE, in *Conics*, a part of the diameter or transverse axis of a conic section, intercepted between the vertex or some other fixed point and a semiordinate. See Conic Sections.

ABSCONSA, a dark lantern used by the monks at the ceremony of burying their dead.

ABSENTEE is a term applicable to those landlords who reside in another country than that from which they draw their rents. The discussions which have taken place on this subject have generally had a reference to Ireland.

Mr M'Culloch maintains that, in so far as the question of expenditure is concerned, absenteeism is not injurious to a country. On the contrary, that it is in the majority of cases advantageous, as its tendency is to turn industry into those channels into which it is most for the public advantage that it should be turned, and eventually to increase the national capital. He allows that a resident landed proprietor has the means of doing a vast deal of good, by setting an example of good order, virtue, and piety, and protecting his tenants and dependents. But, in the case of Ireland, the superiority of resident over absentee landlords must be tried, not by what they ought to have been, but by their actual conduct. And he maintains that nine-tenths of the proprietors of Ireland being the lineal descendants of those who purchased or received grants of the property confiscated during the 17th century, and being almost all Englishmen and Protestants, —intruders on their soil, and enemies of their religion,—the residence of such landlords was more likely to produce discord than good-will. And by a comparison of the actual condition of the baronies where absenteeism prevailed, he has brought forward evidence to shew that the estates are better managed, and the inhabitants have been more contented and tranquil in these, than in the districts most thickly occupied by resident landlords.

The opposite side of this question has been ably argued by writers in the Quarterly Review. *M'Culloch's Treatises and Essays on Economical Policy; Quarterly Review*, vol. xxxiii., p. 455.

ABSINTHIATED, any thing tinged or impregnated with absinthium or wormwood. Bartholin mentions a woman whose milk was become absinthiated, and rendered as bitter as gall, by the too liberal use of wormwood.

*Vinum absinthites*, or *poculum absinthiatum*, "wormwood wine," is much spoken of among the ancients as a wholesome drink, and even an antidote against drunkenness. Its medical virtues depend on its aromatic and bitter qualities. Infused in wine or spirits, it may prove beneficial in cases of indigestion or debility of the stomach.

ABSOLUTE (*ab*, and *solvo*, I loose), in a general sense, something that stands free or independent.

Absolute is more particularly understood of a being or thing which does not proceed from any cause, or does not subsist by virtue of any other being, considered as its cause; in which sense God alone is *absolute*. *Absolute*, in this sense, is synonymous with *independent*, and stands opposed to *dependent.*

Absolute also denotes a thing that is free from conditions or limitations; in which sense the word is synonymous with *unconditional.* We say, an *absolute* decree, *absolute* promise, *absolute* obedience.

*Absolute Government*, that in which the prince is left solely to his own will, being not limited to the observance of any laws except those of his own discretion.

*Absolute Equations*, in *Astronomy*, is the aggregate of the optic and eccentric equations. The apparent inequality of a planet's motion, arising from its not being equally distant from the earth at all times, is called its optic equation, and would subsist even if the planet's real motion were uniform. The eccentric inequality is caused by the planet's motion being uniform. To illustrate which, conceive the sun to move, or to appear to move, in the circumference of a circle, in whose centre the earth is placed. It is manifest, that if the sun moves uniformly in this circle, it must appear to move uniformly to a spectator on the earth; and in this case there will be no optic nor eccentric equation: but suppose the earth to be placed out of the centre of the circle, and then, though the sun's motion should be really uniform, it would not appear to be so, when seen from the earth; and in this case there would be an optic equation, without an eccentric one. Imagine further, the sun's orbit to be not circular but elliptic, and the earth in its focus; it will be as evident that the sun cannot appear to have a uniform motion in such eclipse: so that his motion will then be subject to two equations, the optic and the eccentric.

*Absolute Number*, in *Algebra*, is any pure number standing in any equation without the conjunction of literal characters; as $2x + 36 = 48$; where 36 and 48 are absolute numbers, but 2 is not, as being joined with the letter $x$.

ABSOLUTION, in *Civil Law*, is a sentence whereby the party accused is declared innocent of the crime laid to his charge.

Absolution, in the *Canon Law*, is a juridical act, whereby the priest declares the sins of such as are penitent remitted. —The Romanists hold absolution a part of the sacrament of penance; the council of Trent, sess. xiv. cap. iii., and that of Florence, in the decree *ad Armenos*, declare the form or essence of the sacrament to lie in the words of *absolution*, "I absolve thee of thy sins." The *formula* of absolution, in the Roman church, is absolute; in the Greek church, it is deprecatory; and in the churches of the Reformed, declarative.

ABSOLUTION is chiefly used among Protestants for a sentence by which a person who stands excommunicated is released or freed from that punishment.

ABSORBENT, in general, any thing possessing the faculty of *absorbing*, or swallowing up another.

*ABSORBENT Medicines*, testaceous powders, or substances into which calcareous earth enters, as chalk, crabs eyes, &c., which are taken inwardly, for drying up or absorbing any acid or redundant humours in the stomach or intestines. They are likewise applied externally to ulcers or sores with the same intention.

*ABSORBENTS*, or *ABSORBING Vessels*, in *Anatomy*, a name given promiscuously to the lacteal vessels, lymphatics, and inhalant arteries; a minute kind of vessels found in animal bodies, which imbibe fluids that come in contact with them. On account of their minuteness and transparency, they escape observation in ordinary dissection. They have, however, been detected in every tribe of animals, and, in the animals which have been examined, in every part of the body.

ABSORPTION, in the animal economy, is the function of the absorbent vessels, or that power by which they take up and propel substances. This power has been ascribed to the operation of different causes, according to the theories which physiologists have proposed. Some attribute it to capillary attraction, others to the pressure of the atmosphere, and others to an ambiguous or unknown cause, which they denominate *suction;* for this last is nothing else than the elastic power of one part of the air restoring the equilibrium, which has been destroyed by the removal or rarefaction of another part. See PHYSIOLOGY.

*ABSORPTIONS of the Earth*, a term used by Kircher and others for the sinking in of large tracts of land by means of subterranean commotions, and many other accidents.

Pliny tells us, that in his time the mountain Cybotus, with the town of Curites, which stood on its side, were wholly absorbed into the earth, so that not the least trace of either remained; and he records the like fate of the city of Tantalis in Magnesia, and after it of the mountain Sipylus, both thus absorbed by a violent opening of the earth. Galanis and Gamales, towns once famous in Phœnicia, are recorded to have met the same fate; and the vast promontory called *Phegium*, in Ethiopia, after a violent earthquake in the night-time, was not to be seen in the morning, the whole having disappeared, and the earth closed over it. These and many other histories, attested by the authors of greatest credit among the ancients, abundantly prove the fact in the earlier ages. (KIRCHER'S *Mund. Subter.*, p. 77.)

Picus, a lofty mountain in one of the Molucca isles, which was seen at a great distance, and served as a landmark to sailors, was entirely destroyed by an earthquake; and its place is now occupied by a lake, the shores of which correspond exactly to the base of the mountain. In 1556, a similar accident happened in China. A whole province of the mountainous part of the country, with all the inhabitants, sunk in a moment, and was totally swallowed up: the space which was formerly land was also covered with an extensive lake of water. And, during the earthquakes which prevailed in the kingdom of Chili, in the year 1646, several whole mountains of the Andes sunk and disappeared. In Java the volcano of Papandayang disappeared during an eruption in 1772.

ABSORUS, APSORUS, ABSYRTIS, ABSYRTIDES, (Strabo, Mela, Ptolemy), islands in the Adriatic, in the gulf of Carnero; said to be so called from Absyrtus, Medea's brother, there slain. They are now called *Cherso* and *Osero*.

ABSTEMII, in *Church History*, a name given to such persons as could not partake of the cup of the eucharist on account of their natural aversion to wine. Calvinists allow these to communicate in the species of bread only, touching the cup with their lip; which, on the other hand, is by the Lutherans deemed a profanation.

ABSTENTION, in *Law*, is the act of preventing an heir from taking possession.

ABSTERGENT MEDICINES, those employed for resolving obstructions, concretions, &c., such as soap, &c.

ABSTINENCE, in a general sense, the act or habit of refraining from something to which there is a strong propensity. Among the Jews, various kinds of abstinence were ordained by their law. The Pythagoreans, when initiated, were enjoined to abstain from animal food, except the remains of sacrifices; and to drink nothing but water, unless in the evening, when they were permitted to take a small portion of wine. Among the primitive Christians, some denied themselves the use of such meats as were prohibited by that law, others regarded this abstinence with contempt; of which St Paul gives his opinion, Rom. xiv. 1–3. The council of Jerusalem, which was held by the apostles, enjoined the Christian converts to abstain from meats strangled, from blood, from fornication, and from idolatry. Abstinence, as prescribed by the gospel, is intended to mortify and restrain the passions, to humble our vicious natures, and by that means raise our minds to a due sense of devotion. But there is another sort of abstinence, which may be called *ritual*, and consists in abstaining from particular meats at certain times and seasons. It was the spiritual monarchy of the western world which first introduced this ritual abstinence, the rules of which were called *rogations;* but grossly abused from the true nature and design of fasting. In England, abstinence from flesh has been enjoined by statute since the Reformation, particularly on Fridays and Saturdays, on vigils, and on all commonly called *fish days*. The like injunctions were renewed under Queen Elizabeth; but at the same time it was declared that this was done, not out of motives of religion, as if there were any difference in meats, but in favour of the consumption of fish, and to multiply the number of fishermen and mariners, as well as to spare the stock of sheep. The great fast, says St Augustin, is to abstain from sin.

ABSTINENCE is more particularly used for a spare diet or a slender parsimonious use of food. Physicians relate wonders of the effects of abstinence in the cure of many disorders, and protracting the term of life. The noble Venetian Cornaro, after all imaginable means had proved vain, so that his life was despaired of at 40, recovered, and lived to near 100, by the mere effect of abstinence; as he himself gives the account. It is indeed surprising to what a great age the primitive Christians of the East, who retired from the persecutions into the deserts of Arabia and Egypt, lived, healthful and cheerful, on a very little food. Cassian assures us, that the common rate for 24 hours was 12 ounces of bread, and pure water: with such frugal fare St Anthony lived 105 years; James the Hermit, 104; Arsenius, tutor of the Emperor Arcadius, 120; St Epiphanius, 115; Simeon the Stylite, 112; and Romauld, 120. Indeed, we can match these instances of longevity at home. Buchanan informs us, that one Laurence arrived at the great age of 140 by force of temperance and labour; and Spotswood mentions one Kentigern, afterwards called St Mongah or Mungo, who lived to 185 by the same means. Abstinence, however, is to be recommended only as it means a proper regimen; for in general it must have bad consequences when observed without a due regard to constitution, age, strength, &c. According to Dr Cheyne, most of the chronical diseases, the infirmities of old age, and the short lives of Englishmen, are owing to repletion, and may be either cured, prevented, or remedied by abstinence; but then the kinds of abstinence which ought to be observed, either in sickness or health, are to be deduced from the laws of diet and regimen.

Among the inferior animals, we see extraordinary instances of long abstinence. The serpent kind, in particular, bear abstinence to a wonderful degree. We have seen rattle-snakes which had lived many months without any food, yet still retained their vigour and fierceness. Dr Shaw speaks of a couple of cerastes (a sort of Egyptian serpents), which had been kept five years in a bottle close corked, without any sort of food, unless a small quantity of sand in which they coiled themselves up in the bottom of the vessel may be reckoned as such; yet when he saw them, they had newly cast their skins, and were as brisk and lively as if just taken. But it is natural for divers species to pass four, five, or six months every year, without either eating or drinking. Accordingly, the tortoise, bear, dormouse, serpent, &c. are observed regularly to retire, at those seasons, to their respective cells, and hide themselves, some in the caverns of rocks or ruins; others dig holes under ground; some get into woods, and lay themselves up in the clefts of trees; others bury themselves under water, &c. And these animals are found as fat and fleshy, after some months' abstinence, as before.—Sir G. Ent[1] weighed his tortoise several years successively, at its going to earth in October, and coming out again in March; and found, that of four pounds four ounces, it only used to lose about one ounce.

*Phil. Trans.* No. 134.

We have alleged instances of men passing several months as strictly abstinent as other creatures. In particular, the records of the Tower mention a Scotsman imprisoned for felony, and strictly watched in that fortress for six weeks, during which time he did not take the least sustenance; and on this account he obtained his pardon. Numberless instances of extraordinary abstinence, particularly from morbid causes, are to be found in the different periodical Memoirs, Transactions, Ephemerides, &c., as *Birch's History of the Royal Society*, in the writings of Planque, of Hooglied and Haller; but the investigations of this latter author led to the conclusion, that the extreme cases of persons sustaining inanition for months, or even years, are more than apocryphal, the consequences of very inaccurate observation in the investigators, or of deception in the pretended sufferers; yet Haller gives instances of persons affected by peculiar cerebral diseases, or in extremely low states of the system, surviving inanition until the 8th, 9th, 13th, and even the 21st day. The recent cases of *John Brown*, an Ayrshire miner, who lived 23 days buried in a coal-mine, without swallowing anything but small quantities of a chalybeate water sucked through a straw, is a well-authenticated instance of how little will sustain life, especially in a contaminated atmosphere, which, by diminishing nervous excitability, would mitigate the cravings of hunger. The *fasting woman of Rosshire*, described by *Pennant*, is not one of absolute want of food, but one in which we see how small a quantity of nutriment will sustain life for years in a person suffering under a cerebral affection. *Anne Moore, the fasting woman of Tutbury*, was an impostor detected at length by *Dr Alexander Henderson*. How far nutrition is aided by absorption by the lungs and the skin, is not ascertained; and it is not improbable that each process may contribute to prolong life in real cases of starvation.

ABSTINENTS, or Abstinentes, a set of heretics that appeared in France and Spain about the end of the third century. They are supposed to have borrowed part of their opinions from the Gnostics and Manicheans, because they opposed marriage, condemned the use of flesh meat, and placed the Holy Ghost in the class of created beings. We have, however, no certain accounts of their peculiar tenets.

ABSTRACT (*abs*, and *traho*, I draw), in a general sense, any thing separated from something else.

Abstract *Ideas*, in *Metaphysics*. See Abstraction.

Abstract *Mathematics*, otherwise called *Pure Mathematics*, is that which treats of magnitude or quantity, absolutely and generally considered, without restriction to any species of particular magnitude; such are Arithmetic and Geometry. In this sense, abstract mathematics is opposed to mixed mathematics; wherein simple and abstract properties, and the relations of quantities primitively considered in pure mathematics, are applied to sensible objects, and by that means become intermixed with physical considerations: such are Hydrostatics, Optics, Navigation, &c.

Abstract *Numbers*, are assemblages of units, considered in themselves, without denoting any particular and determinate things. Thus, six is an abstract number when not applied to any thing; but if we say 6 feet, 6 becomes a concrete number.

Abstract *Terms*, words that are used to express abstract ideas. Thus *beauty, ugliness, whiteness, roundness, life, death*, are abstract terms.

Abstract, in *Literature*, a compendious view of any large work; shorter and more superficial than an abridgment.

ABSTRACTION, in *Metaphysics*, is a term used to denote the mind's power of considering certain qualities or attributes of an object apart from the rest; or the power which the understanding has of separating the combinations which are presented to it.

Abstraction is chiefly employed in these three ways. First, When the mind considers any one part of a thing, in some respect distinct from the whole; as a man's arm, without the consideration of the rest of the body. Secondly, When we consider the *mode* of any substance, omitting the substance itself; or when we separately consider several modes which subsist together in one subject. This abstraction the geometricians make use of when they consider the length of a body separately, which they call *a line*, omitting the consideration of its breadth and thickness. Thirdly, It is by abstraction that the mind forms general ideas. Thus, when we would understand a thinking being in general, we gather from our self-consciousness what it is to think; and omitting those things which have a particular relation to our own minds, or to the human mind, we conceive a thinking being in general.

Ideas formed in this manner, which are what we properly call *abstract ideas*, become general representatives of all objects of the same kind. Thus the idea of colour that we receive from chalk, snow, milk, &c. is a representative of all of that kind; and has a name given it, *whiteness*, which signifies the same quality wherever found or imagined. See the article Metaphysics.

ABSURDUM, *reductio ad absurdum*, is a mode of demonstration employed by mathematicians when they prove the truth of a proposition by demonstrating that the contrary is impossible, or leads to an absurdity. It is in this manner that Euclid demonstrates the fourth proposition of the first book of the Elements, by showing that the contrary involves a manifest absurdity, viz. *That two straight lines can inclose a space.*

ABSYRTUS, in heathen mythology, the son of Æetes and Idyia, and brother of Medea. When the latter fled with Jason, she carried Absyrtus with her; but being closely pursued by her father she slew him, and scattered his limbs in the way, that he might be diverted from the pursuit in gathering the mangled remains of his child.

ABTHANES, in *History*, a title of honour used by the ancient inhabitants of Scotland, who called their nobles *thanes*, which in the old Saxon signifies *king's ministers;* and of these the higher rank were styled *abthanes*, and those of the lower *underthanes*.

ABU-ARISCH, a narrow strip of land in the S.W. of Arabia, lying on the borders of the Red Sea, between Lat. 15. 50. and 17. 40. N. and Long. 41. 30. and 43. E. It is a very dry and barren country, and only preserved from utter sterility by periodical inundations of rain from the neighbouring mountains. Its principal traffic is in coffee and senna leaves, and its breed of asses is highly esteemed.

ABU-ARISCH, the capital of the territory of the same name, is situated about 24 miles from the Red Sea, in Lat. 16. 40. N. and Long. 42. 20. E. The town is supposed to have been once much nearer the sea, both from the appearance of the surrounding country, and from the fact that the land here is rapidly gaining upon the sea. In its neighbourhood are several rock-salt mines. Population about 5000.

ABUBEKER, or ABU-BEKR, the first caliph, the immediate successor of Mahomet, and one of his first converts. His original name was Abdulcaaba, signifying *servant of the caaba* or *temple*, which, after his conversion to Mahometanism, was changed to Abdallah, *servant of God;* and on the marriage of the prophet with his daughter Ayesha, he received the appellation of Abu-Bekr, *Father of the virgin.* Illustrious by his family, and possessed of immense wealth, his influence and example were powerful means of propagating the faith he had adopted, and in gaining converts to the new religion. Abubeker was a sound believer; and although he lived in the greatest familiarity with Mahomet, he had always the highest veneration for his character. He vouched for the truth of his revelations after his nightly visits to heaven, and thus obtained the appellation of the *faithful.* He was employed in every mission of trust or importance, was the constant friend of the prophet, and when he was forced to fly from Mecca, was his only companion. But notwithstanding his blind devotion to Mahometanism, his moderation and prudence were conspicuous in checking the fanatical zeal of the disciples of the new religion on the death of Mahomet. This event threatened destruction to the doctrines of Islamism. Its followers could not doubt that it had taken place, and they were afraid to believe it. In this uncertainty and fluctuation of belief, Omar drew his sword, and threatened to cut in pieces all who dared to assert that the prophet was dead. Abubeker, with more coolness and wisdom, addressed the people, *Is it,* says he, *Mahomet whom you adore, or the God whom he has revealed to you? Know that this God is alone immortal, and that all those whom he has created are subject to death.* Appeased and reconciled by this speech, they elected him successor to Mahomet, and he assumed the modest title of caliph, which has continued with all his successors. Ali, the son-in-law of the prophet, regarding the elevation of Abubeker as a violation of his legal rights to the succession, refused at first to recognise the appointment, till he was forced by threats into compliance and submission. His partisans, however, still considered him as the legitimate successor, and their opinion has prevailed among many Mussulmans, who believe that the sovereign authority, both spiritual and temporal, remains with his descendants.

Abubeker first collected and digested the revelations of Mahomet, which had hitherto been preserved in detached fragments, or in the memories of the believers; and to this the Arabians gave the appellation *Almoshaf,* or the Book. He died in the 13th year of the Hegira, respected as a prudent and equitable ruler.

ABUKESO, in commerce, the same with ASLAN.

ABULAHOR, a market town of Greece, on the Aspropotamus, in the province of Acarnania. It exports silk, oil, and fruits.

ABUL CASSIM, the pretended author of a Spanish chronicle of the Conquest of Spain by the Arabs, long supposed to be a translation from the Arabic, and used as such by Mariana and others in writing their histories, but now proved to be spurious.

ABULFARAGIUS, GREGORY, son of Aaron, a physician, born in 1226, in the city of Malatia, near the source of the Euphrates in Armenia. He at first followed the profession of his father, and practised with great success; but he acquired a higher reputation by the study of the Greek, Syriac, and Arabic languages, as well as by his knowledge of philosophy and divinity. He wrote a history in Arabic, which does great honour to his memory. It is divided into dynasties, and consists of ten parts, forming an epitome of universal history from the creation of the world to his own time. The parts of it relating to the Saracens, Tartar Moguls, and the conquests of Jenghis Khan, are esteemed the most valuable. He was bishop of Guba and then of Aleppo. About 1266, being elected primate of the Jacobites in the East, he held that dignity till his death in 1286. His contemporaries speak of him in a strain of most extravagant panegyric. He is styled the *king of the learned, the pattern of his times, the phœnix of the age, and the crown of the virtuous.* Dr Pococke published his history with a Latin translation in 1663, in two vols. 4to.

ABUL FARAJ ALI, a celebrated Arabian poet, born A.D. 897. Of his numerous works, the only one published in Europe is the *Kiteb Agnani*, a collection of ancient poems. *Leipsic*, 2 vols. 4to, 1789.

ABULFAZL, who is called by Sir William Jones, "a learned and elegant," and by others, "the most elegant" writer that the East has produced, was vizier and historiographer to the great Mogul, Akbar. We have not been able to discover the year of his birth, but his death took place in 1602, when he was assassinated on his return from a mission to the Deccan. According to some writers, this foul act was perpetrated at the instigation of the heir apparent to the throne, who had become jealous of the minister's influence with the emperor. Akbar greatly lamented the loss of a man who was not only an able minister of state, but of such talents as a writer, as to make it a common saying in the East, "that the neighbouring monarchs stood more in awe of his pen than of the sword of his master." He wrote, by the emperor's command, a history of his reign, which came down to the forty-seventh year, in which he was assassinated. In connection with this, he also compiled a volume, intended to exhibit a geographical and statistical view of the empire, and of the revenue, household, and expenses of the sovereign. It likewise embraces an account of the religion of the Hindoos, of their sacred books, and their several sects in religion and philosophy. This work, which is fraught with much curious and valuable information, is known under the name of the *Ayeen Akbery.* It has been translated into English with great accuracy by Mr Francis Gladwin. The translation was undertaken and published at Calcutta, under the intelligent patronage of Mr Hastings. "Such a work," he said, in a minute of council, "could not but prove peculiarly useful; as it comprehends the original constitution of the Mogul Empire, described under the immediate inspection of its founder, and will serve to assist the judgment of the Court of Directors on many points of importance to the first interests of the company."—The Calcutta edition, published in 1783–6, in three volumes quarto, is a splendid book, and the most valuable in every respect, as the London reprints are by no means accurate.

ABULGAZI, BAYADUR, (1605–1663,) a khan of the Tartars, who wrote an esteemed history of Tartary, which has been translated into Russian, German, and French.

ABU MANSUR, a celebrated Arabian astronomer of the 9th and 10th centuries, who did much service to science by his observations. He wrote the lives of the Arabian poets; but this work has not appeared in Europe.

ABUNA, the title given to the archbishop or metropolitan of Abyssinia.

ABUNDANT NUMBER, in *Arithmetic*, is a number, the sum of whose aliquot parts is greater than the number itself. Thus, the aliquot parts of 12 being 1, 2, 3, 4, and 6, they make, when added together, 16. An abundant number is opposed to a *deficient* number, or that which is greater than all its aliquot parts taken together; as 14, whose aliquot parts are 1, 2, and 7, which make no more than 10; and to a *perfect* number, or one to which its aliquot parts are equal, as 6, whose aliquot parts are 1, 2, and 3.

ABUNDANTIA, a heathen divinity, a personification of plenty, represented in ancient monuments under the figure of a woman with a pleasing aspect, crowned with garlands of flowers, pouring all sorts of fruit out of a horn which she holds in her right hand, and scattering grain with her left, taken promiscuously from a sheaf of corn. On a medal of Trajan she is represented with two cornucopiæ.

ABURY. See AVIBURY.

ABUS, in *Ancient Geography*, a river of Britain, now the Humber.

ABUSAID, EBN ALJAPTU, sultan of the Moguls, succeeded his father anno 717 of the Hegira. He was the last monarch of the race of Jenghis Khan, who held the undivided empire of the Moguls; for after his death, which happened the same year that Tamerlane was born, it became a scene of blood and desolation, and was broken into separate sovereignties.

ABUSUMBOL, or EBSAMBOUL, or IPSAMBOUL, anciently *Aboccis*, or *Abuncis*, a town on the Nile, in Nubia, to the south of the island of Kogos, in Lat. 22. 20. 11. N. and Long. 31. 40. 57. E. About twenty feet above the river is a temple hewn out of the perpendicular face of the rock. At the entrance are several colossal figures of young persons, in bas-relief, the space between them being filled with hieroglyphics indicating a very high antiquity. A description of this famous temple is given in the article NUBIA.

ABU-TEMAN, an Arabian poet, of whom, though but little can be said, it would be improper to omit all notice, seeing he was held to be the prince of Arabian poets, during the best periods of Arabian literature. He was born about the year 787; and, happily for him, under sovereigns whose love and patronage of literature made poetical eminence an unfailing road to wealth and honour. Part of his early life was passed in Egypt, in the servile capacity of administering drink to those who frequented a mosque. It is also said, that he was for some time employed in the trade of a weaver at Damascus. But his talents for poetry soon lifted him from this humble sphere, and removed him to Bagdad, where the caliphs loaded him with presents, and treated him with the greatest respect. If we are to believe the Arabian historians, a single poem sometimes procured for him many thousand pieces of gold. So highly was he esteemed by his countrymen, that it was said "no one could ever die whose name had been praised in the verses of Abu-Teman!" His own life was very short, for he died in his fortieth year; "the ardour of his mind," says one of his contemporaries, "having wasted his body, as the blade of an Indian scimitar destroys its scabbard." Besides being a great original poet, he was the compiler of three collections of select pieces of the poetry of the East; the most esteemed of which collections is that called the *Hamasa*. Sir William Jones speaks of it as a very valuable compilation. Many of the elegant specimens of Arabian poetry contained in Professor Carlyle's well-known work, were translated from pieces contained in this miscellany. A large portion of it, with a Latin version, was annexed by Schultens to his edition of Erpenius's *Arabic Grammar*, published at Leyden in 1748; and there are also many extracts from it in the collection entitled *Anthologia Arabica*, published at Jena in 1774.

ABYDOS, in *Ancient Geography*, a city of Mysia, in Asia Minor, situated on the Hellespont, which is here scarcely a mile broad. It probably was originally a Thracian town, but was afterwards colonised by Milesians. Nearly opposite, on the European side of the Hellespont, stood Sestos; and it was here that Xerxes crossed the strait on his celebrated bridge of boats when he invaded Greece. Abydos was celebrated for the vigorous resistance it made when besieged by Philip of Macedon; and is famed in story for the loves of Hero and Leander. The old castle of the Dardanelles, built by the Turks, lies a little southward of Sestos and Abydos.

ABYDOS, in *Ancient Geography*, an inland town of Egypt, between Ptolemais and Diospolis Parva, famous for the palace of Memnon and the temple of Osiris. In the latter was discovered by Mr Bankes in 1818, the tablet containing a double series of twenty-six shields of the predecessors of Rameses the Great, which is now deposited in the British Museum.

ABYLA (Ptolemy, Mela), one of Hercules's pillars, on the African side, called by the Spaniards *Sierra de las Monas*, opposite to Calpe in Spain, the other pillar; supposed to have been formerly joined, but separated by Hercules, and thus to have given entrance to the sea now called the *Mediterranean;* the limits of the labours of Hercules. (Pliny.)

ABYSS (Ἄβυσσος). The Greek word means literally '*without bottom*,' but actually, *deep, profound*. It is used in the Septuagint for the Hebrew term תהום, which we find applied either to the ocean or to the under world. In the New Testament it is used as a noun to describe Hades, or the place of the dead generally, but more especially that part of Hades in which the souls of the wicked were supposed to be confined.

Most of these uses of the word are explained by reference to some of the cosmological notions which the Hebrews entertained in common with other Eastern nations. It was believed that the abyss, or sea of fathomless waters, encompassed the whole earth. The earth floated on the abyss, of which it covered only a small part. According to the same notion, the earth was founded upon the waters, or, at least, had its foundations in the abyss beneath. Under these waters, and at the bottom of the abyss, the wicked were represented as groaning, and undergoing the punishment of their sins.

The notion of such an abyss was by no means confined to the East. It was equally entertained by the Celtic Druids, who held that *Annwn* (the deep, the low port), the abyss from which the earth arose, was the abode of the evil principle (Gwarthawn), and the place of departed spirits, comprehending both the Elysium and the Tartarus of antiquity. With them also wandering spirits were called *Plant annwn*, "the children of the deep," (Davis's *Celtic Researches*, p. 175; *Myth. and Rites of the B. Druids*, p. 49).

ABYSS is also used in *Heraldry* to denote the centre of an escutcheon. In which sense a thing is said to be borne in abyss, *en abysme*, when placed in the middle of the shield, clear from any other bearing: He bears azure, a fleur-de-lis, in abyss.

# ABYSSINIA.

Abyssinia.

ABYSSINIA is an extensive country on the eastern coast of Africa, lying between 8° and 16° N. Lat. and 34° and 43° E. Long., bounded on the north-west by Nubia, on the north-east by the Red Sea, on the south by the country of the Gallas, and on the west by countries almost unknown, in the interior of Africa. Its extent is estimated at about 245,000 geographical square miles, and its population at from four to five millions.

Abyssinia is pre-eminently an alpine country. It rises from the low arid district on the borders of the Red Sea, in lofty ranges of mountains, with extensive and elevated table-lands, intersected by numerous valleys. Its mountains assume wild and fantastic forms, with sides frequently abrupt and precipitous, and are only accessible by very difficult passes. The summits of the more lofty are frequently, if not always, covered with snow, a statement not admitted by Bruce, but asserted by both Pearce and Salt, the former of whom was overtaken by a snow-storm on the Samen Mountains in the middle of October; the latter saw snow there from a distance on the 8th of May; and the more recent traveller, Dr Rüppell, found newly-fallen snow on the same mountains in the month of July. The Samen range of mountains are the highest in Abyssinia, and together with the Lamalmon and Lasta mountains, form a long but not continuous chain running north-east and south-west. Several of these mountains, as the Amba-Hai and the Beyeda, are upwards of 12,000 feet high, while the Abba Yaret and the Buahat rise to a height of almost 15,000 feet. Lying between the Samen mountains and the Red Sea, and almost parallel to the coast, is the Taranta range, which attains a height of upwards of 7000 feet. The table-lands or plateaux have been classed by that celebrated geographer Ritter, into three distinct groups or terraces, rising one above another from the borders of the Red Sea. The first of these is the plain of Baharnegash, lying to the west of the Taranta mountains, and extending to the river Mareb. On a higher elevation, lying between the rivers Mareb and Tacazze, is the Tigré plateau. The third or Amhara plateau is separated from the preceding by the Samen mountains, and has a mean elevation of 8000 feet. From this the country descends to unknown regions on the west.

Of the rivers of Abyssinia the most important are the Abai, called also the Bahr-el-Azrek, or Blue River, and the Tacazze. The former, which is the eastern branch of the Nile, and was considered by Bruce to be the main stream of that river, rises from two mountains near Geesh, in Lat. 10. 59. 25. N., 36. 55. 30. E. Long., at an elevation of about 10,000 feet above the level of the sea. It flows first north to the lake of Dembea, through which it has a perceptible current; it then takes a long semicircular sweep round the province of Gojam, and afterwards flows northward till about the 15th degree of north latitude, when it unites with the Bahr-el-Abiad, or White River, which is now considered to be the true Nile. The Tacazze or Atbara rises in the mountains of Lasta, and after draining those of Samen and Tigré, at length falls into the Nile in north latitude 17. 40. The Hawash rises in the south of Abyssinia, about latitude 9. 30. N., and longitude 38. E., and flowing in a north-easterly direction towards the Red Sea, is lost in Lake Abbebad, in latitude 11. 30. N., longitude 41. 40. E. The Mareb rises in the mountains of Taranta, and, flowing nearly parallel to the Tacazze, is afterwards lost in the sand; but Bruce says that in the rainy season it reaches that river. Besides these, there are numerous smaller rivers which rise in the mountains and are lost in the sandy plains below, or fall into larger rivers or lakes. The principal lake of Abyssinia is the Dembea or Tzana in the country of Amhara. It is about 60 miles long, and 40 broad, is fed by numerous rivulets, and abounds in small islands. Lake Ashangee is in the country of Tigré, and about 30 miles long by 15 broad. In the south of Abyssinia, near the Bay of Tajura, in the gulf of Bab-el-Mandeb, is the remarkable lake of Assal. This lake, which has only recently become known to travellers, is of an elliptical form, and about seven miles long. It is half filled with water of the deepest cerulean blue, and half with a solid sheet of glittering snow-white salt, and is no less than 570 feet below the level of the neighbouring gulf.

Abyssinia, from its more or less elevated situation, presents almost every variety of climate, from the burning heat of a tropical sun on the coast, to severe cold on the summits of its snow-crowned mountains. On the table-lands one breathes a pure mountain air, while in the valleys the heat is almost suffocating.

Few countries are more richly endowed by nature than Abyssinia. Its fertility is so great as in some places to produce three crops annually: vegetation gradually increases as it rises from the sandy coast. On the table-lands are found extensive pastures, and cedar forests crown the tops of many of its mountains. Among its fruit trees are numbered the date, orange, lemon, pomegranate, and banana. Coffee grows wild on the western mountains, and on its western declivities the cotton plant is found in great abundance. On the table-lands are extensive maize fields, and there, as well as in other parts of the country, the sugar-cane and vine are cultivated. On the higher grounds, wheat and barley are raised in large quantities, and the low grounds are chiefly covered with *teff*, *Poa abyssinica*, with grains not larger than the head of a pin, of which is made the bread in general use throughout the country. The low grounds produce also a kind of corn called *tokussa*, a species of Eleusine, of which a black bread is made, which constitutes the food of the lowest classes. Durra, or *Holcus Sorghum*, in Abyssinian, *Maschella*, is common. In some provinces *Schami*, Zea Mais, has been introduced; and the natives cultivate other esculent vegetables as *Schimbera*, Circe arietinum; *Misani*, lentils; *Atar*, vetches; *Bagela*, lupines; *Nuck*, oriental sesame; *Telwa*, a species of lintseed; *Schankurte*, a small onion; *Gamal*, a species of cabbage. Myrrh, senna, and various kinds of costly medicinal plants, are very plentiful.

Most of the domestic animals of Europe are found here. The horses are strong and active, and the oxen very numerous—a remarkable species of which, the Galla ox, has horns sometimes four feet long. Goats and sheep are very plentiful, but the latter are small, and have black wool. Of the animals of prey, the most numerous is the striped hyæna, which is very fierce and untameable, and, protected by superstition, roams unchecked in immense numbers over the country, entering the towns and even the houses of the inhabitants. The elephant and rhinoceros are numerous in the low grounds. The Abyssinian rhinoceros has two horns; its skin, which has no folds, is used for shields; as well as for lining drinking-vessels, being regarded as an antidote to poison. Crocodiles and hippopotami are plentiful in the rivers; lions, panthers, and the common and black varieties of leopards, are seen occasionally, and buffaloes frequently. Besides these, there are found several species of monkeys; the common, the caracal, and the booted lynx; the wild cat, a small species of wolf, the Barbary jackal, common fox, fenneck, zibet, weasel, rat, mouse, marmot, Barbary and palm squirrel, jerboa, hare, Syrian hyrax, wild boar, cameleopard, zebra, quagga, camel, and antelopes of the species *oryx*, *oreas*, *bubalis*, *euchore*, *grimmia*, and *dorcas*. The number of birds in this country is immense. Great numbers of eagles, vultures, hawks, and other birds of prey are met with; and partridges, snipes, pigeons, and swallows, are very plentiful. Among the birds of Abyssinia are the *barbatus* and *percnopterus* species of vulture, the occipital eagle, several species of falcons, the *poliocephalus*, *cubla*, and *ferrugineus* species of shrikes, *Psittacus Taranta*, or *Taranta parrakeet*, *Coracias Bengalensis*, or Bengal roller, *Bucco Saltii* or Salt's bucco, *Oriolus monachus*, *Cuculus Senegalensis*, *Picus Abyssinicus*, *Alcedo Abyssinica* or *chelicuti*, *Merops erythropterus*, and *forficatus* or *furcatus*, *Certhia Tacazze*, *Tanagra erythrorhynca*, *Sylvia pammelania*, *Colius striatus*, and *Senegalensis*, *Loxia leucotis*, *Emberiza capensis*, *Fringilla Senegalensis* and *Bengalensis*, *Muscicapa paradisea* and *mutata*, *Alauda desertorum*, *Struthio camelus* or ostrich, *Cursorius Europœus*, *Columba Guinea*, or Guinea pigeon, *Columba Abyssinica*, *Numida mitrata*, *Tringa Senegalensis*, and *Abyssinica*, *Ardea Pondiceriana*, or rather *Erodia Amphilensis*, and the *Phœnicurus musicus*, *capensis*, and the *nitens* species of the Turdus. Serpents of different species are not uncommon, among which of the venomous sort are *Naja Haje*, *Vipera Arcelaus*, *V. Echis*, and probably *V. Cerastes*. Among its insects the most numerous and useful is the bee; for honey everywhere constitutes an important part of the food of the inhabitants, and several of the provinces pay a large proportion of their tribute in this article. Of an opposite class is the locust, the ravages of which here, as in the other parts of Northern Africa, are terrible.

Abyssinia, according to MM. Galinier and Ferret, ought to be ranked among the most complex and remarkable countries in a geological point of view. The formations range from the first to the last degree of the geological scale. They found the primary and transition formations in the country of the Chohos in Tigré; secondary formations at the extremity of Tigré; tertiary and modern formations on the shores of the Red Sea, &c.; besides a great variety of sedimentary rocks, rocks of plutonic and volcanic origin; and besides those commonly named metamorphic rocks, a number of extinct volcanoes, hot springs, repositories of sulphur, rock salt, combustible substances, malachite, and native copper, lead, iron, &c.

Of the mineral wealth of Abyssinia little is known. Granite, slate, and gneiss, form a great part of its mountains; antimony and iron ore, with small quantities of gold and silver, are mentioned among its productions. South-east of Tigré, and about 50 miles from Amphila bay, is an extensive plain of salt, which to the depth of two feet is perfectly pure, and so hard as to require to be cut with a hatchet; at a greater depth it is much coarser and softer, till purified and hardened by exposure to the air. The savage tribes in the vicinity, ever on the watch for plunder, render the digging and carrying off the salt very dangerous to those engaged in these operations, who are therefore obliged to associate in numerous and well-armed bands. This salt is used by the Abyssinians, not only to season and preserve food, but also as a medium of exchange, increasing in value the farther it is carried into the country.

The ancients included Abyssinia under the general name of Ethiopia, and the people under that of Ethiopians, from a word in the Greek language signifying of a dark colour; and the Abyssinians of the present day call themselves Itiopians, and their country Itiopia. Abyssinia, or more correctly Habessina, is a corruption of Habesch, a name given to the country by the Arabs, and signifying a mixed people.

The ancient history of Abyssinia is very imperfectly known. The story of the Abyssinians, that their country is the Sheba mentioned in Scripture whose queen visited Solomon, is unworthy of credit; equally so is the assertion that Solomon had a son by that queen, named Menilebek, from whom sprang the Abyssinian kings. The kingdom of the Auxumitæ flourished in Abyssinia, in the first or second century of our era. Its chief town was Auxume, whose site is now occupied by the modern Axum in Tigré, where many vestiges of its greatness are to be found. It appears that at this time the arts of the Greeks and Egyptians had penetrated into the country; and we find the Greek language used in their monumental inscriptions, as in the famous monument at Axum, executed before the introduction of Christianity, in which the king calls himself "son of the invincible Mars." In the year 522, the Abyssinians, under the command of their king Elesbaan, the most powerful, and the only conquering prince that occupied the throne, attacked and destroyed the kingdom of the Homerites, on the opposite coast of the Red Sea. Elesbaan afterwards resigned the government, and ended his life in a monastery. About 60 years later, the Abyssinians were expelled from Arabia, and from this time till about the year 960 we have very little information respecting them that can be depended on. About the latter period, Queen Judith, a Jewish princess, of more than manly courage and ruthless ambition, conceived the bloody design of murdering all the members of the royal family, and establishing herself in their stead. During the execution of the project the infant king was carried off by some faithful adherents, and conveyed to Shoa, where his authority was acknowledged; while Judith reigned for 40 years over the rest of the kingdom, and transmitted the crown to her posterity. In 1268, however, the kingdom was restored to the royal house, in the person of Icon Amlac. On the accession of this prince the royal residence was removed from Axum to Shoa, and the Amharic became the language of the court. About the close of the 15th century, the Portuguese missions into Abyssinia commenced, and were continued from time to time, till Mendez, by his arrogance and cruelty, brought about their expulsion. This Portuguese Jesuit had so ingratiated himself with the Emperor Lusneius, as to be intrusted with the management of the religious affairs of the country. The emperor himself swore obedience to the Roman Pontiff, and commanded his people to embrace the Roman Catholic religion. But the people had not suffered papal tyranny sufficiently long to submit tamely to the inquisitorial punishments that Mendez administered to the recusants. Civil commotions and insurrections were the consequence, till at length, in 1631, the emperor freed the people from the tyranny of Mendez, by granting them liberty to exercise the religion they preferred; and Basilides, who succeeded his father in 1632, drove Mendez and the whole Jesuitical persecutors out of the country. Abyssinia then became the seat of anarchy and confusion, occasioned by the encroachments of the Gallas from without, and the contests between the governors of the different provinces in the interior. Might everywhere triumphed over right; cities and villages were burned down, and the inhabitants driven out and sold for slaves. In these circumstances, the king, who lived in Gondar, with only a small retinue of servants, received but little respect or obedience from the governors of the different provinces, each of whom was anxious to obtain that title for himself, and was only prevented by the jealousy of the others. The result of these contests has been that Abyssinia, as a kingdom, has ceased to exist. It is now divided into numerous independent kingdoms or provinces, governed either by Galla princes, or by the successors of former governors, who had raised themselves to independence. These petty kings are constantly at war with each other, and the most deadly animosities exist between them.

The most important of the kingdoms of Abyssinia are those of Tigré, Amhara, Gondar, Shoa, and Angot. Tigré is situate in the north-eastern part of Abyssinia, separated from Amhara by the river Tacazze, and comprehends the provinces of, 1. Tigré proper, with Adowa the chief town, and Axum the ancient capital of Abyssinia; 2. Agame; 3. Enderta; 4. the Lasta country, consisting of rude and almost inaccessible mountains; 5. Lamen; 6. Baharnegash; 7. Woijerat; 8. Wofila; besides these are the districts of Tembea, Shirè, Waldubha, &c.

Amhara consists of the large province of Amhara, lying along the Dembea lake, and several of the neighbouring districts; and is governed by a Galla prince.

Gondar is in the possession of a Mahommedan Galla prince and contains, 1. The province of Dembea, named after the lake in its vicinity, with the city of Gondar, which was formerly the chief town of Abyssinia. 2. The province of Bejemder. 3. The province of Maidsha, besides the districts of Godsham, Damot, &c.

Shoa is situate in the south of Abyssinia, and at present seems to be the most powerful and flourishing kingdom in that country. It is inhabited chiefly by Gallas, and is governed by a Galla prince, who resides at Ankobar; the population is estimated at one and a-half million. Angot also in the south of Abyssinia, is inhabited by Gallas and governed by a Galla prince. Its capital is Agof.

The aborigines, who are the most numerous people of Abyssinia, belong to the Caucasian race, and are of a dark olive colour, approaching to black, and generally handsome, with long hair and lively eyes. They are divided into tribes, as the Tigreans, Amharans, Agows, &c. Other races have, at various times, established themselves in the country. A Jewish race inhabit the district of Lamen, and are known by the name of Talashas. They affirm that their forefathers came into the country as early as the days of Rehoboam; but it seems more probable that they had come about the time of the destruction of Jerusalem. From the tenth century they enjoyed their own constitutional rights, and were subject to their own kings, who, they pretend, were descended from king David, until the year 1800, when the royal race became extinct, and since then they have been subject to Tigrè. The Gallas are a wild and savage race from the south, who have overrun the greater part of Abyssinia, so that at present there are few chiefs who have not an intermixture of Galla blood. They are mostly idolaters, but many have

Abyssinia. adopted the Mahommedan faith, and not a few the Christianity of the Abyssinians. Their young men are denied certain privileges, and are despised by their seniors, and even by the women, till they have given proof of their manhood by killing an enemy.

The principal languages of Abyssinia belong to the Ethiopic class, and are divided into several branches. The Geez, which is the language of Tigré, and of which the modern Tigré is a dialect, is that of the religion and literature of the country; and while Tigré was dominant, it was that of the court. From its affinity to the Arabic, it may reasonably be supposed to have been introduced by conquerors or settlers from the opposite shores of the Red Sea. The Amharic, which is the language of the present dominant race, is that used by the court and merchants, and that which travellers who penetrate beyond Tigré, generally have occasion to use. Though this language has many words in common with the Geez, yet whether it be a dialect of that or an ancient African language, is a question which has not been settled. The Agow in its various dialects is the language of the people generally; in some provinces it is used almost exclusively, and in others where it has been superseded by the language of the dominant race, it still exists among the lowest classes. The Gallas have introduced their own language into various parts of the country; but in many cases they have adopted the language of the people whose place they have usurped.

The religion of the Abyssinians is a very degraded form of Christianity. It was introduced as early as the beginning of the fourth century by Frumentius, who was consecrated first Bishop of Abyssinia by St Athanasius of Alexandria. Since that time, it has been so corrupted by errors of various kinds, as to have now become little more than a dead formality mixed up with superstition and Judaism. Their children are circumcised, and the Mosaic commandments with respect to food and purification are observed. Fasts and feast-days are very frequent; baptism and the Lord's Supper are dispensed after the manner of the Greek church. Their worship consists merely in reading passages of Scripture, and dispensing the Lord's Supper without any preaching or singing. Of the more ignorant of the clergy, the greater part are married; and even among the monks, marriage is not rare, though contrary to the rules of their order; and indeed, some of them even live in polygamy, which among the Abyssinians is not uncommon. Their primate or chief bishop, whom they call *Abuna* (*i.e.* our father) is nominated by the Patriarch of Cairo, whom they acknowledge as their spiritual father. The ecclesiastical body is very numerous, consisting of priests of various kinds, with monks and nuns, and is looked upon with great awe and reverence. They have innumerable saints, but above all is the Virgin, whom they consider as queen of heaven and earth, and the great intercessor for the sins of mankind. Their churches are rude edifices, chiefly of a circular form, with thatched roofs, and surrounded by pillars of cedar. Like the Greek church, they have no images of any kind in their places of worship, but paintings are very common; and on entering, every one must leave his shoes at the door. Legends of saints, and works of religious controversy, form almost their entire literature.

The Abyssinians are very rude and barbarous. Engaged as they are in continual wars, and accustomed to bloodshed, human life is not respected among them. Murders and executions are frequent, and at Gondar Bruce seldom went out without seeing dead bodies in the streets, left to be devoured by the dogs and hyænas. When one commits murder, he must make satisfaction to the relatives of the deceased, who may either put him to death or accept of a ransom. When the murdered person has no relatives, the priests take upon themselves the office of avengers. Raw flesh is with them a favourite article of food. At their *brinds*, or raw flesh feasts, the cattle are brought to the door and slaughtered; and the flesh, while yet warm and quivering, is brought in to the guests, and devoured by them with great gusto. Marriage is a very slight connection, dissolvable at any time by either party. The engagement is concluded between the lover and the bride's parents, her consent not being considered at all necessary to the agreement. The lover then carries off the bride on his shoulders, and the ceremony concludes with a brind feast. Their principal liquor is mead; but the common drink of the lower classes is *bouza*, a species of sour beer, made from the fermentation of their bread, principally of that left at their feasts. Their dress consists of a large folding mantle and close drawers; their houses are very rude, of a conical form, and covered with thatch.

The inhabitants of Abyssinia are chiefly engaged in agricultural and pastoral pursuits. Their industrial productions are insignificant, consisting chiefly in preparations of leather, parchment, cotton cloths, and tapestry fabricated from wool and goats' hair, and in manufactures of iron and brass.

Abyssinia is equally unimportant in a commercial point of view. It only possesses a single harbour; and there is no road or navigable river to facilitate intercourse with the interior of the country. In addition to these obstacles, merchants, when travelling, are exposed to the attacks of wild marauding hordes, and subjected to high taxes and duties, which annually amount to a considerable sum. Massuah, its principal, or rather only seaport town, is the chief place for foreign traffic. Caravans bring here the merchandise of this and some of the western countries, and carry away European and Indian goods. Its principal imports are lead, tin, copper, silk, gunpowder, glass, Indian goods, Persian carpets, French cloths, coloured skins from Egypt; the exports are ivory, gold, slaves, cattle, cotton cloth, mules, honey.

The steam navigation of the Red Sea has given an increased degree of importance to Abyssinia in the eyes of several of the European powers. The British, since they got possession of Aden, have been very anxious to establish commercial intercourse with this country; while the French have been no less desirous to attain the same object. The latter have despatched several embassies for the purpose of ascertaining the mercantile capabilities of the country, and have also, in order to effect a union between that country and the See of Rome, established a Catholic mission at Adowa. The English, in the beginning of 1841, sent a political mission to Shoa, with the view to a commercial union with that kingdom. Major Harris, who commanded the expedition, afterwards published an account of his travels there, in three volumes. In 1829, the Church Missionary Society sent Messrs Gobat and Kugler as missionaries to Abyssinia. Mr Kugler died shortly after his arrival, but his place was supplied by Isenberg, who was followed by Messrs Blumhardt and Krapf. Mr Gobat returned to Europe in 1833, and next year published a journal of his residence in Abyssinia. On account of the opposition of the native priests, the missionaries were, in 1838, compelled to leave the country; and after several fruitless attempts to re-establish themselves, the mission was abandoned in 1843. Dr Edward Rüppell, a German naturalist, arrived at Massuah in 1831, and remained in the country nearly two years. His researches have thrown much light on the nature and productions of the country. He brought to Europe a large collection of animals, including many new species, which he deposited in the museum of his native city, Frankfort on the Maine; and in 1838 he published an account of his travels, in two volumes, entitled, *Reise in Abyssinien*. But of all the travellers to this country, perhaps none have done more to extend our knowledge of it than Dr Beke. He reached several places which had never before been visited by Europeans, collected vocabularies of no fewer than thirteen of its languages and dialects, and is the first traveller who has described the sources of Abai since the days of Bruce, whose statements he confirms. He arrived at Tajura in November 1840, and travelling through Shoa, Gojam, Lasta, and Tigré, arrived at Massuah in May 1843. From time to time he communicated an account of his travels to the Royal Geographical Society, which is published in their journal.

ABYSSINIAN, in *Ecclesiastical History*, is the name of a sect in the Christian church, established in the empire of Abyssinia. The Abyssinians are a branch of the Copts or Jacobites, with whom they agree in admitting but one nature in Jesus Christ, and rejecting the council of Chalcedon: whence they are called *Eutychians* or *Monophysites*, and stand opposite to the Melchites. They are only distinguished from the Copts, and other sects of Jacobites, by some peculiar national usages. The Abyssinian sect or church is governed by a bishop or metropolitan styled *Abuna*, sent them by the Coptic patriarch of Alexandria residing at Cairo, who is the only person that ordains priests. The next dignity is that of Komos, or Hegumenos, who is a kind of archpresbyter. They have canons also, and monks: the former of whom marry; the latter, at their admission, vow celibacy, but with a reservation: these, it is said, make a promise aloud, before their superior, to keep chastity; but add in a low voice, *as you keep it*. The emperor has a kind of supremacy in ecclesiastical matters. He alone takes cognizance of all ecclesiastical causes, except some smaller ones reserved to the judges, and confer all benefices, except that of Abuna. See Abyssinia.

ACA, Ace, or Acon, in *Ancient Geography*, a town of Phœnicia, on the Mediterranean; afterwards called *Ptolemais;* now *Acre.*

ACACIA, Egyptian Thorn, or Binding Bean-tree, in *Botany*, a species of mimosa, according to Linnæus, though other botanists make it a distinct genus. Several species of acacia produce *gum arabic*, especially *A. Ehrenbergii*, *A. tortilis*, *A. arabica*, *A. vera*, *A. Seyal*, *A. Verek*. An inferior sort is produced by *A. Adansonii*, *A. albida*, and *A. Karro*. These are natives of Egypt, Arabia, or Africa. The inspissated gum of the bark of *A. catechu* forms the astringent substance name catechu; which, however, is also produced in India from several other trees. The bark of several species of acacia produce a *tannin;* of which a large quantity is now imported from Van Diemen's Land, for the purposes of the tanner, and is chiefly the produce of *A. decurrens* and *A. mollissima.*

*A. julibrissin*, a native of Persia, has, on account of its elegant foliage and flowers, been long acclimated in England; *A. sophora* is a fragrant species, that has more lately been introduced, and is nearly acclimated in the south of our island. It flowers early in spring, and bears many clusters of rich yellow flowers.

The flowers of a species of the acacia are used by the Chinese in making that yellow which we see bears washing in their silks and stuffs, and appears with so much elegance in their painting on paper. The method is this: They gather the flowers before they are fully open; these they put in a clean earthen vessel over a gentle heat, and stir them continually about as they do the tea-leaves, till they become dryish and of a yellow colour; then to half a pound of flowers they add three spoonfuls of fair water, and after that a little more, till there is just enough to hold the flowers incorporated together; they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine lasting yellow they have so long used.

The dyers of large pieces use the flowers and seeds of the acacia for dyeing three different sorts of yellow. They roast the flowers, as before observed; and then mix the seeds with them, which must be gathered for this purpose when fully ripe; by different admixtures of these they give the different shades of colour, only for the deepest of all they add a small quantity of Brazil wood.

Mr Geoffroy attributes the origin of bezoar to the seeds of this plant; which being browsed by certain animals, and vellicating the stomach by their great sourness and astringency, cause a condensation of the juices, till at length they become coated over with a stony matter which we call Bezoar.

Acacia, in the *Materia Medica*, the inspissated juice of the unripe fruit of the *Mimosa Nilotica.*

The juice is brought to us from Egypt, in roundish masses wrapt up in thin bladders. It is outwardly of a deep brown colour, inclining to black; inwardly of a reddish or yellowish brown; of a firm consistence, but not very dry. It soon softens in the mouth, and discovers a rough, not disagreeable taste, which is followed by a sweetish relish. This inspissated juice entirely dissolves in watery liquors, but is scarce sensibly acted on by rectified spirit.

This acacia is a mild astringent medicine. The Egyptians give it in spitting of blood, in the quantity of a drachm, dissolved in any convenient liquor; and repeat this dose occasionally: they likewise employ it in collyria for strengthening the eyes, and in gargarisms for quinsy. Among us, it is little otherwise used than as an ingredient in mithridate and theriaca, and is rarely met with in the shops. What is usually sold for the Egyptian acacia, is the inspissated juice of unripe sloes; this is harder, heavier, of a darker colour, and somewhat sharper taste, than the true sort. See the next article.

*German Acacia*, the juice of unripe sloes inspissated nearly to dryness over a gentle fire, care being taken to prevent its burning. It is moderately astringent, similar to the Egyptian acacia, for which it has been commonly substituted in the shops. It is given in fluxes, and other disorders where styptic medicines are indicated, from a scruple to a drachm.

Acacia, among *Antiquaries*, something resembling a roll or bag, seen on models, as in the hands of several consuls and emperors. Some take it to represent a handkerchief rolled up, wherewith they made signals at the games; others, a roll of petitions or memorials; and some a purple bag full of earth, to remind them of their mortality.

ACACIANS, in *Ecclesiastical History*, the name of several sects of heretics; some of which maintained, that the Son was only a similar, not the same, substance with the Father; and others, that he was not only a distinct but a dissimilar substance. Two of these sects had their denominations from Acacius, bishop of Cæsarea, who lived in the fourth century, and changed his opinions so as, at different times, to be head of both. Another was named from Acacius, patriarch of Constantinople, who lived in the close of the fifth century.

ACACIUS, surnamed Luscus, because he was blind of one eye, was bishop of Cæsarea in Palestine, and succeeded the famous Eusebius: he had a great share in the banishment of Pope Liberius, and bringing Felix to the see of Rome. He gave name to a sect, and died about the year 365. He wrote the life of Eusebius, which is lost, and several other works.

Acacius, *Saint*, bishop of Amida in Mesopotamia, in 420, was distinguished by his piety and charity. He sold the plate belonging to his church, to redeem seven thousand Persian slaves who were perishing with hunger. He gave each of them some money and sent them home. Veranius, their king, was so affected with this noble instance of benevolence, that he desired to see the bishop; and this interview procured a peace between that prince and Theodosius I.

There have been several other eminent persons of the same name; particularly, a martyr under the Emperor Decius;

a patriarch of Antioch, who succeeded Basil in 458, and died in 459; a bishop of Melitene in the fifth century; a famous rhetorician in the reign of the Emperor Julian; and a patriarch of Constantinople in the fifth century, who was ambitious to draw the whole power and authority of Rome by degrees to Constantinople, for which he was excommunicated by Pope Felix II. He in his turn passed sentence of excommunication against the pope. Still, however, he held his patriarchate till his death in 488.

ACAD, ACCAD, or ACHAD, one of the five cities in "the land of Shinar," or Babylonia, said (Gen. x. 10) to have been built by Nimrod. Their situation has been much disputed. Without giving the details of the question, it is sufficient to say that Colonel Taylor, the British resident at Baghdad, who has given much attention to the subject, has, with great probability, identified the ancient Achad (or *Achar*, as it is given in some Hebrew MSS.), with the remarkable pile of ancient buildings called *Akker-koof*, in Sittacene, and which the Turks know as *Akker-i-Nimrood* and *Akker-i-Babil.* Akker-koof is about nine miles west of the Tigris, at the spot where that river makes its nearest approach to the Euphrates. The heap of ruins to which the name of Nimrod's Hill—*Tel-i-Nimrood*, is more especially appropriated, consists of a mound surmounted by a mass of brick-work, which looks like either a tower or an irregular pyramid, according to the point from which it is viewed. It is about 400 feet in circumference at the bottom, and rises to the height of 125 feet above the sloping elevation on which it stands. The mound, which seems to form the foundation of the pile, is a mass of rubbish accumulated by the decay of the superstructure. In the ruin itself, the layers of sun-dried bricks, of which it is composed, can be traced very distinctly. They are cemented together by lime or bitumen, and are divided into courses varying from 12 to 20 feet in height, and are separated by layers of reeds, as is usual in the more ancient remains of this primitive region. The use of this remarkable monument has been a subject of doubt and conjecture. The embankments of canals and reservoirs, and the remnants of brick-work and pottery occupying the place all around, evince that the Tel stood in an important city; and, as its construction announces it to be a Babylonian relic, the greater probability is that it was one of those pyramidal structures erected upon high places, which were consecrated to the heavenly bodies, and served at once as the temples and the observatories of those remote times.

ACADEMICS, or ACADEMISTS, a denomination given to the cultivators of a species of philosophy originally derived from Socrates, and afterwards illustrated and enforced by Plato, who taught in a grove near Athens, consecrated to the memory of Academus, an Athenian hero; from which circumstance this philosophy received the name of *Academical.* Before the days of Plato, philosophy had in a great measure fallen into contempt. The contradictory systems and hypotheses which had successively been advanced were become so numerous, that, from a view of this inconstancy and uncertainty of human opinions, many were led to conclude, that truth lay beyond the reach of our comprehension. Absolute and universal scepticism was the natural consequence of this conclusion. In order to remedy this abuse of philosophy and of the human faculties, Plato laid hold of the principles of the academical philosophy; and, in his Phædo, reasons in the following manner: "If we are unable to discover truth," says he, "it must be owing to two circumstances: either there is no truth in the nature of things; or the mind, from a defect in its powers, is not able to apprehend it. Upon the latter supposition, all the uncertainty and fluctuation in the opinions and judgments of mankind admit of an easy solution: Let us therefore be modest, and ascribe our errors to the real weakness of our own minds, and not to the nature of things themselves. Truth is often difficult of access: in order to come at it, we must proceed with caution and diffidence, carefully examining every step; and, after all our labour, we will frequently find our greatest efforts disappointed, and be obliged to confess our ignorance and weakness."

Labour and caution in the researches, in opposition to rash and hasty decisions, were the distinguishing characteristics of the disciples of the ancient academy. A philosopher possessed of these principles will be slow in his progress, but will seldom fall into errors, or have occasion to alter his opinion after it is once formed. In his essay on the academical or sceptical philosophy, Mr Hume has confounded two very opposite species of philosophy. After the days of Plato, the principles of the first academy were grossly corrupted by Arcesilaus, Carneades, &c. This might lead Mr Hume into the notion, that the *academical* and *sceptical* philosophy were synonymous terms. But no principles can be of a more opposite nature than those which were inculcated by the old academy of Socrates and Plato, and the sceptical notions which were propagated by Arcesilaus, Carneades, and the other disciples of the new academical school.

ACADEMUS, an Athenian hero. See ACADEMY.

# ACADEMY.

ACADEMY, ακαδημια, ακαδημεια, or εκαδημεια, (the first two forms being probably derived from ακος, *medela* and δημος, *populus*, and the last from ἑκας, *procul* or *seorsim*, and δημος, *populus*,) a garden, villa, or grove, situate in the Ceramicus, one of the suburbs of Athens, about six stadia, or nearly a Roman mile to the north-west of the city. The common tradition is, that it took its name from one *Academus* or *Ecademus*, the original owner, who was contemporary with Theseus, and made it a kind of gymnasium; and that after his death it retained his name, and was consecrated to his memory. When Castor and Pollux came to Athens to reclaim by force of arms the person of their sister Helena, who, according to the legend, had been carried off by Theseus, and concealed in some obscure retreat by the ravisher, the Athenians declared that they knew not where the lady was to be found; but as this answer was not deemed satisfactory by the warlike brothers, *Academus*, cognisant with the secret, and anxious to avert a contest about so frivolous a subject of dispute, apprised them that she was concealed in the town of Aphidna; which was immediately attacked, taken by assault, and razed to the ground. Grateful for this traditionary service, the Lacedemonians, who worshipped the Dioscuri (Castor and Pollux), spared the house and gardens known by the name of the *Academy*, when they ravaged the suburbs of Athens; and, in consideration of the disclosure just mentioned, they honoured the memory of the original owner, from whom the place took its name.[1] Such is the legend which the Greek writers have transmitted to us. With regard to the spot itself, which afterwards became so famous, in connection with the name of Plato and his philosophical disciples, it appears to have remained almost in a state of nature, covered with stagnant water, and exceedingly insalubrious, until the time of Cimon, when it was drained, planted with alleys of trees, and embellished with groves and with fountains: after which it became the promenade of the most distinguished Athenians, and particularly of the Platonic philosophers, thence called the *Academics;* just as the *Lyceum*, another gymnasium, situated to the south-east of Athens, became the promenade of the Aristotelian sect of philosophers, called also Peripatetics (*α περιπατεω, obambulo*), from the locomotive fashion in which they communicated or discoursed concerning their peculiar doctrines. The Academy formed part of the Ceramicus (a word derived from κεραμος, signifying *potter's earth* or *earthen vase*, from its being filled with cinerary urns), and was therefore devoted to purposes of sepulture; it being then the practice to inter in a public garden or grove, as in a sort of elysian field, those who had signalized themselves by rendering important services to their country. Cicero, desirous to revive or preserve the name of the Academy, bestowed it on his villa or country-seat near Puzzuoli, where he loved to converse with his friends on philosophical subjects, and where, also, he composed his *Academical Questions*, his treatise on the *Nature of the Gods*, and his celebrated work on the *Commonwealth*, a considerable portion of which was, several years ago, recovered from rescribed or palimpsest manuscripts, by Signor Angelo Maio, librarian of the Vatican.

Academy, in its generalized acceptation, is employed to signify a society of learned men, established for the improvement of science, literature, or the arts. This term, as we have seen, is one of very high antiquity. It was amidst the umbrageous recesses of the gardens of Academus, so favourable to philosophical meditation, that the divine Plato, surnamed the swan of the Academy, established his school, collected his disciples, and taught his sublime morality; wherefore the sect of this illustrious philosopher was called the Academic, and the philosophers who adopted his doctrines Academics. For a long period, accordingly, this title marked out the disciples of Plato alone; but it came afterwards to be applied to all those who belonged to the different learned or literary societies instituted, under the name of Academies, in imitation of the school of Athens, and in order to extend the boundaries of human knowledge. Of these institutions several were established in Athens itself, but none ever equalled the renown of that founded by Plato; and, in point of fact, they were merely schools where Arcesilaus, Carneades, Philo, Antiochus, and other philosophers of less note, explained the different systems with which each in his turn sought to supersede those of his predecessors, but which have since fallen into the most profound neglect and oblivion.

Ptolemy Soter, having by his victories secured undisturbed possession of the throne of Egypt, and wishing to unite to the title of conqueror the more glorious appellation of patron of learning, founded, under the name of Musæon, the celebrated Academy of Alexandria, and provided it with a collection of books, which formed the nucleus of the Alexandrian library. Here he assembled the most distinguished philosophers and scholars of his time, charging them with the investigation of philosophical truth and the improvement of art; and it was to the care and researches of these eminent men and their successors that the famous library, commenced by Ptolemy, and afterwards so barbarously given up to the flames by the Caliph Omar, was enlarged and improved, until it became the pride of Egypt and the glory of the world. This academy, distinguished alike for its useful labours and its improvements in science, has served as a model to modern academies, both as regards the principles on which it was founded, and the object and end of its institution. It admitted into the number of its associates the poets and philosophers of all countries: persons came from every part of the earth to seek instruction, or to deposit new information in its bosom: and all parties were enriched by the continual interchange of ideas and discoveries. For a long period it was the great centre of knowledge. All the literary treasures, scattered throughout the different countries which the tide of barbarism had overflowed, were there collected together: towards the period when Greece began to decline, the spirit and the genius which once presided in her schools of philosophy were in some degree revived in that of Alexandria; and it shone forth like a resplendent beacon-light in the midst of the surrounding darkness, shooting forth rays which have traversed the long course of ages, and guided the academies of modern times in their researches and investigations.

Rome had no academies. In the eyes of the conquerors and masters of the world, the sciences appeared only a secondary object, and of comparatively little importance This Virgil has admitted in his Æneid, where he says, that in art and in science the Romans must yield the palm to other nations, and content themselves with the glory of conquest, and a knowledge of the means by which it might be secured and maintained.[2] The Latin poets and writers, indeed, were formed by the study of Greek models. But no national establishment fostered their genius and favoured their progress, either under the republic, which despised letters, or under the imperial tyrants, who dreaded them. Augustus himself only patronised and rewarded the poets who flattered him; while Mæcenas, in surrounding himself with assemblages of celebrated writers, thought less of extending the boundaries of learning, than of tasting the pleasures of learned society, and wearing off the fatigues of business amidst the sweets of an inter-

---

[1] From certain expressions of Eupolis, and this among others, εν ευσκιοις δρυμοισιν Ακαδημου θεου, "in the umbrageous groves of the god Academus," it would appear that this person was accounted not merely a hero, but a sort of divinity. Hence the Academy was consecrated to Bacchus Academus, or to the beneficent sun of the ascending signs; as the Lyceum with its *temenos* or *lucus* was dedicated to Apollo Lycæus (so called from λυκος, a wolf), or to the destroying sun of the descending signs of the zodiac: and hence also these schools were the astronomical symbols or representatives of the celestial houses of the two solstices; the Academy, of the higher, and the Lyceum, of the lower solstice.

[2] Excudent alii spirantia mollius æra,
Credo equidem; vivos ducent de marmore voltus;
Orabunt caussas melius, cœlique meatus
Describent radio, et surgentia sidera dicent:
Tu regere imperio populos, Romane, memento;
Hæ tibi erunt artes; pacisque imponere morem,
Parcere subjectis, et debellare superbos.
*Æneid.* lib. vi. l. 848.

Academy. course entirely Epicurean, or of enjoyments such as literature alone can afford to men of refined and cultivated minds.

When the darkness which had settled down upon Europe after the fall of the Western Empire began at length to disperse, and when a faint glimmering of light, symptomatic of slowly approaching day, began to flicker and tremble on the dusky brow of the long night of ignorance and barbarism, a passion for instruction became in some measure the mode, and gave birth simultaneously to a multitude of learned associations; and these proceeded at once to the study and improvement of the sciences and arts, long neglected, and almost lost in those very countries where they had formerly been cultivated with the greatest success. The Gauls, however, although partially civilized by the Romans and by Julian the philosopher (vulgarly called the Apostate), had relapsed, under the indolent and imbecile monarchs of the first race, into the most profound ignorance; while the monks, who passed for learned men when they could read, were from policy opposed to the instruction of the people. The spirit of monopoly and exclusion was then, as afterwards, a prominent characteristic of the ecclesiastical system; and the danger of educating the people was as vehemently exaggerated as by certain alarmists of our own day. "The clergy," said Charlemagne, "wish to monopolize all learning, and to continue the sole expounders of the sciences and the laws." Nevertheless this prince, who would have done honour to an age far less barbarous, attempted to resuscitate letters, with which he had some acquaintance; and with this view he, encouraged by the celebrated Alcuin, founded in his palace an academy for promoting the study of grammar, orthography, rhetoric, poetry, history, and the mathematics. This academy was composed of the principal wits of the court, Charlemagne himself being a member. In their academical conferences, every member was to give an account of the ancient authors which he had read; and in order to efface all distinctions of rank among the academicians, he required each of them to choose a name purely literary (as, for example, that of some ancient author or celebrated person of antiquity), which should in no degree serve to recall the birth, station, or dignity of the person assuming it. Accordingly, Egilbert, a young lord, and one of the grandees about the court, modestly took the name of Homer; the archbishop of Mayence called himself Damœtas; Alcuin became Flaccus Albinus; Eginhard, Calliopus; Adelard, abbot of Corbie, Augustin; Theodulph, Pindar; and Charlemagne himself, somewhat forgetful of his own rule, David.[1] Fantastical as all this may appear to us, it was nevertheless productive of good. The nobles, who had been accustomed to value themselves solely on their birth and ancestry, began to acquire a relish for more substantial distinctions, and to feel the force of Charlemagne's remark, that the state was likely to be better served by men who had improved their minds and cultivated their talents, than by those who had no other recommendation than overweening pride and a long pedigree. Hence the academy of Charlemagne soon obtained great celebrity; and although few monuments of its labours remain, yet it unquestionably gave an impulse to learning, diffused a taste for knowledge, and probably laid the first foundations of the French language, which was then a rude idiom, composed of a barbarous mixture of the language of the Goths, of Latin, and of the dialect of Celtic spoken by the ancient Gauls. This idiom the academy subjected to principles, forming it into a regular language, which afterwards became the provençal, or language of romance: and when it had thus, as it were, been licked into shape, Charlemagne proposed to have the hymns, the prayers, and the laws translated into it, for the benefit of the people; a proposal which reflects the greatest honour on his memory. But the clergy resolutely set their faces against an innovation which would have deprived them of part of their influence as the sole expounders both of the civil and the divine laws, and thus in a great measure frustrated the principal object which Charlemagne had in view in founding his academy. Still its labours, though in some respects neutralized by the personal interest of the monks, were not altogether useless, but, on the contrary, were instrumental in diffusing the first gleams of light throughout France, and in preparing it to emerge from a state of barbarism. Academy.

In the following century, Alfred, a man worthy of being classed with the first French legislator, founded an *academy* at Oxford, which formed the basis of the University afterwards established there; but this being a school for instruction rather than an institution for exciting emulation among the instructed, it does not, for that reason, fall within the scope of the present article. About the same period the Moors of Spain, celebrated for their gallantry, their chivalrous manners, and their taste for poetry, music, and letters, had also their academies at Granada and Cordoba; but of the precise nature and object of these institutions little or nothing is known. In the year 1325, the *Academy of the Floral Games* was established at Toulouse. This academy is still in existence, and is of course the most ancient establishment of the kind in Europe. The members assumed the somewhat fantastical name of *Maintainers of the Gay Science;* and the prizes which it awarded, consisting of flowers of gold and silver, excited a strong spirit of emulation among the Troubadours of Languedoc and Provence. This society, to which Clemens Isaurus bequeathed the whole of his property, still enjoys a considerable reputation; and many of the young poets of France, who aspire to be one day crowned with the genuine laurels of Parnassus, repair to it, at the commencement of their career, to dispute for the *violet*, the *marigold*, the *amaranth*, and the *eglantine.*

A whole host of academies sprung up in different countries immediately after the revival of letters in the fifteenth century; but it was in Italy that they were most numerous, every city in fact having its own; and they were frequently distinguished by appellations remarkable either for their oddity or extravagance. Thus, Rome had its *Lincei;* Naples, its *Ardenti;* Parma, its *Insensati;* and Genoa, its *Addormentati;*—names which some modern academicians might adopt without the slightest impropriety. Many flourishing academies existed in France

[1] Some modern writers have supposed that this assumption of ancient or classical names originated in an ardent admiration of antiquity, blended with the genius of an age essentially pedantic; and thus they have endeavoured to account for Alcuin taking the surname of Horace as a prænomen, and calling himself Flaccus Albinus. But from what is stated in the text, this appears to be a mistake. With regard to the circumstance of Charlemagne taking the name of David, which, as a royal one, appears to have been a contravention of his own rule, it is evident that his choice was determined by his passion for the composition of canticles or psalms, in which he believed himself to be eminently skilful, and also by his decided preference of sacred to profane literature. The emperor, in fact, had great pretensions as a theologian; and on one occasion, when reproaching Reibode, archbishop of Treves, with his admiration of Virgil's poetry, he remarked of himself, that he would much rather possess the spirit of the four evangelists than that of the twelve books of the Æneid.

before the Revolution, most of them having been established and endowed by the munificence of Louis XIV. In Britain we have but few, and those of the greatest note fall to be classed under a different appellation, namely, Society.

In giving an account of the principal academies, which is all that this article professes to do, we shall, for the sake of clearness, arrange them under different heads, according to the subjects for the cultivation and improvement of which they were instituted. And we shall commence with

I. *Medical Academies.* Of this description are, the Academy of the *Naturæ Curiosi* of Germany; that founded at Palermo in 1645; that established at Venice in 1701, which used to meet weekly in a hall near the grand hospital; and an institution which took its rise at Geneva in 1715. The Royal Colleges of Physicians at London and Edinburgh have also been ranked by some in the number of academies, but, in our opinion, erroneously; for they are rather of the nature of corporations, organized with a view to guard the privileges and promote the interests of a particular profession, than academies instituted for facilitating the advancement of medical science. This is the exclusive object of the Royal Medical Society, and other institutions of the same sort; which, however, fall to be treated of under a different head, viz. that of Society.

The Academy of *Naturæ Curiosi*, called also the *Leopoldine Academy*, was founded in 1662, by J. L. Bauschius, a physician, who, imitating the example of the English, published a general invitation to medical men to communicate all extraordinary cases that occurred in the course of their practice: and, the scheme meeting with success, the institution was regularly organized, and Bauschius elected president. The works of the *Naturæ Curiosi* were at first published separately; but this being attended with considerable inconvenience, a new arrangement was formed, in 1770, for publishing a volume of observations annually. From some cause, however, the first volume did not make its appearance until 1784, when it came forth under the title of *Ephemerides;* and the work was afterwards continued, at irregular intervals, and with some variations in the title. In 1687, the Emperor Leopold took the society under his protection, and granted its members several privileges, the most remarkable of which was, that its presidents should be entitled to enjoy the style and rank of counts palatine of the holy Roman empire; and hence the title of *Leopoldine* which it in consequence assumed. But though it thus acquired a name, it had no local habitation or fixed place of meeting, and no regular assemblies; instead of which there was a kind of bureau or office, first established at Breslau, and afterwards removed to Nuremberg, where letters, observations, and communications from correspondents, were received, and persons properly qualified admitted as members. By its constitution, the Leopoldine Academy consists of a president, two adjuncts or secretaries, and colleagues or members, without any limitation as to numbers. At their admission, the last come under a twofold obligation; first, to choose some subject for discussion out of the animal, vegetable, or mineral kingdom, provided it has not been previously treated of by any colleague of the academy; and, secondly, to apply themselves to furnish materials for the annual *Ephemerides.* Each member also bears about with him the symbol of the academy, consisting of a gold ring, whereon is represented a book open, with an eye on one side, and on the other the academical motto of *Nunquam otiosus.*

II. *Chirurgical Academies.* An association of this sort was, not many years ago, instituted, by public authority, at Paris; the members of which were not only to publish their own observations and improvements, and those of their correspondents, but also to give an account of the various publications on surgery, and to compose a complete history of the art from the works of all the authors, ancient and modern, who have treated of it. Besides, a question in surgery was to be annually proposed, as the subject of a prize essay, and a gold medal of the value of 200 livres given to the successful competitor.

The *Academy of Surgery* at Vienna was instituted by the present emperor, under the direction of the celebrated Brambella. In it there were at first only two professors; and to their charge the instruction of a hundred and thirty young men was committed, thirty of whom had formerly been surgeons in the army. But latterly the number both of teachers and pupils was considerably increased. Gabrielli was appointed to teach pathology and practice; Boecking, anatomy, physiology, and physics; Streit, medical and pharmaceutical surgery; Hunczowsky, surgical operations, midwifery, and the chirurgia forensis; and Plenk, chemistry and botany. To these was also added Beindel, as prosector and extraordinary professor of surgery and anatomy. Besides this, the emperor provided a large and splendid edifice in Vienna, which affords accommodation both for the teachers, the students, pregnant women, patients for clinical lectures, and servants. For the use of this academy the emperor also purchased a medical library, which is open every day; a complete set of chirurgical instruments; an apparatus for experiments in natural philosophy; a collection of natural history; a number of anatomical and pathological preparations; a collection of preparations in wax, brought from Florence; and a variety of other useful articles. Adjoining to the building, also, there is a good botanical garden. With a view to encourage emulation among the students of this institution, three prize medals, each of the value of 40 florins, are annually bestowed on those who return the best answers to questions proposed the year before. These prizes, however, are not entirely founded by the emperor, but are in part owing to the liberality of Brendellius, formerly protochirurgus at Vienna.

III. *Ecclesiastical Academies.* Under this head may be mentioned the academy at Bologna in Italy, instituted in 1687, for the purpose of investigating the doctrine, discipline, and history, of each age of the church.

IV. *Cosmographical Academies;* as that at Venice, called the *Argonauts.* This was instituted at the solicitation of F. Coronelli, for the improvement of geographical knowledge. Its design was to publish exact maps, particular as well as general, both of the celestial and terrestrial sphere, together with geographical, historical, and astronomical descriptions. Each member, in order to defray the expense of such a publication, was to subscribe a proportional sum, for which he was to receive one or more copies of each piece published. To this end three societies were established; one under F. Moro, provincial of the Minorites in Hungary; another under the Abbot Laurence au Ruy Payenne au Marais; and the third under F. Baldigiani, Jesuit, professor of mathematics in the Roman College. The device of this academy is the terraqueous globe, with the motto *Plus ultra;* and at its expense all the globes, maps, and geographical writings of F. Coronelli have been published.

In the year 1799, a *Geographical Academy* was established at Lisbon, principally for the purpose of elucidating the geography of Portugal. By the labours of the members of this academy, an accurate map of the country, which was much wanted, has been completed.

V. *Academies of Science.* These comprehend such

Academy. as have been erected for improving natural and mathematical knowledge, and are otherwise called *Philosophical* and *Physical Academies.*

The first of these was instituted at Naples, about the year 1560, in the house of Baptista Porta. It was called the Academy *Secretorum Naturæ;* and was succeeded by the Academy of *Lincei,* founded at Rome by Prince Frederic Cesi, towards the end of the same century. This academy was afterwards rendered famous in consequence of the discoveries made by some of its members, among whom, the first place is due to the celebrated Galileo, one of the most illustrious names of which the history of science can boast. Several other academies, instituted about this time, also contributed to the advancement of the sciences; but none of them was in any respect comparable to that of the *Lincei.*

Some years after the death of Torricelli, the *Accademia del Cimento* made its appearance, under the protection of Prince Leopold, afterwards Cardinal de' Medici. Redi was one of its chief members. In so far as regards the studies pursued by the other academicians, a very correct idea of them may be formed from the curious experiments published in 1667, by their secretary Count Laurence Magulotti, under the title of *Saggi di Naturali Esperienze;* a copy of which was presented to the Royal Society, translated into English by Mr Waller, and published at London in 4to.

The *Accademia degl'Inquieti,* afterwards incorporated into that of *Della Tracia,* in the same city, followed the example of that of Del Cimento. Some excellent discourses on physical and mathematical subjects, by Geminiano Montenari, one of the chief members, were published in 1667, under the title of *Pensieri Fisico-Matematici.*

The *Academy of Rossano,* in the kingdom of Naples, was originally an academy of belles lettres, founded in 1540, and transformed into an academy of sciences in 1695, at the solicitation of the learned abbot Don Giacinto Gimma; who being made president, under the title of Promoter General of the institution, gave it a new set of regulations. He divided the academicians into the following classes: grammarians, rhetoricians, poets, historians, philosophers, physicians, mathematicians, lawyers, and divines; with a class apart for cardinals and persons of quality. To be admitted a member, it was requisite to have taken a degree in one or other of the faculties. The members were not allowed to take the title of *Academicians* in the title-pages of their works, without a written permission from their president, which was not granted till their works had been examined by the censors of the academy; and this permission was the greatest honour the academy could confer, as they thereby adopted the works thus examined, and became answerable for them against all criticisms that might be made upon them. To this law the president or promoter himself was subject; and no academician was allowed to publish anything against the writings of another without leave obtained from the society.

But Italy boasts of a number of scientific academies besides those above mentioned. The Royal Neapolitan Academy was established in 1779; and the published memoirs contain some valuable researches on mathematical subjects. The Royal Academy of Turin was established by the late king when duke of Savoy. Its memoirs were originally published in Latin, under the title of *Miscellanea Philosophica Mathematica Societatis Privatæ Taurinensis;* and the first volume appeared in 1759. Among the original members of this institution the most celebrated was Lagrange, who burst on the scientific world quite unexpectedly, by the novelty and depth of his papers in the first volume of the transactions. An Academy of Sciences, Belles Lettres, and Arts, was established at Padua by the senate, near the close of the eighteenth century. It is composed of twenty-four pensionaries, twelve free associates, twenty-four pupils, twelve associates belonging to the *ci-devant* Venetian States, and twenty-four foreigners, besides honorary members. It has published several volumes of memoirs in the Italian language. The Academy of Sciences and Belles Lettres of Genoa was established in 1783. It consists of thirty-two members; but their labours have been chiefly directed to poetry, nor are we aware that they have published any memoirs. The Academy of Milan was preceded, and perhaps introduced, by a literary assembly, consisting of ten persons, who published a sheet weekly, containing short remarks on subjects of science, belles lettres, and criticism. This society terminated in 1767. But soon afterwards another was established, the transactions of which, published under the title of *Scelta d'Opuscoli Scientifici,* contain several very interesting papers. The Academy of Sciences at Siena, instituted in 1691, published the first volume of its transactions in 1761, and has since continued them, at long intervals, under the title of *Atti dell'Accademia di Siena.* Between the years 1770 and 1780, M. Lorgna established at Verona an academy of sciences of a novel description. The object of it was to form an association among the principal scientific men in all parts of Italy, for the purpose of publishing their memoirs. The first volume appeared in the year 1782, under the title of *Memorie di Matematica e Fisica della Societa Italiana.* The most celebrated names that appear in this volume are those of Boscovich, the two Fontanas, and Spallanzani. There are also scientific academies at Mantua, Pisa, Pavia, and Modena; but several of these do not publish their transactions.

Towards the beginning of the seventeenth century, F. Mersenne is said to have given the first idea of a philosophical academy in France, by the conferences of naturalists and mathematicians occasionally held at his lodgings. At these Gassendi, Descartes, Hobbes, Roberval, Pascal, Blondel, and other celebrated persons, assisted. F. Mersenne proposed to each certain problems to be examined, or certain experiments to be made, and acted, to use a Gallic idiom, as the centre of re-union. By and by these private assemblies were succeeded by more public ones, formed by M. Montmort, and by Thevenot the celebrated traveller. Nor was this spirit confined to France. Animated by the example which had been set in that country, several Englishmen of learning and distinction instituted a kind of philosophical academy at Oxford towards the close of Cromwell's government; and this, after the Restoration, was erected into a Royal Society. And the English example, in its turn, re-acted upon France; for, in 1666, Louis XIV., assisted by the counsels of Colbert, founded at Paris

The *Royal Academy of Sciences.* Being desirous of establishing the sciences, arts, and literature upon a solid foundation, Louis, immediately after the peace of the Pyrenees, directed M. Colbert to form a society of men of known abilities and experience in the different branches of knowledge, who should meet together under the king's protection, in order to communicate freely their respective discoveries; and with the view of carrying his design the more effectually into execution, he appropriated a sufficient revenue, not only to defray the charge of experiments, but likewise to afford moderate salaries to the members. The commands of the Grand Monarque were executed with equal zeal and ability by his minister. For having conferred with those who were at that time most celebrated for their learning, M. Colbert resolved to form a society of such persons as were conversant in natural philosophy and mathematics; to join to them persons skilled in history and other branches of erudition; and, lastly, to draw together those who were engaged in the cultivation of what was then called the belles lettres, as well as of grammar, eloquence, and poetry. The geometricians and natural philosophers were ordered to meet on Tuesdays and Saturdays, in a great hall of the king's library, where the books of mathematics and natural philosophy were contained; the learned in history to assemble, on Mondays and Thursdays, in the hall where the books of history were arranged; and the class of belles lettres to meet on Wednesdays and Fridays; while all the different classes were directed to assemble together upon the first Thursday of every month, and by their respective secretaries to make a report of the proceedings of the previous month. In a short time, however, the classes of history and belles lettres were united to the *French Academy*, which was originally instituted for the improvement of the French language; in consequence of which the Royal Academy contained only two classes, viz. that of natural philosophy and that of mathematics.

In the year 1696, the king, by an ordonnance dated the 26th of January, gave this academy a new form, and put it upon a footing still more respectable. By this decree it was provided, that henceforth it should consist of four descriptions of members, viz. honorary, pensionary, associates, and élèves; which last were a kind of pupils or scholars, one of whom was attached to each of the pensionaries. The first class was to contain ten persons, and each of the rest twenty. The honorary academicians were to be all inhabitants of France, the pensionaries were all to reside in Paris, and the élèves were also to live in the capital; but eight of the associates might be chosen from among foreigners. The officers were, a president, named by the king out of the class of honorary academicians, and a secretary and treasurer, who held their offices for life. Of the pensionaries, three were to be geometricians, three astronomers, three mechanicians, three anatomists, three botanists, and the remaining two perpetual secretary and treasurer. Of the twelve associates, two were to apply themselves to geometry, two to botany, and two to chemistry; while the élèves were to devote themselves to the particular branches of science cultivated by the pensionaries to whom they were respectively attached, and not to speak except when called to do so by the president. Clerical persons, whether regular or otherwise, were declared inadmissible, except into the class of honorary academicians; nor could any one be admitted an associate or pensionary unless known by some considerable printed work, some machine, or other discovery. The assemblies were held on Wednesdays and Saturdays, except when either chanced to be a holyday; in which case the meeting was held on the day immediately preceding. To encourage members to pursue their inquiries and researches, the king engaged to pay not only the ordinary pensions, but even to confer extraordinary gratifications according to the degree of merit displayed in their respective performances; and, furthermore, his Majesty became bound, as we have already stated, to defray the whole expense of experiments and other investigations which it might be judged necessary from time to time to institute. Hence, if any member gave in a bill of charges for experiments he had made, or desired the printing of any book, and tendered an account of the disbursements required to effect that object, the money was immediately paid by the king, upon the president's allowing and signing the bill. In like manner, if an anatomist required, we shall say, live tortoises in order to make experiments on the action and functions of the heart, he had only to signify his intention through the president, and as many as he pleased were brought him at the king's charge. The motto of the academy was *Invenit et perfecit.*

In the year 1716, the Duke of Orleans, then regent, made an alteration in the constitution of this body, augmenting the number of honorary members and of associates eligible from among foreigners, admitting regular clergy among such associates, and suppressing the class of élèves, the existence of which had been attended with some inconveniences, particularly that of producing too great an inequality among the academicians, and of giving rise to misunderstandings and animosities among the members. At the same time he created two other classes; the one consisting of twelve adjuncts, who, like the associates, were allowed a deliberative voice in matters relative to science; and the other of six free associates, who were not attached to any particular science, nor obliged to pursue any particular work.

From the period of its re-establishment in 1699, this academy was very exact in publishing annually a volume containing either the works of its own members, or such memoirs as had been composed and read to the academy during that year. To each volume was prefixed a history of the academy, or an extract of the memoirs and of the *res gestæ* of the different sittings; and appended to the history were éloges pronounced on such academicians as had died in the course of the year. M. Rouille de Meslay, counsellor to the parliament of Paris, founded two prizes, one of 2500 and the other of 2000 livres; the former for the best work, essay, or treatise, on physical astronomy, and the latter for any treatise or improvement relating to navigation and commerce. But notwithstanding all the advantages which the members of this academy enjoyed, and the great facilities afforded them for the prosecution of their researches, the institution latterly degenerated; in consequence, doubtless, of the perpetual interference of the court in behalf of its favourites, or to effect the exclusion of men of unquestionable merit who had incurred its displeasure. The effect of all this was, that persons of inferior acquirements were frequently admitted, while those of the most distinguished talents and reputation were excluded; and hence it gradually sunk in public estimation, until admission not only ceased to be an honour, but even became a subject of contempt and derision. Hence the well-known lines—

Ci gît Pirot, qui ne fut rien,
Pas même Académicien.

The Revolution swept away the academy amidst the wrecks of the monarchy. It was suppressed by the Convention in the year 1793; and being new-modelled and re-organized upon a better and more efficient plan, it received the name of Institute, an appellation which it still bears, notwithstanding the great political changes which have since taken place. See INSTITUTE.

The French had also considerable academies in most of their great cities. Montpellier, for example, had a royal academy of sciences on nearly the same footing as that at Paris, of which, indeed, it was in some measure the counterpart; Toulouse also had an academy under the denomination of Lanternists; and there were analogous institutions at Nismes, Arles, Lyons, Dijon, Bordeaux, and other places. Of these several, we believe, are still in existence, if not in activity.

The *Royal Academy of Sciences at Berlin* was founded in 1700, by Frederic II. king of Prussia, on the model of the Royal Society of England; excepting that, besides natural knowledge, it likewise comprehended the belles lettres. In 1710, it was ordained that the president should be one of the counsellors of state, and nominated by the king. The members were divided into four classes: the first for prosecuting physics, medicine, and chemistry; the second for mathematics, astronomy, and mechanics; the third for the German language and the history of the country; and the fourth for oriental learning, particularly in so far as it concerns the propagation of the gospel among heathen nations. Each class was empowered to elect a director for itself, who should hold his post for life. The members of any of the classes were entitled to free admission into the assemblies of the other classes.

The great promoter of this institution was the celebrated Leibnitz, equally distinguished as a jurist, philologist, linguist, antiquary, mathematician, and philosopher, and who accordingly was chosen the first director. The first volume of their transactions was published in 1710, under the title of *Miscellanea Berolinensia;* and although the institution received but few marks of the royal favour for some time, they continued to publish new volumes in 1723, 1727, 1734, and 1740. But Frederic III., the late king of Prussia, at length imparted new vigour to this academy, by inviting to Berlin such foreigners as were most distinguished for their merit and literature, at the same time that he encouraged his own subjects to prosecute the study and cultivation of the sciences; and thinking that the academy, over which some minister or opulent nobleman had till that time presided, would derive advantage from having a man of letters at its head, he conferred that honour on M. Maupertuis. At the same time he gave a new set of regulations to the academy, and took upon himself the title of its protector.

The effect of these changes, however, it is not necessary to enlarge upon, as innovations still more recent have been introduced, with a view to direct the attention of the members to researches of real utility, to improve the arts, to stimulate national industry, and to purify the different systems of moral and literary education. To attain these ends a directory was chosen, consisting of a president and the four directors of the classes, and two men of business, not members of the academy, though at the same time persons of acknowledged learning; and to the body thus constituted was intrusted the management of the funds, and the conduct of the economical affairs of the institution. The power of choosing members was granted to the academy; but the king reserved to himself the privilege of confirming or annulling their choice, as he might think fit. The public library at Berlin, and the collection of natural curiosities, were united to the academy, and intrusted to its superintendence.

The academicians hold two public assemblies annually; at the latter of which is given, as a prize, a gold medal of fifty ducats value. The subject prescribed for this prize is successively taken from natural philosophy, mathematics, metaphysics, and general erudition.

The *Imperial Academy of Sciences at St Petersburg* was projected by the Czar Peter the Great. That despotic reformer, having in the course of his travels observed the advantage of public societies for the encouragement and promotion of literature, formed the design of founding an academy of sciences at St Petersburg. By the advice of Wolf and Leibnitz, whom he consulted on this occasion, the society was accordingly regulated, and several learned foreigners were invited to become members. Peter himself drew the plan, and signed it on the 10th of February 1724; but he was prevented, by the suddenness of his death, from carrying it into execution. His decease, however, did not prevent its completion; for on the 21st of December 1725, Catharine I. established it according to Peter's plan, and on the 27th of the same month the society assembled for the first time. On the 1st of August 1726, Catharine honoured the meeting with her presence, when Professor Bulfinger, a German naturalist of great eminence, pronounced an oration upon the advances made in the theory of magnetic variations, and also on the progress of research in so far as regarded the discovery of the longitude. A short time afterwards the empress settled a fund of L.4982 *per annum* for the support of the academy; and fifteen members, all eminent for their learning and talents, were admitted and pensioned, under the title of Professors in the various branches of science and literature. The most distinguished of these professors were Nicholas and Daniel Bernoulli, the two De Lisles, Bulfinger, and Wolf.

During the short reign of Peter II. the salaries of the members were discontinued, and the academy utterly neglected by the court; but it was again patronised by the Empress Anne, who even added a seminary for the education of youth, under the superintendence of the professors. Both institutions flourished for some time under the direction of Baron Korf; but upon his death, towards the latter end of Anne's reign, an ignorant person being appointed president, many of the most able members quitted Russia. At the accession of Elizabeth, however, new life and vigour were infused into the academy. The original plan was enlarged and improved; some of the most learned foreigners were again drawn to Petersburg; and, what was considered as a good omen for the literature of Russia, two natives, Lomonosof and Rumovsky, men of genius and abilities, who had prosecuted their studies in foreign universities, were enrolled among its members. Lastly, the annual income was increased to L.10,659, and sundry other advantages were conferred upon the institution.

The late Empress Catharine II., with her usual zeal for promoting the diffusion of knowledge, took this useful society under her immediate protection. She altered the court of directors greatly to the advantage of the whole body, corrected many of its abuses, and infused a new vigour and spirit into their researches. By her Majesty's particular recommendation the most ingenious professors visited the various provinces of her vast dominions; and as the funds of the academy were not sufficient to defray the whole expense of these expeditions, the empress supplied the deficiency by a grant of L.2000, which was renewed as occasion required.

The purpose and object of these travels will appear from the instructions given by the academy to the several persons who engaged in them. They were ordered to institute inquiries respecting the different sorts of earths and waters; the best methods of cultivating barren and desert spots; the local disorders incident to men and animals, together with the most efficacious means of relieving them; the breeding of cattle, particularly of sheep; the rearing of bees and silk-worms; the different places and objects for fishing and hunting; minerals of all kinds; the arts and trades; and the formation of a *Flora Russica*, or collection of indigenous plants. They were particularly instructed to rectify the longitude and latitude of the principal towns; to make astronomical, geographical, and meteorological observations; to trace the courses of the rivers; to construct the most exact charts; and to be very distinct and accurate in remarking and describing the manners and customs of the different races of people, their dresses, languages, antiquities, traditions, history, religion; in a word, to gain every information which might tend to illustrate the real state of the whole Russian empire. More ample instructions cannot well be conceived; and they appear to have been very zealously and faithfully executed. The consequence has been, that perhaps no country can boast, within the space of so few years, such a number of excellent publications on its internal state, its natural productions, its topography, geography, and history, and on the manners, customs, and languages of the different tribes who inhabit it, as have issued from the press of this academy.

The first transactions of this society were published in 1728, and entitled *Commentarii Academiæ Scientiarum Imperialis Petropolitanæ ad annum* 1726, with a dedication to Peter II. The publication was continued under this form until the year 1747, when the transactions were called *Novi Commentarii Academiæ*, &c.; and in 1777, the academy again changed the title into *Acta Academiæ Scientiarum Imperialis Petropolitanæ*, and likewise made some alteration in the arrangement and plan of the work. The papers, which had been hitherto published in the Latin language only, are now written indifferently either in that language or in French; and a preface is added, entitled *Partie Historique*, which contains an account of its proceedings, meetings, the admission of new members, and other remarkable occurrences. Of the *Commentaries*, fourteen volumes were published: the first of the *New Commentaries* made its appearance in 1750, and the twentieth in 1776. Under the new title of *Acta Academiæ*, a number of volumes have been given to the public; and two are printed every year. These transactions abound with ingenious and elaborate disquisitions upon various parts of science and natural history; and it may not be an exaggeration to assert, that no society in Europe has more distinguished itself for the excellence of its publications, particularly in the more abstruse parts of the pure and mixed mathematics.

The academy is still composed, as at first, of fifteen professors, besides the president and director. Each of these professors has a house and an annual stipend from L.200 to L.600. Besides the professors, there are four adjuncts, with pensions, who are present at the sittings of the society, and succeed to the first vacancies. The direction of the academy is generally intrusted to a person of distinction.

The buildings and apparatus of this academy are extraordinary. There is a fine library, consisting of 36,000 curious books and manuscripts; together with an extensive museum, in which the various branches of natural history, &c. are distributed in different apartments. The latter is extremely rich in native productions, having been considerably augmented by the collections made by Pallas, Gmelin, Guldenstaedt, and other professors, during their expeditions through the various parts of the Russian empire. The stuffed animals and birds occupy one apartment. The chamber of rarities, the cabinet of coins, &c. contain innumerable articles of the highest curiosity and value. The motto of the society is exceedingly modest: it consists of only one word, *Paulatim*.

The *Academy of Sciences at Bologna*, called the *Institute of Bologna*, was founded by Count Marsigli in 1712, for the cultivation of physics, mathematics, medicine, chemistry, and natural history. Its history is written by M. de Limiers, from memoirs furnished by the founder himself.

The *Academy of Sciences at Stockholm*, or the *Royal Swedish Academy*, owes its institution to six persons of distinguished learning, amongst whom was the celebrated Linnæus. They originally met on the 2d of June 1739, when they formed a private society, in which some dissertations were read; and in the latter end of the same year their first publication made its appearance. As the meetings continued and the members increased, the society attracted the notice of the king; and, accordingly,  on the 31st of March 1741, it was incorporated under the name of the Royal Swedish Academy. Not receiving any pension from the crown, it is merely under the protection of the king, being directed, like our Royal Society, by its own members. It has now, however, a large fund, which has chiefly arisen from legacies and other donations; but a professor of experimental philosophy, and two secretaries, are still the only persons who receive any salaries. Each of the members resident at Stockholm becomes president by rotation, and continues in office during three months. There are two kinds of members, native and foreign; the election of the former description takes place in April, that of the latter in July; and no money is paid at the time of admission. The dissertations read at each meeting are collected and published four times in the year: they are written in the Swedish language, and printed in octavo; and the annual publications make a volume. The first forty volumes, which were completed in 1779, are called the *Old Transactions;* for in the following year the title was changed into that of *New Transactions.* The king is often present at the ordinary meetings, and regularly attends the annual assembly in April for the election of members. Any person who sends a treatise which is thought worthy of being printed, receives the Transactions for that quarter *gratis;* together with a silver medal, which is not esteemed for its value, being worth only three shillings, but for its rarity and the honour conveyed by it. All the papers relating to agriculture are published separately under the title of *Œconomica Acta.* Annual premiums, in money and gold medals, principally for the encouragement of agriculture and inland trade, are also distributed by the academy. The fund for these prizes is supplied by private donations.

The *Royal Academy of Sciences at Copenhagen* owes its institution to the zeal of six individuals, whom Christian VI., in 1742, ordered to arrange his cabinet of medals. These persons were, John Gram, Joachim Frederic Ramus, Christian Louis Scheid, Mark Woldickey, Eric Pontopidan, and Bernard Moelman, who, occasionally meeting for this purpose, extended their designs; associated with them others who were eminent in several branches of science; and forming a kind of literary society, employed themselves in searching into, and explaining the history and antiquities of their country. The Count of Holstein, the first president, warmly patronised this society, and recommended it so strongly to Christian VI. that, in 1743, his Danish majesty took it under his protection, called it the Royal Academy of Sciences, endowed it with a fund, and ordered the members to join to their former pursuits, natural history, physics, and mathematics. In consequence of the royal favour, the members engaged with fresh zeal in their pursuits; and the academy has published fifteen volumes in the Danish language, some of which have been translated into Latin.

The *American Academy of Sciences* was established in 1780, by the council and house of representatives in the province of Massachusetts Bay, for promoting a knowledge of the antiquities of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for encouraging medicinal discoveries, mathematical disquisitions, philosophical inquiries and experiments, astronomical, meteorological, and geographical observations, and improvements in agriculture, manufactures, and commerce; and, in short, for cultivating every art and science which may tend to advance the interest and increase the happiness of the people. The members of this academy can never exceed 200, nor fall below forty.

The *Royal Irish Academy* arose out of a society established at Dublin about the year 1782, and consisting of a number of gentlemen, most of whom belonged to the University. They held weekly meetings, and read essays in turn on various subjects. The members of this society afterwards formed a more extensive plan, and, admitting only such names as might add dignity to their new institution, became the founders of the *Royal Irish Academy;* which professed to unite the advancement of science with the history of mankind and polite literature. The first volume of their transactions for 1787 appeared in 1788, and seven volumes were afterwards published. A society was formed in Dublin, similar to the Royal Society in London, as early as the year 1683; but the distracted state of the country proved unpropitious to the cultivation of philosophy and literature.

The *Academy of Sciences at Manheim* was established by Charles Theodore, Elector Palatine, in the year 1755. The plan of this institution was furnished by Schæpflin, according to which it was divided into two classes, the historical and physical. In 1780, a sub-division of the latter took place, into the physical properly so called, and the meteorological. The meteorological observations are published separately, under the title of *Ephemerides Societatis Meteorologicæ Palatinæ.* The historical and physical memoirs are published under the title of *Acta Academiæ Theodoro-Palatinæ.*

The *Electoral Bavarian Academy of Sciences at Munich* was established in 1759, and publishes its memoirs under the title of *Abhandlungen der Baierischen Akademie.* Soon after the Elector of Bavaria was raised to the rank of King, the Bavarian government, by his orders, directed its attention to a new organization of the Academy of Sciences of Munich. The design of the king was, to render its labours more extensive than those of any similar institution in Europe, by giving to it, under the direction of the ministry, the immediate superintendence over all the establishments for public instruction in the kingdom of Bavaria. The Privy-Councillor Jacobi, a man of most excellent character, and of considerable scientific attainments, was appointed president.

The *Electoral Academy at Erfurt* was established by the Elector of Mentz, in the year 1754. It consists of a protector, president, director, assessors, adjuncts, and associates. Its object is to promote the useful sciences. Their memoirs were originally published in the Latin language, but afterwards in German. The Hessian Academy of Sciences at Giessen publish their transactions under the title of *Acta Philosophico-Medica Academiæ Scientiarum Principalis Hessiacæ.* In the Netherlands there are scientific academies at Flushing and Brussels, both of which have published their transactions.

A branch of the royal family of Portugal established at Lisbon, a number of years ago, a Royal Academy of the sciences, agriculture, arts, commerce, and economy in general. It is divided into three classes; natural science, mathematics, and national literature. It is composed of honorary members, as ministers of state and persons of high rank in Lisbon; foreign members, called *socios veteranos;* and acting members. The total number is sixty, of which twenty-four belong to the last class. They enjoy an allowance from government, which has enabled them to establish an observatory, a museum, a library, and a printing office. Their published transactions consist of *Memorias de Litteratura Portugueza,* and *Memorias Economicas,* besides *Scientific Transactions.* They have also published *Collecçao de Livros ineditos de Historia Portugueza.*

VI. Academies or Schools of Arts. Under this we may mention, first of all, the academy at Petersburg, established by the Empress Elizabeth, at the suggestion of Count Shuvalof, and annexed to the Academy of Sciences. The fund for its support was L.4000 *per annum,* and the foundation admitted forty scholars. The late empress formed it into a separate institution, augmented the annual revenue to L.12,000, and increased the number of scholars to three hundred: she also constructed, for the use and accommodation of the members, a large circular building, which fronts the Neva. The scholars are admitted at the age of six, and continue until they have attained that of eighteen. They are clothed, fed, and lodged, at the expense of the crown; and are all instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of fourteen they are at liberty to choose any of the following arts, divided into four classes, viz. first, painting in all its branches, of history, portraits, battles, and landscapes, architecture, mosaic, enamelling, &c.; secondly, engraving on copperplates, seal-cutting, &c.; thirdly, carving on wood, ivory, and amber; fourthly, watch making, turning, instrument making, casting statues in bronze and other metals, imitating gems and medals in paste and other compositions, gilding, and varnishing. Prizes are annually distributed to those who excel in any particular art; and from those who have obtained four prizes, twelve are selected, who are sent abroad at the charge of the crown. A certain sum is paid to defray their travelling expenses; and when they are settled in any town, they receive an annual salary of L.60, which is continued during four years. There is a small assortment of paintings for the use of the scholars; and those who have made great progress are permitted to copy the pictures in the imperial collection. For the purpose of design, there are models in plaster, all done at Rome, of the best antique statues in Italy, and of the same size with the originals, which the artists of the academy were employed to cast in bronze.

The *Royal Academy of Arts in London* was instituted for the encouragement of designing, painting, sculpture, &c. &c. in the year 1768. This academy is under the immediate patronage of the king, and under the direction of forty artists of the first rank in their several professions. It furnishes, in winter, living models of different characters to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians are annually elected out of the forty, whose business it is to attend by rotation, to set the figures, to examine the performance of the students, and to give them necessary instructions. There are likewise professors of painting, architecture, anatomy, and perspective, who annually read public lectures on the subjects of their several departments; besides a president, a council, and other officers. The admission to this academy is free to all students properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit.

The *Academy of Painting and Sculpture at Paris.* This took its rise from the disputes that happened between the master painters and sculptors in the French capital; in consequence of which, MM. le Brun, Sarrazin, Corneille, and others of the king's painters, formed a design of instituting a particular academy; and having presented a petition to the king, obtained an arrêt dated January 20. 1648. In the beginning of 1655, they obtained from Cardinal Mazarin, a brevet, and letters patent, which were registered in parliament; in gratitude for which favour, they chose the cardinal their protector, and made the chancellor their vice-protector. In 1663, they obtained, through M. Colbert, a pension of 4000 livres. The academy consisted of a protector, a vice-protector, a director, a chancellor, four rectors, adjuncts to the rectors, a treasurer, four professors (one of whom was professor of anatomy, and another of geometry), several adjuncts and counsellors, an historiographer, a secretary, and two ushers.

Every day for two hours in the afternoon, the Academy of Painting held a public assembly, to which the painters resorted either to design or to paint, while the sculptors modelled after the naked figure. There were twelve professors, each of whom kept the school for a month; and there was an equal number of adjuncts to supply their places in case of need. The professor upon duty placed the naked figure as he thought proper, and set it in two different attitudes every week. This was what they called *setting the model.* In one week of the month he set two models together, which was called *setting the group.* The paintings and models made after this model, were called *academics*, or *academical figures.* They had likewise a woman who stood as a model in the public school. Three prizes for design were distributed among the élèves or disciples every quarter; and four others, two for painting, and two for sculpture, every year.

There was also an Academy of Painting, Sculpture, &c. at Rome, established by Louis XIV., wherein those who had gained the annual prize at Paris were entitled to be three years entertained at the king's expense, for their further improvement.

In 1778, an Academy of Painting and Sculpture was established at Turin. Their meetings were held in the palace of the king, who distributed prizes among the most successful members. In Milan, an Academy of Architecture was established so early as the year 1380, by Galeas Visconti. About the middle of the last century, an Academy of the Arts was established there, after the example of those at Paris and Rome. The pupils were furnished with originals and models, and prizes were distributed annually. The prize for painting was a gold medal, and no prize was bestowed till all the competing pieces had been subjected to the examination and criticism of competent judges. Before the effects of the French revolution reached Italy, this was one of the best establishments of the kind in that kingdom. In the hall of the academy were some admirable pieces of Correggio, as well as several ancient paintings and statues of great merit; particularly a small bust of Vitellius, and a statue of Agrippina, of most exquisite beauty, though it wants the head and arms. The Academy of the Arts, which had been long established at Florence, but which had fallen into decay, was restored by the late Grand Duke. In it there are halls for naked and plaster figures, for the use of the sculptor and the painter. The hall for plaster figures had models of all the finest statues in Italy, arranged in two lines; but the treasures of this, as well as all the other institutions for the fine arts, were greatly diminished by the rapacity of the French. In the saloon of the Academy of the Arts at Modena, there are many casts of antique statues; but since it was plundered by the French it has dwindled into a petty school for drawings from living models: it contains the skull of Correggio. There is also an Academy of the Fine Arts in Mantua, and another at Venice.

In Madrid, an Academy for Painting, Sculpture, and Architecture, was founded by Philip V. The minister for foreign affairs is president. Prizes are distributed every three years. In Cadiz, a few students are supplied by government with the means of drawing and modelling from figures; and such as are not able to purchase the requisite instruments are provided with them.

An Academy of the Fine Arts was founded at Stockholm in the year 1733 by Count Tessin. In its hall are the ancient figures of plaster presented by Louis XIV. to Charles XI. The works of the students are publicly exhibited, and prizes are distributed annually. Such of them as display distinguished talents obtain pensions from government, to enable them to reside in Italy for some years, for the purposes of investigation and improvement. In this academy there are nine professors, and generally about four hundred students. In the year 1705, an Academy of Painting, Sculpture, and Architecture was established at Vienna, with the view of encouraging and promoting the fine arts.

The *Royal Academy of Music* is a name given in France to the grand opera, which is considered as in some sort a combination of all the liberal arts; painting, music, and the dance forming the principal part of that enchanting spectacle. The opera is of Venetian origin; and the Abbé Perrin, who officiated as master of the ceremonies to Gaston, Duke of Orleans, was the first who introduced it at Paris. He obtained letters patent from the king, dated the 28th June 1669, conferring upon him the privilege of establishing *Operatic Academies in Music and in French Verse* throughout the kingdom. Latterly, the theatre where operas are represented has been denominated the *Théâtre des Arts;* a name which has probably been suggested by the following verses of Voltaire, which convey a just definition of this delightful entertainment:—

> Il faut se rendre à ce palais magique,
> Où les beaux vers, la danse, la musique,
> L'art de tromper les yeux par les couleurs,
> L'art plus heureux de séduire les cœurs,
> De cent plaisirs font un plaisir unique.

The *Academy of Ancient Music* was established in London in 1710, by several persons of distinction, and other amateurs, in conjunction with the most eminent masters of the time, in the view of promoting the study and practice of vocal and instrumental harmony. This institution, which had the advantage of a library, consisting of the most celebrated compositions, both foreign and domestic, in manuscript and in print, and which was aided by the performances of the gentlemen of the chapel royal, and the choir of St Paul's, with the boys belonging to each, continued to flourish for many years. In 1731, a charge of plagiarism brought against Bononcini, a member of the academy, for claiming a madrigal of Lotti of Venice as his own, threatened the existence of the institution. Dr Greene, who had introduced the madrigal into the academy, took part with Bononcini, and withdrew from the society, taking with him the boys of St Paul's. In 1734, Mr Gates, another member of the society, and master of the children of the royal chapel, also retired in disgust; so that the institution was thus deprived of the assistance which the boys afforded it in singing the soprano parts. From this time the academy became a seminary for the instruction of youth in the principles of music and the laws of harmony. Dr Pepusch, who was one of its founders, was active in accomplishing this measure; and by the expedients of educating boys for their purpose, and admitting auditor members, the subsistence of the academy was continued. The *Royal Academy of Music* was formed by the principal nobility and gentry of the kingdom, for the performance of operas, composed by Mr Handel, and conducted by him at the theatre in the Haymarket. The subscription amounted to L.50,000, and the king, besides subscribing L.1000, allowed the society to assume the title of *Royal Academy.* It consisted of a governor, deputy-governor, and twenty directors. A contest between Handel and Senesino, one of the performers, in which the directors took the part of the latter, occasioned the dissolution of the academy, after it had subsisted with reputation for more than nine years.

The *Academy of Architecture* was founded, under Louis XIV., by his celebrated minister Colbert in 1671, and was composed of the most distinguished architects of the time. It was provided, however, that the professor of architecture, and the secretary to the academy, should always be chosen from those architects intrusted with the superintendence of royal edifices; and the title of academician was conferred by brevet. The Academy of Architecture held its sittings every Monday at the Louvre, where it occupied the apartment called the *Queen's Saloon;* but at the commencement of the Revolution it was remodelled, like the Academy of Sciences, and transformed into a school for the cultivation and improvement of the fine arts. This school was divided into two sections, the first of which was devoted to painting and sculpture, and the second to architecture; and these two sections received, by a royal ordonnance of the 11th August 1819, the title of *Royal Academy of the Fine Arts.* The instruction in architecture at this institution consists of lessons given in special courses of lectures by four different professors; first, on the theory of the art; secondly, on its history; thirdly, on the mathematical principles of construction; and, fourthly, on perspective; which last branch is common to both sections. By the munificence of the government, this institution is amply provided with means for supporting the pupils admitted within its walls, as also for affording them every facility in the prosecution of their studies; and with the view of exciting emulation as well as rewarding excellence, a grand prize is annually given.

The *Academy of Dancing* was erected by Louis XIV., and had particular privileges conferred upon it.

VII. *Academies of Law.* Under this head we may mention the famous academy at Berytus, and that of the *Sitientes* at Bologna. We are not aware of any other.

VIII. *Academies of History.* The first of these to which we shall advert, is the *Royal Academy of Portuguese History at Lisbon.* This academy was instituted by King John V. in 1720. It consists of a director, four censors, a secretary, and fifty members, to each of whom is assigned some part of the ecclesiastical or civil history of the nation, which he is required to treat either in Latin or Portuguese. In the church history of each diocese, the prelates, synods, councils, churches, monasteries, academies, persons illustrious for sanctity or learning, and places famous for miracles or relics, must be distinctly related in twelve chapters. The civil history comprises the transactions of the kingdom, from the government of the Romans down to the present time. The members who reside in the country are obliged to make collections and extracts out of all the registers, &c. where they live. Their meetings take place once every fifteen days. A medal was struck by this academy in honour of their prince, on the obverse of which was his effigy, with the inscription *Johannes V. Lusitanorum Rex*, and on the reverse, the same prince represented standing, and raising History, almost prostrate before him, with the legend, *Historia, Resurges.* Underneath are the following words in abbreviature: REGia ACADemia HISToriæ LUSITanæ, INSTITuta VI. Idus Decembris MDCCXX.

An *Academy of History* was some time ago established by some learned men at Tubingen, for publishing the best historical writings, the lives of the chief historians, and compiling new memoirs on any matter of importance connected with either.

About the year 1730, a few individuals in Madrid agreed to assemble at stated periods, for the purpose of preserving and illustrating the historical monuments of Spain. In the year 1738, the rules which they had drawn up were confirmed by a royal cedula of Philip V. This academy consists of twenty-four members. The device is a river at its source; the motto, *In patriam populumque fluit.* It has published editions of Mariana, Sepulveda, Solis, and the ancient Chronicles relative to the affairs of Castile, several of which were never before printed. All the diplomas, charters, &c. belonging to the principal cities in Spain, since the earliest period, are in its possession. It has long been employed in preparing a geographical dictionary of that country.

IX. *Academies of Antiquities;* as that at Cortona in Italy, and that at Upsal in Sweden. The first is designed for the study of Hetrurian antiquities; the other for illustrating the northern languages, and the antiquities of Sweden, in which valuable discoveries have been made by it. The head of the Hetrurian academy is called *Lucomon,* a name by which the ancient governors of the country were distinguished. One of their laws is, to give audience to poets only one day in the year; and another is, to fix their sessions, and impose a tax of a dissertation on each member in his turn.

The *Academy of Medals and Inscriptions at Paris* was set on foot by M. Colbert, under the patronage of Louis XIV. in 1663, for the study and explanation of ancient monuments, and for perpetuating great and memorable events, especially those of the French monarchy, by coins, relievos, inscriptions, &c. The number of members was at first confined to four or five, chosen out of those of the French academy; and they met in the library of M. Colbert, from whom they received his Majesty's orders. Though the days of their meetings were not determined, they generally assembled on Wednesdays, especially in the winter season; but, in 1691, the king having given the inspection of this academy to M. de Pontchartrain, comptroller-general of the finances, he fixed their meetings on Tuesdays and Saturdays. By a new regulation, dated the 16th of July 1701, the academy was composed of ten honorary members; ten associates, each of whom had two declarative voices; ten pensioners; and ten élèves, or pupils. They then met every Tuesday and Wednesday, in one of the halls of the Louvre; and had two public meetings yearly, one the day after Martinmas, and the other the 16th after Easter. The class of élèves was suppressed, and united to the associates. The king nominated their president and vice-president yearly; but their secretary and treasurer were perpetual. The rest were chosen by the members themselves, agreeably to the constitutions on that head given to them. One of the first undertakings of this academy was to compose, by means of medals, a connected history of the principal events of Louis XIV.'s reign. In this design, however, they met with very great difficulties, and consequently it was interrupted for a number of years; but at length it was completed down to the advancement of the Duke of Anjou to the crown of Spain. In this celebrated work, the establishment of the academy itself was not forgotten. The medal on this subject represents Mercury sitting, and writing with an antique stylus on a table of brass; he leans with his left hand upon an urn full of medals, and at his feet are several others placed upon a card. The legend is, *Rerum gestarum fides*, and on the exergue, *Academia Regia Inscriptionum et Numismatum, instituta* MDCLXIII.; signifying, that the Royal Academy of Medals and Inscriptions, founded in 1663, ought to give to future ages a faithful testimony of all great actions. Besides this work, we have several volumes of their memoirs; and their history, written and continued by their secretaries.

Under this class the *Academy of Herculaneum* properly ranks. It was established at Naples about 1755, at which period a museum was formed of the antiquities found at Herculaneum, Pompeii, and other places, by the Marquis Tanucci, who was then minister of state. Its object was to explain the paintings, &c. which were discovered at those places; and for this purpose the members met every fortnight, and at each meeting three paintings were submitted to three academicians, who made their report on them at their next sitting. The first volume of their labours appeared in 1775, and they have been continued under the title of *Antichità di Ercolano.* They contain engravings of the principal paintings, statues, bronzes, marble figures, medals, utensils, &c. with explanations. In the year 1807, an Academy of History and Antiquities, on a new plan, was established at Naples, by Joseph Buonaparte. The number of members was limited to forty; twenty of whom were to be appointed by the king, and these twenty were to present to him, for his choice, three names for each of those wanted to complete the full number. Eight thousand ducats were to be annually allotted for the current expenses, and two thousand for prizes to the authors of four works, which should be deemed by the academy most deserving of such a reward. A grand meeting was to be held every year, when the prizes were to be distributed, and analyses of the works read. The first meeting took place on the 25th of April 1807; but the subsequent changes in the political state of Naples have prevented the full and permanent establishment of this institution. In the same year an academy was established at Florence, for the illustration of Tuscan antiquities, which has published some volumes of memoirs.

In consequence of the attention of several literary men in Paris having been directed to Celtic antiquities, a *Celtic Academy* was established in that city in the year 1807. Its objects were, first, the elucidation of the history, customs, antiquities, manners, and monuments of the Celts, particularly in France; secondly, the etymology of all the European languages, by the aid of the Celto-British, Welsh, and Erse; and, thirdly, researches relating to Druidism. The attention of the members was also particularly called to the history and settlements of the Galatæ in Asia. Lenoir, the keeper of the museum of French monuments, was appointed president. A fasciculus, consisting of 150 or 160 pages, was to be published monthly; and the engravings illustrative of Celtic antiquities were to be under the inspection of Lenoir. The devices are, *Gloriæ Majorum*, and *Sermonem patriam moresque requiret.*

X. Academies of Belles Lettres are those wherein eloquence and poetry are chiefly cultivated. These are very numerous in Italy, and were not uncommon in France.

The *Academy of Umidi at Florence* has contributed greatly to the progress of the sciences by the excellent Italian translations executed by some of its members, of the ancient Greek and Latin historians. But their chief attention was directed to Italian poetry, at the same time that they applied themselves to the polishing of their language, which produced the *Academy della Crusca.*

The *Academy of Humourists, Umoristi*, had its origin at Rome in the marriage of Lorenzo Marcini, a Roman gentleman, at which several persons of rank were guests; for it being carnival time, to give the ladies some diversion, they betook themselves to the reciting of verses, sonnets, speeches, first *extempore*, and afterwards premeditately; which gave them the denomination of *Belli Humori.* After some experience, and coming more and more into the taste of these exercises, they resolved to form an academy of belles lettres, and changed the title of *Belli Humori* for that of *Humoristi;* choosing for their device a cloud, which, after being formed of exhalations from the salt waters of the ocean, returns in a gentle sweet shower; with this motto from Lucretius, *Redit agmine dulci.*

In 1690, the *Academy of Arcadi* was established at Rome, for reviving the study of poetry and of the belles lettres. Besides most of the politer wits of both sexes in Italy, this academy comprehended many princes, cardinals, and other ecclesiastics; and, to avoid disputes about pre-eminence, all appeared masked after the manner of Arcadian shepherds. Within ten years from its first establishment, the number of *Academicians* amounted to six hundred. They held assemblies seven times a year in a meadow or grove, or in the gardens of some nobleman of distinction. Six of these meetings were employed in the recitation of poems and verses of the Arcadi residing at Rome, who read their own compositions; except ladies and cardinals, who were allowed to employ others. The seventh meeting was set apart for the compositions of foreign or absent members. This academy is governed by a custos, who represents the whole society, and is chosen every four years, with a power of electing twelve others yearly for his assistance. Under these are two sub-custodes, one vicar or pro-custos, and four deputies or superintendents, annually chosen. The laws of the society are immutable, and bear a near resemblance to the ancient model. There are five modes of electing members. The first is by *acclamation.* This is used when sovereign princes, cardinals, and ambassadors of kings desire to be admitted; and the votes are then given *viva voce.* The second is called *annumeration.* This was introduced in favour of ladies and academical colonies, where the votes are taken privately. The third, *representation*, was established in favour of colonies and universities, where the young gentry are bred, who have each a privilege of recommending one or two members privately to be balloted for. The fourth, *surrogation*, whereby new members are substituted in the room of those dead or expelled. The last, *destination*, whereby, when there is no vacancy of members, persons of poetical merit have the title of Arcadi conferred upon them till such time as a vacancy shall happen. All the members of this body, at their admission, assume new pastoral names, in imitation of the shepherds of Arcadia. The academy has several colonies of Arcadi in different cities of Italy, who are all regulated after the same manner.

XI. Academies of Languages, called by some, *Grammatical Academies;* as,

The *Academy della Crusca at Florence*, famous for its vocabulary of the Italian tongue, which was formed in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors confound this with the Florentine academy. The discourses which Torricelli, the celebrated disciple of Galileo, delivered in the assemblies, concerning levity, the wind, the power of percussion, mathematics, and military architecture, are a proof that these academies applied themselves to things as well as words.

The *Academy of Fructiferi* had its rise in 1617, at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members arose to upwards of nine hundred. It was prior in time to the French academy, which only appeared in 1629, and was not established into an academy before the year 1635. Its history is written in the German tongue, by George Neumarck.

The *French Academy* had its rise from a meeting of men of letters in the house of M. Conrart, in 1629. In 1635, it was erected into an academy by Cardinal Richelieu, for refining and ascertaining the French language and style. The number of its members was limited to forty, out of whom a director, chancellor, and secretary were to be chosen; the two former of whom were to hold their posts for two months; the latter was perpetual. The members of this academy enjoyed several privileges and immunities, among which was that of not being obliged to answer before any court but that of the king's household. They met three times a week in the Louvre. At the breaking up of each meeting forty silver medals were distributed among the members, having on one side the king of France's head, and on the reverse, *Protecteur de l'Académie*, with laurel, and this motto, *A l'Immortalité.* By this distribution, the attendance of the academicians was secured; for those who were present received the surplus intended for the absent. To elect or expel a member, the concurrence of at least eighteen was required; nor could any one be chosen unless he petitioned for it; by which expedient the affront or refusals on the part of persons elected was avoided. Religious persons were not admitted; nor could any nobleman or person of distinction be elected on any other footing than as a man of letters. None could be expelled, except for base and dishonest practices; and there were but two instances of such expulsions, the first of M. Grainer for refusing to return a deposit, the other of the Abbé Furetière for plagiarism. The design of this academy was to give not only rules, but examples, of good writing. They began with making speeches on subjects taken at pleasure, about twenty of which were printed. At their first institution they met with great opposition from the parliament; it being two years before the patents granted by the king could be registered. This institution has been severely satirized, and the style of its compositions has been ridiculed as enervating instead of refining the French language. They were also charged with having surfeited the world by flattery, and exhausted all the topics of panegyric in praise of their founder; it being a duty incumbent on every member, at his admission, to make a speech in praise of the king, the cardinal, the chancellor Seguier, and the person in whose room he is elected. The most remarkable work of this academy is a dictionary of the French tongue; which, after fifty years spent in settling the words and phrases to be used in writing, was at last published in 1694.

An academy similar to the above was founded at Petersburg under the auspices of the Princess Dashkof; and the plan having been approved by the crown, a fund was established for its support. It is attached to the Imperial Academy of Sciences at St Petersburg.

The *Royal Spanish Academy at Madrid* held its first meeting in July 1713, in the palace of its founder, the Duke d'Escalona. It consisted at first of eight academicians, including the duke; to which number fourteen others were afterwards added, the founder being chosen president or director. In 1714, the king granted them the royal confirmation and protection. Their device is a crucible in the middle of the fire, with this motto, *Limpia Fixa, y da Esplendor;* "It purifies, fixes, and gives brightness." The number of its members was limited to twenty-four; the Duke d'Escalona was chosen director for life, but his successors were elected yearly, and the secretary for life. Their object, as marked out by the royal declaration, was to cultivate and improve the national language. They were to begin with choosing carefully such words and phrases as have been used by the best Spanish writers; noting the low, barbarous or obsolete ones; and composing a dictionary wherein these might be distinguished from the former.

The *Royal Swedish Academy* was founded in the year 1786, for the purpose of purifying and perfecting the Swedish language. A medal is struck by its direction every year in honour of some illustrious Swede. This academy does not publish its transactions.

XII. Academies of Politics. Of this description was that at Paris, consisting of six persons, who met at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. But this academy proved of little service, as the kings of France were unwilling to trust any but their ministers with the inspection of foreign affairs.

Academy is a term also applied to those royal collegiate seminaries in which young men are educated for the navy and army. In our country there are three seminaries of this description; the Naval Academy at Portsmouth, the Royal Military Academy at Woolwich, and the Royal Military College at Farnham and Sandhurst. Besides these there are the Colleges of Addiscombe and Haileybury for the education of young men destined for the military and civil service of the Honourable East India Company. For an account of each of these, see the respective articles.

---

ACADIE, or Acady, in *Geography*, a name formerly given to Nova Scotia, or New Scotland, in America.

ACÆNA, in *Antiquity*, a Grecian measure of length, being a ten feet rod, used in measuring their lands.

ACAMANTIS, the ancient name of the island of Cyprus, taken from one of its promontories situated to the west, and called *Acamas*, from the hero of that name.

ACAMAS, son of Theseus and Phædra, was chosen to accompany Diomedes to Troy, to demand the restoration of Helen. During his residence at the court of Priam he gained the affections of Laodice, the second daughter of the king, by whom he had a son called *Munitus*. He is mentioned by Virgil as one of the heroes who concealed themselves in the wooden horse. He founded a city in Phrygia, called *Acamantium;* and one of the Athenian tribes was called after him, *Acamantis*. Homer mentions two other heroes of this name: one a Thracian prince, who came to succour Priam; another a son of Antenor.

ACANTHA, in *Botany*, the prickle of any plant: in *Zoology*, a term for the spine or prickly fins of fishes.

ACANTHOPTERYGIOUS Fishes, a term for those fishes whose back fins are hard, osseous, and prickly.

ACANTHUS, in *Architecture*, an ornament representing the leaves of the Acanthus, used in the capitals of the Corinthian and Composite orders, but the species of the plant is still doubtful.

ACAPULCO, a town and port in Mexico, on a bay of the Pacific Ocean, about 190 miles S.S.W. of Mexico, in Lat. 16. 50. N. Long. 99. 46. W. The harbour, which is one of the finest in the world, is easy of access, and the anchorage is so secure that heavily-laden ships can anchor close to the rocks which surround it. The town lies N.W. of the harbour, and is defended by the castle of San Diego, which stands on an eminence. During a part of the dry season the air is infected with the putrid effluvia of a morass eastward of the town. This, together with the heat of the climate, which ranges from 86 to 90 degrees Fahr., aggravated by the reflection of the sun's rays from the granite rocks that environ the town, renders it very unhealthy, especially to Europeans, though a passage cut through the rocks on the east side has tended to improve its salubrity. The population amounts to about 4000, mostly people of colour. The exports are chiefly silver, indigo, cochineal, Spanish cloth, and some peltry. Formerly, a galleon sailed annually from this port to Manilla in the Philippine Islands, and another annually returned from thence, laden with the treasures and luxuries of the East. On the arrival of this galleon a great fair was held, to which merchants resorted from all parts of Mexico. The trade between Acapulco and Manilla has been annihilated by the revolution in America; and the town has dwindled into comparative insignificance. Captain Hall found in it only 30 houses, and some reed-huts. In the beginning of December 1852 this town suffered severely from an earthquake.

ACARNANIA, a province of ancient Greece, now called Carnia. It was bounded on the N. by the Ambracian gulf, on the N.E. by Amphilochia, on the W. and S.W. by the Ionian sea, and on the E. by the river Achelous. It was a mountainous country, with numerous lakes and tracts of rich pasture, and its hills are to the present day crowned with thick wood. It was celebrated for its excellent breed of horses. The Acarnanians, according to Mr Grote, though admitted as Greeks to the Pan-Hellenic games, were more akin in character and manners to their barbarian neighbours of Epirus. Up to the time of the Peloponnesian war, they are mentioned only as a race of rude shepherds, divided into numerous petty tribes and engaged in continual strife and rapine. They were, however, favourably distinguished from their Ætolian neighbours by the fidelity and stedfastness of their character. They were good soldiers and excelled as slingers. At the date above mentioned they begin, as the allies of the Athenians, to make a more prominent figure in the history of Greece. The chief town was Stratos, and subsequently Leucas.

ACARON, or Accaron, a town of Palestine, called *Ekron* in Scripture, now Akri.

ACASTUS, son of Pelias, king of Iolcus, was one of the Argonauts, and took part in the hunt of the Calydonian boar. His sisters, at the instigation of Medea, cut their father to pieces and boiled him in a cauldron, expecting to see him restored to them in the bloom of youth. The sorceress having failed in her promise, Acastus drove her and Jason out of Iolcus, buried his father, and instituted games to his memory. Peleus, after having been purified by Acastus from the murder of Eurytion, appeared at these games, where he contended with Atalanta. Astydamia, or Hippolyte, the wife of Acastus, falling in love with this hero, and finding him proof against her solicitations, accused him to her husband of having made an attempt on her virtue. Acastus, unwilling to slay his guest, took his revenge by depriving him of his sword while he slept, after the fatigues of the chase, on Mount Pelion. Peleus on awakening missed his sword, and found himself in imminent danger of destruction by the hands of the Centaurs, but was rescued by the timely intervention of Chiron, who restored to him his sword. Returning, he slew both Acastus and his wife, and took possession of Iolcus. (*Apollod.* i. 9, iii. 13.)

ACATALECTIC, a term in ancient poetry for such verses as have all their feet or syllables, in contradistinction to those that have a syllable too few.

ACCA, Saint, bishop of Hagustaldt, or Hexham, in Northumberland, succeeded Wilfrid in that see in 709. He ornamented his cathedral in a most magnificent manner; and erected a noble library, consisting chiefly of ecclesiastical learning, and a large collection of the lives of the saints. He was an able divine, and famous for his skill in church music. He wrote several books, particularly *Passiones Sanctorum*, and *Pro illustrandis Scripturis, ad Bedam.* He died in 740.

ACCAPITARE, in *Law*, the act of becoming vassal of a lord, or of yielding him homage and obedience. Hence,

ACCAPITUM signifies the money paid by a vassal upon his admission to a feu.

Accapitum, in our *Ancient Law*, was used also to express the relief or fee payable on the entry of an heir to the chief lord.

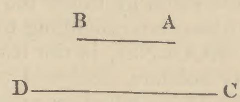
ACCEDAS ad curiam, in *English Law*, a writ used where a man has received, or fears, false judgment in an inferior court. It lies also for justice delayed, and is a species of the writ Recordare.

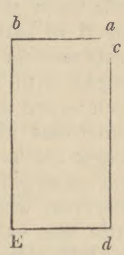
ACCELERATION, in *Natural Philosophy*, denotes generally an increase of motion or velocity, and is chiefly applied to the motion of such bodies as go on, not with a uniform motion, but one which becomes continually quicker and quicker as they advance. A body, for example, rolling down a hill proceeds slowly at first, but gradually increases as it descends, until at last it acquires a velocity and momentum which bears down every thing before it. The same thing takes place when a body is dropped, and allowed to fall freely in the air; although the acceleration is here less observable, on account of the great rapidity of the descent. The earth, in its annual motion round the sun, is subject to a continued acceleration from the apogee to the perigee, while from thence again it suffers a similar retardation. Many other examples occur of such acceleration; but the most interesting is the Acceleration of Falling Bodies. That such an acceleration does take place, is obvious from many circumstances, particularly the increasing momentum which a body acquires in proportion to the height of its descent. But it was only by considering the cause of the descent that the true law of the acceleration was determined. This great discovery we owe to the genius of Galileo. Various theories had been framed by philosophers to account for the accelerated descent of falling bodies, but all of them inconclusive and visionary. Some, for instance, ascribed it to the weight of the pure air above increasing as the body descended. The followers of Gassendi pretended that there are continually issuing out of the earth certain attractive corpuscles directed in an infinite number of rays; these, say they, ascend and then descend in such a manner, that the nearer a body approaches to the earth's centre, the more of these attractive rays press upon it, in consequence of which its motion becomes accelerated. The Cartesians again ascribed the effect to the reiterated impulses of their *materia subtilis* acting continually on falling bodies, and propelling them downwards. It appears now incredible how such dreams could have been gravely proposed by men having the reputation of philosophers. Galileo, however, on considering the subject attentively, and applying the powerful aids of geometry and mathematics, soon discovered that the true cause was simply the continued action of the moving force of gravity. This force, Galileo reasoned, must operate continually on the body, not only at the moment of starting, but also during every moment of its descent. And as the body retains and accumulates all these impressions according to the great and original law of moving bodies, no wonder that its motion should become continually accelerated: for, suppose that gravity were to act only at certain small intervals, each second for instance, and suppose that at first it communicates such a motion to the body as causes it to descend, say ten feet in the first second; the body could not stop here even though gravity were ceasing altogether to act on it: retaining the original impression, it would still go on moving uniformly at the rate of ten feet every second of its descent; but at the end of the first second, gravity

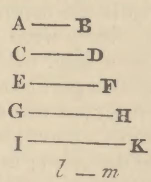
Accelera-tion.

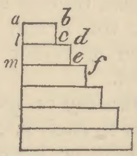
again acts on it and communicates a second impression, by virtue of which it would descend ten feet during the second interval, in addition to the ten feet arising from the original impulse; so that on the whole it descends 20 feet in the second interval. In the same manner, during the third interval it would descend 30 feet, and during the fourth 40, and so on; the space described in each second thus increasing regularly with the increase of the time.

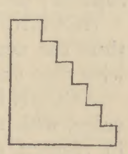
Hence Galileo deduced the fundamental law of acceleration in falling bodies, that the *Velocity*, which in every case is just the space described in each second or other fixed interval, *increases in exact proportion to the whole time of descent;* so that whatever be the velocity at the end of the first second, then at the end of any number of seconds the velocity would just be as many times greater,—a law from which he easily deduced all the others regarding the descent of falling bodies, which are of so much importance in mechanical inquiries. The most remarkable is that which regards the *Space*[1] described, or the total amount of the descent in a given time. This Galileo deduced very elegantly from a simple geometrical consideration. In every case of a body moving uniformly without acceleration, the space described in any given time must be proportional to the time, and must be found by multiplying the time by the velocity: it may be represented, therefore, by a simple diagram. Let A B, for instance, denote by its length the velocity of the body, or the number of feet described by it in a second, and C D the time or number of seconds during which it is in motion; then, if we construct a rectangle $a$ E, of which one of the sides, $a\ b$, is equal to A B, and the other, $c\ d$, equal to C D, this rectangle, that is, the number of square feet in it, will denote the space, that is, the number of lineal feet described during the whole period. Let us now apply this principle to the case of a body moving with an accelerated velocity, and let AB, CD, EF, &c. denote the velocities at the end of certain equal intervals of time, of which let each be denoted by $l\ m$; and suppose also, that during each of these intervals the motion is uniform, and is only accelerated by a sort of start which takes place at the end of each: then, if we construct a rectangle $a\ l\ b$, of which $a\ b$ is equal to A B, the velocity at the end of the first interval, and $a\ l$ equal to $l\ m$ the first interval, this rectangle will denote the space described during that interval. Continue now the line $a\ l$ to $m$, making $l\ m = a\ l = l\ m$, and continue also $l\ c$ to $d$, so that $l\ d$ may be equal to D C, the velocity during the second interval, and complete the rectangle $d\ l\ m\ e$, this will denote the space described in the second interval; and, in the same manner, each of the succeeding rectangles in descending will denote the space described in



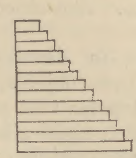


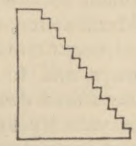


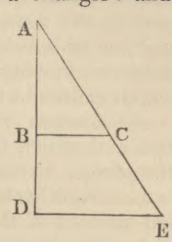




the succeeding interval, so that the total amount of the descent will be denoted by the sum of all the rectangles together, or by the compound figure which they form. But what is the nature of this figure? It is evidently, as appears more clearly by taking out the parallel lines, triangular, only that the longest side presents a serrated outline. What is the cause of this? It is clearly owing to the supposition we have made of the motion continuing uniform during the intervals, and then increasing by starts; instead of growing continually, as it really does. Suppose then that we shorten the intervals one-half, for instance, and double their number, we shall then be much nearer the truth; but the inequalities in the hypothenuse of the triangle are now greatly reduced; and the more we thus diminish the intervals, and increase their number, the more nearly does it approach to a straight line. In the extreme case, therefore, where there are in reality no intervals, but where the velocity goes on continually increasing, neither will there be any inequalities in the outline; the figure will be really a triangle: and while the vertical side A B denotes the time of descent, and the horizontal B C the velocity, the area of the triangle will denote in square measure the space descended in the given time. But the areas of similar triangles are in every case proportional to the squares of their corresponding sides; that is, the area A B C is to A D E as the square of A B or B C is to the square of A D or D E. Hence in general it follows, that the *spaces* described in any given time or times are always *proportional to the squares of these times*, and also to the *squares of the velocities at the end of such times.* Thus, if a body describes 16 feet during the first second of its descent, it will, during the next, descend 4 times as much, or 64; during the third 9 times, or 144 feet; during the fourth 16 times, or 256, and so on.







Such, then, is the great law of acceleration in regard to the spaces described. It is easily deducible also from numerical or algebraical considerations. Let the velocity, for example, at the end of any given time, such as a second, be denoted by 1; then in the second, third, and fourth, it will be 2, 3, 4, &c. But the space described at the end of any time is evidently equal to the time multiplied by the mean velocity; that is, the velocity at the half-interval. During the first second, therefore, the space described will be $\frac{1}{2}$, during the second $\frac{3}{2}$, during the third $\frac{5}{2}$, during the fourth $\frac{7}{2}$, and so on; adding these successively, the whole space from the beginning at the end of each interval will be $\frac{1}{2}$, $\frac{4}{2}$, $\frac{9}{2}$, $\frac{16}{2}$, &c., being each proportional to the square of the time. Algebraically again, if we suppose gravity to act only at the end of successive intervals, and the motion to continue uniform during these, then the spaces described will form an arithmetical progression, such as $a$, $2\ a$, $3\ a$, $4\ a$, $5\ a$, &c. ... $n\ a$, and the whole space will be the sum of this series, or $a + n\ a \times \frac{n}{2} =$

[1] This phrase, we may remark, probably from Galileo's geometrical illustration, has been rather awkwardly introduced in these discussions, and in a way which tends to produce a little obscurity. Space generally includes the idea of extension, in at least two dimensions, both length and breadth; whereas it is here employed to denote merely the lineal extent, the length of the track described by the moving body.

$n^2 + n \times \frac{a}{2}$. Suppose now the intervals diminished in extent and increased in number indefinitely, they will bear no sort of proportion to $n^2$: the second term of the above sum therefore may be neglected, and ultimately the whole space will be proportional to $n^2$, the square of the time. In every view, then, this great law is established; and when we come to try it experimentally, which is done by means of Atwood's machine, it is confirmed by the nicest observation; every falling body describing in the first second $16\frac{1}{12}$ feet, and in every other a space proportional to the time. See *Atwood's* Machine, Dynamics, Mechanics, &c. (J. B.)

Acceleration, in *Astronomy*, is applied in various ways, and to different objects. Thus, the *Acceleration of the Fixed Stars* denotes that apparent increase of motion or velocity by which night after night they arrive sooner and sooner upon the meridian than before. A star which passes the meridian to-night at 10 o'clock, for instance, will to-morrow night arrive at it 3′ 56″ sooner, or at 56′ 4″ past nine, and so on each succeeding evening; thus anticipating continually the motion of the sun, which regulates the length of the day. A star which passes the meridian to-day with the sun, will to-morrow pass 3′ 56″ sooner; so that it appears to revolve with a quicker or accelerated motion. It is in reality the sun, however, moving continually backwards among the stars which causes in them this apparent acceleration.

*Acceleration of the Planets* denotes that accelerated motion with which they all, as well as the earth, advance from the perigee to the apogee of their orbits. This acceleration is most readily observed by comparing the successive diurnal motions of the planet in its orbit. When the actual diurnal motion exceeds the mean diurnal motion, the planet is accelerated; and, on the other hand, when it falls short of it, it is retarded, as takes place between the apogee and perigee.

*Acceleration of the Moon* is a remarkable increase which has been discovered in the moon's motion in her orbit, which has been going on increasing from age to age by a gradation so imperceptible, that it was only discovered or suspected by Dr Halley, on comparing the ancient eclipses observed at Babylon and others with those of his own time. The quantity of this acceleration was afterwards determined by Mr Dunthorne from more accurate data regarding the longitudes of Alexandria and Babylon, and from the most authentic eclipse of which any good account remains, observed at Babylon in the year 721 before Christ. The beginning of this eclipse, as observed at that time, was about an hour and three quarters sooner than he found it would have been by computation; and hence he found the mean acceleration, or what has since been termed the moon's secular equation, about 10″ of a degree each century. According to Laplace, it amounts to 11·135″. This remarkable fact had long excited the attention of astronomers; as, along with several others of the same kind among the heavenly bodies, it seemed to betray imperfection; exhibiting inequalities which were continually increasing, instead of correcting themselves or being somehow compensated by that admirable design which prevailed in every other part of the system. At last, however, it was discovered, by the application of a refined analysis, that these inequalities were not perpetual; that they actually terminate in the lapse of ages, and again return in the opposite direction, thus preserving entire the harmony of the celestial motions. This fine discovery, which observation alone could never have disclosed, we owe to the genius of Laplace. See Astronomy in this work; also *Phil. Trans.* No. 204, 218, and vol. xlvi. 1749, 1750, 1777; *Mém. de l'Acad. Par.* 1757, 1763, 1786; *Mém. de l'Acad. Berlin*, 1773, 1782; *Connoissances des Temps*, 1779, 1782, 1790; Newton's *Principia*, second edition; Say's *Astronomy;* Vince's *Astronomy;* *Astronomie*, par Lalande, &c. (J. B.)

Acceleration *of Bodies on inclined Planes.* The same general law obtains here as in bodies falling perpendicularly: the effect of the plane is to make the motion slower; but the inclination being everywhere equal, the retardation arising therefrom will proceed equally in all parts, at the beginning and the ending of the motion.

ACCENDENTES, a lower order of ministers in the Romish church, whose office is to light and trim the candles.

ACCENDONES, in Roman antiquity, a kind of gladiators, whose office was to excite and animate the combatants during the engagement. The orthography of the word is contested: the first edition of Tertullian, by Rhenanus, has it *accedones;* an ancient manuscript, *accendones.* Aquinas adheres to the former, Pitiscus to the latter. The origin of the word, supposing it *accendones*, is from *accendo*, I kindle; supposing it *accedones*, from *accedo*, I accede, am added to. The former places their distinguishing character in enlivening the combat by their exhortations and suggestions: the latter supposes them to be much the same with what among us are called *seconds*, among the Italians, *patroni;* excepting that these latter only stand by to see the laws of the sword duly observed, without intermeddling to give advice or instruction.

ACCENSI, in the Roman armies, certain supernumerary soldiers, designed to supply the place of those who should be killed or anywise disabled. They were thus denominated, *quia accensebantur*, or *ad censum adjiciebantur.* Vegetius calls them *supernumerarii legionum.* Cato calls them *ferentarii*, in regard they furnished those engaged in battle with weapons, drink, &c. Nonnius suggests another reason of that appellation, viz. because they fought with stones, slings, and weapons, *quæ feruntur*, such as are thrown, not carried in the hand. They were sometimes also called *velites*, and *velati*, because they fought clothed, but not in armour; sometimes *adscriptitii*, and *adscriptivi;* sometimes *rorarii.* The *accensi*, Livy observes, were placed in the rear of the army, because little was expected from them: they were taken out of the fifth class of citizens.

Accensi, in antiquity, denotes an inferior order of officers, appointed to attend the Roman magistrates, somewhat in the manner of ushers, serjeants, or tipstaves among us. They were thus called from *accire*, to send for; one part of their office being to call assemblies of the people, summon parties to appear and answer before the judges, &c.

Accensi was also an appellation given to a kind of adjutants, appointed by the tribune to assist each centurion and decurion; in which sense *accensus* is synonymous with *optio.* In an ancient inscription, given by Torre, we meet with Accensus Equitum Romanorum; an office nowhere else heard of. That author suspects it for a corruption; and instead thereof reads, A Censibus.

ACCENSION, the action of setting a body on fire: thus the accension of tinder is effected by striking fire with flint and steel.

ACCENT, in *reading* or *speaking*, an inflection of the voice, which gives to each syllable of a word its due pitch in respect of height or lowness. See Reading. The word is originally Latin, *accentus;* a compound of *ad*, to, and *cano*, to sing. *Accentus quasi adcantus*, or *juxta cantum.* In this sense, accent is synonymous with the Greek τονος; the Latin *tenor*, or *tonor;* and the Hebrew טעם, *gustus*, taste.

Accent, among grammarians, is a certain mark or

Accent.

character placed over a syllable to direct the stress of its pronunciation. We generally reckon three grammatical accents in ordinary use, all borrowed from the Greeks, viz. the *acute accent* ('), which shows when the tone of the voice is to be raised; the *grave accent* (`), when the note or tone of the voice is to be depressed; and the *circumflex accent* (^), which is composed of both the acute and the grave, and points out a kind of undulation of the voice. The Latins have made the same use as the Greeks of these three accents.

The Hebrews have a grammatical, a rhetorical, and a musical accent; though the first and last seem, in effect, to be the same, both being comprised under the general name of *tonic accents*, because they give the proper tones to syllables; as the rhetorical accents are said to be euphonic, because they tend to make the pronunciation more sweet and agreeable. There are four euphonic accents, and twenty-five tonic: of these some are placed above, and others below the syllables; the Hebrew accents serving not only to regulate the risings and fallings of the voice, but also to distinguish the sections, periods, and members of periods, in a discourse, and to answer the same purposes with the points in other languages. Their accents are divided into *emperors, kings, dukes,* &c. each bearing a title answerable to the importance of the distinction it makes. Their emperor rules over a whole phrase, and terminates the sense completely; answering to our point. Their king answers to our colon; and their duke to our comma. The king, however, occasionally becomes a duke, and the duke a king, as the phrases are more or less short. It must be noted, by the way, that the management and combination of these accents in Hebrew poetry differ from their management and combination in prose. The use of the tonic or grammatical accents has been much controverted; some holding that they distinguish the sense, while others maintain that they are only intended to regulate the music or singing, alleging that the Jews sing rather than read the Scriptures in their synagogues.[1] Be this, however, as it will, it is certain the ancient Hebrews were not acquainted with these accents. The opinion which prevails amongst the learned is, that they were invented about the sixth century, by the Jewish doctors of the school of Tiberias, called the *Massorets*.

[1] Cooper, *Dom. Mosaic. Clav.* p. 31.

As to the Greek accents, now seen both in manuscripts and printed books, there has been no less dispute about their antiquity and use than about those of the Hebrews. But, apart from the bewildering discussions of modern scholars, more erudite than wise, the man who with a clear knowledge of the phenomena of the living voice, shall draw his ideas on this subject directly from the ancient grammarians and rhetoricians will find the following things to be undoubted:—(1.) That by *accent* (προσωδία, τόνος) the Greeks understood the elevation or falling of the voice on a particular syllable of a word, either absolutely, or in relation to its position in a sentence, accompanied with an *intension* or *remission* of the vocal utterance on that syllable (ἐπίτασις, ἄνεσις,) occasioning a marked predominance of that syllable over the other syllables of the word. The predominance thus given, however, had no effect whatever on the quantity —long or short—of the accented syllable. The accented syllable in Greek as in English, might be long or it might be short; elevation and emphasis of utterance being one thing, and prolongation of the vocal sound quite another thing, as any one acquainted with the first elements of music will at once perceive. The difficulty which many modern scholars have experienced in conceiving how a syllable could be accented and not lengthened, has arisen partly from a complete want of distinct ideas on the nature of the elements of which human speech is composed, and partly also from a vicious practice which has long prevailed in the British schools, of reading Greek, not according to the laws of its own accentuation, but according to the accent of Latin handed down to us through the Roman Catholic church. For the rules of Latin accentuation are, as Quintilian and Cicero, and the grammarians expressly mention, very different from the Greek; and the long syllable of a word has the accent in Latin in a hundred cases, where the musical habit of the Greek ear placed it upon the short. There is besides a vast number of words in Greek accented on the last syllable (like *voluntee'r, ambusca'de,* in English), of which not a single instance occurs in the Latin language. Partly, however, from ignorance, partly from carelessness, and partly from stupidity, our scholastic men transferred the pronunciation of the more popular learned language to that which was less known; and with the help of time and constant usage, so habituated themselves to identify the accented with the long syllable, according to the analogy of the Latin, that they began seriously to doubt the possibility of pronouncing otherwise, and even wrote learned works disavowing the doctrine of accent altogether, as an element of spoken speech among the classical Greeks. But since the appearance of a more philosophical spirit in philology, under the guidance of Hermann, Boeckh, and other masterminds among the Germans, the confused discussions arising from these misunderstandings have ceased; and all our best grammarians now recognise the importance of this element of ancient Hellenic enunciation, while not a few carry out their principles into a consistent practice. The only circumstance, indeed, that prevents our English scholars from practically recognising the element of accent in classical teaching, is the apprehension that this would interfere seriously with the practical inculcation of quantity; an apprehension in which they are certainly justified by the practice of the modern Greeks, who have given such a predominance to accent, as altogether to subordinate, and in many cases completely overwhelm quantity; and who also, in public token of this departure from the classical habit of pronunciation, regularly compose their verses with a reference to the spoken accent only, leaving the quantity—as in modern language generally—altogether to the discretion of the poet. But as experiment will teach any one, that there is no necessity whatever in the nature of the human voice, for this confusion of two essentially different elements, it is not unlikely that British scholars will soon follow the example of the Germans, and read Greek prose at least systematically according to the laws of classical speech, as handed down to us by the grammarians of Alexandria and Byzantium. In the recitation of classical verse, of course, as it was not constructed on accentual principles, the skilful reader will naturally allow the musical accent, or the emphasis of the rhythm to overbear, to a great extent, or altogether to overwhelm, the accent of the individual word; though with regard to the recitation of verse, it will always remain a problem how far the ancients themselves did not achieve an "*accentuum cum quantitate apta conciliatio*," such as that which Hermann (*De emendanda ratione, &c.*) describes as the perfection of a polished classical enunciation.

The subject of Greek accent has been frequently handled by distinguished scholars both in this country and abroad; but it may be sufficient to refer the reader for more minute information to a paper in the *Classical Museum*, vol. i. p. 338; to Pennington's work on Greek pronunciation, Cambridge, 1844; and to a work on the same subject by Blackie, Edinburgh, 1853; and to the German work on Greek accent by Göttling. (English.) London, 1831.

The use of accents to prevent ambiguities is most remarkably perceived in some eastern languages, particularly the Siamese and Chinese. Among the people of China, every word, or, which is the same thing, every syllable, admits of five accents, according as it is spoken more acutely or remissly; and thus stands for many different things. The same sound *ya*, according to the accent affixed to it, signifies *God*, *a wall*, *excellent*, *stupidity*, and a *goose*. The Chinese have but 330 spoken words in their language; but these being multiplied by the different accents or tones which affect the vowels, furnish a language tolerably copious. By means of accents, their 330 simple sounds come to denote 1650 things; but this being hardly sufficient, they are increased further by aspirates added to each word, to double the number. The Chinese only reckon four *accents*, for which the missionaries use the following marks, *aá*, *â*, *à*, *a* ; to which they have added a fifth, thus *ã*. They make a kind of modulation, wherein, prolonging the duration of the sound of the vowel, they vary the tone, raising and sinking it by a certain pitch of voice; so that their talking is a sort of music or singing. Attempts have been made to determine the quantity of the rise or fall on each accent by means of musical notes; but this is hard to effect, as being different in different persons. Hence the great difficulty of the language to foreigners, who are forced to sing most scrupulously; for if they deviate ever so little from the accent, they say quite a different thing from what was intended. Thus, meaning to compliment the person you are talking of with the title *Sir*, you call him a beast with the same word, only a little varied in the tone. Magalhon, however, makes the language easier to learn on this account. The Siamese are also observed to sing rather than to talk. Their alphabet begins with six characters, all only equivalent to a K, but differently accented. For though in the pronunciation the accents are naturally on the vowels, yet they have some to diversify such of their consonants as are in other respects the same.

Accent, in *Music*. See Music, § *Melody*.

ACCEPTANCE, in *Commerce*, is the subscribing, signing, and making one's self debtor for the sum contained in a bill of exchange or other obligation.

ACCEPTER, or Acceptor, the person who accepts a bill of exchange, &c.

ACCEPTILATION, among civilians, an acquittance or discharge given by the creditor to the debtor without the payment of any value.

ACCESSION, a coming to, applied where one object comes into conjunction with another, as the *accession* of a dynasty to a throne, an *accession* of a field to an estate.

In *Law*, it is a method of acquiring property, by which, in things that have a close connection or dependence upon one another, the property of the principal draws after it the property of the accessory: thus, the owner of a cow becomes likewise the owner of the calf. It sometimes likewise signifies consent or acquiescence. Thus, in the bankrupt law of Scotland, when there is a settlement by a trust-deed, it is accepted on the part of each creditor by a deed of accession.

The most important application of the term is its historical and constitutional, in reference to monarchical government. The beginning of every monarch's reign may be called his accession, but it is generally said of a monarch that he "succeeds," and the term is more distinctively applied to the epoch of a new dynasty, as the accession of the House of Capet in France, of the House of Austria or of Bourbon in Spain, and of the House of Stuart or of Hanover in England. Such accessions are very frequent in European history. In France alone, besides late changes, we have the accession of the Carlovingian dynasty in Pepin (752), of the Capetian in Hugh Capet (987), of the House of Valois in Philip VI. (1328), and of the House of Bourbon in Henry IV. (1485). A fixed principle of succession by which the heir of a childless monarch is indicated with certainty, is a great preservative of peace among monarchies. The most desolating wars have arisen from disputed successions. In Oriental despotisms, even the first step in certainty—the indication of the particular son who shall succeed his father—is often wanting, and it has been usual to put to death or mutilate the brethren of the selected one, to prevent contention. Even in this country it was long ere the principle of succession was so well established, as to apply with certainty to distant relations. The great war of independence in Scotland arose from the question, whether a grandchild by the eldest child had any preference over a younger. The same difficulty created the great wars of the Roses. Edward III. had three sons, the Black Prince, Lionel Duke of Clarence, and John of Gaunt, Duke of Lancaster. On the death of Richard II., the son of the Black Prince, the descendant of his elder uncle, the Duke of Clarence, should have succeeded by scientific principles of descent, but Henry IV., the son of John of Gaunt, made good his accession.

The highest perfection in peaceful constitutional accession is reached when the legislature of a country requires to change the line of monarchs, and fixes beforehand on another line, which, by virtue of the selection, has a peaceful accession. This has been only accomplished in our own country, when it was twice effected within a very short interval, when at the Revolution the crown was settled on William and Mary, and the Princess Anne and her heirs. On the death of her last child it was necessary to make a new settlement, and going back to the descendants of King James I., the grandson of his daughter the Queen of Bohemia, was selected and made the accession of the House of Hanover.

ACCESSORY, or Accessary, something that accedes, or is added to another more considerable thing; in which sense it is opposed to principal.

In *Common Law*, it is applied to a person guilty of a felonious offence, not principally, but by participation; as by advice, command, or concealment. There are two kinds of *accessories; before* the fact, and *after* it. The first is he who commands or procures another to commit felony, and is not present himself; for if he be present he is a principal. The second is he who receives, assists, or comforts any man that has done murder or felony, whereof he has knowledge. A man may also be accessory to an accessory, by aiding, receiving, &c. an accessory in felony.

*Accessory Nerves*, a pair of nerves which arise from the medulla in the vertebræ of the neck, ascend and enter the skull, and pass out of it again with the par vagum.

Accessory, among painters, an epithet given to such parts of a history-piece as serve chiefly for ornament.

ACCIAIUOLI, Donato, a native of Florence, was born in 1428, and was famous for his learning and the honourable employments which he held. He wrote a Latin translation of some of Plutarch's Lives; Commentaries on Aristotle's Ethics and Politics; and the lives of Hannibal, of Scipio, and of Charlemagne. He was sent to France by the Florentines, to solicit aid from Louis XI. against Pope Sixtus IV., but on his journey died at Milan in 1478: his body was carried to Florence, and buried in the church of the Carthusians at the public expense. The small fortune he left his children is a proof of his probity and disinterestedness. His daughters, like those of Aristides, were portioned by his fellow-citizens, as an acknowledgment of his services. His funeral eulogium was spoken by Christopher Landini; and an elegant epitaph, by Politian, was inscribed on his tomb.

ACCIDENT, in *Grammar*, implies a property attached to a word, without entering into its essential definition. See Grammar.

Accident, in *Heraldry*, an additional point or mark in a coat of arms, which may be either omitted or retained without altering the essence of the armour; such as abatement, difference, and tincture.

Accident, among *Logicians*, is used in a threefold sense. 1. Whatever does not essentially belong to a thing; as the clothes a man wears, or the money in his pocket. 2. Such properties in any subject as are not essential to it: thus, whiteness in paper is an accidental quality. 3. In opposition to substance, all qualities whatever are called accidents; as sweetness, softness, &c.

ACCIDENTAL, in *Philosophy*, is applied to that effect which flows from some cause intervening by accident, without being subject, or at least without any appearance of being subject, to general laws or regular returns. In this sense *accident* is opposed to *constant* and *principal*. Thus the sun's place is, with respect to the earth, the constant and principal cause of the heat in summer and the cold in winter; whereas winds, snows, and rains, are the accidental causes which often alter and modify the action of their principal cause.

*Accidental Colours* are those which depend upon the affections of the eye, in contradistinction to those which belong to light itself. The impressions made upon the eye by looking stedfastly on objects of a particular colour are various, according to the single colour or combination of colours in the object; and they continue for some time after the eye is withdrawn, and give a false colouring to other objects. M. Buffon has endeavoured to trace the connections which these accidental colours have with such as are natural, in a variety of instances. The subject has also been considered by De la Hire and M. Æpinus. M. d'Arcy has contrived a machine for determining the duration of those impressions on the eye; and from the result of several experiments, he inferred, that the effect of the action of light on the eye continued about eight thirds of a minute.

*Accidental Point*, in *Perspective*, is that point in the horizontal line where the projections of two lines parallel to each other meet the perspective plane.

ACCIPITER, among the Romans, signified a hawk, which, from its being very carnivorous, they considered as a bird of bad omen:

> Odimus accipitrem, quia semper vivit in armis. Ovid.

Pliny however tells us, that in some cases, particularly in marriage, it was esteemed a bird of good omen, because it never eats the hearts of other birds; intimating thereby, that no differences in a married state ought to reach the heart. The accipiter was worshipped as a divinity by the inhabitants of Tentyra, an island in the Nile, being considered by them as the image of the sun; and hence we find that luminary represented, in hieroglyphics, under the figure of a hawk.

In the Linnæan system this name is given to the first order of birds.

ACCISMUS denotes a feigned refusal of something which a person earnestly desires. The word is Latin; or rather Greek, ακκισμος; supposed to be formed from *Acco*, the name of a foolish old woman noted in antiquity for an affectation of this kind.

ACCIUS, Lucius, a Latin tragic poet, the son of a freedman, and, according to St Jerome, born in the consulship of Hostilius Mancinus and Attilius Serranus, in the year of Rome 583; but there appears somewhat of confusion and perplexity in this chronology. He made himself known before the death of Pacuvius by a dramatic piece, which was exhibited the same year that Pacuvius brought one upon the stage; the latter being then eighty years of age, and Accius only thirty. We do not know the name of this piece of Accius's, but the titles of several of his tragedies are mentioned by various authors. He wrote on the most celebrated stories which had been represented on the Athenian stage; as Andromache, Andromeda, Atreus, Clytemnestra, Medea, Meleager, Philoctetes, the civil wars of Thebes, Tereus, the Troades, &c. He did not always, however, take his subjects from the Grecian story; for he composed one dramatic piece wholly Roman: it was entitled *Brutus*, and related to the expulsion of the Tarquins. It is affirmed by some that he wrote also comedies; which is not unlikely, if he was the author of two pieces, the Wedding, and the Merchant, which have been ascribed to him. He did not confine himself to dramatic writing; for he left other productions, particularly his Annals, mentioned by Macrobius, Priscian, Festus, and Nonnius Marcellus. He has been censured for writing in too harsh a style, but in all other respects has been esteemed a very great poet. He was so much esteemed by the public, that a comedian was punished for only mentioning his name on the stage. Cicero speaks with great derision of one Accius who had written a history; and, as our author had written annals, some insist that he is the person censured: but as Cicero himself, Horace, Quintilian, Ovid, and Paterculus, have spoken of our author with so much applause, we cannot think it is the same person whom the Roman orator censures with so much severity.

Accius, a poet of the 16th century, to whom is attributed *A Paraphrase of Æsop's Fables*, on which Julius Scaliger bestows great encomiums.

ACCLAMATION, a confused noise or shout of joy, by which the public express their applause, esteem, or approbation.

Acclamation, in a more proper sense, denotes a certain form of words, uttered with extraordinary vehemence, and in a peculiar tone somewhat resembling a song, frequent in the ancient assemblies. Acclamations were usually accompanied with applauses, with which they are sometimes confounded, though they ought to be distinguished; as acclamation was given by the voice, applause by the hands: add, that acclamation was also bestowed on persons absent, applause only on those present. Acclamation was also given by women, whereas applause seems to have been confined to men.

Acclamations are of various kinds; ecclesiastical, military, nuptial, senatorial, synodical, scholastical, theatrical, &c. We meet with loud acclamations, musical and rhythmical acclamations; acclamations of joy and respect, and even of reproach and contumely. The former, wherein words of happy omen were used, were also called *Laudationes et bona vota*, or good wishes; the latter, *Execrationes et convicia*. Suetonius furnishes an instance of this last kind in the Roman senate, on occasion of the decree for demolishing the statues of Domitian, when the fathers, as the historian represents it, could not refrain from contumelious acclamations of the deceased. The like were shown after the death of Commodus, where the acclamations run in the following strain:—*Hosti patriæ honores detrahantur, parricidæ honores detrahantur; hostis statuas undique, parricidæ statuas undique, gladiatoris statuas undique*, &c. The formula, in acclamations, was repeated sometimes a greater, sometimes a lesser number of times. Hence we find in Roman writers, *acclamatum est quinquies, et vicies*; five times, and twenty times; sometimes also *sexagies*, and even *octuagies*; sixty and eighty times.

Acclamations were not unknown in the theatres in the earliest ages of the Roman commonwealth; but they were artless then, and little other than confused shouts. Afterwards they became a sort of regular concerts. That mentioned by Phædrus, *Lætare incolumis, Roma, salvo Prin-*

*cipe*, which was made for Augustus, and proved the occasion of a pleasant mistake of a flute-player called *Princeps*, shows that musical acclamations were in use in that emperor's reign. *Revertentem ex provincia modulatis carminibus prosequebantur*, says Suetonius, who gives another instance in the time of Tiberius: a false report of Germanicus's recovery being spread through Rome, the people ran in crowds to the Capitol with torches and victims, singing, *Salva Roma, Salva Patria, Salvus est Germanicus.* Nero, passionately fond of music, took special care to improve and perfect the music of acclamations. Charmed with the harmony with which the Alexandrians, who came to the games celebrated at Naples, had sung his praises, he brought several over to instruct a number of youth, chosen from among the knights and people, in the different kinds of acclamations practised in Alexandria. These continued in use as long as the reign of Theodoric. But the people did not always make a single chorus; sometimes there were two, who answered each other alternately: thus, when Nero played in the theatre, Burrhus and Seneca, who were on either hand, giving the signal by clapping, 5000 soldiers, called *Augustals*, began to chant his praise, which the spectators were obliged to repeat. The whole was conducted by a music-master, called *mesochorus* or *pausarius*. The honour of acclamations was chiefly rendered to emperors, their children, and favourites; and to the magistrates who presided at the games. Persons of distinguished merit also sometimes received them, of which Quintilian gives us instances in Cato and Virgil. The most usual forms were, *Feliciter, Longiorem vitam, Annos felices.* The actors themselves, and they who gained the prizes in the games of the circus, were not excluded the honour of acclamations.

To theatrical acclamations may be added those of the soldiery and the people in time of triumph. The victorious army accompanied their general to the Capitol; and, among the verses they sung in his praises, frequently repeated Io TRIUMPHE, which the people answered in the same strain. It was also in the way of acclamation that the soldiers gave their general the title of *Imperator*, after some notable victory; a title which he only kept till the time of his triumph.

The acclamations of the senate were somewhat more serious than the popular ones, but arose from the same principle, viz. a desire of pleasing the prince or his favourites; and aimed likewise at the same end, either to express the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new protestations of fidelity. These acclamations were usually given after a report made by some senator, to which the rest all expressed their consent by crying, OMNES, OMNES; or else, ÆQUUM EST, JUSTUM EST. Sometimes they began with acclamations, and sometimes ended with them, without other debates. It was after this manner that all the elections and proclamations of emperors, made by the senate, were conducted; something of which practice is still retained at modern elections of kings and emperors, where *Vivat Rex*, and *Long live the King*, are customary forms of acclamation.

The Greeks borrowed the custom of receiving their emperors in the public places from the Romans. Luitprand relates, that at a procession where he was present, they sung to the Emperor Nicephorus, πολλα ετεα; that is, *many years;* which Coddin expresses thus, by το ψαλλειν το πολυχρονιον, or by το πολυχρονιζειν; and the wish or salutation by πολυχρονισμα. And at dinner, the Greeks then present wished with a loud voice to the emperor and Bardas, *Ut Deus annos multiplicet*, as he translates the Greek. Plutarch mentions an acclamation so loud, upon occasion of Flaminius's restoring liberty to Greece, that the very birds fell from heaven with the shout. The Turks practise something like this, on the sight of their emperors and grand viziers, to this day.

For the acclamations with which authors, poets, &c. were received, who recited their works in public; it is to be observed, the assemblies for this purpose were held with great parade in the most solemn places, as the Capitol, temples, the Athenæum, and the houses of great men. The chief care was that the acclamations might be given with all the order and pomp possible. Men of fortune who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the interest to such as applauded his exercises. These acclamations were conducted much after the same manner as those in the theatre, both as to the music and the accompaniments: they were to be suited both to the subject and to the person. There were particular ones for the philosophers, for orators, for historians, and for poets. It would be difficult to rehearse all the forms of them; one of the most usual was *Sophos*, which was to be repeated three times. Martial comprehends several other usual forms in this verse:

*Graviter, Cito, Nequiter, Euge, Beate.*

Neither the Greeks nor Romans were barren on this head. The names of gods and heroes were given to those whom they would extol. It was not enough to do it after each head of discourse, chiefly after the exordium; but the acclamations were renewed at every fine passage, frequently at every period.

The acclamations with which the spectators honoured the victories of the athletæ, were a natural consequence of the impetuous motions which attended the gymnastic games. The cries and acclamations of the people, sometimes expressing their compassion and joy, sometimes their horror and disgust, are strongly painted by different poets and orators.

Acclamations made also a part of the ceremony of marriage. They were used for the omen's sake, being the *Læta Omina* sometimes spoken of before marriage in Roman writers.

Acclamations, at first practised in the theatre, and passing thence to the senate, &c. were, in process of time, received into the acts of councils, and the ordinary assemblies of the church. The people expressed their approbation of the preacher variously; the more usual forms were, *Orthodox! Third Apostle*, &c. These acclamations being sometimes carried to excess, and often misplaced, were frequently prohibited by the ancient doctors, and at length abrogated; though they appear to have been in some use about the time of St Bernard.

*ACCLAMATION MEDALS*, among *Antiquaries*, such as represent the people expressing their joy in the posture of acclamation.

ACCLIVITY, the rise or ascent of a hill, in opposition to the declivity or descent of it. Some writers on fortification use it for the talus of a rampart.

ACCOLA, among the Romans, signified a person who lived *near* some place; in which sense it differed from *incola*, the *inhabitant* of such a place.

ACCOLADE, a ceremony anciently used in the conferring of knighthood.

Antiquaries are not agreed wherein the accolade properly consisted. The generality suppose it to be the embrace or kiss which princes anciently gave the new knight, as a token of their affection: whence the word accolade; q. d. a clasping, or taking round the neck. Others will rather have it to be a blow on the chine of the neck, given on the same occasion. The Accolade is of some antiquity, in whichsoever of the two senses it be taken. Gregory of Tours writes, that the kings of France, even of the first race, in conferring the gilt shoulder-belt, kissed the knights on the left cheek. For the *accolée*, or blow, John of Salisbury assures us it was in use among the ancient Normans; by this it was that William the Conqueror conferred the honour of knighthood on his son Henry. At first it was given with the naked fist, but was afterwards changed into a blow with the flat of the sword on the shoulder of the knight.

ACCOLÉE, sometimes synonymous with ACCOLADE. It is also used in various senses in heraldry: sometimes it is applied to two things joined; at other times, to animals with crowns, or collars about their necks, as the lion in the Ogilvys' arms; and lastly to keys, batoons, maces, swords, &c., placed saltierwise behind the shield.

ACCOLTI, BENEDICT, better known among jurists by the name of ARETINUS, was born at Arezzo in 1415. He became a professor of law at Florence; and having been admitted a citizen, was elected chancellor of the republic in 1459. His death took place in 1466. He wrote in Latin a treatise concerning the war which the Christians carried on against the infidels to recover Judea and the holy sepulchre. This work is the ground-plot of Tasso's *Jerusalem Delivered.* It only includes, however, the history of the first crusade. He also wrote an account of the *Excellent Personages of his Time*, in the form of a dialogue.

ACCOLTI, *Francis*, brother of Benedict. See P. ARETINO.

ACCOMAC, a county in the *Tidewater* district of Virginia, U.S., North America, containing in 1850 a population of 17,861.

ACCOMMODATION, the application of one thing, by analogy, to another; or the making two or more things agree with one another. To know a thing by *accommodation*, is to know it by the idea of a similar thing referred thereto.

A prophecy of Scripture is said to be fulfilled in various ways: properly, as when a thing foretold comes to pass; and improperly, or by way of *accommodation*, when an event happens to any place or people, like to what fell out some time before to another. Thus, the words of Isaiah, spoken to those of his own time, are said to be fulfilled in those who lived in our Saviour's, and are *accommodated* to them: "Ye hypocrites, well did Esaias prophesy of you," &c.; which same words St Paul afterwards *accommodates* to the Jews of his time.

The primitive church *accommodated* multitudes of Jewish, and even Heathen ceremonies and practices, to Christian purposes; but the Jews had before done the same by the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only *accommodated* by Moses to the purposes of Judaism.[1] Spencer maintains, that most of the rites of the old law were in imitation of those of the Gentiles, and particularly of the Egyptians; that God, in order to divert the children of Israel from the worship they paid to their false deities, consecrated the greater part of the ceremonies performed by those idolators, and had formed out of them a body of the ceremonial law; that he had indeed made some alterations therein, as barriers against idolatry; and that he thus *accommodated* his worship to the genius and occasions of his ancient people. To this condescension of God, according to Spencer,[2] is owing the origin of the tabernacle, and particularly that of the ark. These opinions, however, have been controverted by later writers.

ACCOMMODATION PAPER. See EXCHANGE.

[1] Saurin, *Diss. O. T* tom. i.

[2] *De Legibus Hebr.* diss. 1. l. 3. p. 32.

ACCOMPANIMENT, ACCOMPAGNAMENTO, ACCOMPAGNATURA, in *Music.* See MUSIC.

ACCOMPANIMENT, in *Painting*, denotes such objects as are added, either by way of ornament or fitness, to the principal figures; as dogs, guns, game, &c. in a hunting piece.

ACCOMPANIMENT, in *Heraldry*, any thing added to a shield by way of ornament; as the belt, mantling, supporters, &c. It is also applied to several bearings about a principal one; as a saltier, bend, fesse, chevron, &c.

ACCOMPLICE, one that has a hand in a business, or is privy in the same design or crime with another. The Council of Sens, and the statutes of several other synods, expressly prohibit the revealing of *accomplices.*

ACCOMPLISHMENT, the entire execution or fulfilling of any thing.

ACCORD, in *Painting*, is used to express the harmony that reigns among the lights and shades of a picture. See the article PAINTING.

ACCORDION, a musical instrument. For its principle see MUSIC.

ACCORSO (in Latin *Accursius*), FRANCIS, an eminent lawyer, born at Florence about 1182. He began the study of law at a late period of life; but such were his assiduity and proficiency, that he soon distinguished himself. He was appointed professor at Bologna, and became a very eminent teacher. He undertook the great work of uniting and arranging into one body the almost endless comments and remarks upon the Code, the Institutes, and Digests, all which tended to involve the subjects in obscurity and contradiction. When he was employed in this work, it is said that, hearing of a similar one proposed and begun by Odofred, another lawyer of Bologna, he feigned indisposition, interrupted his public lectures, and shut himself up, till he had, with the utmost expedition, accomplished his design. His work has the vague title of the *Great Gloss.* The best edition of it is that of Godefroi, published at Lyons in 1589, in 6 vols. folio. Accursius was greatly extolled by the lawyers of the twelfth and thirteenth centuries, but those of the fourteenth and of the sixteenth formed a much lower estimate of his merits. There can be no doubt that he has disentangled with much skill the sense of many laws; but it is equally undeniable that his ignorance of history and antiquities has often led him into absurdities, and been the cause of many defects in his explanations and commentaries. He is said to have lived in opulence, and died at Bologna in 1260, in the seventy-eighth year of his age. His eldest son, Francis, who filled the chair of law at Bologna with great reputation, was invited to Oxford by King Edward I., and in 1275 or 1276 read lectures on law in that university. In 1280 he returned to Bologna, where he died in 1321.

ACCORSO, or ACCURSIUS, *Mariangelo*, a learned and ingenious critic, was a native of Aquila, in the kingdom of Naples, and lived about the beginning of the sixteenth century. To a perfect knowledge of Greek and Latin he added an intimate acquaintance with several modern languages. Classical literature was much improved and promoted by his labours. In discovering and collating ancient manuscripts he displayed uncommon assiduity and diligence. His work entitled *Diatribæ in Ausonium, Solinum, et Ovidium*, printed at Rome, in folio, in 1524, is a singular monument of erudition and critical skill. He bestowed, it is said, unusual pains on Claudian, and made above seven hundred corrections on the works of that poet, from different manuscripts. Unfortunately the world has been deprived of the advantage of these criticisms, for they were never published. An edition of *Ammianus Marcellinus*, which he published at Augsburg in 1533, contains five books more than any former one. He was the first editor of the *Letters of Cassiodorus*, with his *Treatise on the Soul.* The affected use of antiquated terms, introduced by some of the Latin writers of that age, is humorously ridiculed by him, in a dialogue published in 1531, entitled *Osco, Volsco, Romanaque Eloquentia Interlocutoribus, Dialogus Ludis Romanis actus.* It was republished at Rome in 1574, in 4to, with his name. He was also the author of a poem entitled *Protrepticon ad Corycium*, published in a scarce collection named *Coryciana*, printed at Rome in 1524. Accorso had been accused of plagiarism in his notes on Ausonius; and the solemn and determined manner in which he repelled this charge of literary theft, presents us with a singular instance of his anxiety and care to preserve his literary reputation unstained and pure. It is in the following oath: "In the name of gods and men, of truth and sincerity, I solemnly swear, and if any declaration be more binding than an oath, I in that form declare, and I desire that my declaration may be received as strictly true, that I have never read or seen any author from which my own lucubrations have received the smallest assistance or improvement; nay, that I have even laboured, as far as possible, whenever any writer has published any observations which I myself had before made, immediately to blot them out of my own works. If in this declaration I am forsworn, may the pope punish my perjury; and may an evil genius attend my writings, so that whatever in them is good, or at least tolerable, may appear to the unskilful multitude exceedingly bad, and even to the learned trivial and contemptible; and may the small reputation I now possess be given to the winds, and regarded as the worthless boon of vulgar levity."

ACCOUNT, or ACCOMPT, in a general sense, a computation or reckoning of any thing by numbers.—Collectively, it is used to express the books which merchants, traders, bankers, &c. use for recording their transactions in business.

ACCOUNTS, *Chamber of*, in the French polity, a sovereign court of great antiquity, which took cognizance of and registered the accounts of the king's revenue; nearly the same with the English *Court of Exchequer*.

ACCOUNTANT, or ACCOMPTANT, in the most general sense, is a person skilled in accounts. In a more restricted sense, it is applied to a person or officer appointed to keep the accounts of a public company or office.

ACCOUNTANT-GENERAL, an officer in the court of chancery, appointed by Act of Parliament to receive all moneys lodged in court, instead of the masters, and convey the same to the Bank of England for security. There is also an accountant-general in the Irish Chancery, and one in Scotland, who has charge of the accounts of the Court of Session.

ACCRETION, among civilians, the property acquired in a vague or unoccupied thing, by its adhering to or following another already occupied: thus, if a legacy be left to two persons, one of whom dies before the testator, the legacy devolves to the survivor by right of accretion.

ACCROCHE, in *Heraldry*, denotes a thing's being hooked with another.

ACCUBATION, a posture of the body, between sitting and lying. The word comes from the Latin *accubare*, compounded of *ad*, to, and *cubo*, I lie down. *Accubation*, or *Accubitus*, was the table posture of the Greeks and Romans; whence we find the words particularly used for the lying, or rather (as we call it) sitting down to meat. The Greeks introduced this posture. The Romans, during the frugal ages of the republic, were strangers to it; but as luxury got footing, this posture came to be adopted, at least by the men; for as to women, it was reputed an indecency in them to lie down among the men, though afterwards this too was got over. Children did not lie down, nor servants, nor soldiers, nor persons of meaner condition. They took their meals sitting, as a posture less indulgent. The Roman manner of disposing themselves at table was this:—A low round table was placed in the *cænaculum*, or dining-room, and about this, usually three, sometimes only two, beds or couches; and, according to their number, it was called *biclinium* or *triclinium*. These were covered with a sort of bedclothes, richer or plainer, according to the quality of the person, and furnished with quilts and pillows, that the guests might lie the more commodiously. There were usually three persons on each bed; to crowd more was esteemed sordid. In eating, they lay down on their left sides, with their heads resting on the pillows, or rather on their elbows. The first lay at the head of the couch, with his feet extended behind the back of the second; the second lay with the back of his head towards the navel of the first, only separated by a pillow, his feet behind the back of the third; and so of the third or fourth. The middle place was esteemed the most honourable. Before they came to table, they changed their clothes, putting on what they called *cænatoria vestis*, the dining garment; and pulled off their shoes, to prevent soiling the couch. In the time of the emperors, couches higher and softer than the *triclinia*, called *accubita*, came into use, the clothes and pillows of which were termed *accubitalia*. Accubation at meals was also a Jewish practice, as we learn from Josephus, and from a passage in the gospel of St John xiii. 24, 26.

ACCUBITOR, an ancient officer of the court of Constantinople, who lay near the emperor. He was the head of the youth of the bed-chamber, and had the *cubicularius* and *procubitor* under him.

ACCUMULATION, in a general sense, the act of heaping or amassing things together. Among lawyers it is used in speaking of the concurrence of several titles to the same thing, or of several circumstances to the same proof.

ACCUMULATION *of Degrees*, in a university, is the taking of several of them together, or at shorter intervals than usual, or than is allowed by the rules of the university.

ACCUMULATION *of Wealth*. See POLITICAL ECONOMY.

ACCURSED, something that lies under a curse, or sentence of excommunication.—In the Jewish idiom, *accursed* and *crucified* were synonymous. Among them, every one was accounted *accursed* who died on a tree. This serves to explain the difficult passage in Rom. ix. 3, where the apostle Paul wished himself *accursed after the manner of Christ, i.e.* crucified, if happily he might, by such a death, save his countrymen. The preposition απο, here made use of, is used in the same sense, 2 Tim. i. 3, where it obviously signifies *after the manner of*.

ACCUSATION, the charging of any person with a criminal action, either in one's own name or in that of the public. The word is compounded of *ad*, to, and *causari*, to plead.

Writers on politics treat of the benefit and the inconveniences of public accusations. Various arguments are alleged both for the encouragement and discouragement of accusations against great men. Nothing, according to Machiavel, tends more to the preservation of a state than frequent accusations of persons intrusted with the administration of public affairs. This, accordingly, was strictly observed by the Romans in the instance of Camillus, accused of corruption by Manlius Capitolinus, &c. Accusations, however, in the judgment of the same author, are not more beneficial than calumnies are pernicious; which is also confirmed by the practice of the Romans. Manlius, not being able to make good his charge against Camillus, was cast into prison.

By the Roman law, there was no public accuser for public crimes; every private person, whether interested in the crime or not, might accuse, and prosecute the accused to punishment or absolution. Cato, the most innocent person of his age, had been accused 42 times, and as often absolved.

But the accusation of *private* crimes was never received but from the mouths of those who were immediately interested in them: None (*e. g.*) but the husband could accuse his wife of adultery.

The ancient Roman lawyers distinguished between *postulatio, delatio*, and *accusatio*. For, first, leave was desired to bring a charge against one, which was called *postulare:* then he against whom the charge was laid was brought before the judge, which was called *deferre*, or *nominis delatio:* lastly, the charge was drawn up and presented, which was properly the *accusatio*. The accusation properly commenced, according to Pedianus, when the *reus* or party charged, being interrogated, denied he was guilty of the crime, and subscribed his name to the *delatio* made by his opponent.

In Britain, by Magna Charta, no man shall be imprisoned or condemned on any accusation, without trial by his peers or the law; none shall be vexed with any accusation, but according to the law of the land; and no man shall be molested by petition to the king, &c. unless it be by indictment or presentment of lawful men, or by process at common law. Promoters of suggestions are to find surety to pursue them, and if they do not make them good, shall pay damages to the party accused, and also a fine to the king. No person is obliged to answer upon oath to a question whereby he may accuse himself of any crime.

ACCUSATIVE, in *Latin Grammar*, is the fourth case of nouns, and signifies the relation of the noun on which the action implied in the verb terminates; and hence, in such languages as have cases, these nouns have a particular termination, called *accusative*, as, *Augustus vicit Antonium*, Augustus vanquished Antony. Here *Antonium* is the noun on which the action implied in the word *vicit* terminates, and therefore must have the accusative termination. See Grammar.

ACELDAMA, the field purchased with the money for which Judas betrayed Christ, and which was appropriated as a place of burial for strangers. It was previously a "potter's field." The field now shewn as Aceldama lies on the slope of the hills beyond the valley of Hinnom, south of Mount Zion. This is obviously the spot which Jerome points out (*Onomast. s. v.* "Acheldamach,") and which has since been mentioned by almost every one who has described Jerusalem.

ACENTETUM, or Acenteta, in *Natural History*, a name given by the ancients to the purest and finest kind of rock-crystal.

ACEPHALA, Cuvier's class of *Mollusca*, so called from the animals' having no head (α, and κεφαλη).

ACEPHALI, or Acephalitæ, a term applied to several sects who refused to follow some noted leader. Thus, the persons who refused to follow either John of Antioch or St Cyril, in a dispute that happened in the Council of Ephesus, were termed *Acephali*, without a head or leader. Such bishops, also, as were exempt from the jurisdiction and discipline of their patriarch, were styled *Acephali*.

Acephali, the levellers in the reign of King Henry I., who acknowledged no head or superior. They were reckoned so poor, that they had not a tenement by which they might acknowledge a superior lord.

ACEPHALOUS, or Acephalus, in a general sense, without a head. The term is more particularly used in speaking of certain nations or people, represented by ancient naturalists and cosmographers, as well as by some modern travellers, as formed without heads; their eyes, mouth, &c. being placed in other parts. Such are the Blemmyes, a nation of Africa, near the head of the Niger, represented thus by Pliny and Solinus: *Blemmyis traduntur capita abesse, ore et oculis pectori affixis.* Ctesias and Solinus mention others in India, near the Ganges, *sine cervice, oculos in humeris habentes.* Mela also speaks of people, *quibus capita et vultus in pectore sunt.* And Suidas, Stephanus Byzantinus, Vopiscus, and others after them, relate the like. Some modern travellers have pretended to find acephalous people in America.

Acephalus, an obsolete term for the tænia or tapeworm, which was long supposed to be acephalous. The first who gave it a head was Tulpius, and after him Fehr: the former even makes it *biceps*, or two-headed.

Acephalus is also used to express a verse defective in the beginning.

ACER, the Maple Tree, a genus of trees; of which *A. campestre*, the maple, and *A. saccharinum*, are the best known. *A. pseudoplatanus* is a lofty tree, which is chiefly found native in the south of Europe, but several varieties grow in Britain.

ACERB, a sour rough astringency of taste, such as that of unripe fruit.

ACERENZA, a town of the kingdom of Naples, in the province of Basilicata, 80 miles east from Naples, containing 3600 inhabitants; anciently *Acherontia.—Hor. Carm. l.* 3. iv.

ACERINA, in *Ichthyology*, a name given by Pliny and other old naturalists to the fish we call the *ruffe*.

ACERNO, a town of Italy, in the citerior principality of Naples, with a bishop's see, and 2500 inhabitants. It is situated 14 miles north-east of Salerno, in Long. 15. 4. E. Lat. 40. 45. N.

ACERRA, in *Antiquity*, an altar erected among the Romans, near the bed of a person deceased, on which his friends daily offered incense till his burial. The real intention probably was to overcome any offensive smell that might arise about the corpse. The Chinese have still a custom like this: they erect an altar to the deceased in a room hung with mourning, and place an image of the dead person on the altar, to which every one that approaches it bows four times, and offers oblations and perfumes.

The *acerra* also signified a little pot, wherein were put the incense and perfumes to be burnt on the altars of the gods and before the dead. It appears to have been the same with what was otherwise called *thuribulum* and *pyxis*.

The Jews had their *acerræ*, in our version rendered *censers;* and the Romanists still retain them under the name of *incense pots*. In Roman writers we frequently meet with *plena acerra*, a full acerra; to understand which, it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains: the former poured out full *acerræ* on the altar, the latter took out two or three bits with their fingers.

Acerra, a town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, seated on the river Agno, 7 miles north-east of Naples; anciently *Acerræ*. It contains 6300 inhabitants. Long. 14. 23. E. Lat. 40. 55. N.

ACESAS, of Salamis in Cyprus, was famed for his skill in weaving and embroidery; but especially so for the peplus or mantle which, with the assistance of his son Helicon, he made for the Athena Polias. This peplus is mentioned by Euripides (*Hecuba*, 468.), and by Plato (*Euthyphron*, § 6.) See Athenæus, ii.

ACESCENT, a word used to denote any thing which is turning sour, or which is slightly acid. It is only applied properly to the former of these two meanings. The second may be expressed by either of the two words *acidulous* or *sub-acid*.

ACESINES, in *Ancient Geography*, a large and rapid river of India, which Alexander passed in his expedition into that country. The kingdom of Porus, which was conquered by Alexander, lay between the Hydaspes and this river, which, uniting with the former and other considerable rivers, pours its waters into the Indus. According to Major Rennell, the modern Chunab is the Acesines of the ancients.

ACESIUS, a bishop of Constantinople in the reign of Constantine, was a rigid adherent to the Novatian doctrines, according to which those whom persecutions had shaken from the faith, or who were guilty of any mortal sin after baptism, could not be admitted to the communion of the church, even after exhibiting the most convincing proofs of sincere repentance. Constantine, who was extremely displeased with the severity of this rigid sect, in discouraging and rejecting repentance, is said to have thus expressed himself: "Then, Acesius, make a ladder for yourself, and go up to heaven alone."

ACESTES, son of Egesta, or Segesta, and the river-god Crimisus, the reputed founder of the town of Segesta, and the entertainer of Æneas on his arrival in Sicily.

ACESTOR, surnamed Sacas, a tragic poet at Athens, of Thracian or Mysian origin, contemporary with Aristophanes.

Acestor, a sculptor of Cnossus mentioned by Pausanias, vi. 17.

Acestor, a surname of Apollo, as patron of the healing art; derived from ἀκέομαι, to heal.

ACETABULUM, in antiquity, a measure used by the ancients, equal to one-eighth of our pint. It seems to have acquired its name from a vessel in which acetum or vinegar was brought to their tables, and which probably contained about this quantity.

Acetabulum, in *Anatomy*, a cavity in any bone for receiving the protuberant head of another, and thereby forming that species of articulation called Enarthrosis.

Acetabulum, in *Botany*, the trivial name of a species of the peziza, or cup peziza, a genus belonging to the cryptogamia fungi of Linnæus. It has got the name of *acetabulum* from the resemblance its leaves bear to a cup.

ACETAL, the basis of Acetous Acid or vinegar, consisting of eight atoms of carbon, nine of hydrogen, and three of oxygen. The compounds of Acetic Acid with various bases are termed Acetates. It is the Acetic Acid of chemists. See Chemistry.

ACETARY. Grew, in his *Anatomy of Plants*, applies this term to a pulpy substance in certain fruits, *e. g.* the pear, which is inclosed in a congeries of small calculous bodies towards the base of the fruit, and is always of an acid taste.

ACETOMETER, a barbarous word used by chemists for an instrument to determine the strength of vinegar. It should be *Oxometer*.

ACETOSA, Sorrel; by Linnæus joined to the genus *Rumex*.

ACETOSELLA, in *Botany*, a species of Oxalis.

ACHÆA, in *Ancient Geography*, a town of the island of Rhodes, in the district of Ialysus, and the first and most ancient of all; said to be built by the Heliades, or grandsons of the sun.

ACHÆANS, the inhabitants of Achaia Propria, a Peloponnesian state. This republic was not considerable, in early times, for the number of its troops, nor for its wealth, nor for the extent of its territories; but it was famed for its probity, its justice, and its love of liberty. Its high reputation for these virtues was very ancient. The Crotonians and Sybarites, to re-establish order in their towns, adopted the laws and customs of the Achæans. After the famous battle of Leuctra, a difference arose betwixt the Lacedemonians and Thebans, who held the virtue of this people in such veneration, that they terminated the dispute by their decision. The government of the Achæans was democratical. They preserved their liberty till the time of Philip and Alexander; but in the reign of these princes, and afterwards, they were either subjected to the Macedonians, who had made themselves masters of Greece, or oppressed by domestic tyrants. The Achæan commonwealth consisted of twelve inconsiderable towns in Peloponnesus. Towards the 124th Olympiad, about the time when Ptolemy Soter died, and when Pyrrhus invaded Italy, the republic of the Achæans recovered its old institutions and unanimity. This was the renewal of the ancient confederation, which subsequently became so famous under the name of the Achæan League; having for its object, not as formerly a common worship, but a substantial political union. Though dating from the year B.C. 280, its importance may be referred to its connection with Aratus of Sicyon about 30 years later,—as it was further augmented by the splendid abilities of Philopœmen. Thus did this people, so celebrated in the heroic age, once more emerge from comparative obscurity, and become the greatest among the states of Greece in the last days of its national independence. The inhabitants of Patræ and of Dymæ were the first assertors of ancient liberty. The tyrants were banished, and the towns again made one commonwealth. A public council was then held, in which affairs of importance were discussed and determined. A register was appointed to record the transactions of the council. This assembly had two presidents, who were nominated alternately by the different towns. But instead of two presidents, they soon elected but one. Many neighbouring towns, which admired the constitution of this republic, founded on equality, liberty, the love of justice, and of the public good, were incorporated with the Achæans, and admitted to the full enjoyment of their laws and privileges.—*Thirlwall, Hist. of Greece. Helwing, Geschichte der Achaïschen Bundes.*

ACHÆMENES, the ancestor of the Persian kings, and founder of the Achæmenidæ, which was the most illustrious family of the Pasargadæ, the noblest of the Persian tribes. He is said to have been nourished by an eagle. The unbroken line of succession of this family of kings is given in Herodotus, lib. vii. 11, where Xerxes declares himself sprung "from Darius, son of Hystaspes, son of Arsames, son of Ariaramnes (Αρμνεώς), son of Teïspes, son of Cyrus, son of Cambyses, son of Teïspes, son of Achæmenes." The adjective *Achæmenius* is sometimes used by the Roman poets in the sense of *Persian.—Hor. od.* iii. 44. *Epod.* xiii. 8.

Achæmenes, son of Darius I. king of Persia, and brother of Xerxes, had the government of Egypt bestowed on him, after Xerxes had forced the Egyptians to return to their allegiance. He some time after commanded the Egyptian fleet in the celebrated expedition which proved so fatal to all Greece. The Egyptians having again taken up arms after the death of Xerxes, Achæmenes was sent into Egypt to suppress the rebellion, but was vanquished by Inarus, chief of the rebels, succoured by the Athenians.

ACHÆUS, cousin-german to Seleucus Ceraunus and Antiochus the Great, kings of Syria, became a very powerful monarch, and enjoyed the dominions he had usurped for many years; but at last he was punished for his usurpations in a dreadful manner, in the year B.C. 214, as related by Polybius.[1]

[1] Lib. iv. 2; viii. 18.

Achæus, son of Xuthus, the mythical ancestor of the Achæans.

Achæus of Eretria, a tragic poet, born B.C. 484. In the satirical drama he displayed considerable abilities. The fragments of his pieces were published at Bonn, 1834.

ACHAIA, a name taken for that part of Greece which Ptolemy calls *Hellas*, the younger Pliny *Græcia*; afterwards called *Livadia*, now *Hellas Proper*.

*Achaia Propria*, anciently a small district in the north of Peloponnesus, running 65 miles along the bay of Corinth, and bounded on the west by the Ionian Sea, on the south by Elis and Arcadia, and on the east by Sicyonia. Its inhabitants were the *Achæans*, properly so called; its metropolis *Patræ*. It now forms part of the kingdom of Greece.

ACHAIA also denoted all those countries that joined in the Achæan league, reduced by the Romans to a province. Likewise the Peloponnesus.

ACHAIÆ *Presbyteri*, or the Presbyters of Achaia, were those who were present at the martyrdom of St Andrew the apostle, A.D. 59; and are said to have written an epistle in relation to it. Bellarmin, and several other eminent writers in the church of Rome, allow it to be genuine; while Du Pin and some others expressly reject it.

ACHAICUS, a follower of the apostle Paul. He, with Stephanas and Fortunatus, was the bearer of the First Epistle to the Corinthians. (1 Cor. xvi.)

ACHAIUS, king of Scotland, A.D. 788. See SCOTLAND.

ACHALALACTLI, a species of king-fisher.

ACHAN, the son of Carmi, of the tribe of Judah, at the taking of Jericho, concealed two hundred shekels of silver, a Babylonish garment, and a wedge of gold, contrary to the express command of God. This sin proved fatal to the Israelites, who were repulsed at the siege of Ai. In this dreadful exigence, Joshua prostrated himself before the Lord, and begged that he would have mercy upon his people. Achan was discovered by casting lots, and he and his children were stoned to death. This expiation being made, Ai was taken by stratagem. (Josh. vii. viii.)

ACHANE, an ancient Persian corn measure, containing 45 Attic medimni.

ACHARACA, anciently a town of Lydia, situate between Tralles and Nysa; in which were the temple of Pluto and the cave Charonium, where patients slept in order to obtain a cure.

ACHARD, CARL FRANZ, a Prussian chemist, born at Berlin, in 1754, who is chiefly known now by his process for extracting sugar from *beet-root*, in which Margraff had before detected its existence. In 1800 the French Institute voted him thanks for his paper, but considered his process of little value; until it was taken up by Napoleon in 1812, and tried at Rambouillet; since which it has been extensively carried on in France; but it is doubtful if it can ever compete with the produce of the sugar-cane, in a free market, though the sugar manufactured from it is very white, and belongs to the same kind of sugar as that from the sugar-cane. His other works are physico-chemical experiments on the adhesion of different bodies. Achard died in 1821.

ACHARNÆ, the principal demus of Atticæ, sixty stadia north of Athens, inhabited by the tribe Œneis. The Acharnians carried on an extensive traffic in charcoal, which they prepared from the wood of Mount Parnes, not far distant. The district was fertile, and the population warlike. One of the plays of Aristophanes is entitled 'The Acharnians.'—See LEAKE'S *Attica, p.* 35.

ACHAT, in *Law*, implies a purchase or bargain. And hence probably purveyors were called *Achators*, from their making bargains.

ACHATES, the faithful friend and companion of Æneas, celebrated in Virgil's Æneid.

ACHATES, in *Natural History*, the same as AGATE.

ACHATES, in *Ancient Geography*, a river in Sicily, now the *Dirillo;* which runs from north to south, almost parallel with the Gela, and not far from the ancient Selinus. *Plin.* It gave name to the achates, or agate, said to be first found there.

ACHAZIB, or ACHZIB, in *Ancient Geography*, a town of Galilee, in the tribe of Asher, nine miles from Ptolemais. —Also a town in the more southern parts of the tribe of Judah.

ACHEEN, an independent native state of Sumatra, in the Eastern Archipelago, situate on the north-western part of the island, and extending about 50 miles to the south-east. It is bounded by Tamiang on the eastern, and by the Sinkel river on the western coast of Sumatra. A commercial intercourse with Acheen has subsisted from the earliest period of British connection with the East. It was then a flourishing and extensive state, but subsequently declined from its importance, having become a prey to anarchy, from the contests of petty chiefs. Acheen is esteemed comparatively healthy, being more free from woods and swamps than most other portions of the island; and the fevers and dysenteries to which these are supposed to give occasion, are there said to be uncommon. The soil is light and fertile, and produces a variety of the finest fruits and vegetables; also rice and cotton in great plenty and perfection. Cattle are abundant, and reasonable in price. Though no longer the great mart of eastern commodities, it still carries on a considerable trade with the natives of that part of the continent of India termed the coast of Coromandel, who supply it with the cotton goods of their country, and receive in return gold dust, sapan wood, betel-nut, patch-leaf, a little pepper, sulphur, camphor, and benzoin. The country is supplied with Bengal opium, and also with iron, and many other articles of merchandise, by the European traders. Gold dust is collected in the mountains near Acheen, but the greater part is brought from the southern ports of Nalaboo and Soosoo. Sulphur is gathered from a volcanic mountain in the neighbourhood, which supplies their own consumption for the manufacture of gunpowder, and admits of a large exportation.

In their persons the Achenese differ from the rest of the Sumatrans, being taller, stouter, and of a darker complexion. They do not appear to be a distinct people, but are thought, with great appearance of reason, to be a mixture of Battas, Malays, and Moors from the west of India. In their dispositions they are more active and industrious than their neighbours; they possess more penetration and sagacity; have more general knowledge; and, as merchants, they deal upon a more extensive and liberal footing. Their religion is Mahometanism; and having a great number of mosques and priests, its forms and ceremonies are strictly observed. They speak a mixed language of Malay and Batta, with all the other jargons used by the eastern Mahommedans. In writing, they use the Malay character.

The monarchy is hereditary, and the king usually maintains a guard of 100 sepoys about his palace. When Acheen was a flourishing state, he ruled with despotic authority. There was, however, according to Mr Marsden, a grand council of the nation, which consisted of the sultan at its head; of four chief counsellors, and eight of a lower degree, who sat on the king's right hand; and of sixteen others who sat on his left. How far this council shares or controls the royal prerogative, does not seem to be ascertained. "At the king's feet," says Mr Marsden, "sits a woman, to whom he makes known his pleasure; by her it is communicated to an eunuch, who sits next to her; and by him to an officer, who then proclaims it aloud to the assembly. There are also present two other officers, one of whom has the government of the *bazaar* or market, and the other the superintending and carrying into execution the punishment of criminals. All matters relative to commerce and the customs of the port come under the jurisdiction of another functionary, who performs the ceremony of giving the *chap* or licence for trade; which is done by lifting a golden-hafted *kris* over the head of the merchant who arrives, and without which he dares not to land his goods. Presents, the value of which is become pretty regularly ascertained, are then sent to the king and his officers. If the stranger be in the style of an ambassador, the royal elephants are sent down to carry him and his letters to the monarch's presence; these being first delivered into the hands of an eunuch, who places them in a silver dish, covered with rich silk, on the baek of the largest elephant, which is provided with a machine for that purpose. Within about an hundred yards of an open hall where the king sits, the cavalcade stops, and the ambassador dismounts, and makes his obeisance by bending his body and lifting his joined hands to his head. When he enters the palace, if an European, he is obliged to take off his shoes; and having made a second obeisance, is seated upon a carpet on the floor, where *betel* is brought to him." The crown revenues, which fluctuate considerably, are derived from import and export duties levied on all goods. Monopolies, the approved resource of despotism, also afford a revenue. These are managed by the officer who has the superintendence of commerce, and who frequently uses his power as an instrument of extortion.

Acheen was first visited by Portuguese adventurers in 1509, after they had discovered the passage to the East Indies by the Cape of Good Hope. Hostilities immediately commenced with the inhabitants, and continued with various success, until the Portuguese lost Malacca in 1641. About the year 1586 the monarchy of Acheen attained to its greatest height of power and prosperity. It had a flourishing commerce; and the port of Acheen was crowded with vessels from all the Asiatic countries, which were allowed to carry on their trade with the most perfect security. About the year 1600, when the Dutch navigators had penetrated to these seas, some of their vessels which had entered the port of Acheen were nearly cut off by the treachery of the inhabitants. It was in 1602 that Acheen was first visited by the English ships under Captain Lancaster, where they were well received. In 1607, the reigning sultan having greatly extended his dominions on every side, assumed the title of sovereign. He had some correspondence with King James; and in answering one of his letters, he takes the title of King of Sumatra, and intimates to the king of England his wish that he would send out to him one of his countrywomen for a wife. The French visited Acheen in 1621 under Commodore Beaulieu. The Dutch were now become the powerful rivals of the Portuguese in the eastern seas. They succeeded in 1640, by the aid of their allies the Achenese, in wresting from them Malacca, which they had so long maintained. They afterwards commenced their encroachments on the Achenese, and reduced the extent of their ancient dominion, which, joined to the weakness of the government, occasioned the decline of the Achenese power. In 1641, the sultan Peducka Siri, who, though of a cruel disposition, was a powerful sovereign, died; and the Achenese monarchy continued in the female line till 1700, when a priest found means to acquire the supreme power. The country was agitated during the whole of the eighteenth century by anarchy, and the most sanguinary revolutions. In 1813, the state of Acheen, formerly so flourishing, was found with hardly any form of civil order existing, every port and village being occupied by petty usurpers, who subsisted by piracy and smuggling. At length, in 1815, the reigning monarch, Johawir Allum Shah, was deposed, and Syful Allum Shah, the son of a wealthy merchant of Prince of Wales Island, raised to the throne. But in 1818, the ex-king recovered his principality, and, in the following year, concluded a treaty of friendship and alliance with the East India Company. In 1824, the British government agreed to cede all their possessions in Sumatra to the King of the Netherlands, and entirely to withdraw British authority from the island. But in taking this step they were not unmindful of the interests of their ally, and in the course of the preliminary negotiations, a confident expectation had been expressed by the British plenipotentiaries, that no measures hostile to the king of Acheen would be adopted by the new possessor of Fort-Marlborough. The appeal was met in a liberal spirit on the part of the Dutch authorities, and an assurance frankly given that the Netherlands government would so regulate its relations with Acheen as to ensure uninterrupted security to the merchant and the sailor, and at the same time to preserve unimpaired the independence of the native state.

Acheen, the capital of the above state, is situate on a river at the north-western extremity of Sumatra, and about a league from the sea, where a road is formed, in which the shipping may be secure under the shelter of several islands. The town is indifferently built of bamboos and rough timber, and raised some feet from the ground on account of the overflow of the river in the rainy season. Its appearance and the nature of the buildings resemble the generality of the Malay bazaars, excepting that the superior wealth of this place has occasioned a great number of public edifices, which do not however possess the smallest pretensions to magnificence. The sultan's palace, which is the chief public building, is a very rude and uncouth piece of architecture, designed to resist the force of an enemy, and surrounded with a moat and strong walls, but without any regular plan, or any view to the modern system of military defence. Several pieces of ordnance are planted near the gate, some of which are Portuguese; but two were sent from England by James I., on which the founder's name and the date are still legible. Under the conditions of the treaty of 1819, already noticed, the British government were bound to furnish the king of Acheen with four brass field-pieces and a specified quantity of arms and military stores. The river on which the town is situate is not large; and the stream being divided into several channels, is rendered shallow at the bar. In the dry season it will not admit boats of any burden, much less large vessels, which lie without in the road formed by the islands off the point. The chief exports are, brimstone, betel-nut, ratans, benzoin, camphor, gold dust, pepper, and horses; the imports, opium, salt, piece-goods, muslin, &c. The town is estimated to contain about 8000 houses. Long. 95. 45. E. Lat. 5. 35. N. Marsden's *Sumatra*, Forrest's *Voyage*, Hamilton's *East India Gazetteer*, *Treaties and Engagements with Native Princes in Asia. Note addressed by British to the Netherlands Plenipotentiaries.* (E. T.)

ACHELOUS, in *Fabulous History*, wrestled with Hercules, for no less a prize than Dejanira, daughter of King Œneus; but as Achelous had the power of assuming all shapes, the contest was long dubious. At last, as he took that of a bull, Hercules tore off one of his horns, so that he was forced to submit, and to redeem it by giving the conqueror the horn of Amalthea, the same with the cornucopia, or horn of plenty; which Hercules, having filled with a variety of fruits, consecrated to Jupiter. Strabo interprets this fable as referring to the river Achelous, whose stream was so rapid, that it roared like a bull, and overflowed its banks; but Hercules, by confining it with embankments, broke off one of the horns, and so restored plenty to the country. *Tauriformis* is an ancient poetical epithet for rivers. See the next article.

Achelous, a river of Acarnania, which rises in Mount Pindus, and dividing Ætolia from Acarnania, falls into the Ionian Sea. It was formerly called *Thoas* from its impetuosity, and *king of rivers* (Homer), being the largest in Greece. It has a course of 130 miles. The epithet *Acheloius* is used for *Aqueus* (Virgil), the ancients calling all water *Achelous*, especially in oaths, vows, and sacrifices, according to Ephorus. It is now called *Aspro Potamo.* There was also a river in Arcadia, and another in Thessaly, of the same name.

ACHENWALL, Gottfried, a German writer, who obtained considerable celebrity from having first reduced statistics to a regular branch of study, and excited much of the attention of others to the subject. He was born at Elbing, in East Prussia, in October 1719. He studied, according to the custom of Germany, in several universities; and was at Jena, Halle, and Leipsic, before he took a degree at the last of those cities. He removed to Marburg in 1746, where he continued during two years to read lectures on history, and on the law of nature and of nations, and commenced those inquiries in statistics by which his name became known. In 1748 he removed to Göttingen, where he resided till his death in 1772. He was married in 1752 to a lady named Walther, who obtained some celebrity by a volume of poems published in 1750.

ACHER, a river in the grand duchy of Baden, rising in the Mummel lake, and falling into the Rhine between Lichtenau and Greffern.

ACHERN, the chief city of the bailiwick of the same name, in the Grand Duchy of Baden, on the river Acher, with 1750 inhabitants. Near this place a monument marks the spot where Marshall Turenne was killed by a random shot, in 1675.

ACHERNER, or ACHARNER, a star of the first magnitude, in the southern extremity of the constellation ERIDANUS, but invisible in our latitude.

ACHERON, feigned by the poets to have been the son of Ceres, whom she hid in hell for fear of the Titans, and turned into a river, over which souls departed were ferried on their way to Elysium.

ACHERON, in *Ancient Geography*, a river of Thesprotia, in Epirus; which, after forming the lake Acherusia, at no great distance from the promontory of Chimerium, falls into the sea opposite to the isle of Paxo.

ACHERON, or ACHEROS, a river of Bruttii in Italy, running from east to west, where Alexander, king of Epirus, was slain by the Lucani, being deceived by the oracle of Dodona, which bade him beware of Acheron.

ACHERSET, an ancient measure of corn, conjectured to be the same with our quarter, or eight bushels.

ACHERUSIA PALUS, a lake between Cumæ and the promontory Misenum, now *Il Lago della Collucia.* (Cluverius.) Some confound it with the *Lacus Lucrinus*, and others with the *Lacus Averni;* but Strabo and Pliny distinguish them.—Also a lake of Epirus, through which the Acheron runs.—There is also a cave of the same name, through which Hercules is fabled to have descended to hell to drag forth Cerberus.—A small lake, near Hermione, in Argolis, bore the same name; and mention is made of another Acherusian lake near Memphis in Egypt.

ACHERY, JEAN-LUC D', a learned Benedictine of the congregation of St Maur, was born at St Quentin, in Picardy, in 1609, and made himself famous by printing several works, which till then were only in manuscript: particularly, the Epistle attributed to St Barnabas; the Works of Lanfranc, archbishop of Canterbury; a collection of scarce and curious pieces, under the title of *Spicilegium, i. e.* Gleanings, in 13 volumes quarto. The prefaces and notes which he annexed to many of these pieces, show him to have been a man of genius and abilities. There was an edition of this valuable work published in 1725, in three volumes folio; but the editor appears to have taken some unwarrantable liberties with the learned prefaces of his author. Achery had some share in the pieces inserted in the first volumes of the Acts of the Saints of the order of St Benedict; the title whereof acquaints us that they were collected and published by him and Father Mabillon. After a very retired life, till the age of 76, he died at Paris the 29th of April 1685, in the abbey of St Germain in the Fields, where he had been librarian.

ACHIAR is a Malayan word, which signifies all sorts of fruits and roots pickled with vinegar and spice. The Dutch import from Batavia all sorts of achiar, but particularly that of BAMBOO, a kind of cane, extremely thick, which grows in the East Indies. It is preserved there, while still green, with very strong vinegar and spice; and is called *bamboo achiar.* The name changes according to the fruit with which the achiar is made.

ACHIAS, a Cuvierian and Fabrician genus of Dipterous insects.

ACHICOLUM is used express the *fornix, tholus,* or *sudatorium* of the ancient baths; which was a hot room where they used to sweat. It is also called *architholus.*

ACHILLA, ACHOLLA, or ACHULLA, an ancient town on the eastern coast of Africa Propria. Its site is now occupied by the ruins known as *El Aliah*, of a late date, but very extensive, among which has been found a curious bilingual inscription, in Phœnician and Latin. Barth, *Wanderungende*, vol. i. p. 176. Gesenius, *Monum. Phœnic.* p. 139.

ACHILLÆA, YARROW, MILFOIL, NOSEBLEED, or SNEEZEWORT.

ACHILLES, one of the greatest heroes of ancient Greece, was the son of Peleus and Thetis. He was a native of Phthia, in Thessaly. His mother, it is said, in order to consume every mortal part of his body, used to lay him every night under live coals, anointing him with ambrosia, which preserved every part from burning but one of his lips, owing to his having licked it. She dipped him also in the waters of the river Styx; by which his whole body became invulnerable, except that part of his heel by which she held him. But this opinion is not universal, nor is it a part of his character as drawn by Homer; for in the Iliad (B. xxi. 161.) he is actually wounded in the right arm by the lance of Asteropæus, in the battle near the river Scamander. Peleus afterwards intrusted him to the care of the centaur Chiron, who, to give him the strength necessary for martial toil, fed him with honey and the marrow of lions and wild boars. To prevent his going to the siege of Troy, she disguised him in female apparel, and hid him among the maidens at the court of King Lycomedes; but Ulysses discovering him, persuaded him to follow the Greeks. Achilles distinguished himself by a number of heroic actions at the siege. Being disgusted, however, with Agamemnon for the loss of Briseïs, he retired from the camp; but returning to avenge the death of his friend Patroclus, he slew Hector, fastened his corpse to his chariot, and dragged it round the walls of Troy. At last Paris, the brother of Hector, wounded him in the heel with an arrow, while he was in the temple treating about his marriage with Polyxena, daughter of King Priam. Of this wound he died, and was interred on the promontory of Sigæum; and after Troy was taken, the Greeks sacrificed Polyxena on his tomb, in obedience to his desire, that he might enjoy her company in the Elysian fields. It is said that Alexander, seeing this tomb, honoured it by placing a crown upon it; at the same time crying out, that "Achilles was happy in having, during his life, such a friend as Patroclus, and, after his death, a poet like Homer." Achilles is supposed to have died 1183 years before the Christian era.

ACHILLES *Tatius.* See TATIUS.

*TENDO-ACHILLIS*, in *Anatomy*, is a strong tendinous cord formed by the tendons of several muscles, and inserted into the os calcis. It has its name from the fatal wound Achilles is said to have received in that part from Paris, the son of Priam.

ACHILLEUS CURSUS (Ἀχιλλειος δρομος), in *Ancient Geography*, a narrow tongue of land near the mouth of the Borysthenes, where Achilles is said to have instituted races. Opposite to it was the celebrated ACHILLES INSULA, or LEUCE (*Serpent's Isle*), with a temple sacred to that hero. *Eurip. Iphig. in Taur.* 438.

ACHILLINI, ALEXANDER, was born at Bologna in 1463. He was celebrated as a lecturer both in medicine and philosophy, and was styled the Great Philosopher. Achil-

Achiotte || Achmet.

lini died in 1512. His philosophical works were printed in one volume folio, at Venice, in 1508, and reprinted with considerable additions in 1545, 1551, and 1568.

ACHIOTTE, or ACHIOTE, a foreign drug, used in dyeing, and in the preparation of chocolate. It is the same with the substance more usually known as ARNOTTO.

ACHIROPOETOS (α, χειρ, and ποιεω), a name given by ancient writers to certain miraculous pictures of Christ and the Virgin, supposed to have been made without hands. The most celebrated of these is the picture of Christ preserved in the church of St John Lateran at Rome; said to have been begun by St Luke, but finished by angels.

ACHLYS ('Αχλύς), in *Pagan Mythology*, the eternal night, more ancient than Chaos; described in Hesiod (*Scut. Herc.* 264,) as the personification of misery and sadness.

ACHMET, son of Seirim, an Arabian author, who wrote a book on the interpretation of dreams, which was translated into Greek and Latin. The original was supposed to be lost: but it seems probable that Achmet is the same person as Abú Bekr Mohammed Ben Sírín, who lived in the 7th century, and whose 'Ονειροκριτικά in Arabic is extant in the Royal Library at Paris.

ACHMET I., emperor of the Turks, the third son and successor of Mahomet III., ascended the throne before he reached the age of 15. During his reign, the Turkish empire underwent great reverses. The Asiatic rebels, who took refuge in Persia, involved the two empires in a war, during which the Turks lost Bagdad, to recover which every effort proved unsuccessful. In his reign, Transylvania and Hungary were the scenes of war between the Turks and Germans. In addition to the calamities and distresses of war abroad, and internal tumults and broils, a pretender to his throne disturbed his repose, and made attempts on his life. He was much devoted to amusements, and spent his time chiefly in the harem and in the sports of the field. He expended great sums of money in building, and particularly on the magnificent mosque which he erected in the Hippodrome. Achmet was less cruel than some of his predecessors, but he was haughty and ambitious. He died in 1617, at the age of 29.

ACHMET II., emperor of the Turks, son of Sultan Ibrahim, succeeded his brother Solyman in 1691. The administration of affairs during his reign was feeble and unsettled. The Ottoman territory was overrun by the imperialists; the Venetians seized the Morea, took the isle of Chios, and several places in Dalmatia; and the Arabs attacked and plundered a caravan of pilgrims, and even laid siege to Mecca. Though inefficient as a ruler, Achmet in private life was mild, devout, and inoffensive, fond of poetry and music, and amiable to those about his person. He died in 1695, at the age of 50.

ACHMET III., emperor of the Turks, son of Mahomet IV., succeeded his brother Mustapha II., who was deposed in 1703. After he had settled the discontents of the empire, his great object was to amass wealth. With this view he debased the coin, and imposed new taxes. He received Charles XII. of Sweden, who took refuge in his dominions after the battle of Pultowa in 1709, with great hospitality; and, influenced by the sultana mother, he declared war against the Czar Peter, Charles's formidable rival. Achmet recovered the Morea from the Venetians; but his expedition into Hungary was less fortunate, for his army was defeated by Prince Eugene at the battle of Peterwaradin in 1716. As the public measures of Achmet were influenced by ministers and favourites, the empire during his reign was frequently distracted by political struggles and revolutions. The discontent and sedition of his soldiers at last drove him from the throne. He was deposed in 1730, and succeeded by his nephew Mahomet V. He died in 1736, at the age of 74.

Achmet || Achromatic.

ACHMET GEDUC, a famous Turkish general in the fifteenth century. When Mahomet II. died, Bajazet and Zezan both claimed the throne. Achmet sided with the former, and by his bravery and conduct fixed the crown on his head. Bajazet, in accordance with the usual policy of tyrants, rewarded his too conspicuous merits by taking away his life.

ACHMIM, AKMIM, or ECHMIM, a town of Upper Egypt, situate in a very fertile district. The streets are better than is usual in Egypt, though, being built only of unburnt brick, they have a gloomy appearance. The Greeks have a church, which they hold in great veneration, and which is adorned with granite pillars from the ruins of the city of Chemnis or Panopolis. Pop. 3000.

ACHMITE (ἀκμή, a point), a mineral found in Norway, near Konigsberg, a silicate of soda and peroxide of iron.

ACHOR, a valley of Jericho, between it and Ai; so called from Achan, who was there stoned to death.

ACHOR, in *Medicine*, a species of HERPES.

ACHOR, in *Mythology*, the god of flies; to whom, according to Pliny, the inhabitants of Cyrene offered propitiatory sacrifices.

ACHRAS, a genus of plants, natural order *Sapoteæ*.

ACHRAY, a small but wildly picturesque lake in Perthshire, near Loch Katrine, 15 miles N.W. from Stirling.

ACHROMATIC, an epithet expressing want of colour. The word is Greek, being compounded of α privative, and χρωμα, *colour*.

*ACHROMATIC Telescopes* are telescopes contrived to remedy the aberrations in colours. The invention of the telescope, by which the powers of vision are extended to the utmost boundaries of space, forms an epoch in the history of science. The human intellect had at last emerged from the long night of error, and begun to shine with unclouded lustre. The age of erudition, which arose on the revival of letters, had been succeeded by the age of science and philosophy. The study of the ancient classics had infused some portion of taste and vigour. But men did not long remain passive admirers; they began to feel their native strength, and hastened to exert it. A new impulsion was given to the whole frame of society; the bolder spirits, bursting from the trammels of authority, ventured to question inveterate opinions, and to explore, with a fearless yet discerning eye, the wide fields of human knowledge. Copernicus had partly restored the true system of the world; Stevinus had extended the principles of mechanics; the fine genius of Galileo had detected and applied the laws of motion; the bold excursive imagination of Kepler had, by the aid of immense labour, nearly completed his discovery of the great laws which control the revolutions of the heavenly bodies; and our countryman Napier had just rendered himself immortal by the sublime discovery of logarithms. At this eventful period, amidst the fermentation of talents, the refracting telescope was produced by an obscure glass-grinder in Holland,—a country then fresh from the struggle against foreign oppression, and become the busy seat of commerce and of the useful arts. Yet the very name of that meritorious person, and the details connected with his invention, are involved in much obscurity. On a question of such peculiar interest we shall afterwards endeavour to throw some light, by comparing together such incidental notices as have been transmitted by contemporary writers. In the mean time, we may rest assured that the construction of the telescope was not, as certain authors would insinuate, the mere offspring of chance, but was, like other scientific discoveries, the fruit of close and patient observation of facts, directed with skill, and incited by an ardent curiosity. A new and perhaps incidental

Invention of the telescope.

Achromatic Glasses.

appearance, which would pass unheeded by the ordinary spectator, arrests the glance of genius, and sets all the powers of fancy to work. But the inventor of the telescope, we are informed, was acquainted besides with the elements of geometry, which enabled him to prosecute his views, and to combine the results with unerring success. No sooner was this fine discovery—admirable for the very simplicity of its principle—whispered abroad, than it fixed the attention of the chief mathematicians over Europe. Kepler, with his usual fertility of mind, produced a treatise on *Dioptrics*, in which he investigated at large the distinct effects of the combinations of different lenses.[1] Galileo, from some very obscure hints, not only divined the composition of the telescope, but actually constructed one, with a concave eye-glass, which still bears his name. This telescope is shorter, but gives less light than another one proposed by Kepler, and called the astronomical telescope, which inverts the objects, and consists likewise of only two lenses, that next the eye being convex. With such an imperfect instrument—the same, indeed, though of rather higher magnifying power, with our modern opera-glass—did the Tuscan artist, as our great poet quaintly styles the philosopher, venture to explore the heavens.[2] He noticed the solar spots, surveyed the cavernous and rocky surface of the moon, observed the successive phases of the planet Venus, and discovered the more conspicuous of Jupiter's satellites. The truths thus revealed shook the inveterate prejudices of the learned, and furnished the most triumphant evidence to the true theory of the universe.

It is painful to remark, that the application of the first telescope in the country which had given it birth was directed to a very different purpose. The maker, after having finished one, judging it of singular use in the military profession, was naturally induced, by the hope of patronage, to present it to the younger Prince Maurice, whose bravery and conduct had so beneficially contributed to the independence of the United Provinces. But at this moment a bloody tragedy was acting in Holland. The chief of the republic, not content with that high station which the gratitude of his fellow-citizens had conferred upon him, sought to aggrandize his power by crushing all opposition. In the prosecution of his ambitious designs, he artfully gained the favour of the undiscerning populace, and joining his intrigues to the violence of the Calvinistic clergy, he succeeded in preferring the charge of a plot against the more strenuous supporters of the commonwealth, which involved them in ruin. Not only was the celebrated Grotius condemned to the gloom of perpetual imprisonment, but the aged senator Barneveldt, whose wise and upright counsels had guided the state amidst all the troubles of a long revolutionary conflict, was led to the scaffold, on the 14th of May 1619, while his persecutor, ashamed to approach the spectacle of his sufferings, beheld at a distance, with the coolness of a tyrant, from the windows of his palace, and *by help of a telescope*, the gesture and aspect of the venerable patriot, and all the melancholy circumstances attending the decollation.[3]

Improvers of the telescope.

The skill and ingenuity of artists and mathematicians were now exerted in attempts to improve the construction of an instrument so fortunately contrived. The perfection of the telescope would require the union, as far as they are capable of being conjoined, of three different qualities,—distinctness of vision, depth of magnifying power, and extent of field. Of these requisites, the first two are evidently the most important, and to attain them was an object of persevering research. For the condition of amplitude and clearness, it was necessary that the principal image, or the one formed by the eye-glass, should be large, bright, and well defined. On the supposition then generally received, that, in the passage of light through the same media, the angle of incidence bears a constant ratio to the angle of refraction, which is very nearly true in the case of small angles, it followed, as a geometrical consequence, that the spherical figure would accurately collect all the rays into a focus. To obtain the desired improvement of the telescope, therefore, nothing seemed to be wanting but to enlarge sufficiently its aperture, or to employ for the eye-glass a more considerable segment of the sphere. On trial, however, the results appeared to be at variance with the hasty deductions of theory, and every sensible enlargement of aperture was found to occasion a corresponding glare and indistinctness of vision. But a discovery made soon afterwards in optics led to more accurate conclusions. Willebrord Snell, a very ingenious Dutch mathematician, who was snatched away at an early age, traced out by experiment, about the year 1629, the true law that connects the angles of incidence and of refraction; which the famous Descartes, who had about this time chosen Holland for his place of residence, published, in 1637, in his *Dioptrics*, under its simplest form, establishing, that the sines of those angles, and not the angles themselves, bore a constant ratio in the transit of light between the same diaphanous media. It hence followed, that the lateral rays of the light which enter a denser medium, bounded by a spherical surface, in the direction of the axis, will not meet this axis precisely in the same point, but will cross it somewhat nearer the surface. In short, the constant ratio or index of refraction will be that of the distances of the actual focus from the centre of the sphere, and from the point of external impact. Since an arc differs from its sine by a quantity nearly proportioned to its cube, the deviation of the extreme rays from the correct focus, or what is called the spherical aberration,

Snell.

---

[1] Kepler explained the construction of the astronomical telescope with two convex lenses; he likewise proposed a third glass to restore the inverted image. But Scheiner first employed the astronomical telescope, and described his observations with it in 1630. Father Rheita placed the third lens of Kepler near the primary focus, and thus enlarged the field of view. Such is the arrangement in the common spy-glass, which he gave in 1665.

[2] ..................... like the moon, whose orb
Through optic glass the Tuscan artist views
At evening from the top of Fesolé,
Or in Valdarno, to descry new lands,
Rivers, or mountains, on her spotty globe. (*Paradise Lost*, book i. 286–290.)

[3] The discovery of the telescope, from the mystery at first practised, is involved in considerable uncertainty. The most probable statement, however, ascribes the invention so early as 1590 to Zachary Jansen, an intelligent spectacle-maker at Middleburg. This intelligent person, led by accident to exercise his ingenuity on the subject, appears to have in private matured the execution of that wonderful though simple instrument. In a short time, however, the secret had transpired; and Laprey or Lippersheim, a townsman of the same profession, produced telescopes for sale between the years 1600 and 1610. But, in 1608, Jansen likewise constructed the compound microscope; and both instruments, by the activity of trade, were now spread quickly over Europe. The telescope was copied, and perhaps improved, by Adrian Metius, son of the celebrated mathematician. It was publicly sold at Frankfort in 1608, and in the following year the instruments were brought by Drebbel for sale to London.

must likewise proceed in that ratio, and consequently will increase with extreme rapidity, as the aperture of the telescope is enlarged. It was now attempted to modify the figure of the object-glass, and to give it those curved surfaces which an intricate geometrical investigation marks out as fitted to procure a perfect concentration of all the refracted rays. Various contrivances were accordingly proposed for assisting the artist in working the lenses into a parabolic or spheroidal shape, and thus obtaining the exact surfaces generated by the revolution of the different conic sections. All those expedients and directions, however, were found utterly to fail in practice, and nature seemed, in this instance, to oppose insurmountable barriers to human curiosity and research. Philosophers began to despair of effecting any capital improvement in dioptrical instruments, and turned their views to the construction of those depending on the principles of catoptrics, or formed by certain combinations of reflecting specula. In 1663, the famous James Gregory, who in many respects may be regarded as the precursor, and in some things even the rival of Newton, published his *Optica Promota;* a work distinguished by its originality, and containing much ingenious research and fine speculation. In this treatise, a complete description is given of the reflecting telescope now almost universally adopted, consisting of a large perforated concave reflector combined with another very small and deep speculum placed before the principal focus. But such was still the low state of the mechanical arts in England, that no person was found capable of casting and polishing the metallic specula with any tolerable delicacy, and the great inventor never enjoyed the satisfaction and transport of witnessing the magic of his admirable contrivance. It was after the lapse of more than half a century, that Hadley—to whom we likewise owe another instrument scarcely less valuable, the quadrant, or sextant, known by his name—at last succeeded in executing the reflecting telescope. In the first attempt, silvered mirrors had been substituted for the specula; nor did the reflectors come to obtain much estimation, till, about the year 1733, the ingenious Mr Short distinguished himself by constructing them in a style of very superior excellence.

Gregory.

Hadley.

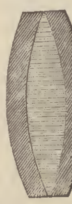
But though thus late in guiding the efforts of artists, the optical treatise of Gregory proved the harbinger of that bright day which soon arose to illumine the recesses of physical science. The capacious mind of Newton, nursed in the calm of retirement and seclusion, was then teeming with philosophical projects. In 1665, when the tremendous visitation of the plague raged in London, and threatened Cambridge and other places communicating with the capital, this sublime genius withdrew from the routine of the university to his rural farm near Grantham, and devoted himself to most profound meditation. Amidst his speculations in abstruse mathematics and theoretical astronomy, Newton was induced to examine the opinions entertained by the learned on the subject of light and colours. With this view he had recently procured from the Continent some prisms of glass, to exhibit the phenomena of refraction. Having placed the axis of the prism or glass wedge at right angles to a pencil of light from the sun, admitted through a small hole of the window-shutter in a darkened room, he contemplated the glowing image or spectrum now formed on the opposite wall or screen. This illuminated space was not round, however, as the young philosopher had been taught to expect, but appeared very much elongated, stretching out five times more than its breadth, and marked by a series of pure and brilliant colours. It was therefore obvious that the colours were not confined to the margin of the spectrum, nor could proceed from any varied intermixture of light and shade; and the conclusion seemed hence irresistible, that the white pencil, or solar beam, is really a collection of distinct rays, essentially coloured and differently refracted; that the ray, for instance, which gives us the sensation of the violet, is always more bent aside from its course by refraction than the ray which we term green,—and that this green ray again is more refracted than the red. When the spectrum was divided, by interposing partially a small screen, and each separate parcel of rays made to pass through a second prism, they still retained their peculiar colour and refractive property, but now emerged in parallel, and not in diverging lines as at first. The sun's light is thus decomposed by the action of the prism into a set of primary coloured rays; and these rays, if they be afterwards recombined in the same proportions, will always form a white pencil. It was hence easy to discern the real cause of the imperfection of dioptrical instruments, which is comparatively little influenced by the figure of the object-glass or spherical aberration, but proceeds mainly from the unequal refraction of light itself. The focal distance of the red ray being, in the most favourable case, about one fortieth part shorter than that of the violet ray, the principal image is necessarily affected with mistiness, and its margin always encircled by a coloured ring; for each point of the remote object from which the light arrives is not represented by a corresponding point in the image, but by a small circle composed of graduating colours, the centre being violet and the circumference red. This radical defect seemed at that time to be altogether irremediable. Newton had recourse, therefore, to the aid of catoptrics, and contrived his very simple though rather incommodious reflecting telescope, consisting of a concave speculum, with a small plane one placed obliquely before it, to throw the image towards the side of the tube. This instrument he actually constructed; and with all its rudeness, it promised essential advantages to astronomy. The Newtonian reflector, after having been long neglected, was lately revived by Dr Herschel; and from its great simplicity and moderate dissipation of light, it is perhaps on the whole not ill calculated for celestial observations.

Newton.

These unexpected and very important discoveries, which entirely changed the face of optics, were soon communicated to the Royal Society, and published in the *Philosophical Transactions* for 1672. They were not received however by the learned with that admiration to which they were justly entitled, but gave occasion to so much ignorant opposition and obstinate controversy, that the illustrious author, thoroughly disgusted at such unmerited reception, henceforth, pursuing his experimental researches in silence, made no disclosure of them to the world till more than thirty years afterwards, when his fame being mature, and his authority commanding respect, he suffered his *Treatise on Optics* to appear abroad. This celebrated production has long been regarded as a model of pure inductive science. The experiments which it relates appear ingeniously devised; the conclusions from them are drawn with acuteness, and pursued with exquisite skill; and the whole discourse proceeds in a style of measured and elegant simplicity. Though the researches were conducted by a process of strict analysis, the composition of the work itself is cast into the synthetical or didactic form, after the manner followed in the elementary treatises of the ancient mathematicians. But with all its beauty and undisputed excellence, it must be confessed that the treatise of optics is not exempt from faults, and even material errors. We should betray the interests of science, if we ever yielded implicit confidence even to the highest master. It is the glory of Newton to have led the way in sublime discovery, and to have impressed whatever he touched with the stamp of profound and original genius. The philosopher paid the debt of human infirmity, by imbibing some tincture of the mystical spirit of the age, and taking a slight bias from the character of his studies. The difficult art of experimenting was still in its infancy, and inquirers had not attained that delicacy and circumspection which, in practice, are indispensable for obtaining accurate results. Most of the speculations in the second and third books of Newton's *Optics*, as we shall afterwards have occasion to observe, are built on mistaken or imperfect views of some facts, which the admixture of extraneous circumstances had accidentally disguised. The very ingenious, but hasty, and often untenable hypotheses, which are subjoined, under the modest and seemingly hesitating title of *Queries*, have, on the whole, been productive of real harm to the cause of science, by the splendid example thus held forth to tempt the rashness of loose experimenters, and of superficial reasoners. Even in the first book of *Optics*, some of the capital propositions are affected by hasty and imperfect statements. The term *refrangibility*, applied to the rays of light, is at least unguarded; it conveys an indistinct conception, and leads to inaccurate conclusions. The different refractions which the primary rays undergo are not absolute properties inherent in these rays themselves, but depend on the mutual relation subsisting between them and the particular diaphanous medium. When the medium is changed, the refraction of one set of rays cannot be safely inferred from that of another. Nay, in the passage among certain media, those rays which are designated as the most refrangible will sometimes be the least refracted. To ascertain correctly, therefore, the index of refraction, it becomes necessary, in each distinct case, to examine the bearing or disposition of the particular species of rays; since the principle, that the refraction of the extreme rays is always proportioned to that of the mean rays, involves a very false conclusion.

When Newton attempted to reckon up the rays of light decomposed by the prism, and ventured to assign the famous number *seven*, he was apparently influenced by some lurking disposition towards mysticism. If any unprejudiced person will fairly repeat the experiment, he must soon be convinced, that the various coloured spaces which paint the spectrum slide into each other by indefinite shadings; he may name four or five principal colours, but the subordinate divisions are evidently so multiplied as to be incapable of enumeration. The same illustrious mathematician, we can hardly doubt, was betrayed by a passion for analogy, when he imagined, that the primary colours are distributed over the spectrum after the proportions of the diatonic scale of music, since those intermediate spaces have really no precise and defined limits. Had prisms of a different kind of glass been used, the distribution of the coloured spaces would have been materially changed. The fact is, that all Newton's prisms being manufactured abroad, consisted of plate or crown glass, formed by the combination of soda, or the mineral alkali, with silicious sand. The refined art of glass-making had only been lately introduced into England, and that beautiful variety called crystal, or flint-glass, which has so long distinguished this country, being produced by the union of a silicious material with the oxyde of lead, was then scarcely known. The original experimenter had not the advantage, therefore, of witnessing the varied effects occasioned by different prisms, which demonstrate, that the power of refraction is not less a property of the peculiar medium than of the species of light itself. He mentions, indeed, prisms formed with water confined by plates of glass; but the few trials which he made with them had evidently been performed with no sufficient attention. In spite of his habitual circumspection, he could not always restrain the propensity so natural to genius, that of hastening to the result, and of trusting to general principles more than to any particular details. But the same indulgent apology will not be conceded to some later authors. It is truly astonishing that systematic writers on optics, in obvious contradiction to the most undoubted discoveries related by themselves, should yet repeat with complacency the fanciful idea of the harmonical composition of light.

Admitting the general conclusion which Newton conceived himself entitled to draw from analogy and concurring experiment, that "the sine of incidence of every ray considered apart, is to the sine of refraction in a given ratio;" it was strictly demonstrable, that no contrary refractions whatever, unless they absolutely restored the pencil to its first direction, could collect again the extreme rays, and produce, by their union, a white light. Thus, let the ratios of the sines of the angles of incidence and refraction of the violet rays in their transit from air to other two denser mediums, be expressed by $1 : M$ and $1 : m$; and the like ratios of the red rays under the same circumstances, by $1 : N$ and $1 : n$; where $M\ m$ and $N\ n$ respectively denote the refracting indices of those extreme rays. It is manifest that the refracting indices, corresponding to the passage of the violet and red rays from the first to the second medium, will be represented by $M–N$, and $m–n$. But by hypothesis, $M : m :: N : n$, and consequently $M : m :: M–N : m–n$; so that the extreme rays would not be still separated and dispersed in proportion to the mean extent of the final refraction. The great philosopher appears to have contemplated with regret the result of his optical principle; and he had the penetration to remark, that if a different law had obtained, the proper combination of distinct refracting media would have corrected the spherical aberration. With this view, he would propose for the object-glass of a telescope, a compound lens, consisting of two exterior meniscuses of glass, their outsides being equally convex, and their insides of similar but greater concavity, and having the interior space filled with pure water, as in the figure annexed.



He gives a rule, though without demonstration, and evidently disfigured or imperfect, for determining the curvature of the two surfaces: "And by this means," he subjoins, "might telescopes be brought to sufficient perfection, were it not for the different refrangibility of several sorts of rays. But, by reason of this different refrangibility, I do not see any other means of improving telescopes by refractions alone, than that of increasing their lengths."

These remarks appeared to preclude all attempts to improve the construction of the refracting telescope. Brightness and range of sight were sacrificed to distinctness. Instead of enlarging the aperture, recourse was had to the expedient of increasing the length of the focus. For nice astronomical observations, telescopes were sought of the highest magnifying powers, and their tubes had by degrees been extended to a most enormous and inconvenient size. But the famous Dutch mathematician Huygens contrived to supersede the use of these in certain cases, by a method which required, however, some address. Many years afterwards the reflecting, or rather catadioptric telescope, of the Gregorian construction, was executed with tolerable perfection. But a long period of languor succeeded the brilliant age of discovery. Not a single advance was made in the science of light and colours, till thirty years after the death of

Huygens.

Achromatic Glasses.

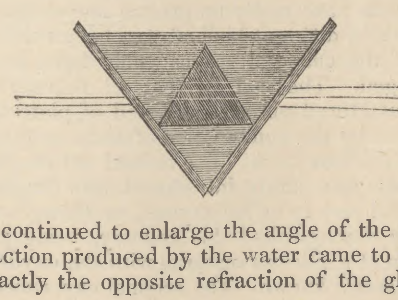
Newton.[1] His immortal *Principia* had not yet provoked discussion, and philosophers seemed inclined to regard the conclusions in the *Treatise of Optics* with silent and incurious acquiescence. This memorable fact not only evinces the danger of yielding, in matters of science, implicit confidence even to the highest authority, but shows, amidst all the apparent bustle of research, how very few original experiments are made, and how seldom these are repeated with the due care and attention.

The impossibility of correcting the colours in object-glasses of telescopes was therefore a principle generally adopted; though some vague hopes, grounded chiefly on the consideration of final causes, were still at times entertained of removing that defect. As the eye consists of two distinct humours, with a horny lens or cornea interposed, it was naturally imagined that such a perfect structure should be imitated in the composition of glasses. This inviting idea is concisely mentioned by David Gregory, the nephew of James, in his little tract on *Dioptrics*. It has also been stated that a country gentleman, Mr Hall of Chesterhall, in Worcestershire, discovered, about the year 1729, the proper composition of lenses by the united segments of crown and flint-glass, and caused a London artist, in 1733, to make a telescope under his directions, which was found on trial to answer extremely well. But whatever might be the fact, no notice was taken of it at the time, nor indeed till very long after, when circumstances had occurred to call forth public attention.

The Newtonian principle was first openly rejected, and a discussion excited, which eventually led to a most valuable discovery in optics, by a foreign mathematician of great celebrity and transcendent talents. Leonard Euler was one of those rare mortals who arise, at distant intervals, to shed unfading lustre on our species. Endowed with a penetrating genius and profound capacity, he was capable of pursuing his abstruse investigations with unremitting ardour and unwearied perseverance. To him the modern analysis stands chiefly indebted for its prodigious extension; and he continued to enrich it in all its departments with innumerable improvements and fine discoveries, during the whole course of a most active, laborious, and protracted life. Unfortunately the philosophical character of Euler did not correspond to his superlative eminence as a geometer. Bred in the school of Leibnitz, he had imbibed the specious but delusive metaphysics of the *sufficient reason*, and of the necessary and absolute constitution of the laws of nature. He was hence disposed in all cases to prefer the mode of investigating *a priori*, and never appeared to hold in due estimation the humbler yet only safe road to physical science, by the method of experiment and induction. Euler expressed the indices of refraction by the powers of a certain invariable root, and fancied that the exponents of those powers are proportional for the several rays in different media. Instead of making, in short, the numbers themselves proportional, as Newton had done, he assigned this property to their logarithms. In the *Berlin Memoirs* for 1747, he inserted a short paper, in which he deducted from his optical principle, by a clear analytical process, conducted with his usual skill, the composition of a lens formed after certain proportions with glass and water, which should remove entirely all extraneous colours, whether occasioned by the unequal refraction of the several rays, or by spherical aberration; and in concluding, he remarked, with high satisfaction, the general conformity of his results with the wonderful structure of the eye.

John Dolland.

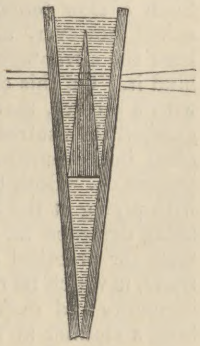
But this paper met with opposition in a quarter where it could have been least expected. John Dolland, who had afterwards the honour of completing one of the finest and most valuable discoveries in the science of optics, was born in 1706, in Spitalfields, of French parents, whom the revocation of the edict of Nantes had compelled to take refuge in England, from the cruel persecution of a bigoted and tyrannical court. Following his father's occupation, that of a silk-weaver, he married at an early age; and being fond of reading, he dedicated his leisure moments to the acquisition of knowledge. By dint of solitary application, he made some progress in the learned languages; but he devoted his main attention to the study of geometry and algebra, and the more attractive parts of mixed or practical mathematics. He gave instructions in these branches to his son Peter, who, though bred to the hereditary profession, soon quitted that employment, and commenced the business of optician, in which he was afterwards joined by his father. About this time the volume of the *Berlin Memoirs*, containing Euler's paper, fell into the hands of the elder Dolland, who examined it with care, and repeated the calculations. His report was communicated by Mr Short to the Royal Society in 1752, and published in their Transactions for that year. Dolland, as might well be expected, could detect no mistake in the investigation itself, but strenuously contested the principle on which it was built, as differing from the one laid down by Newton, which he held to be irrefragable. "It is, therefore," says he, rather uncourteously, and certainly with little of the prophetic spirit, "it is, therefore, somewhat strange that any body now-a-days should attempt to do that which so long ago has been demonstrated impossible." The great Euler replied with becoming temper, but persisted in maintaining that his optical principle was a true and necessary law of nature, though he frankly confessed that he had not been able to reduce it yet to practice. The dispute now began to provoke attention on the Continent. In 1754, Klingenstierna, an eminent Swedish geometer, demonstrated that the Newtonian principle is in some extreme cases incompatible with the phenomena, and therefore ought not to be received as an undoubted law of nature. Thus pressed on all sides, Dolland at length had recourse to that appeal which should have been made from the beginning,—to the test of actual experiment. He constructed a hollow wedge with two plates of glass, ground parallel, in which he laid inverted a common glass prism, and filled up the space with clear water, as in the annexed figure.



He now continued to enlarge the angle of the wedge, till the refraction produced by the water came to counterbalance exactly the opposite refraction of the glass, which

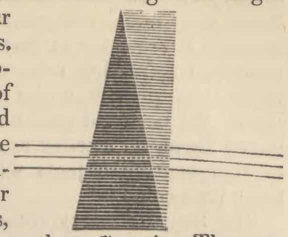
[1] The fine discovery of the apparent aberration of the fixed stars, made by our countryman Dr Bradley in 1729, cannot be justly deemed an exception to this remark. It belongs more to astronomy than to optics, and is indeed merely the result, however important, of the progressive motion of light, detected near sixty years before by the Danish philosopher Roemer, combined with the revolution of the earth in her orbit.

must obtain whenever an object is seen through the compound prism, without change of direction, in its true place. But, contrary to what he so firmly expected, the external objects appeared glaringly bordered with coloured fringes; as much, indeed, as if they had been viewed through a glass prism with an angle of thirty degrees. It was therefore quite decisive that Newton had not performed his experiment with scrupulous accuracy, and had trusted rather too hastily to mere analogical inference. But to remove every shadow of doubt from the subject, Mr Dolland, finding that large angles were inconvenient for observation, ground a prism to the very acute angle of nine degrees, and adjusted, by careful trials, a wedge of water to the same precise measure of refraction. Combining the opposite refractions as before, he beheld, on looking through the apparatus (as here represented), their various objects real position, but distinctly marked with the prismatic colours. In these experiments, although the mean ray pursues the same undeviating course, the extreme rays which enter parallel with it emerge from the compound prism, spreading out on both sides.

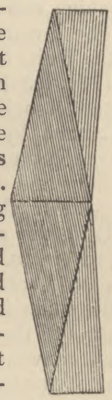


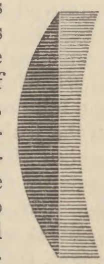
The capital point being completely ascertained, Dolland next tried so to adapt the opposite refractions as to destroy all extraneous colour. This effect he found to take place when the angle of the wedge had been further increased, till the refracting power of the water was to that of the glass in the ratio of five to four. His conclusive experiments were made in 1757, and he lost no time in applying their results to the improvement of the object-glasses of telescopes. Following the proportion just ascertained, he conjoined a very deep convex lens of water with a concave one of glass. In this way he succeeded in removing the colours occasioned by the unequal refraction of light; but the images formed in the foci of the telescopes so constructed, still wanted the distinctness which might have been expected. The defect now proceeded, it was evident, merely from spherical aberration; for the excess of refraction in the compound lens being very small, the surfaces were necessarily formed to a deep curvature.

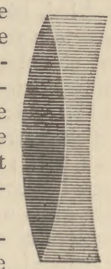
But this partial success only stimulated the ingenious artist to make further trials. Having proved that the separation of the extreme rays, or what has been since termed the *dispersive power*, is not proportioned to the mean refraction in the case of glass and water, he might fairly presume that like discrepancies must exist among other diaphanous substances, and even among the different kinds of glass itself. The charm of uniformity being once dispelled, he was encouraged to proceed, with the confident hope of ultimately achieving his purpose. His new researches, however, were postponed for some time by the pressure of business. But on resuming the inquiry, he found the English crown-glass and the foreign yellow or straw-coloured, commonly called the Venice glass, to disperse the extreme rays almost alike, while the crystal, or white flint-glass, gave a much greater measure of dispersion. On this quarter, therefore, he centred his attention. A wedge of crown and another of flint-glass were ground till they refracted equally, which took place when their angles were respectively 29 and 25 degrees, or the indices of refraction were nearly as 22 to 19; but on being joined in an inverted position, they produced, without changing the general direction of the pencil, a very different divergence of the compound rays of light. He now reversed the experiment, and formed wedges of crown and flint-glass to such angles as might destroy all irregularity of colour by their opposite dispersions. When this condition was obtained, the refractive powers of those wedges of crown and flint-glass were nearly in the ratio of three to two, and consequently the sines of half their angles, or the angles themselves, if small, were as 33 to 19, or nearly as 7 to 4. The rays which enter parallel now escape likewise parallel, but all of them deflected equally from their course.



The appearance was rendered still more conspicuous by repeating the combination of the glass wedges, as in the figure here adjoined. It will be perceived that the pencils of rays which enter at equal distances on both sides of the common junction, must nearly meet in the same point of the axis; for in small arcs the chords are almost proportional to the arcs themselves. This arrangement, indeed, with the projecting wedge of crown-glass in front, represents actually the composition of an object-glass formed of two distinct and opposing lenses, which would produce a similar effect. It was only required to apply a semi-convex lens of crown-glass before a semi-concave one of flint-glass, such that the curvature of the former be to that of the latter nearly as 7 to 4; but with some modifications in this ratio, according to the peculiar qualities of the glass. [The figure annexed represents this combination.] But the depth of the lenses might be diminished, by giving them curvature on both sides. Thus, if a double convex of crown-glass were substituted, of the same power, and consequently with only half the curvature on each side; the lens of flint-glass adapted to it having, therefore, their common surface of an equal concavity, would need, in order to produce the former quantity of refraction, and consequently to maintain the balance of opposite dispersions, a concavity eight times less than before on the other surface. Or if a double concave of flint-glass with half its first depth were used, the front convexity of the lens of crown-glass would be five-sevenths of the former curvature, as here represented. The surface where the two lenses are united may hence have its curvature changed at pleasure; but every alteration of this must occasion corresponding changes in the exterior surfaces.





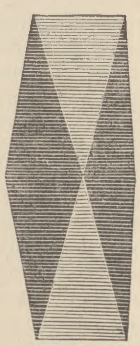


In all these cases, the refraction of the convex pieces being reduced to one-third by the contrary refraction of the concave piece, the focal distance of the compound glass must be triple of that which it would have had singly. But a most important advantage results from the facility of varying the adaptation of the lenses; for, by rightly proportioning the conspiring and counteracting curvatures, it was possible to remove almost entirely the errors arising from spherical aberration. This delicate problem Mr Dolland was the better prepared to encounter, as he had already, in 1753, improved the telescope materially, by introducing no fewer than six eye-glasses, disposed at proper distances, to divide the refraction. The research itself, and the execution of the compound lens, presented peculiar difficulties; but the ingenuity and toilsome exertions of the artist were at length, in 1758, rewarded with complete success. " Notwithstanding," says he, in concluding his paper, "so many difficulties as I have enumerated, I have, after numerous trials, and a resolute perseverance, brought the matter at last to such an issue, that I can construct refracting telescopes, with such apertures and magnifying powers, under limited lengths, as, in the opinion of the best and undeniable judges, who have experienced them, far exceed any thing that has been produced, as representing objects with great distinctness, and in their true colours."

The Royal Society voted to Mr Dolland, for his valuable discovery, the honour of the Copley medal. To this new construction of the telescope Dr Bevis gave the name of *Achromatic* (from *α* privative, and *χρωμα, colour*), which was soon universally adopted, and is still retained. The inventor took out a patent, but did not live to reap the fruits of his ingenious labours. He died in the year 1761, leaving the prosecution of the business to his son and associate Peter Dolland, who realized a very large fortune by the exclusive manufacture, for many years, of achromatic glasses, less secured to him by the invidious and disputed provisions of legal monopoly, than by superior skill, experience, and sedulous attention. In 1765, the younger Dolland made another and final improvement, to which his father had before advanced some steps. To correct more effectually the spherical aberration, he formed the object-glass of three instead of two lenses, by dividing the convex piece; or he inclosed a concave lens of flint-glass between two convex lenses of crown-glass, as exactly represented in the figure here annexed. He showed a telescope of this improved construction, having a focal length of three feet and a half, with an aperture of three inches and three quarters, to the celebrated Mr Short, who tried it with a magnifying power of one hundred and fifty times, and who, superior to the jealousy of rivalship, and disposed to patronise rising merit, most warmly recommended it, and declared that he found "the image distinct, bright, and free from colours."

Peter Dolland.

What were the curvatures of those distinct component lenses, Dolland has not mentioned, and perhaps he rather wished to conceal them. The Duke de Chaulnes was enabled, however, by means of a sort of micrometer, to ascertain the radii of the several surfaces, in the case of one object-glass of the best composition. He found these radii, beginning with the front lens, to be respectively 311½, 392; 214, 294; 294 and 322½, in French lines, which corresponded, in English inches, to 32·4, 40·8; 22·2, 30·6; 30·6 and 33·5. If these measures were correct, however, it would follow, that the middle lens of flint-glass was not perfectly adapted to the curvature of the lens of crown-glass placed immediately before it. Similar admeasurements have been repeated by others, but the results differ considerably, and no general conclusion can be safely drawn. There is no doubt that the artist varied his practice, according to the nature of the glass which he was obliged to use. The more ordinary proportions for the curvatures of the component lenses would be represented by a truncated prism, formed with a double cluster of wedges, the outer ones having angles of 25° 53′, and 14° 27′, and consisting of crown-glass, and the inner one made of flint-glass, with an inverted angle of 27° 3′. These two wedges of crown-glass would produce the same refraction, it might be shown, as a single one having an angle of 40° 54′; wherefore this refraction will be diminished, by the opposite influence of the wedge of flint glass, in the ratio of 49 to 16, or reduced to nearly one-third.



Thus was achieved, and fully carried into practical operation, the finest and most important detection made in optics since the great discovery of the unequal refraction of the several rays of light. It was drawn forth by a long series of trials, directed with judgment and ingenuity, but certainly very little aided by the powers of calculation. Such a slow tentative procedure was perhaps the best suited, however, to the habits of an artist, and it had at least the advantage of leaving no doubt or hesitation behind it. On this occasion, we cannot help being struck with a remark, that most of those who have ever distinguished themselves in the philosophical arts by their original improvements, were seldom regularly bred to the profession. Both the Dollands, we have seen, began life with plying at the loom; Short had a liberal education, being designed for the Scotish church, but, indulging a taste for practical optics, he afterwards followed it as a trade, in which he rose to pre-eminence; Ramsden, whose ingenuity and exquisite skill were quite unrivalled, was bred a clothier in Yorkshire; Tassie, who revived or created among us the nice art of casting gems, was originally a stone-mason at Glasgow; and Watt, who, by his very happy applications of mechanics, and his vast improvements on the steam-engine, has, more than any other individual perhaps, contributed to the great national advancement, was early an ivory-turner in that same city, and still found pleasure, in his declining years, with the amusement of the lathe. We might easily enlarge this catalogue; but enough has been said to prove the justness of the observation, and it suggests reflections which are not favourable to fixed and systematic plans of education.

Subsequent improvements.

The theory of achromatic telescopes, embraced in all its extent, opened a field of abstruse and difficult investigation. But the English mathematicians at that period, though they might appear to be especially invited to the discussion, very generally neglected so fine an opportunity for the exercise of their genius. They coldly suffered the artists to grope their devious way, without offering to guide their efforts by the lights of science. On the Continent the geometers of the first order were all eager to attempt the solution of problems at once so curious and important. For several years subsequent to 1758, the Transactions of the foreign academies were filled with memoirs on the combination of achromatic lenses, displaying the resources and refinements of the modern analysis, by Euler, Clairaut, and D'Alembert,—by Boscovich, Klingenstierna, Kæstner, and Hennert. On this, as on other occasions, however, we have to regret the want of close union between artists and men of science. Those profound investigations are generally too speculative for any real use; they often involve imperfect or inaccurate data; and the results appear wrapped in such comprehensive and intricate formulæ, as to deter the artist from endeavouring to reduce them into practice. We should have thought it preferable, on the whole, not to load the solution of the main problem with minute conditions, but to aim at a few general rules, which could afterwards be modified in their application according to circumstances. All this might have been accomplished, without scarcely travelling beyond the limits of elementary geometry.

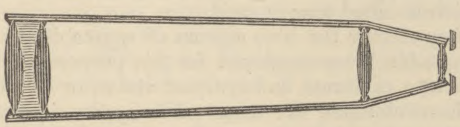
Euler.

Euler and his adherents at Berlin were still not disposed to abandon his favourite optical hypothesis. It was even pretended that Dolland must have owed his success to a nice correction of spherical aberration, and not to any really superior dispersive power belonging to the flint-glass. But that candid philosopher afterwards yielded to the force of reason and testimony; and, collecting his various optical papers, he published, in the successive years 1769, 1770, and 1771, a complete treatise on *Dioptrics*, occupying three quarto volumes, which contain a store of ingenious and elegant disquisitions.

Clairaut. D'Alembert.

The last memoir which Clairaut ever wrote related to achromatic glasses. D'Alembert prosecuted the subject with diligence and ardour; and the volumes of his *Mathematical Opuscules*, published between the years 1761 and 1767, contain some elaborate dioptrical investigations. Among other conclusions which he deduced from his multiplied researches, he proposed a new composition for the object-glass of a telescope, to consist of three lenses, the outmost one being a meniscus of crown-glass, or having a convex and a concave surface, then a meniscus of flint-glass in the middle, and adapted to this, on the inside, a double convex of crown-glass. Of all the continental works, however, which treat of achromatic combinations, the tracts of Boscovich, who possessed a very fine taste for geometry, may be held as the simplest and clearest. We cannot help noticing, by the way, a curious theorem of his concerning the form and arrangement of eye-glasses, which would be free from irregular colours. It is, that the correction will be produced by means of two lenses of the same kind of glass, if separated from each other by an interval equal to half the sum of their focal distances. This principle furnishes a very simple construction for the common astronomical telescope, through which the objects are seen inverted. In the annexed figure, the object-

Boscovich.



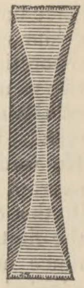
glass, as usual, is achromatic, being composed of two convex lenses of crown-glass, with a concave one of flint-glass fitted between them; but the eye-glass consists of two distinct lenses of crown-glass, both of them convex, and exactly similar, the first having every dimension triple that of the other, and their mutual distance double the focal length of the smaller.

Supposing, however, that the errors occasioned by spherical aberration were completely removed, the principle of achromatic combination is yet far from being so perfect as it has often been represented. Although the opposite dispersions of the flint and of the crown-glass should bring together the extreme rays, we are not, from this coincidence, warranted to infer that the several intermediate rays would likewise be accurately blended. In fact, a wedge of flint-glass not only separates all the rays much more than a similar one of crown-glass, but divides the coloured spaces after different proportions. While the combined lenses formed of those two kinds of glass give an image entirely free from the red and violet borders, they may still introduce secondary shades of green or yellow, sufficient to cause a certain degree of indistinctness. The mode of correcting this defect would be, to produce a counterbalance of colours, by conjoining several media endued with different refractive and dispersive powers. In these qualities, crown-glass itself admits of some variation, owing to the measure of saline ingredient; but flint-glass differs widely with regard to its optical properties, owing chiefly to the diversified proportion of minium or oxyde of lead which enters into its composition, and partly to the variable admixture of manganese employed to discharge the yellow tint occasioned by the lead. Manifest advantages, therefore, would result from a choice combination of three or more varieties of glass, since both the primary and the secondary deviations of colour would be corrected. Without pretending to any theoretical perfection, every thing really wanted in practice would be thus attained. A series of nice experiments on the optical relations of glass could not fail, by their results, to reward the assiduity of the ingenious artist. He would trace and determine the separate influence exerted on the refractive and dispersive powers by soda in the crown-glass, and by minium and manganese in the flint-glass. It is highly probable, that with perseverance he might discover a vitreous composition better adapted than any yet known for achromatic purposes. It is very generally believed, that the achromatic telescopes now manufactured in London are not of the same excellence with those first made by Peter Dolland. This declension of such a beautiful art has frequently been imputed to the baneful operation of a severe and oppressive system of excise. Whether the new mode of charging the duty on glass at the annealing arch has produced any beneficial effects, we are still to learn.

Achromatic Glasses.

Dr Blair

An extensive and ingenious set of experiments on the dispersive powers of different liquids, was undertaken, about the year 1787, and successfully prosecuted for some time afterwards, by Dr Robert Blair, for whom there had been recently created, under royal patronage, the chair of practical astronomy in the University of Edinburgh; one of the very few professorships in that distinguished seminary which have been suffered to remain inefficient and merely nominal. Of these experiments, a judicious account was, in 1790, communicated by their author to the Royal Society of Edinburgh, in a paper drawn up with evident ability, but rather too diffuse, and unnecessarily digressive. Dr Blair had a very small brass prism perforated with a hole, which he filled with a few drops of the liquid to be examined, and confined each end by a plate of glass with parallel surfaces. He then applied, inverted to the prism in succession, a number of glass wedges which he had provided of different angles, and observed, when the bars of the window, seen through this compound prism, appeared colourless, the angle of the wedge now expressed the relative dispersive power of the liquid. This way of experimenting was sufficiently simple, but a more accurate and expeditious method might have easily been devised. For instance, if the prism, furnished with a graduated arch, had remained fixed, and a single glass wedge made to turn upon it, and present successive inclinations to the observer, the refracting angle at which the irregular colours were united could be deduced by an easy calculation. Dr Blair found, by his trials, that muriatic acid, in all its combinations, but particularly with antimony and mercury, shows a very great dispersive power. The essential oils stood the next with regard to that property, though differing considerably among themselves. In Dr Blair's first attempts to improve the achromatic telescope, he conjoined two compound lenses; the one formed with a double concave of crown-glass and a semi-convex of essential oil, and the other composed of a double convex filled with essential oil, of great dispersive power, and of a semi-concave, likewise containing essential oil, but less apt for dispersion. This very complex arrangement seemed, however, to produce the desired effect, not only discharging from the image the extreme fringes of red and violet, but excluding also the intermediate shades of green or yellow. A simpler combination was afterwards used, requiring merely one liquid, composed of muriatic acid joined with antimony, or the triple salt of that acid united in certain proportions to ammonia and mercury. This liquid, being accurately prepared, was inclosed between two thin glass shells, to form a double convex lens: on the front was applied a semi-convex of crown-glass, and a meniscus of the same material behind, the whole being secured by a glass ring.



An object-glass so constructed seemed to perform its office with great perfection, effectually correcting both the primary and the secondary admixture of colours. This kind of eye-glass Dr Blair proposed to denominate *aplanatic* (from α privative, and πλαναω, to *err* or *wander*), and he obtained a patent for his invention. The late George Adams, optician in Fleet Street, was intrusted with the fabrication and sale of the telescopes thus constructed. Some of them were said to answer extremely well; but, whether from want of activity on the part of the tradesman, or from defect of temper in the patentee, these instruments never acquired much circulation. It was alleged that the liquid by degrees lost its transparency. Indeed we suspect that there is no combination in which liquids are concerned, which can be judged sufficiently permanent for optical purposes. It seems hardly possible to preclude absolutely the impression of the external air; the liquid must, therefore, have a tendency both to evaporate and to crystallize; and, in the course of time, it will probably, by its activity. corrode the surfaces of the glass.

The manufacture of achromatic telescopes in England furnished, for a long period, a very profitable article of exportation. Even after the introduction of those instruments was prohibited by several foreign governments, the object-glasses themselves, in a more compendious form, were smuggled abroad to a large amount. In fact, no flint-glass of a good quality was then made on the Continent. A very material alteration, however, in that respect, has taken place, at least in France, where the stimulus impressed by the revolution has worked so many changes, and where ingenuity and science, in most of the mechanical arts, have so visibly supplied the scantiness of capital. The French now construct achromatic telescopes, equal, if not superior, to any that are made in England. (J. L.)

French achromatic telescopes.

---

ACHTEL (literally an eighth part), a measure of capacity, used in Germany. Eight *Achtels* make an *Eimer*, but the scale varies in different parts of the country.

ACHTYRKA, a city of Russia, the capital of the circle of the same name. It contains eight churches, one of which, with an image of the Virgin, attracts many pilgrims: 1338 houses; and 16,205 inhabitants, who are employed in making woollen cloth, and some other articles. It is situate in Long. 34. 50. E. Lat. 50. 23. N.

ACHYR, a strong town and castle of the Ukraine, subject to the Russians since 1667. It stands on the river Uorsklo, near the frontiers of Russia, 127 miles west of Kiow. Long. 36. 0. E. Lat. 49. 32. N.

ACICANTHERA, in *Botany*, the trivial name of a species of Rhexia.

ACICULÆ, the small spikes or prickles of the hedgehog, *echinus marinus*, &c.

ACIDALIUS, Valens, would, in all probability, have been one of the greatest critics of modern times, had he lived longer to perfect those talents which nature had given him. He was born at Witstock, in Brandenburg; and having visited several academies in Germany, Italy, and other countries, where he was greatly esteemed, he afterwards took up his residence at Breslaw, the metropolis of Silesia. Thuanus tells us, that his excessive application to study was the occasion of his untimely death. He died on the 25th of May 1595, having just completed his 28th year. He wrote a Commentary on Quintus Curtius; also, Notes on Tacitus, on the twelve Panegyrics, besides speeches, letters, and poems. His poetical pieces are inserted in the *Deliciæ* of the German poets, and consist of epic verses, odes, and epigrams. M. Baillet has given him a place among his *Enfans Célèbres;* and says, that he wrote a comment upon Plautus when he was but 17 or 18 years old, and composed several Latin poems at the same age.

Acidalius, a fountain near Orchomenus, a city of Bœotia, in which the Graces, who are sacred to Venus, bathed. Hence the epithet *Acidalia*, given to Venus.

ACIDITY, that quality which renders bodies acid.

ACIDOTON, in *Botany*, the trivial name of a species of Adelia.

ACIDS, in *Chemistry*, a class of substances which are distinguished by the following properties:—

1. When applied to the tongue, they excite that sensation which is called *sour* or *acid*.

2. They change the blue colours of vegetables to a red. The vegetable blues employed for this purpose are generally tincture of litmus, and syrup of violets or of radishes, which have obtained the name of *re-agents* or *tests*. If these colours have been previously converted to a *green* by alkalies, the acids restore them.

3. They unite with water in almost any proportion.

4. They combine with all the alkalies, and most of the metallic oxides and earths, and form with them those compounds which are called *salts*.

It must be remarked, however, that every acid does not possess all these properties; but all of them possess a sufficient number of them to distinguish them from other substances. And this is the only purpose which artificial definition is meant to answer. See Chemistry.

ACIDULÆ. Mineral waters that are brisk and sparkling, without the action of heat, are thus named; but if they are hot also, they are called Thermæ.

ACIDULATED, a name given to medicines that have an acid in their composition.

ACIDULOUS denotes a thing that is slightly *acid:* it is synonymous with the word *sub-acid*.

ACILIUS GLABRIO, Marcus, consul in the year of Rome 562, and 191 years before the Christian era, distinguished himself by his bravery and conduct in gaining a complete victory over Antiochus the Great, king of Syria, at the Straits of Thermopylæ in Thessaly, and on several other occasions. His son built the temple of Piety at Rome, in consequence of a vow the father made before this battle. He is mentioned by Pliny, Valerius Maximus, and others.

ACINACES, an ancient Persian sword, short and straight, and worn, contrary to the Roman fashion, on the right side, or sometimes in front of the body, as shewn in the bas-reliefs found at Persepolis. Among the Persian nobility they were frequently made of gold, being worn as a badge of distinction. The acinaces was an object of religious worship with the Scythians and others.—*Herod.* iv. 62.

ACINODENDRUM, in *Botany*, the trivial name of a species of Melastoma.

ACINOS, in *Botany*, the trivial name of a species of Thymus.

ACINUS, or Acini, the small protuberances of mulberries, strawberries, &c., and by some applied to grapes. Generally it is used for those small grains growing in bunches, after the manner of grapes, as *ligustrum*, &c.

ACIPENSER, Sturgeon. For the living species, see Ichthyology; for the fossil species, see the *Ganoïd* fishes of Agassiz.

ACI REALE, a city on the coast of Catania, at the base of Ætna. It is well built, clean, and healthy, with a delicious climate. Pop. about 15,000: they are industrious, and carry on a considerable trade in the wines of the adjacent fertile territory, fruit, cotton, flax, linen, silk, cutlery, and jewellery. Several small contiguous towns also bear the name of Aci; as Aci Castello, Aci Terra, Aci Santa Lucia, &c.

ACIS, in *Mythology*, the son of Faunus and the nymph Symæthis, was a beautiful shepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was so enraged, that he crushed his rival with a rock; and his blood, gushing forth from under the rock, was metamorphosed into the river bearing his name. *Ovid. Met.* xiii. 750., *Sil. Ital.* xiv. 221. This river, now *Fiume di Jaci*, or *Acque Grandi*, rises under a bed of lava, on the eastern base of Ætna, and passing Aci Reale, after a rapid course of one mile, falls into the sea. The waters of the stream, once celebrated for their purity, are now sulphureous.—*Cluverii Sicil.*; *Brydone's Sicily*; *Smyth's Sicily.*

ACKERMANN, John Christian Gottlieb, a very learned physician and professor of medicine, was born at Zeulenrode in Upper Saxony, in the year 1756. Having acquired the rudiments of his medical education under the tuition of his father, who was also a physician, he proceeded to Jena and to Göttingen, and studied under Baldinger and Heyne. On quitting the latter university, he established himself in practice at Stendal, the numerous manufactories of which place enabled him to contribute many important observations to the translation of Rammazzini's *Treatise of the Diseases of Artificers*, which he published in 1780–83. After practising here several years, he was appointed public professor in ordinary of medicine in the university of Altorf in Franconia, which office he continued to fill with great repute to the time of his death, which took place in 1801. All Dr Ackermann's works display great erudition. To the history of medicine he contributed many valuable articles; the disquisitions, in particular, on the lives and writings of Hippocrates, Galen, Theophrastus, Dioscorides, Aretæus, and Rufus Ephesius, which he furnished to Harles's edition of Fabricius's *Bibliotheca Græca*, are justly esteemed as masterpieces of critical research. As a practitioner he appears to have possessed no mean talents for observation; though he has been accused, and, it must be acknowledged, not without reason, of betraying occasionally a predilection for antiquated hypotheses. Besides various translations of English, French, and Italian medical authors, which were published, for the most part, previously to his removal to Altorf, he is the author of 13 different original works on different branches of medicine, between the years 1775 and 1800.

ACKNOWLEDGMENT, in a general sense, is a person's owning or confessing a thing; but more particularly, is the expression of gratitude for a favour.

*Acknowledgment-Money*, a certain sum paid by tenants in several parts of England, on the death of their landlords, as an acknowledgment of their new lords.

ACLIDES, in *Roman Antiquity*, a kind of missile weapon with a thong affixed to it, by which it was drawn back. Most authors describe it as a sort of dart or javelin; but Scaliger makes it roundish or globular, and full of spikes, with a slender wooden stem to poise it by. Each warrior was furnished with two.

ACLOWA, in *Botany*, a barbarous name of a species of Colutea. It is used by the natives of Guinea to cure the itch: they rub it on the body as we do unguents.

ACME, the top or height of any thing. It is usually applied to the maturity of an animal just before it begins to decline; and physicians have used it to express the utmost violence or crisis of a disease.

ACMELIA, in *Botany*, the trivial name of a species of Spilanthus.

ACNIDA, Virginian Hemp.

ACNUA, in *Roman Antiquity*, signified a certain measure of land, about an English rood and a quarter.

ACOEMETÆ, or Acoemeti, from ἀκοιμητος, sleepless; a set of monks who chanted the divine service night and day in their places of worship. They divided themselves into three bodies, who alternately succeeded one another, so that the service in their churches was never interrupted. This practice they founded upon the precept, *Pray without ceasing.* They flourished in the East about the middle of the fifth century. There are a kind of acoemeti still subsisting in the Romish church, viz., the religious of the holy sacrament, who keep up a perpetual adoration, some one or other of them praying before the holy sacrament day and night.

ACŒTES, the son of a poor fisherman of Mæonia, who followed the occupation of a pilot. Being once on a voyage to Delos, the ship touched at Naxos (frequently called *Dia*), where the sailors carried on board with them a beautiful boy, whom they had found on shore overcome with sleep and wine. Acœtes recognising the youth to be more than mortal, endeavoured to dissuade them from their purpose, but without effect. On awaking, the boy, who was no other than the god Bacchus, desired to be carried back to Naxos. The crew agreed to do so, but kept the ship's head in the opposite direction, in spite of the entreaties of the god and the remonstrances of Acœtes. Suddenly the offended deity put forth his power, and the ship stood motionless in the water. The crew in vain plied the oar: vine-wreaths twined around them, and shot in tangles through the rigging. Tigers, lynxes, and panthers, bestrode the deck, and Bacchus himself appeared in his true form, armed with his terrible *thyrsus.* The sailors incited to madness, leaped into the sea, and were immediately changed into fishes. Acœtes alone was saved, and became a priest of Bacchus at Naxos.—*Ovid. Met.* iii. 582.

ACOLUTHI, or Acoluthists (ἀκολουθοι, from α, copulative, and κελευθος, a way), in *Antiquity*, was an appellation given to those persons who were steady and immovable in their resolutions; and hence the Stoics, because they would not forsake their principles nor alter their resolutions, acquired the title of *acoluthi.*

Acoluthi, *Acolytes*, among the ancient Christians, were a peculiar order of the inferior clergy in the Latin church, for they were unknown to the Greeks for above 400 years. They were next to the subdeacon; and we learn from the fourth council of Carthage, that the archdeacon, at their ordination, put into their hands a candlestick with a taper, giving them thereby to understand that they were appointed to light the candles of the church; as also an empty pitcher, to imply that they were to furnish wine for the eucharist. The name and office still exist in the Romish church.

ACOLYTHIA, in the *Greek church*, denotes the office or order of divine service; or the prayers, ceremonies, hymns, &c., whereof the Greek service is composed.

ACOMINATUS, NICETAS, was secretary to Alexius Comnenus and to Isaacus Angelus successively. He wrote a history from the death of Alexius Comnenus in 1118, where Zonaras ended his, to the year 1206, which has gone through many editions, and has been much applauded by the best critics.

ACONCROBA, in *Botany*, the indigenous name of a plant which grows wild in Guinea, and is in great esteem among the natives for its virtues in the small-pox. They give an infusion of it in wine. The leaves of this plant are opaque, and as stiff as those of the phillyrea; they grow in pairs, and stand on short foot-stalks; they are small at each end, and broad in the middle; and the largest of them are about three inches in length, and an inch and a quarter in breadth in the middle. Like those of our bay, they are of a dusky colour on the upper side, and of a pale green underneath.

ACONITI, in *Antiquity*, an appellation given to some of the Athletæ, but differently interpreted. Ἀκονιτι, adv. signifies literally *without dust* (α, priv. and κόνις); and probably was used of a victory obtained without difficulty, or when none dared to oppose an athlete on account of his strength and skill. *Paus.* vi. 7, § 2; *Hor. Epist.* i. 1. 51.

ACONITUM, ACONITE, WOLFSBANE, or MONKS-HOOD. It yields the alkaloid *aconitine*, which is a deadly poison; but has been used in medicine as an external anodyne remedy in acute pains, and also in minute doses internally.

ACONTIAS, in *Zoology*, an obsolete name of the *anguis jaculus*, or dart-snake, belonging to the order of *Ophidians;* and Cuvier employs it to designate a sub-genus of *anguis*.

ACONTIUM, ακοντιον, in Grecian antiquity, a kind of dart or javelin, resembling the Roman spiculum.

ACONTIUS, a young man of the island Cea, who having gone to Delos to see the sacred rites which were performed there by a crowd of virgins in the temple of Diana, fell violently in love with Cydippe, the daughter of a noble Athenian; but not daring to ask her in marriage, on account of the superiority of her rank, he insidiously threw down at her feet an apple, on which were inscribed these words,

> Me tibi nupturam (felix eat nomen) Aconti,
> Juro, quam colimus, numina magna deæ.

Or, according to others,

> Juro tibi sanctæ per mystica sacra Dianæ,
> Me tibi venturam comitem, sponsamque futuram.

The virgin having taken up the apple, inadvertently read the words, and thus apparently bound herself by a promise; for by law, everything uttered in that temple was held to be ratified. When her father, a little after, ignorant of what had happened, betrothed her to another man, she was suddenly seized with a fever; whereupon Acontius sent her a letter (expressed by Ovid, *Heroid.* 20.) to persuade her that her fever was caused by Diana for not having fulfilled the promise which she had made to him in the temple of that goddess. Cydippe therefore resolved to comply with the wishes of Acontius, even against the inclination of her father. Her answer is the subject of Ovid's 21st *Epist. Heroid.* (ADAM'S *Clas. Biog.*)

ACONTIUS, properly ACONCIO, *James*, a philosopher, civilian, and divine, born at Trent in the sixteenth century. He embraced the reformed religion; and coming into England in the reign of Queen Elizabeth, he was favourably received and much honoured by that princess, which he acknowledges in a book dedicated to her. This work is his celebrated *Collection of the Stratagems of Satan*, which has been often translated, and passed through many editions.

ACORIS, a king of Egypt, who flourished about B.C. 385.

ACORN, the fruit of the oak-tree.

ACORN, in sea language, a little ornamental piece of wood, fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the mast-head. It is used to keep the vane from being blown off from the spindle in a whirlwind, or when the ship leans much to one side under sail.

ACORUS, CALAMUS, AROMATICUS, SWEET FLAG, or SWEET RUSH. It belongs to the natural order of *Aroides*.

ACORUS, in the *Materia Medica*, a name sometimes given to the great galangal.

ACORUS, in *Natural History*, blue coral. The true sort is very scarce; some, however, is fished on the coasts of Africa, particularly from Rio del Rey to the river of the Camarones. This coral is part of the merchandise which the Dutch trade for with the Camarones: that of the kingdom of Benin is also very much esteemed. It grows in form of a tree on a rocky bottom.

ACOSTA, JOSEPH D', a celebrated Spanish author, was born at Medina del Campo about the year 1539. In 1571, he went to Peru as a Provincial of the Jesuits, having entered into that society in his fourteenth year. After a residence in America of seventeen years, he returned to his native country, and became in succession visitor for his order of Aragon and Andalusia, superior of Valladolid, and rector of Salamanca; in which city he died in February 1600.

About ten years before his death, he published at Seville, in one volume quarto, his valuable work entitled *Historia Natural y Moral de las Indias*. The first two books of this history were written during his residence in Peru, and were published separately after his return to Spain, in the Latin language, with this title: *De Natura Novi Orbis, libri duo*. He afterwards translated them into Spanish, and added to them other five books, the whole composing a connected work, under the first-mentioned title. This work, which has been translated into all the principal languages of Europe, is written on a regular and comprehensive plan. Dr Robertson pronounces Acosta "an accurate and well-informed writer." Among other things, he treats the subject of climate in a more philosophical manner than could have been expected in a writer of that age, and of his order. "He was the first philosopher," says the eminent author just quoted, "who endeavoured to account for the different degrees of heat in the old and new continents, by the agency of the winds which blow in each;"—a theory which was afterwards adopted by Buffon, and supported with his usual powers of copious and eloquent illustration. In the course of these discussions, Acosta frequently comments upon the opinion of Aristotle and other ancient philosophers, that the middle zone of the earth was so much scorched by the rays of the sun as to be destitute of moisture and verdure, and totally uninhabitable. This notion seems to have held its ground in the Schools, even after the discovery of South America had disclosed the magnificent scenery and stupendous rivers of the tropical regions. It appears to have been thought a sort of impiety to question a dogma of such ancient date, and sanctioned by the assent of all the school divines. We learn, from a curious passage in Osborne's *Miscellany of Essays, Paradoxes, and Letters*, that the exposing of this ancient error in geography was one of the circumstances which brought upon the famous Sir Walter Raleigh the charge of general scepticism and atheism. Acosta mentions, that, when he went to America, his mind was deeply imbued with frightful notions of this supposed burning zone, and that his surprise was great when he beheld it so different from what it had been represented in the "ancient and received philosophy." "What could I do then," says he, "but laugh at Aristotle's meteors and his philosophy?"

Having said thus much in regard to one of the most curious and valuable of the earlier accounts of the new world, it may be proper to add, that, in speaking of the conduct of his countrymen, and the propagation of their faith, Acosta is in no respect superior to the other prejudiced and fanatical writers of his country and age. Though he acknowledges that the career of Spanish conquest was marked by the most savage cruelty and oppression, he yet represents this people as the chosen instruments of the Deity for spreading the truths of the gospel among the nations of America, and recounts a variety of miracles, as a proof of the constant interposition of Heaven, in favour of these merciless and rapacious invaders.

Besides his History, Acosta wrote the following works: 1. De Promulgatione Evangelii apud Barbaros. 2. De Christo Revelato. 3. De Temporibus Novissimis, libri vi. 4. Concionum, tomi iii.

Acosta, *Uriel d'*, a Portuguese of noble family, a Jew by descent, was born at Oporto towards the close of the sixteenth century. Brought up in the Roman Catholic faith, and naturally of a religious disposition, he was a strict observer of the rites of the church till the course of his inquiries led him, after much painful doubt, to abandon the religion of his youth. Apparently ignorant of any other form of Christianity, he sought refuge in Judaism, and passing over to Amsterdam, was received into the synagogue, after undergoing the rite of circumcision, and having his name changed from Gabriel to Uriel. He soon discovered, however, that those who sat in Moses' seat were shameful perverters of his law; and his bold protests served only to exasperate the rabbis, who finally punished his contumacy with the greater excommunication. Persecution seemed only to stimulate his temerity, and he soon after published a defence, in which he not merely exposed the departures of the Jewish teachers from the law, but combated the doctrine of a future life, in which he held himself supported by the silence of the Mosaic Books. For this he was imprisoned and fined, besides incurring public odium as a blasphemer and atheist. Nothing deterred, he pursued his speculations, which ended in his repudiating the divine authority of the law of Moses. Wearied, however, by his melancholy isolation, and longing for the benefits of society, he was driven, in the inconsistency of despairing scepticism, to seek a return to the Jewish communion. Having recanted his heresies, he was re-admitted after an excommunication of 15 years. He soon made himself again obnoxious to discipline, and was excommunicated a second time. After seven years of miserable exclusion, he once more sought admission, and after passing through a humiliating penance was again received. These notices of his singular and unhappy life are taken from his *Exemplar Humanæ Vitæ*, published and refuted by Limborch. He died by his own hand, after an ineffectual attempt on the life of his most bitter persecutor.

ACOSTAN, a mountainous island in the north seas, between Asia and America, observed by Captain Cook.

ACOUSMATICI, sometimes also called *Acoustici*, in Grecian antiquity, such of the disciples of Pythagoras as had not completed their five years' probation.

ACOUSTIC, in general, denotes any thing that relates to the ear, the sense of hearing, or the doctrine of sounds.

*Acoustic Disciples*, among the ancient Pythagoreans, those more commonly called Acousmatici.

*Acoustic Ducts*, in *Anatomy*, the same with *meatus auditorius*, or the external passage of the ear.

*Acoustic Vessels*, in the ancient theatres, were a kind of vessels made of brass, shaped in the bell fashion, which being of all tones within the pitch of the voice, or even of instruments, rendered the sound more audible, so that the actors could be heard through all parts of theatres which were even 400 feet in diameter.

# ACOUSTICS.

ACOUSTICS, that branch of Natural Philosophy which treats of the nature of Sound, and the laws of its production and propagation. It is a subject extremely curious and interesting, and has at all times excited much attention among philosophers. In treating it here, it was at first our intention to embody the original article in this Encyclopædia with that which was contributed for the last Supplement by Professor Leslie. On considering, however, that the latter embraces in itself a general outline of the whole science;—that it is distinguished, like all the other productions of that philosopher, by soundness, depth, and striking originality; and that any changes even in the arrangement might destroy its peculiar character;—we have thought it best to preserve this valuable essay entire. It accordingly forms the *Second* Part of this Treatise; the *First* being devoted to the explanation of the more elementary principles; and the *Third* to some details supplemental to those contained in the Second.

## Part I.

Nature of sound.

In regard to the nature of sound, the slightest attention is sufficient to convince us, that this sensation is not owing to the action of any peculiar substance or power, like Heat, Light, or Electricity, but arises merely from a certain mechanical action; a sort of concussion or agitation which takes place among the bodies from which the sound is emitted. Every noise or sound with which we are acquainted is accompanied with some action of this kind. The report of a cannon, for example, produces a concussion which shakes the ground under and to a great distance around it. In the same manner the rushing of waters, the roar of the sea, the whistling of the wind as it breaks on the trees or other obstacles which oppose it; the rattling of carriages, and that infinite diversity of sounds which arises in general from the percussion of one object against another: in all these cases there is a sensible and indeed violent agitation among the bodies from which the sound proceeds. In musical sounds, which are of a softer nature, we still also observe an agitation, which is often felt communicating itself to the surrounding bodies. If, for example, we stand under or near a pianoforte when it is sounding, we feel a sensible tremor in the floor of the apartment. If we lay the finger or hand on the instrument, or touch any other, such as a violin, when it is sounding, or a bell, we feel the same sort of tremor in every part of them; and this is well observed in the case of any glass vessel, such as a tumbler or large cup. If we strike it so as to make it sound, and then touch the mouth of it with the finger, we feel a sensible tremor in the glass; and when this internal agitation is stopped, as it generally is by the contact with the finger, then the sound ceases along with it. If there be any water in the glass, the tremor is observed communicating itself to the water, and putting the whole mass in motion. This is particularly well observed when we make the glass sound by rubbing the edge of it with the finger, as is done in the musical glasses. When the sound is brought fully out, the water is violently agitated; and as the sound declines, the agitation declines along with it. Such agitation then, in the sounding body, being

Acoustics.

the constant accompaniment of sound, ceasing when it ceases, and again beginning when the sound recommences; and there being no other circumstance which can be discovered accompanying the sound in this manner; there can be no doubt that this is in some way or other the cause of the sensation.

Transmitted through the medium of the air.

But how can any mere agitation or imperceptible tremor among bodies, and these at a distance, affect the organ of hearing? It is through the medium of the surrounding air. We have seen how the tremor of the piano-forte is communicated to the floor of the apartment, and is there felt under our feet. This communication can only take place through the legs of the instrument, which form the only connection between it and the floor. Through these, therefore, it is somehow conveyed; and in the same manner every tremor of this kind creates an agitation in the surrounding air, through which it is conveyed from the centre of agitation in all directions until it reaches the ear, and there striking or agitating the organ, produces the sensation of sound. That such agitation does take place in the air, we have a striking proof in the discharge of artillery, which often produces such an agitation as to shatter the glass in the windows of adjoining houses. The ear then forms merely a sort of organ of touch, but of such exquisite sensibility that it becomes affected by the slightest agitation in the fluid atmosphere by which it is surrounded. But this fluid is continually agitated, and in a thousand different ways, by the various motions and actions which are continually going on among the bodies on the surface of the earth. Every agitation of this kind communicates itself to the surrounding atmosphere; it is by it conveyed and propagated in all directions from the centre of agitation, somewhat like what we observe in a smooth surface of water when a stone is thrown into the middle of it;—a series of little waves are observed arising and propagating themselves in concentric circles from the centre of agitation on all sides. In a similar manner every agitation in the aërial medium propagates its influence in all directions, and from these varied impressions arise all those diversities of sound which affect the ear.

This idea of the process of hearing and of the cause of sound is certainly very remarkable, and well calculated to excite our surprise and curiosity, when we think of that infinite variety which we observe; single sounds, varying in intensity from the gentlest tap to the noise and violence of an explosion; continued sounds, from the ripple of waters to the roar of the cataract; strains of melody which enchant the ear, rising from grave to acute, and falling again to the lowest in the compass; or those harsher notes which only grate by their discord. Can it be possible that all these diversities arise from agitations in the air, differing only in the manner in which they strike the ear, in the force and quickness of their action, or in the regularity of their succession? What incredible sensibility in this organ, to perceive and be moved by such imperceptible shades of gradation, and to recognise such infinite diversities in kind! The powers of the eye in discriminating the minutest shades of colour justly excite our astonishment; but each colour presents a peculiar modification of light. The powers of the ear must appear still more extraordinary, if every sensation in it arises merely from a mechanical agitation of the same nature in every case, but only differing in the force of the impulse. Yet this is really the case; and the more we examine into the subject, the more clearly does it appear demonstrable by the laws of geometry and mechanics.

That the air is necessary for the production of sound, is clearly proved by the beautiful experiment of inclosing a bell within the receiver of an air-pump, and then exhausting the air. As the process of exhaustion proceeds, the sound is observed to become continually fainter and fainter, until at last it nearly dies away altogether. The bell, however, continues to ring, at least the hammer continues to strike, and thereby to agitate the bell as before; and yet no sound is emitted, plainly because there is no medium to convey the agitation to the ear. If the sound in this experiment cannot be altogether extinguished, this will be found to arise from the impracticability of exhausting the air altogether out of the receiver, and also of insulating completely the bell from the plate of the air-pump on which it stands, the support serving to convey the sound even after the air is exhausted. A very good mode of performing this experiment is, to have a bell with a small piece of clock-work attached to it, which strikes at regular intervals, and with a tone of uniform intensity.

Mode in which sound is propagated.

In order to conceive the mode in which sound is propagated through the air, let us consider what takes place when we move a series of balls ranged in a line on a table, or suspended by threads. If we strike the one end of the line by impelling a ball against it, it is only the ball at the other end which appears to be affected. This flies off from the rest, and leaves them almost stationary. The intermediate balls, therefore, serve merely to transmit the impulse from the one end to the other of the series. In the same manner it is that the agitation or impulse from which sound arises is transmitted through the air. This fluid, like every other body, consists of an infinite number of little particles; a single series of which may be represented to us by the balls in the above example. These particles are not even in contact with each other; they are separated by minute intervals, but are yet connected together by attractive and repulsive forces, which tend to retain them perpetually in equilibrio. In every case, therefore, there is in reality a chain of such particles reaching from the sounding body to the ear. The former by its agitation strikes that particle which is next it, the intermediate ones serve to convey the impression, and the last one, flying off, strikes the sentient organ of hearing. The process is exactly similar to that of impulse along a series of balls, only that in the case of the air, the intermediate particles, instead of remaining at rest, move each of them backwards and forwards by a very minute interval; the first communicating its motion to the second, the second to the third, and so on to the last; each performing a slight oscillatory movement, which advances from the beginning to the end of the series.

We now see at once the cause of a remarkable and well-known fact, that the propagation of sound is not instantaneous; it requires time to advance from the sounding body to the ear, as is daily observed and illustrated in the discharge of fire-arms. If the distance be at all considerable, a sensible interval is always observed to elapse between the flash and the report. The light flies almost instantaneously, but the report is retarded according to the distance; as is also seen in many other cases: when we observe the workmen, for example, cutting up large stones in any quarry; if we stand at a little distance, we see invariably and distinctly the blow of the hammer on the stone before the sound reaches the ear. These and other similar facts leave no doubt that sound advances only at a certain rate, and invariably requires time for its propagation; and the reason is, that each aërial particle in the chain of communication must have a certain time, minute no doubt, but still definite, to perform its oscillation, and communicate its motion to the rest; and thus the advance of the agitation and of the sound is retarded, and only sweeps with a regulated progression along the line.

Sound propagated on all sides.

It is not through one series of particles merely that the oscillatory motion is communicated. The sounding body having every part of it in a state of agitation, generally acts all round; but even though it were only to act in one direction, the impulse, once begun at the centre, is propagated in all directions; for though only one particle were originally affected, so intimately are they all connected together and united into a system by their mutual attractions and repulsions, that this cannot advance in any degree forwards without affecting the particles on each side: these affect what are before and around them; and thus the impulse is communicated, and diffuses itself on all sides. These lateral impressions would appear to be necessarily somewhat enfeebled, yet it is one remarkable characteristic of such oscillatory movements, that, like the vibrations of a distended cord, or the oscillations of a pendulum in a cycloid, they are all performed in the same time, however minute or however extended. The lateral impressions, therefore, though ever so feeble, are yet transmitted with the same rapidity as the direct; the sound may be weakened, and we often observe it so;—a speaker, for example, is always best heard in front; the report of a cannon is also loudest in that direction, but still the sound is heard at the very same instant all round.

It is owing to this diffusion of the agitation in all directions, the original impression being spread out, not merely in concentric circles like the little waves in a pool, but expanding continually, if we can conceive it, into a wider and wider concentric sphere.—it is owing to this that every sound decreases so rapidly as we recede from it, and at last dies away altogether in the distance. It requires a very loud sound to be heard at the distance of a mile, yet we have heard the guns of Edinburgh Castle at the distance of 20 miles; and the noise occasioned by the falls of Niagara is said to be often heard at 60 miles. That this diffusion of the agitating impression is the true cause of the diminution of the sound, is proved in a remarkable manner by confining the air on all sides, as in a tube. M. Biot, in his *Traité de Physique*, gives an account of some very interesting experiments made by himself in the train of cast-iron pipes used for the conducting of water into Paris, and which extended about 2860 feet, thus including in their interior a cylindrical column of air upwards of half a mile in length; at which distance a person standing at one end of the pipes, and speaking within, could be easily heard at the other. "The lowest voice," says he, "was heard at this distance so as to distinguish completely the words, and to establish a continued conversation. I wished to ascertain at how low a tone the voice ceased to become audible, and I could not reach it. Words spoken as low as when one whispers in the ear of another were heard and appreciated; so that if we wished to speak so as not to be understood, there was only one way of doing it, and that was not to speak at all." It is on this principle that depends the effect of those tubes which are now in such general use, as modes of communication between distant apartments, in houses and public offices. Hence, also, are performed many amusing tricks with statues or busts, situated in different parts of a room, answering questions, and speaking to one another; the figures being connected by tubes concealed under the walls or floor, or communicating with an apartment below, in which a speaker is stationed.

Velocity of sound.

In regard to the actual velocity with which the impulse of sound advances, it appears, from the most accurate experiments on the discharge of pieces of ordnance, and marking the interval between the flash and the report, at a distance carefully measured, that in ordinary circumstances this amounts to no less than 1130 feet each second, which is nearly equal to the velocity of a cannon ball the moment it issues from the piece. This last is very speedily retarded by the resistance of the air; but sound advances with undiminished velocity. Hence it will travel a mile in a little more than four seconds and a half, or $12\frac{3}{4}$ miles per minute. On this depends an easy method of determining in many cases our distance from objects, and which may often prove useful, particularly in military operations. We have only to observe, in seconds, the interval between the flash and report of the cannon or musket, and allow $4\frac{1}{2}$ seconds to every mile, or 1130 feet to every second. Thus, in a house in Lothian Street, directly opposite to the castle of Edinburgh, we have frequently observed a sensible interval elapse, as the sound of the guns travelled across the intermediate valley, we think about 2″ or more; and the distance in a straight line is about 760 yards, or a little less than half a mile. In the same manner, by observing the interval between the flash of lightning and the thunder, we can tell the distance of the point where the electric discharge takes place.

It is remarkable also, that all kinds of sound, strong or weak, acute or grave, advance with the same velocity; and this arises from the circumstance already noticed, that all the oscillatory movements in the air, however minute or however extended, are performed each in the very same interval of time. This effect was distinctly proved in the experiments made by Biot in the cast-iron pipes already noticed, by playing different airs on the flute at one of the extremities of the tube. Now, it is well known that a musical air is adapted to a certain measure or time, which regulates very nicely the intervals between the successive notes; consequently, if any of these were propagated more rapidly or more slowly than others, by the time they reached the ear these would have been confounded with what preceded or followed them; and the air would have appeared quite altered, in place of which it was uniformly regular, and in its natural time; whence it clearly followed, that all sounds are propagated with equal velocity.

Cause of echoes.

The above view of the propagation of sound explains at once the remarkable phenomenon of the echo, which arises in every case from obstacles opposing the progress of sound. The agitation in the air, however, though interrupted by such obstacles, is not destroyed: each aërial particle which strikes against the opposing surface is reflected from it like an elastic ball which strikes against any wall or table. The sound is thus reflected at an angle equal to the angle of incidence; and it is when a number of these reflected impressions are thrown back to the point whence the original sound issues, by the configuration of the opposing obstacles, as so frequently happens among rocks, walls, &c. that an echo is produced.

Air not the only vehicle of sound.

Hitherto we have considered the *air* only as the vehicle of sound, and, without doubt, it is the grand medium of its transmission. Other bodies, however, convey it in a similar manner, and some of them even with much greater rapidity and force. In the liquid element this is proved by the acuteness which fishes display to sounds made in the air, and by many experiments. Professor Robison related, that with his head plunged under water, he could hear the sound of a bell, rung also in the water, at the distance of 1200 feet. We have already seen how the tremor of the piano-forte is communicated to the floor of the apartment; and many other familiar facts show clearly that sound is transmitted through the most solid bodies. How readily do we hear from one apartment of a house, or from one floor to another. The scratch of a pin is easily heard from one end of a log to another. A well-known but striking experiment in illustration of the transmission of sound is, to suspend any sonorous body, as a bell, a glass, a silver spoon, or a tuning fork, from a thread, and putting with the finger the extremities of the thread one in each ear;—if the body be then struck against any obstacle, the apparent loudness and depth of the sound are quite surprising. Again, if we shut the ears altogether, we yet feel very sensibly the impression of any sound conveyed through the mouth, the teeth, or the head:—if we put a small stick or rod in the mouth, and touch with the other extremity a watch lying on the table, the beats will become quite audible, though the ears be actually shut. Every noise in the mouth or among the teeth is conveyed internally to the ear in the same manner. Sound, therefore, is transmitted through liquids and solids, as well as through the air; and indeed, when we consider that the former are quite similarly constituted with the air, being composed of an infinite number of little particles, combined into a system by the same species of attractive and repulsive forces, it is noway surprising that an impulse communicated to any of these bodies should in like manner be diffused throughout the mass; and this must be by the same species of internal oscillations among the particles.

Such being the nature and propagation of sound, and its actual velocity as determined by experiment, it has long been the study of philosophers to reconcile these effects with those physical properties of the air and of liquid bodies, which are known from other circumstances, and can be calculated by the laws of mechanics, aided by the powers of mathematical analysis. This subject is investigated in the following Part; written, as already mentioned, by Professor Leslie. (G. B.)

## Part II.

The doctrine of sound is unquestionably the most subtile and abstruse in the whole range of physical science. It has given occasion, in recent times, to much controversy and discussion, and has eventually called forth all the mighty resources of a refined and elaborate calculus. Yet an evident obscurity still remains to overcloud the subject. The discrepancies between theory and observation have been made entirely to disappear from astronomy, which has at last attained a degree of perfection befitting the sublimity of the science. But some latent suspicions pervade the structure of acoustics, sufficient to disturb that feeling of confidence which is calculated to invigorate our pursuits.

Sound conveyed by a certain tremor.

The impression of sound is conveyed by means of a certain tremor or internal agitation, which shoots, with more or less celerity and force, through any substance, whether solid or fluid. Nor is it requisite that the conducting medium should belong to the class of bodies which are commonly denominated elastic. In fact, all bodies whatever, in the minute and sudden alterations of their form, exert a perfect elasticity, and only seem to want this energy when they undergo such great changes that their component particles take a new *set* or arrangement, which prevents the full effect of re-action.

It is not every kind of tremulous motion, however, that will excite the sensation of sound. A certain degree of force and frequency in the pulsations appears always necessary to affect our sense of hearing. Yet the impression of sound is not confined to the mere external organ: the auditory nerves have a considerable expansion, and sympathize with those of taste and of smell. The only inlet of vision is by that very narrow aperture, the pupil of the eye; but the reception of sound partakes more of the character of the general sense of feeling, which, though most vivid at the extremities of the fingers, is likewise diffused over the whole surface of the body. The intimation of the ear is accordingly assisted by the consent of the palate, the teeth, and the nostrils. Fishes hear very acutely under water, though the organ itself lies so concealed in the head as to have long escaped the diligence of anatomists.

It was formerly supposed, that the transmission of impulse through a solid body is perfectly instantaneous. This formed, indeed, one of the Cartesian tenets, which Newton himself has tacitly admitted. But accurate observations have since proved, that motion is always really progressive, and propagated in succession. Professor Leslie has shown that the darting of impact through any substance, whether hard or soft, is accomplished by the agency of the same interior mechanism as that of sound, and has furnished the method of calculating, in some of the more difficult cases, the celerity of transmission.

All bodies essentially elastic.

All bodies may be considered as composed of physical points, without any sensible magnitude, but connected together by a system of mutual attraction and repulsion. When those integrant particles are compressed by external violence, a repulsive force is exerted to regain their first position; or if they be dilated, a corresponding attraction now draws them back to their neutral site of equilibrium. We may further presume, that in solids these constituent forces are confined to the proximate particles only, but that in the case of liquids or other fluids they embrace the particles in their near vicinity, and include a sphere of action varying in its extent. Hence, the former suffer disruption, without bending or giving way to powerful pressure; while the latter, acting by a sympathetic union, gently recede and take a new arrangement. In fact, the attribute of hardness applied to body is only a relative, and not an absolute quality; in the inferior degrees it relapses into softness, and softness again passes through interminable shades to the most yielding fluidity. The application of heat, by enlarging the system of internal connection, generally promotes softness, and heightens the degree of fluidity itself. The effect is conspicuous in the increased flow from a capillary syphon, when kept warm. But even liquids, when struck with a blow so rapid and sudden as to preclude the sympathy of their adjacent molecules, will assume all the character of the hardest substances. This fact has a familiar illustration in the play of duck and drake; but it is beautifully exemplified in the successive rebounds made by cannon-shot, from the surface of the sea.

In confirmation of the remark, we may quote a very singular and curious circumstance, mentioned by travellers, relative to the method of catching fish, which is successfully practised in some of the more northern countries. The hardy peasant, when the smaller lakes and rivers of Lapland or Siberia are completely frozen over, as soon as he observes, through the clear ice, a fish, perhaps at a considerable depth, but lying close to the bottom, strikes a smart blow against the firm surface, and the impulse sent through the vertical column of water instantly stuns or kills his prey, which he draws up by a large hook let down through the hole just made in the ice.

If we conceive a conducting substance to be struck at one extremity, the proximate particles, yielding at first to the impulsion, will again expand themselves, like the recoil of a spring, and press against the next particles in the chain. The vibratory commotion will thus be conveyed, by a successive transfer of impressions, along the whole series of physical points. Analogous also to the

Acoustics. oscillations of a spring or a pendulum, this multitude of concatenated internal pulses, whatever be the force or extent of agitation, will constantly be performed in the same instants of time. The celerity of transmission must depend on the elasticity of the medium compared with its gravity. This estimate is most readily obtained by determining what may be called the *modulus* of elasticity, or the height of a column of the same density as the conducting substance, whose weight would measure that elasticity; or, to speak more precisely, that the thousandth part of such a column, for instance, should be equivalent to the repulsive force corresponding to a condensation of one thousandth part in the vibrating body. It may be demonstrated from the principles of dynamics, that the celerity of the transmission of impulse or sound through any medium is equal to what a falling body would acquire in falling through half the height of the modulus of elasticity. Hence this celerity for each second will be expressed in English feet by multiplying the square root of half the modulus by 8, or by extracting the square root of the modulus multiplied by 32.

*Modulus of elasticity.*

Celerity of sound through different solid bodies.

Mr Leslie has pointed out a very simple method for ascertaining the modulus of elasticity in the case of solid rods or planks, by observing, when they are laid in a horizontal position, with their ends resting against two props, the *swag* or curvature which they take. By an experiment of this kind, he found that Memel fir had a modulus equal to 671,625 feet. Wherefore, an impulse would shoot through the substance of a deal-board with the velocity of 4,636 feet each second, or about four times the rapidity of sound. Professor Chladni, who has thrown so much curious light on the convoluted curves formed by vibrations spreading along the surface of solid bodies, inferred, from a very different procedure,—from the musical note which a bar of the substance emits when struck,—the celerity of the transmission of sound through iron and glass, which he reckoned for both at 17,500 feet, or above three miles each second, being more than fifteen times swifter than the ordinary communication through the atmosphere.

The rate with which the tremor of sound is transmitted through cast-iron, was very lately ascertained, from actual experiment, by the ingenious M. Biot. This philosopher availed himself of the opportunity of the laying of a system of iron pipes, to convey water to Paris. These pipes were about eight feet each in length, connected together by narrow leaden rings. A bell being suspended within the cavity, at one end of the train of pipes, on striking the clapper at the same instant against the side of the bell and against the internal surface of the pipe, two distinct sounds were successively heard by an observer stationed at the other extremity. In these observations M. Biot was often assisted by the late M. Malus, who has, too soon for the progress of science, been hurried away by death, after having opened the delicate discovery of the *polarization of light.* With a train of iron pipes of 2550 feet, or nearly half a mile in length, the interval between the two sounds was found, from a mean of two hundred trials, to be 2·79 seconds. But the transmission of sound through the internal column of air would have taken 2·5 seconds; which leaves ·29″ for the rapidity of the tremor conducted through the cast-iron. From other more direct trials, it was concluded that the exact interval of time during which the sound performed its passage through the substance of the train of pipes, amounted only to 26-100th parts of a second; being ten to twelve times less than the ordinary transmission through the atmosphere.

Except the observations of M. Hassenfratz, in the famous subterranean quarries which extend under almost the whole of Paris, we are not acquainted with any attempts that have been made to measure the elasticity of stone or brick. Yet sound is conveyed through these materials with great effect. The rattling of a carriage on the street spreads a very sensible tremor along the most solid buildings and the stateliest edifices. If a large stone be rubbed against the outside of the wall of a house, it will occasion within doors a strange rumbling noise. A miner will strike his pick against the side of a long gallery, when he wishes to give intimation to his companion, who listens at the other extremity. But stones or bricks, without being directly excited, may yet form a part of the chain which transmits sound, by receiving the tremulous impressions from the air on the one side, and delivering them again to that fluid on the other. We all know how easily the voice is heard through a thin partition. The mode of obstructing the passage of sound is, either to employ very thick masonry, or to interrupt the facility of communication and transfer, by means of subdivisions opposed. Hence another distinct use of lath and plaster. Experiments on the elasticity of stones and other articles of building are not only curious, but of real importance; for, in many cases, their efficient strength must depend on their fitness to resist incidental impressions. This consideration is peculiarly necessary in selecting and combining the materials employed in the construction of bridges.

Supposed incompressibility of water.

Respecting the elasticity of water and other liquids, our information is more satisfactory and complete. It was long held as an axiom, that the substance of water is absolutely incompressible. Yet the experiments on which this belief was grounded would, if weighed attentively, point to an opposite inference. On such a subject it were idle to cite Lord Bacon, whose credulity and ignorance of mathematical science betrayed him so often into false or shallow conclusions. The philosophers of the Florentine academy *del Cimento* tried the compression of water in three different ways, which are described in the account of their experiments printed in 1661. 1. Having provided two glass tubes terminated by hollow balls, they filled the one partly and the other to excess with pure water, and joined the tubes hermetically, so as to form one piece. Then applying heat to the first ball till the water boiled, they forced its vapour to press against the column in the other stem. But no contraction of the fluid took place, though a copper ball was afterwards substituted; and when the action of the heat was still farther urged, the tube at last burst with violence. 2. Into a glass tube, immediately above six pounds of water, they introduced eighty pounds of quicksilver, without causing any diminution of volume. 3. Their most noted experiment was, having filled a hollow silver ball with water by a small hole, afterwards soldered accurately, to give it a few smart blows with a hammer; when, far from suffering compression, the water was seen to ooze or spirt from the pores, as they imagined, of the silver.

Mr Boyle, whose practice it was generally to repeat the more striking experiments made on the Continent, had a round tin or pewter vessel filled carefully with water, and tightly plugged: the blow of a wooden mallet beat it flat, but on piercing the tin with the point of a small nail, the confined water instantly sprung to the height of two or three feet. About the year 1752, Dr Peter Shaw, who read public lectures in London, exhibited a stout copper ball of four inches in diameter, and filled with water by a small orifice, into which a screw was fitted, and forced to enter by turning an iron arm or lever: the globe was partly opened by this enormous

*Adv. Bib.*

Acoustics. squeeze, and the water spouted from the crevice as from a fountain.

These experiments all concur to show that water is capable of sustaining an immense pressure without undergoing any very sensible contraction; but they prove, at the same time, the actual existence of such a contraction, since the projecting of the water, after a crack has once begun in the vessel that confines it, could only proceed from the evolution of an internal repulsive force. Divers, accordingly, at considerable depths under water, hear distinctly the collision of two stones, or the remote ringing of a bell. Authentic instances are mentioned of sounds being transmitted audibly more than two miles through that fluid.

Compressibility of water demonstrated by Mr Canton.

The compressibility of water was first demonstrated by the ingenious Mr Canton in 1762, by a very simple and conclusive experiment. To a glass ball of rather more than an inch and half in diameter, he joined hermetically a tube about four inches long, and having a bore equal to the hundredth part of an inch. The relative capacity of this ball and of the stem he ascertained by introducing mercury, and weighing nicely its separate portions. The stem was then marked by the edge of a file into divisions, corresponding each to the hundred thousandth part of the whole capacity of the ball. This instrument was now filled with distilled water, carefully purged of its adhering air, and placed under the receiver of a pneumatic machine: on producing an exhaustion, the water appeared constantly to swell, rising four divisions and three-fifths in the stem, or a space nearly equal to the mercurial expansion corresponding to half a degree of heat on Fahrenheit's scale. In a condensing engine, the water sunk just as much, for each additional pressure of an atmosphere,—the bulb remaining always at the same temperature, or at the fiftieth degree of Fahrenheit. Since the stem was left open, the pressure exerted by the air, both on the inside and the outside of the instrument, must in all cases have been precisely the same; and consequently, the glass had no disposition to alter its figure, and modify the results. The contraction or expansion produced was, therefore, confined wholly to the body of water and to the thin shell of glass, of which indeed the influence might be rejected as insignificant. It was hence decided that the purest water suffers a visible concentration, or a diminution of its volume, under a powerful compression. But, in the course of his experiments, Mr Canton observed a curious circumstance, that water is more compressible in cold than in warm weather. Thus, the contraction, under a single incumbent atmosphere, amounted to 4·9 divisions when the thermometer stood at 34°, but was only 4·4 divisions when the heat rose to 64°. This singular fact might afford room for speculation; but it were better, in the mean while, to repeat the experiment again with more delicacy, and on a greater scale.

Compressibility of other fluids.

The compression of some other fluids was likewise measured in the same way. The contraction, under the weight of an atmosphere, and at the ordinary temperature, amounted, in millionth parts of the entire capacity of the ball, to sixty-six with alcohol, to forty-eight with olive oil, to forty with sea-water, and only to three when mercury was opposed. We may therefore estimate, in round numbers, the modulus of elasticity belonging to those different substances as under:

| | |
|---|---|
| Alcohol | 580,000 English feet. |
| Distilled water | 700,000 |
| Olive oil | 730,000 |
| Sea-water | 780,000 |
| Mercury | 800,000 |

In liquids of so distinct a nature, we should have expected a greater diversity in their elastic power; nor is it easy to conceive on what conditions or habitudes that quality actually depends. The elasticity of a body, like its other constitutional properties, may result from the peculiar internal structure, or the arrangement of the integral molecules.

Some experiments on the compressibility of water have been since performed with more striking effect, but not equally exempt from all objections. In 1779, Professor Zimmerman of Brunswick printed a short account of some trials made by him and Abich, director of the salt-mines, with a press of a particular construction, consisting of a tight cylinder of very thick brass, with a piston nicely fitted, to be pushed down by means of a long lever, at whose extremity different weights were appended. Rain-water being introduced into the cavity, was subjected to an enormous pressure, equivalent to that of 313 atmospheres, and had its volume then diminished between one thirty-fifth and one thirty-sixth part. This quantity gives, for the effect of a single incumbent atmosphere, a condensation amounting to seventy-five millionth parts, instead of forty-six, as found by Mr Canton. The excess was no doubt owing to the distention of the brass cylinder, which, with all its strength and solidity, would yet partially yield to the action of such prodigious force. This circumstance renders the experiment somewhat unsatisfactory, and the influence of friction must likewise affect the accuracy of the calculation.

Zimmerman.

The effect of such distention is easily witnessed in the case of glass. If a large bulb of a thermometer be suddenly squeezed between the finger and the thumb, the mercury will start up in the stem perhaps several degrees, and will again sink as quickly after the pressure is removed. To prevent any derangement from communication of heat, the hand may be covered with a thick glove. But the fact can be shown in a less exceptionable way: Let a mercurial thermometer, with a large bulb and a long stem, be first held upright, and then immediately inverted; between these two positions the column of mercury will descend through a visible space. This apparent change of volume has been hastily supposed by some experimenters to mark the compressibility of mercury, which could not be sensible but under the action of a column of incomparably greater height.

Bramah's hydraulic press.

It would be most desirable to institute a new set of observations on the condensation of different substances, by means of Bramah's hydraulic press, which is a far more perfect machine, and scarcely subject at all to the disturbance of friction. Having once ascertained the distention of the metallic cavity from pressure, it would be hence easy to correct all the other results. This mode of experimenting promises also the important advantage of enabling us to determine, with ease, the compressibility of solids themselves. It would only be required to give those bodies a cylindrical form nearly adapted to the cavity, and to fill up the interstice with water, or rather with mercury. The contraction which the thin sheet of fluid would undergo, being deducted from the whole contraction, would exhibit the contraction suffered by the solid nucleus.

Celerity of sound through water.

From all these investigations we may gather, that an impulse, or a sonorous tremor, would shoot through a body of fresh water with the velocity of about 4,475 feet each second, being four times swifter than the ordinary flight of sound in the atmosphere. Through the waters of the ocean, the transmission of sound would be still more rapid, by a seventeenth part. It hence follows, that a violent commotion, excited under that vast mass, might reach from pole to pole in the space of three hours and twenty minutes.

The swell of the sea is accordingly always observed to precede the coming storm. The shocks of the famous earthquake at Lisbon, in 1755, were partially felt at very distant points of the ocean, as far even as the West Indies, but after a considerable interval of time.

and through ice.

Respecting the power of ice to conduct sound, we possess not sufficient data for the solution of the problem. The Danish philosophers are indeed said to have lately performed experiments of this kind on a very extensive scale, along the frozen surface of the Baltic. We are not acquainted with the precise results; but it seems probable, from various analogies, that ice has nearly the same faculty of transmission as water itself. If a heavy blow be struck against any part of the frozen surface of a large pool or lake, a person standing at a wide distance from the spot will feel, under foot, a very sensible tremor, some considerable time before the noise conveyed through the atmosphere has reached his ear. It is asserted, that the savage tribes who rove on the icy steppes of Tartary can readily distinguish, from afar, the approach of cavalry, by applying their head close to the frozen surface of the ground.

Propagation of sound through the atmosphere.

But the proper and ordinary vehicle of sound is our atmosphere. Aristotle, deriving his information probably from the tenets of the Pythagorean school, seems to have acquired tolerably just notions of the nature of sound and of the theory of harmonics. The language of that philosopher was so much corrupted, however, and disguised by ignorant transcribers, that Galileo, who not only studied music as a science, but practised it as a delightful art, may be fairly allowed to have rediscovered those general doctrines. Mersenne and Kircher afterwards made a variety of most ingenious experiments, which, though rather overlooked at the time, tended greatly to extend the science of harmony. But it was reserved for the genius of Newton to sketch out the true theory of sound.

Newton's theory of the propagation of sound.

In his *Principia* he explained the origin of aërial pulses, and, by a fine application of dynamics, conducted with his usual sagacity, he succeeded in calculating their celerity of transmission. The solution which he has given of this intricate problem is far, however, from being unexceptionable in the form and mode of reasoning. Instead of attempting to embrace all the conditions affecting the problem, in a differential equation, for which, indeed, his fluxionary calculus was not yet far enough advanced, he proceeds less boldly, and only arrives at the conclusion by an indirect process and a sort of compensation of errors. His investigation of the progress of sound through the air is chiefly drawn from the analogy of the motion of waves along the surface of water. This comparison greatly assists our conceptions, but it fails in a variety of essential points. Newton further assumed the rising and subsiding of waves to be a reciprocating motion, similar to that of the oscillations of a fluid contained in a wide and long tube, with its ends turned upwards. On this supposition, it was not difficult to prove, that those alternating movements would correspond to the vibrations of a pendulum of half the length of the tube. Transferring the inference, therefore, to the undulations of a fluid, it followed, that the space between two consecutive waves would be described during the sweep of a pendulum having a length equal to this interval. But the conclusion does not very well accord with the phenomena. That a wave travels with a velocity as the square root of its breadth, may be nearly true; and that its reciprocating motions, whatever be the height, are all performed in the same time, is a necessary consequence of the great principle in dynamics first pointed out by Huygens and Hooke,—that when the effort to restore equilibrium is proportioned to the quantity of displacement, the alternations of figure are constantly isochronous. But the velocity of the undulating progression, as calculated from those principles, will not be found to correspond with actual observation. Newton was apparently sensible of this disagreement, and would consider his proposition as only an approximation to the truth; assigning as the cause of discrepancy, *that the particles of water do not rise and fall perpendicularly, but rather describe arcs of a circle.* The great defect of the hypothesis, however, consisted in supposing all the parts of a wave to rise up and sink together in the same spot. The fact is, that the fore part of a wave is always in the act of ascending, while the hinder part of it is as constantly subsiding; which combined but contrary movements, without actually transferring any portion of the water, give an appearance of progressive advance to the swell.

In extending this theory to the propagation of sound, Newton was, on the whole, more successful. It resulted from his investigation, that the aërial pulses fly uniformly, spreading themselves equally on every side, and with a celerity equal to what would be acquired by a body in falling through half the height of the modulus of the air's elasticity. This modulus, or the altitude of a column of air, of uniform density, and whose pressure would be equivalent to the ordinary elasticity of that fluid, was computed in the first edition of the *Principia*, which came out in 1687, on the supposition that water is 850 times denser than air, mercury $13\frac{1}{2}$ times denser than water, and that the mean height of the barometer is thirty English inches. The modulus of elasticity, or the height of an equiponderant column of air, was therefore estimated at 29,042 feet, which gave 968 feet each second for the celerity of the transmission of sound through the atmosphere. In the next edition, which did not appear till twenty-six years thereafter, the computation of the modulus was somewhat altered, but certainly not rendered more correct. Assuming the same standard of barometric height as before, and supposing mercury to be $13\frac{2}{3}$ times heavier than water, and water 870 times heavier than air, the modulus would be 29,725 feet, to which the corresponding velocity of sound is 979 feet in the second.

His correction of the theory.

In these successive estimates, there is perhaps betrayed some desire to magnify the result, yet without nearly approaching to the amount of actual observation. Dr Derham had recently determined, from repeated trials made with care, that the ordinary flight of sound is at the rate of 1142 feet each second; and Newton endeavoured, by some very strained hypotheses, to accommodate his calculation to this correct measure. 1. He supposes the particles of air to be perfectly solid spherules, whose diameter is the ninth part of their mutual distance. Sound, being instantaneously communicated through these, would thus have its velocity increased by one-ninth, or 109 feet, or brought up to 1088 feet in the second. 2. He next assumes, that the particles of vapour concealed in the air, and augmenting the common elasticity without partaking of the impression of sound, amount to a tenth part of the whole. This would increase the celerity of the sonorous pulse in the subduplicate ratio of 10 to 11, or as 20 to 21 nearly, and consequently advance the last measure from 1088 to 1142 feet.

Remarks on these corrections.

But these random and fanciful conjectures hardly require any serious consideration. What may be the size of the ultimate particles of air, or whether they have any sensible magnitude at all, we are utterly without the means of determining. There appears no limit, indeed, to the degree of condensation of which the air is capable, but what proceeds from the imperfection of the engines employed for that purpose. Nay, supposing so large a proportion of absolute matter to exist in the composition of our atmosphere, it really would not affect the result, since the transit of sound, as we have shown, is necessarily progressive, even through the most solid substance. To this principle there could be no exception, unless the particles of air were held to be mere atoms, incapable of further subdivision,—in short, without actual magnitude, and therefore bearing no relation whatever to the space in which they float. The second hypothesis advanced is still more insufficient to rectify the general conclusion. That moisture, in its latent or gaseous form, is united with the air, will be granted; but it by no means constitutes so notable a share of the fluid as Newton has assumed, scarcely exceeding, at the ordinary temperature, perhaps the five-hundredth part of the whole weight. But this diffuse vapour could not in the least derange the original calculation; for, being always combined with the air, the measure of elasticity assigned by experiment was really that of the compound fluid which forms our atmosphere.

Rectified calculation of the velocity of sound.

We are now enabled, by the help of more perfect data, to rectify the modulus of atmospheric elasticity, or the height of a homogeneous and equiponderant column of the fluid. From the observations made with barometrical measurements, it appears that such a column, exerting a pressure equivalent to the elasticity of the air, has, at the limit of freezing water, an altitude of 26,060 feet, and consequently, that the modulus would, at an ordinary temperature of 62° by Fahrenheit, amount to 27,800 feet. This corrected estimate gives only 943 feet each second for the celerity of sound. And since the elasticity of the medium is exactly proportioned to its density, the result is the same, whatever be the rarefaction or condensation of the air, so long as its temperature continues unaltered. The flight of sound is hence as rapid near the surface as in the higher regions of the atmosphere. It is the conjunction of heat alone that will increase the celerity of transmission, by augmenting the elasticity of the medium without adding to its weight. The acceleration thus produced must amount to rather more than one foot in the second for each degree by Fahrenheit's scale. Such a difference ought to be perceptible under the torrid zone.

Rate of transmission through different gases.

But the rate of the transmission of sound must vary in different gases, after the inverse subduplicate ratio of their densities. Thus, through carbonic gas, the communication of the tremor would be about one-third slower than ordinary; but through hydrogen gas, which is twelve times more elastic than common air, the flight would very nearly exceed three and a half times the usual rapidity. An admixture of this gas with the atmosphere would, therefore, greatly accelerate the transmission of sound. The joint combination of heat and moisture, by heightening the elasticity of the air, must likewise produce a similar effect.

Experiment in France,

These inferences are confirmed by observation, as far as it extends. The velocity of sound was determined with considerable accuracy, and on a great scale, by Cassini and Maraldi, while employed in conducting the trigonometrical survey of France. During the winter of the years 1738 and 1739, these astronomers repeatedly discharged, at night, when the air was calm and the temperature uniform, a small piece of ordnance, from their station on Mont Martre, above Paris, and measured the time that elapsed between the flash and the report, as observed from their signal tower at Montlehery, at the distance of about eighteen miles. The mean of numerous trials gave 1130 feet for the velocity of the transmission of sound.

and in America.

About the same time, Condamine, who was sent with the other academicians to ascertain the length of a degree in Peru, took an opportunity of likewise measuring the celerity of sound, at two very different points. He found this was 1175 feet on the sultry plain of Cayenne, and only 1120 feet on the frozen heights of Quito. It was obvious, therefore, that the rarefaction of the air in those lofty regions had in no degree affected the result. Compared with what had been observed in France, the velocity of the aërial pulses was somewhat diminished at Quito by the prevailing cold, but was, on the other hand, considerably augmented by the excessive heat and moisture which oppress Cayenne.

But the difference, amounting indeed to one-fifth of the whole, between the velocity of sound as deduced from theory, and as determined by actual experiment, still appeared very perplexing. This want of congruity was the more felt, since the Newtonian system of gravitation, after maintaining a long struggle with the adherents of the Cartesian philosophy, had at last obtained the undisputed possession of the Continent. Its triumph was insured by the admirable dissertations on the subject of tides, transmitted to the Academy of Sciences at Paris in the year 1740, when our celebrated countryman Maclaurin had the honour of sharing the prize with Euler and Daniel Bernoulli. The law of attraction received, indeed, a temporary shock a few years afterwards, from the result of the investigation which Clairaut first gave of the lunar inequalities; but, on resuming his analysis of the problem, and computing the values of the smaller terms of the formula, that great geometer obtained, in 1752, a final product, exactly conformable to the best astronomical observations; and the solidity of the Newtonian system was henceforth placed on the firmest foundation.

It was therefore peculiarly desirable to examine likewise the justness of the hydrodynamical conclusions of Newton. The propositions concerning the propagation of sound were perhaps justly considered as the most obscure part of the whole *Principia*. Some of the first-rate mathematicians abroad, particularly D'Alembert and John Bernoulli, declared their utter inability to comprehend such intricate and disjointed demonstrations. At last the problem of sonorous pulses was attacked directly and in its full extent, by the late Count Lagrange, whose death, although at a ripe age, will be lamented as a most severe loss to mathematical science. That illustrious geometer shone forth at once like a meteor, and before he had completed his twenty-third year he gave a rigorous and profound analysis of the propagation of sound through the atmosphere, in the first volume of the Turin Memoirs, which appeared in 1759. "He pointed out some mistakes that even Newton had committed in the reasoning; but mistakes which, by a happy compensation of errors, did not affect essentially the results. Advancing from these discussions, he assigned the dynamical conditions of undulation, which, after the proper limitations, were reduced to an equation involving *partial differences* of the second order. But this refined branch of analysis, invented by D'Alembert and Euler, is still so imperfect, that, in order to integrate the final expression, it had become requisite to omit the higher powers of the differentials. Yet after all this display of accurate research and skilful adaptation of symbols, followed by a lax and incomplete calculus, the same conclusion was obtained as that which Newton had derived chiefly from the force of analogy and sagacity of observation; and philosophers were thus obliged to submit, and to content themselves with recording the variance between theory and experiment in regard to the celerity of sound, or with referring that discrepancy to some extraneous influence." (*Edinb. Review*, vol. xv. p. 431.)

Investigation of La-Grange.

M. Poisson, one of those interesting men whose native

Acoustics. genius has surmounted all the obstacles of fortune, very lately attempted a more complete analysis of the propagation of sound, in the Papers of the Polytechnic School. The final equation is more fully expressed, and its integration is pushed some few steps farther; but still the result is precisely the same as before. The skill and precaution displayed in framing the conditions of the problem are afterwards mostly abandoned in the various simplifications adopted to arrive at the conclusion.

Rectification of the theory by Laplace.

A very ingenious and apparently satisfactory method of reconciling theory with observation, in the estimate of the transmission of sound, was not long since suggested by the celebrated Count Laplace. If the heat contained in air had, at every state of the density, been united constantly after the same proportion, the elasticity resulting from the infusion of this subtile and highly distensible element would invariably accord with what observation assigns to the compound aërial fluid. But the capacity of air, or its aptitude to retain heat, varies with its internal condition; being increased by rarefaction, and proportionally diminished by condensation. When air is compressed, therefore, it liberates a portion of its heat; and when it undergoes dilatation, it becomes disposed to abstract more heat from the adjoining bodies. Till the equilibrium of heat is restored, the air will be sensibly warmer after each act of compression, and colder when suffered to dilate. If the shock given to a portion of air be very sudden and violent, the quantity of heat evolved from it is profuse and powerful. On this principle, M. Mollet, member of the academy of Lyons, led by some facts noticed by artists who manufactured wind-guns, first constructed, in 1804, the curious instrument for producing fire by the rapid condensation of air confined in a tube. But such evolution of heat must besides augment the elasticity of the air, as the contrary abstraction of it will, in a like degree, diminish that force. At every sudden alteration of density, therefore, a new power is infused, which had not entered into the ordinary and undisturbed estimate of the air's elasticity. Consequently, from this consideration alone, the aërial pulses must shoot with some greater celerity than calculation assigns, because the particles of air, which are suddenly condensed, have their elasticity further augmented by the portion of heat evolved, while the corresponding particles, which are simultaneously dilated, have their disposition to contract likewise increased, by the momentary prevalence of cold.

Examination of this correction.

The principle advanced by Laplace must therefore have a real operation, tending to reconcile the calculated velocity of sound with that which is deduced from experiment. The only question is, how far its influence could actually extend. But, according to the formula given in Leslie's *Elements of Geometry*, p. 495, a condensation equal to the 90th part of the volume of air would occasion the extrication of one degree of heat by Fahrenheit's scale. Now, since each degree of heat enlarges the bulk or augments the elasticity of the air by the 450th part, it follows, that the heat, extricated by sudden impulse, will communicate to the air a momentary additional spring, amounting to one-fifth of the whole elastic force. Wherefore the celerity of sound would, by that influence, be increased in the subduplicate ratio of five to six, or nearly as 21 to 23; which gives an addition of only 90 feet each second to the whole quantity, bringing it up to 1033 feet. The correction is thus insufficient, not amounting to half of the discrepancy which it was its object to reconcile.

It may be suspected, therefore, that some inaccuracy or omission infects the investigation itself. Till the integral calculus has arrived at much greater perfection, it will often be requisite for the analyst, in the solution of dynamical problems, to descend from his elevation, and seek to simplify the differential expressions by a sober and judicious application of the principles of physics. "Imagine a string of particles, or physical points, A, B, C, D, E, F, &c. in a state of rest, or mutual balance. If A were pushed nearer to B, and then suddenly abandoned, it would recoil with a motion exactly similar to the oscillation of a pendulum. The time of this relapse might easily be determined, from a comparison of the force of gravity with that of elasticity, or from the number of particles contained in a column of equipoise. The minute interval between the adjacent particles, being now divided by the duration of each fit of contraction, will give the velocity with which the vibratory influence shoots along the chain of communication. This simple investigation leads still to the same result as before. But it proceeds on assumptions which are evidently incorrect; for it supposes the pulses to follow each other in accurate succession, every contraction terminating as the next begins. Since the particles, however, do not exist in a state of insulation, while B repels A, it must likewise press against C; and C, in its turn, must gradually affect D. Before the contraction of A and B is completed, that of B and C is therefore partially performed; and this anticipated influence may even extend to the remoter particles. Nor is the system of mutual action at all materially disturbed by such anticipations. Each pulsation is performed in the same way as if it were quite detached; only the succeeding one is partly accomplished before the regular period of its commencement. The velocity of aërial undulation is in this way much accelerated." (*Edinb. Rev.* vol. xv. p. 433.) Each successive movement among the particles may be viewed as produced by a force not regularly decreasing, but partaking of the uniformity which obtains in projection. Hence the velocity of sound is intermediate between that derived from theory and that with which air would rush into a vacuum. But the arithmetical mean between 943 and 1334 feet is $1138\frac{1}{2}$, and the geometrical is $1121\frac{1}{2}$ feet; neither of which differs much from 1130 feet, the quantity determined by actual experiment.

Modifications required in the theory of sound.

After the last correction, however, proposed by M. Laplace, for adjusting theory with observation relative to the celerity of the transmission of sound, the difference will not perhaps be regarded such as longer to present any serious obstacle; especially when the coincidence appears closer than what generally attends the theoretical deductions concerning the motions of fluids. The remaining difficulties affecting the subject refer chiefly to the way in which the aërial pulses are propagated, and the modifications which they are afterwards capable of receiving.

Duration and strength of pulsation.

1. No sensation is ever excited, unless the impression made upon our organs be repeated or continued during a certain short space of time. On this principle depends the whole success of the juggler, who contrives to change the situation of the various objects before us with a rapidity exceeding the ordinary exercise of sight or touch. A brand whirled swiftly round the head gives all the appearance of a circle of fire; and if one presses very hard an ivory ball between his fingers, he will seem still to feel it for several instants after it has been withdrawn. To excite the sensation of sound, it is requisite that the aërial pulses should have a certain force and duration. According to some observations, the ear is not affected at all, unless the tremulous impulse communicated to the tympanum lasts during the tenth part of a second. Every pulsation of a more transient kind is lost absolutely and completely to our organ of hearing.

On the other hand, the impression of sound is not prolonged beyond the time of its actual production. If it were otherwise, indeed, all sounds would degenerate into indistinct noises; and articulate discourse, which distinguishes man from the lower animals, and constitutes the charm of social life, would have been utterly impossible. This fact, so obvious, and yet so important, shows indisputably that the propagation of sonorous pulses through the atmosphere is not, in all its circumstances, analogous to the succession of waves on the surface of water. These undulations continue long afterwards to rise and spread from the centre of their production. The pulsations of the air, no doubt, likewise survive their excitement; but such of them as succeed the first impulsion must not have the force and character of those which are directly shot through the fluid. What is the precise discrimination between these different pulses, we are not enabled from mere theory to determine. But such a distinction must undoubtedly exist, otherwise indeed all discourse would continue to fill the ear with a monotonous hum, or an indistinct muttering. It would be difficult to institute conclusive experiments on this subject, yet collateral researches might be devised which could not fail to guide our inquiry.

Concentration in a particular direction.

2. But another defect in the analogy between waves and sonorous pulses is, that the latter, without affecting to spread equally, are capable of acquiring a superior force or tendency in some given direction. Certain unconfined sounds, indeed, are diffused uniformly on every side. Thus, the noise of the explosion of a powder-mill is heard, and often dreadfully felt, at a great distance all round the scene of disaster. But the report of a cannon, though audible in every direction, appears invariably loudest in the quarter to which the engine is pointed. On this principle, a seaman, when he seeks to be heard more audibly, or at a greater distance, is accustomed, if no other help occurs, to apply his spread hands on each side of his mouth, and thus check or diminish the waste of sound by its lateral dispersion. For the same reason, the bent and projecting circular piece annexed to the farther end of a speaking-trumpet is of most decided use, in assisting to give direction to the flight of the aërial pulses.

Accumulation along barriers.

3. The theory of undulatory movements furnishes some elucidation, but no adequate explication, of the augmented effect of sound in the direction of a lateral barrier. The extension of such an obstacle might appear to check merely the spread and consequent attenuation of the sonorous pulses; but the great accumulation of impulse always occurs, on either side, at the extremity of the advancing wave. By what system of interior forces this effect is produced, it would be difficult satisfactorily to explain. Yet we perceive something analogous in the swell which runs along the margin of a pool, and in the billow which, flowing from the open sea, heaves against the sides of a projecting mole.

It is hence that sound is made to sweep with such intensity over the smooth surface of a long wall or of an extended gallery. An elliptical figure, though of manifest advantage, is not really essential to a whispering gallery; for the point of sonorous concentration is found beyond the true catoptrical focus, and much nearer to the wall. A fact of the same kind is well ascertained—that sounds are always heard the most audibly, and at the greatest distance, in a level open country, or still better on the smooth surface of a vast lake, or of the ocean itself. The roaring of the cannon in certain naval engagements has been noticed at points so very remote from the scene of action, as might seem, if not perfectly authenticated, to be altogether incredible. On the other hand, again, sound is enfeebled and dissipated sooner in alpine regions. Thus, the traveller, roving at some height above a valley, descries, with uncommon clearness, perhaps a huntsman on the brow of the opposite mountain, and while he watches every flash, yet can he scarcely hear the report of the fowling-piece.

On a similar principle, we would explain the operation of the ear-trumpet, which affords such relief to one of the most cheerless maladies that can afflict humanity. The wide mouth of that instrument, it is well known, is turned to catch the stream of sound; the extent of pulsation is gradually contracted as the tide advances; and the same quantity of impulse being probably maintained, the vibratory energy is intensely accumulated at the narrow extremity, where it strikes the cavity of the ear. A trumpet of this form might, in many cases, be found very advantageous, not only for remedying the defects of the organ of hearing, but for assisting the observer to collect feeble and distant sounds. Even an umbrella held close behind the head, with its concavity fronting the sonorous pulses, will, it has been alleged, sensibly heighten their impression.

Reflection modified.

4. To explain legitimately the reflection of sound, would require some modifications in the theory of atmospheric undulation. Each obstructing point is certainly not the centre of a new system of pulses; for, in many cases, this would occasion unutterable confusion. Nor can the excitement of sound be supposed to dart in straight lines, or to perform the same accurate reflection as the rays of light. In fact, neither smoothness nor exact regularity of surface is required for the production of an echo. A range of buildings, a row of tall trees, a ridge of rocks, or a chain of heights, will, in certain positions, reflect sound with clear and audible effect. It follows, therefore, that the reflection must be formed, not at the immediate surface of those obstacles, which could occasion only an irregular dispersion, but at some boundary at a small distance, and running parallel to the mean direction of the whole barrier. We may conceive the tide of sound accumulating where it stops, and investing the opposite surface like an atmosphere, till a repulsion is exerted, which again rolls it back. What seems to constitute the perfection of an echo, is, that the sum of the distances of every point of the reflecting surface from the person who speaks, and from him who listens, should be the same. When this disposition obtains, all the reflected sounds must reach the ear in due succession, without being intermingled or confused.

We may observe, that echoes are often confounded with the mere *resonance* occasioned by vibrations excited among the obstacles themselves. In a large empty room, with its naked floor, and walls, and benches, the voice quickly throws the whole into a tremulous commotion, and seems drowned in the ringing prolonged sound which is produced; nor does this unpleasant effect cease, until the spectators have occupied the benches, filled the hall, and obstructed by their weight the vibration of the floor. What is called the *deadening* of sound, consists in merely checking or preventing the disturbance of extraneous tremor. For this purpose, the floor is covered with carpets, and the walls lined with wainscot or hangings. Such barriers, we have seen, would not, by their yielding quality, blunt or obstruct the formation of echoes. Their only effect is, to muffle the elastic surfaces which they cover.

Speaking trumpet.

The performance of the speaking-trumpet has generally been referred to the concentrated reflection of sound. Some authors have carried the hypothesis even so far as to investigate, from mathematical principles, the best figure of that instrument. Much labour and great ingenuity have been utterly wasted in this fruitless attempt.

Kircher proposed the tube to be shaped like a truncated parabolic conoid, the mouth-piece occupying the focus; and he concludes that all the *rays of sound* would, by reflection from such a surface, be sent forward exactly in parallel lines. Other philosophers have imagined, from a fanciful analogy to the property of ivory balls, that the figure described by the revolution of the logarithmic curve about its absciss would be the most proper for the speaking-trumpet. M. Lambert, of the Berlin academy, whose genius and originality were both of the first order, has given a solution still different. But it would be idle to recite the various attempts which have ended in no practical result.

The true physical explication of the speaking-trumpet was first given, as far as we know, in the course of an incidental remark by Professor Leslie, in his *Experimental Inquiry into the Nature and Propagation of Heat.* "In the case of articulate sounds," says he, "the confining of the air does not affect the pitch of voice, but it augments the degree of intonation. The lateral flow being checked, that fugacious medium receives a more condensed and vigorous impulsion. As the breath then escapes more slowly from the mouth, it waits and bears a fuller stroke from the organs of speech. But the speaking-trumpet is only an extension of the same principle. Its performance does certainly not depend upon any supposed repercussion of sound; repeated echoes might divide, but could not augment the quantity of impulse. In reality, however, neither the shape of the instrument, nor the kind of material of which it is made, seems to be of much consequence. Nor can we admit that the speaking-trumpet possesses any peculiar power of collecting sound in one direction; for it is distinctly audible on all sides, and is perhaps not much louder in front, comparatively, than the simple unassisted voice. The tube, by its length and narrowness, detains the efflux of air, and has the same effect as if it diminished the volubility of that fluid, or increased its density. The organs of articulation strike with concentrated force; and the pulses, so vigorously thus excited, are, from the reflected form of the aperture, finally enabled to escape, and to spread themselves along the atmosphere. To speak through a trumpet costs a very sensible effort, and soon fatigues and exhausts a person. This observation singularly confirms the justness of the theory which I have now brought forward."

Hassenfratz.

Nearly about the same time, this theory was confirmed by some ingenious experiments made by M. Hassenfratz, at Paris. His method of estimating the power of a speaking-trumpet consisted in fixing a small watch in the mouth-piece, and observing at what distance the beats ceased to be distinctly audible. He found that the effects were precisely the same with a trumpet of tinned iron, whether used in its naked form, or after it was tightly bound with linen to prevent any vibration of the metal. Nor could there be the smallest reflection of sound from the internal surface of the tube, for the beating of the watch was heard exactly at the same distance after the whole of the inside had been lined with woollen cloth. These simple experiments prove decisively that the performance of the speaking-trumpet depends principally on the intenser pulsation which is excited in the column of confined air. In the same way, sound is prodigiously augmented in a long narrow passage. If a musket be fired within the gallery of a mine, the explosion heard in a remote corner will have the loudness and character of thunder.

Sound of musketry.

The progressive motion of sound furnishes the explication of various remarkable facts and striking phenomena. Thus, to a person standing at some distance, and directly in front of a long file of musketry, the general discharge will appear as a single collected sound, the numerous reports all reaching his ear nearly at the same instant. But one stationed at the end of the line will hear only a prolonged rolling noise, not unlike a running fire; because the distinct sounds, from the different distances which they have to travel, will arrive in a continued succession.

Noise of thunder.

Hence, likewise, the tremendous rumbling noise of distant thunder, which is not produced, as many have supposed, by the repetition of echoes. In certain situations, indeed, and particularly in hilly tracts, echoes may no doubt contribute to augment the general effect; but their ordinary influence seems to be really insignificant, since it should cause the same modification of sound in the explosion of a cannon, which is essentially different, however, from the muttering and crash of thunder. This lengthened and varied noise must yet be the production of a moment. The rapidity of lightning surpasses conception, and the prolongation of the sound which follows it is owing to the various distances of the chain of points which emit the sonorous impressions. The electrical influence darts with immeasurable swiftness from cloud to cloud, till perhaps it strikes at last into the ground. But from every point of this tortuous path distinct pulses of sound are transmitted, which consequently reach the ear at very different intervals. Sometimes they arrive intermingled, and give the sensation of a violent crash; at other times they seem suspended, and form a sort of pause. It would not be very difficult in any case to imagine the zig-zag track which the lightning must pursue in order to produce a given protracted rumbling noise. The duration of each peal of thunder will evidently be shortened if it chance to shoot athwart, but must continue the longest when it runs in the line of the spectator. As the distance of thunder is estimated by allowing somewhat more than a mile for every five seconds that elapse between the flash and the beginning of the report, so the space traversed by the lightning, if its general direction were known, might be computed by the same rule, from the endurance of the sound.

Musical note.

We will not enter at present on that branch of acoustics which treats of the doctrine of harmony; but a few scattered remarks may trace the general outline of the subject. A musical note, far from being only a repetition of the same simple sound, should be considered as the conjunction of subordinate sounds reiterated at proportional intervals. The sweetness of this compound effect or tone appears to depend on the frequent recurrence of interior unison. The secondary sounds which naturally and invariably accompany the fundamental note are repeated only two, three, or four times faster; nor does the science of music admit of any proportions but what arise from the limited combinations of those very simple numbers. Harmony, again, is created by an artificial union of different notes, analogous to the natural composition of tone.

Vibrating instruments.

All tones are produced by the regular vibrations either of solid substances or of confined air itself. Strings of gut or of metal are most generally used; but small plates or pillars of wood, of glass, or even of stone, will answer the same purpose, forming the singular instrument called *staccata* or *harmonica.* In these cases, the quality of the vibrations depends on the joint influence of a variety of circumstances; not only on the length of the fibres, but on their thickness, their elasticity, their density, and the degree of tension to which they are subjected. The motion of a musical stretched chord was first investigated by the very ingenious Dr Brook Taylor, though his solution has been since proved to be incomplete. At the same time, in fact, that the whole chord oscillates, its simpler portions, the half, the third, and the fourth of its length, actually perform a set of intermediate vibrations.

Wind-instruments.

Wind-instruments produce their effect by the vibrations of a column of air confined at one end, and either open or shut at the other. These vibrations are determined merely by the length of the sounding column. Yet interior and subordinate vibrations are found to co-exist with the fundamental one. The whole column spontaneously divides itself into portions equal to the half, the third, or the fourth of its longitudinal extent. We shall more easily conceive these longitudinal vibrations, by observing the contractions and expansions of a long and very elastic string, to the end of which a ball is attached. A spiral spring shows still better the repeated stretching and recoil. If struck suddenly at the one end, it will exhibit not only a total vibration, but likewise partial ones, winding vermicularly along the chain of elastic rings.

But when the air is struck with uncommon force, the subordinate vibrations become predominant, and yield the clearest and loudest tones. This we perceive in the dying sounds of a bell, which rise by one or two octaves, and expire in the shrillest note. On such a very narrow foundation—on the variable force with which it is blown—rests the whole performance of the bugle-horn, whose compass is extremely small, consisting only of the simplest notes. In other wind-instruments, the several notes are caused by the different lengths of the tube, or by the various positions of the holes made in its side.

Tones produced by the burning of hydrogen gas.

The longitudinal vibrations of a column of air, contained within a tube open at both ends, are powerfully excited, and very loud and clear tones produced, by the inflammation of a streamlet of hydrogen gas. This curious experiment was made first in Germany, and appears indeed to have been scarcely known, or at least noticed in other countries. Yet it is most easily performed, and will be considered as amusing, if not instructive. A phial, having a long narrow glass pipe fitted to its neck, being partly filled with dilute sulphuric acid, a few bits of zinc are dropt into the liquid. As the decomposition of the water embodied with the acid now proceeds, the hydrogen gas thus generated flows regularly from the aperture, and is capable of catching fire, and of burning for some considerable time, with a small yet steady round flame. This very simple arrangement, frequently styled the philosophic lamp, is in reality of the same nature with the combination, on a large scale, of the gas lights. A glass tube being passed over the exit-pipe, the burning speck at its point instantly shoots into an elongated flame, and creates a continued sharp and brilliant musical sound. This effect is not owing to any vibrations of the tube itself, for it is nowise altered by tying a handkerchief tightly about the glass, or even by substituting a cylinder of paper. The tremor excited in the column of air is therefore the sole cause of the incessant tone, which only varies by a change in the place of the flame, or a partial obstruction applied at the end of the tube. But still it is not easy to conceive how the mere burning of a jet of hydrogen gas within the cavity should produce such powerful vibrations. The exciting force must necessarily act by starts, and not uniformly. The length of the flame might seem to prove, that the hydrogen gas is not consumed or converted into aqueous vapour as fast as it issues from the aperture. A jet of it catches instantaneous fire, but is immediately followed by another, the succession of inflamed portions being so rapid as entirely to escape the keenness of sight. The column of air contained within the tube would thus be agitated by a series of incessant strokes or sudden expansions.

The singular fact now described had occurred incidentally to the writer of this article in the course of his earliest experiments; and he has often thought since, that, on the same principle, an organ might be constructed, which would have a very curious and pleasing effect. A vertical motion of the glass tubes, and the partial shutting or opening of their upper ends, would occasion a considerable variety of notes. By passing the hydrogen gas over different metals, the flame would be made to assume various colours. The apparatus might work by a spontaneous mechanism; and while the eye was gratified by the display of rich and vivid tints, the ear would be charmed with strains of new and melodious symphony. (J. L.)

## Part III.

Distinction between musical and other sounds.

We shall here add some further explanations in regard to the nature of different sounds, and particularly of musical sounds.

Nothing appears more surprising than that variety of sounds which different bodies emit when excited either by percussion or by any other method. If we strike, for example, upon a log of wood, or a table, or a book, we obtain nothing but a harsh sort of noise, which ceases almost the moment it is emitted. Whatever shape we form the wood into, it makes hardly any difference. The same thing takes place with other bodies, such as metal, or glass, or earthen ware, &c. when these are in large masses; but how different is the case if we form them into rods or slips, into thin plates, or, still better, into cylindrical or hemispherical vessels, as cups, tumblers, bells, cymbals, &c. These, when struck, invariably emit a sound much more prolonged, and in general highly musical or grateful to the ear. What, then, is the cause of this remarkable distinction? All that we can observe generally in regard to these sonorous bodies when sounding is, that the whole body is agitated by an internal tremor, which continues so long as the sound can be heard. But if we examine them in their simplest forms, some very remarkable circumstances are brought to light. Take, for example, a slip of metal or glass, fix it firmly at one extremity, and then strike the other; the body, as in other cases, emits a prolonged and musical note, and becomes agitated with the usual sonorous tremor. This is particularly well observed in a common tuning fork. But the nature of this agitation is of a very simple kind. The slip merely oscillates backwards and forwards with great rapidity on the extremity by which it is fixed. Each of these oscillations, as the slip strikes the surrounding air, must produce a distinct sound; but these impressions following each other in very rapid succession, the ear can distinguish nothing but a single continued and prolonged note. The same thing takes place if we fix the slip at both ends, provided it be long enough and thin enough to oscillate in the middle; and this is the case with all kinds of distended wires or strings. These are fixed at the two ends, and when they are struck, as with the hammer of the key of the piano-forte, or drawn aside by the hand and then abandoned, they continue to vibrate for a long time, and to emit tones varying in gravity or acuteness, but all highly musical. One remarkable circumstance regarding the vibrations of these slips or chords is, that they are all performed in the very same time, however minute or however extended. They vary in different slips or chords, according to their length, tension, and other circumstances; but in the same slip or chord they are all alike. When any chord or slip is drawn out of the straight line and then abandoned, the oscillations are wide at first, but

Acoustics.

continually diminish in extent till they cease altogether, as at Plate I. *Fig.* 1. Now the smallest of these vibrations takes just as long time in its performance as the largest; and the latter, again, however wide, is performed just as quickly as the former. The reason is, that the force of elasticity, which produces the vibrations, increases as the chord is drawn farther from the straight line, and thus accelerates the wide vibrations in proportion to their extent, as can easily be demonstrated. The consequence is, that the successive impressions of sound which constitute the continued and prolonged note, all follow each other at the same interval; and the regularity with which these impressions successively fall on the ear appears to be one essential ingredient in that melody or agreeable effect which the sound produces. This is proved by a very simple experiment. If we sound one of the strings of a violin or violoncello, it emits for a long time the musical note which belongs to it; but if, while it is sounding, we move the finger quickly along it from the bottom upwards, so as to shorten continually the length of the string, to accelerate thereby the vibrations, and thus alter the regularity of their succession, the sound continues, but all sort of melody is gone. Some philosophers, and in particular Dr Robison, have thought that this regular succession of sonorous impressions is the only source of melody; but this is far from being the case, else how could we account for those diversities in the sweetness of different tones, produced by different instruments or from different sources? What can be more regular in succession than the impressions of sound from a distant water-fall? And accordingly the effect is soft and agreeable in a high degree, yet how inferior in melody to the tone of a fine bell, or of an organ, or the notes of a distant bugle. Another remarkable circumstance regarding the vibrations of these slips or chords is, that the sound is not emitted from the string itself so much as from the mass with which it communicates. If, for example, we strike a tuning fork gently, so as to make it vibrate, it emits a sound so feeble that it cannot be heard until we bring it close up to the ear; but if, when it is vibrating, we press the extremity on a table, or a book, or any similar substance, the sound becomes perfectly audible. In the same manner a distended wire, if quite insulated, hardly emits an audible tone; but set it on a board, or, which is still better, on a hollow box, and then the tones are loud, deep, and highly musical. Many authors who have treated this subject ascribe the sound to the wire or chord striking the air at every vibration. This, however, is but an imperfect view of what really takes place. The tones arising from this source are in general perfectly inaudible, and the use of the wire is rather to excite the vibrations in the mass with which it is connected. This is the true sonorous body; and in this manner even wood, which appears when struck the most tuneless of all substances, is yet made to emit tones of the most exquisite sweetness; as appears in the violin and violoncello, harp, and indeed in all stringed instruments. The wood appears incapable of having a continued series of vibrations excited in it by percussion; but the strings produce this effect in a very remarkable manner, and which has hardly received that attention from writers on Acoustics which it deserves. They put the whole mass of the wood into a tremor, they excite its vibrations, and they determine and govern their frequency and the regularity of their succession. These vibrations over the whole surface of the wood communicate an infinite multitude of similar vibrations in the air, all which reaching the ear at the same instant, produce those powerful and audible tones which we observe.

Let us now consider the nature of those remarkable distinctions of musical sounds into grave and acute, on the combination of which depends the whole charm of music. Every one knows, that in stringed instruments this depends entirely on the length and tension of the string, as is well observed in the violin. By shortening the strings with the fingers, we obtain notes always more and more acute; and by tightening the strings with the pins at their extremities, we produce the same effect. In different strings, also, another circumstance has a sensible effect, namely, the thickness or mass of the string: the greater this is, the sound is the more grave, and the less the more acute. All these effects are very clearly observed, and proved with mathematical accuracy, by means of an instrument termed the monochord or sonometer; which is an apparatus contrived for stretching different strings and causing them to sound by vibration, with props or bridges to vary their lengths, and weights suspended to vary and measure the different tensions, the vibrations of the strings being communicated to a hollow box of thin elastic wood, to augment the sound. *Fig.* 2. represents the instrument in an upright form, which is best adapted for experiment with tension, because the weight can be applied directly under the string without friction. *Fig.* 3. is a horizontal form: the weight here is applied over a pulley, and therefore the tension cannot be so very accurately measured. It answers, however, better for some other kinds of experiments, in regard to the length of the strings and the subordinate vibrations. Whichever of these forms of the instrument be used, we obtain invariably the same results. The more weight we apply to stretch any of the chords, the more acute does the sound become. If we lengthen the strings again in any degree, the more grave does the sound become; and the same takes place if we substitute a heavy for a light string. It is very remarkable, however, that if we examine these effects carefully, and apply the aid of mathematical investigation, they all resolve into one general law. Adding to the weight and tension on the strings, shortening their length and diminishing their weight, have all the same common effect; namely, to quicken their vibrations. It is on the single circumstance, therefore, of the quickness or slowness of the vibrations of the strings, in whatever way it is produced, that the acuteness or gravity of the tones depends. This, then, is the great law on which all the gradations of musical notes depend: quicken the vibrations of the chord by any means, and we are sure to sharpen the tone in the very same proportion: make the vibrations slower in any way, and in the same proportion does the tone become more grave. The above circumstances, however, do not all alter the rate of vibration in the same degree. If we shorten or lengthen the string, the vibrations are quickened or slackened, and consequently the tones made more acute or grave in the very same proportion: that is, a string half the length of another just makes double the number of vibrations in the same time, and one one-third of the length three times; one double the length, again, makes half the number of vibrations, and one triple the length one-third of the number. The effect of the tension, again, and the weight of the strings, follows a different law. If we load one string with double the weight of another, it does not double the number of vibrations: it requires four times the weight to do this, and nine times the weight to triple the number; the quickness being in all cases in proportion to the square root of the weight. The effect of the weight of the string follows a similar law; one string requiring four times the mass of another to make its vibrations in half the time, and nine times this to make them in one-third of the time. So that if we denote the length of the string by L, the weight

Acoustics.

Grave and acute sounds.

of a lineal inch by W, and the weight or force of tension by T, then the number of vibrations, N, in a given time will be in proportion to $\frac{\sqrt{T}}{L\sqrt{W}}$.

On this law depends the construction of all kinds of stringed instruments, and the adjustment of the length, magnitude, and tension of the strings, to produce the tones that we wish in the instrument, without overstraining the materials, or making them any way liable to go out of tune. Accurate experiments, however, are wanting to apply with success the above formula to actual practice. On the above principle, also, of the velocity of the vibrations regulating the tone of every sound, depends entirely the system of our musical scale, as well as all those combinations of sound which constitute concord or harmony in music. Every one knows, that if with any sound we strike its octave at the same time, the two coalesce so completely together as to form almost a single continued note, which in music forms the most perfect concord. Now the octave above is emitted from that string whose vibrations are exactly double in number to the original note. The vibrations of the latter, therefore, must coincide completely with the former at every other vibration. The impression of both these reaches the ear at the very same instant, and thus the two sounds are blended into one. The intermediate sound of the octave which intervenes between these is hardly perceived, owing to the rapidity of their succession; and as it also recurs at regular intervals, it does not interrupt the harmony, but rather contributes to give fulness and richness to the combined tone. The same thing takes place, though in a less degree, with the double, the triple, and other octaves, and with all the different sounds which form concords together; and the more frequently the two sounds unite, the more perfect in every case is the concord. When they do not unite but at sensible intervals, there is then produced at each of these a distinct rise in the sound, which becomes suddenly louder from the union of the two, and then diminishes as they begin to separate, producing a succession of swells, or *beats*, as they are termed in music. The intervals between these beats are filled up by the vibrations of the two sounds occurring, first one and then the other; and as they form on the whole a very irregular succession of impressions, they produce a jarring effect, which grates on the ear. These combined sounds are hence termed *discords*. All this will be readily understood by an example or two, and a figure. Take first the fundamental tone and its octave; let the vibrations of each which produce the continued sound be represented by dots, as at *Fig.* 4; and when the two sounds concur, let this be denoted by dots larger in size: then the succession of impressions will be as at *Fig.* 5, where we have a regular succession of beats, recurring in such rapid succession that the ear can only distinguish a single sound. The octave also intervenes, but quite regularly, and also in such rapid succession, that it seems rather to heighten than to mar the general harmony. In the same manner, *Fig.* 6. represents the union of the fundamental sound and its double octave; which is the same system, only the beats are at wider intervals, and the intermediate octaves double in number. Take now two sounds, the number of whose vibrations are to each other as 2 to 3; that is, suppose one of them performs its vibrations in two very small parts of a second, and the other in three. If we take the annexed scale to represent the parts of a second, we easily form the series of sounds and of beats at *Fig.* 7. We have still, it will be seen, a regular succession of beats, but the intermediate single sounds do not recur at regular intervals. We have first an interval of two parts of a second; then we have three sounds succeeding each other during the other three parts; and then an interval of two parts between that and the beat. There is obviously, therefore, a tendency to discord; but the whole series occurs in such rapid succession that the effect on the ear is quite harmonious. Take now the proportion of 5 to 7. Here, as at *Fig.* 8, we have a regular succession of beats, but we have no fewer than ten intermediate single sounds, and these succeeding each other in a very irregular manner. We have all the elements of discord, therefore; and accordingly the union of these two sounds would be sure to grate on the ear, unless they were of so high a pitch that the beats should become inaudible. These would then produce, as before, a continued sound; and the effect of the intermediate ones would be in some degree, but not altogether, lost: we might have a concord, but not a very perfect one. It hence appears obvious why the union of some notes, which on a grave key are discordant, become harmonious by raising sufficiently the pitch. In the same manner, in every other case the greater the intervals between the successive conjunctions of the sounds, and the more irregular the succession of the intermediate impression, the greater will be the discord.

Such are the effects of combined sounds; but it is extremely remarkable that every single sound, besides its fundamental note, yields also spontaneously various others of the most perfect concord with it, but all higher, and each rising successively in pitch, so that they have hence received the name of *Acute Harmonics*. This curious and important fact, first noticed by Galileo, to whom also we are indebted for the theory of musical strings, has since excited much attention among succeeding philosophers, as well as among those skilled in the practice of music. In stringed instruments, it is best observed in the low notes of the piano-forte or violoncello. These were formerly thought to emit one simple uniform tone. An attentive ear, however, as is now universally allowed by musicians, can actually discover three others besides the original, viz. the octave above, the twelfth, and the double octave. This was first distinctly proved by Rameau; and the experiment is easily tried by striking one of the low keys, and withdrawing the finger briskly: then, after the fundamental note has ceased, the three shriller ones will be heard. The octave being in some measure blended with the original note, is not so easily perceived, except by an ear habituated to the minutest discrimination of sound. But with ordinary attention the twelfth and the double octave are heard distinctly.

Nothing in the whole science of Acoustics has given rise to so much speculation and varied discussion as this singular property of musical strings. It would appear at first sight to overturn the whole doctrine we have been laying down regarding the effect of the rapidity of the vibrations in regulating the tone; for here we have the same string yielding at once a diversity of notes, varying in a wide gradation from grave to acute. Can it be possible that the string, besides one principal series of vibrations from end to end, may at the same time execute vibrations among its parts, throwing itself, as in *Fig.* 9, into two, three, or four subdivisions; and the whole string, as it oscillates between its extremities, serving as a movable axis on which such partial vibrations may be at the same time performed? This appeared at first so extraordinary and wild a conjecture, that it was long ere it could meet with any serious attention among philosophers, far less be admitted as an accurate view of what really takes place. It was rather ascribed to something unconnected with the string; some referring the production of these harmonic notes to the structure of the ear, and the mode in which it receives the impression of the fundamental note; others, as the celebrated Lagrange, (to whom, along with our countryman Taylor, and Bernoulli, Euler, and D'Alembert, we owe the whole theory of the curves assumed by the vibration of musical strings,) supposed that they arose from sympathetic vibrations excited in the different bodies adjacent to the string, but without attempting to give any reason why these affections should always excite notes more acute than the fundamental. The possibility of these partial vibrations, however, was clearly proved by Daniel Bernoulli; and, however curious it may seem, the fact has now been established by many conclusive experiments and observations. That strings are capable of vibrating in this way, we may be convinced, from the following considerations. If we take any string, and withdraw it from the straight line by applying the finger, not to the centre, but nearer to one of the ends, so as to bring it into the position A B C, *Fig.* 10, then it will on the other side assume the position A D C, in every way the reverse of the first, as is easily proved by experiment. In general, the vibrations are so quick that they cannot be perceived by the eye; but if the finger be held opposite to B, or in any other part between A and C, it will be found that the vibration is nowhere so great as at D. In the same manner, if we apply both fingers in opposite directions, and at equal distances from the extremities, so as to draw the string into the position A B D C, the centre E remaining unchanged, then, on the other side, it will assume the position A *b* E *d* C; and as the central point E continues all the time immovable, it is evident that the whole string will continue vibrating partially, in the very same manner as if it had been composed of two strings, each half the length, and fixed at E. This point E is hence generally termed a node, or *nodal point.* In the same way, by applying the moving forces at other different points, the string may be made to perform three, four, or any greater number of partial vibrations, in relation to so many intermediate nodal points, *Fig.* 12; and it is not difficult to conceive, therefore, how, by the application of certain forces, the whole string may be performing its oscillations from end to end, while at the same time it may be agitated internally by two, three, or more partial vibrations; and this is proved by actual experiment. If we take a piece of common twine about fifteen or twenty feet long, and stretch it between two fixed points rather loosely;—if we then cause it to vibrate by the middle, it merely makes the ordinary vibrations; but if we apply our force to withdraw it from the straight line near one of the extremities, we can then see distinctly, besides its principal vibrations, a series of subordinate ones going on throughout its whole length. It is remarkable also that strings of this kind are extremely susceptible of these subordinate vibrations. When the string is vibrating regularly between its extremities, the slightest deranging circumstance is sufficient to excite and to superinduce the partial actions; as appears very distinctly in an experiment contrived by Mr Hawkins of London, by stretching between two bridges a long and spirally coiled brass wire, the spirals being about the diameter of a quill, and extended considerably more than those of a cork-screw. The tension was such as hardly to emit any sound, but to leave the vibrations when touched quite visible to the eye. If, when the whole string is vibrating, we oppose a slight obstacle, say at the middle, the string then instantly divides itself into two, and along with its principal vibration performs two others between the centre and each extremity. If the obstacle—and even a puff of wind from the mouth is sufficient—be placed at the distance of one-fourth the length of the string from either extremity, then it divides itself into four, and along with its principal vibration performs four others; and so on, according to whatever aliquot part of the string the obstacle be presented; the latter always subdividing itself into the same number of parts, and performing a series of subordinate vibrations between each, which can often be observed and heard for several minutes accompanying the principal one. The same effects are beautifully observed, as was first shown by Professor Robison, by means of a monochord sounded by an ivory wheel. When the string was vibrating simply, if its middle point was then touched slightly with a quill, this point instantly stopped, but the string continued to vibrate in two parts, sounding the octave; and the same thing happened if it was touched at one-third,—it then divided itself into three parts, with two nodal points, and sounded the twelfth; and any thing soft, such as a lock of cotton, put in the way of the wide vibrations of the string, was sufficient to produce the effect.

From these facts and observations, therefore, no doubt can remain that the acute harmonics accompanying the fundamental note arise entirely from these partial vibrations, of which every string appears to be so susceptible. But one important question still remains, and has never yet received any satisfactory solution; namely, what are the circumstances which determine these partial vibrations so generally in every string? Very slight obstacles are no doubt sufficient, but still there must be some particular causes to determine every string to divide itself so regularly into two, three, four, or more parts; executing in such regular succession the vibration peculiar to each. Inequalities in the densities or thicknesses of the different parts of the strings have been suggested as a probable reason; but this appears quite inadequate to produce effects so very constant in their operation, and which besides occur, let the string or wire be ever so uniform in its texture. This subject requires further examination, and the trial of several experiments. The only probable circumstance to which we can ascribe these effects consists in the re-action of the supports to which the extremities of the strings are attached. It is well known, that when two strings in the same instrument are tuned to the same note, if one of them be struck, the other begins to vibrate, and to sound at the same time. Strings differing by an octave have the same effect; and even those differing more in tone, yet appear to act and to re-act on each other. These effects have usually been ascribed to the action of the air, communicating the vibrations from one string to another. This, however, is not the case, as is proved by a simple experiment. If we stretch two similar strings on two different boards, and tune them to the same note; then if we detach the one wholly from the other, the vibrations of the one do not in the least affect those of the other, let them be even brought quite close together. But the moment we place the boards in contact with each other, though the strings themselves be thereby farther separated than before, yet the one vibrates uniformly in sympathy with the other; and the moment the boards are again detached, the effect ceases. It is clear, therefore, that the vibrations of the one string are communicated to those of the other, not through the medium of the air, but through that of the wood; and this can only take place by means of the vibrations of the one string communicating through the supports to the wood. This agitates the supports of the other string, and these giving at first a very slight vibrating motion to the extremities, this gradually increases as it is continued, until the whole string is made to vibrate with the other. Instead of the effect, therefore, proceeding from the middle of the string to either extremity, as would be the case with aërial pulses, it is just the reverse. When once the motion is begun, the aërial undulations may certainly aid and augment the effect; but this, without doubt, originates at the extremities of the strings, and from these is communicated to the centre. That strings in unison with each other should vibrate in this manner more readily than any other, is quite easily accounted for; because in that case the vibrations of the one, however they may be produced, are quite isochronous with those of the other: they are more readily excited, therefore, because when they are once begun, however minute they may be at first, they yet harmonize exactly with the other, and every succeeding impulse from it just arrives in the proper time to augment the effect of the preceding, until the two motions become exactly alike. Were the string not isochronous, the succeeding impulses might tend sometimes to augment and sometimes to diminish the effect of the preceding ones; so that no sensible vibration would take place, as really happens with all discordant strings. With octaves, however, and other concords, the vibrations are still produced, because the vibrations of the fundamental note always concur with those at certain intervals, and at others do not oppose them. All these effects are very similar to what occurs in the motion of pendulums; a very slight impulse is sufficient to put a large pendulum into very wide vibrations, if it be often repeated, and always at the proper time to augment and not oppose the motion already communicated. Here it is that pendulums swinging in the same frame affect wonderfully the vibrations of each other, exactly like musical strings in the same instrument. If when two isochronous pendulums are at rest one of them be set in motion, in a short time the other commences to vibrate, in a very slight degree at first, but always increasing and increasing, until at last its oscillations become quite as wide as the other. This effect arises entirely from the vibrations of the one pendulum communicating through the wood very slight impulses to the axis or centre on which the other moves. This sets it in motion, and the impulses being constantly repeated and properly timed, excite at last vibrations as wide as the original. In a similar manner it is that one string causes another in the same instrument to vibrate, by means of the supports on which it is stretched; and if this be the case so remarkably in different strings, may not the vibrations of any single string re-act on itself through its own supports, and thus excite all those secondary vibrations which produce the acute harmonics? The string being first struck in the centre, the fundamental note must first of all be emitted. But the vibration of this agitating the supports at each extremity, these must necessarily re-act upon the string itself, must modify the original central impulse, and excite all those subordinate vibrations which are observed. That this is the true cause of these partial actions, and consequently of all those varied tones which they excite, appears extremely probable. But experiments, as we observed, are wanting to demonstrate these effects satisfactorily.

Such, then, are the singular phenomena of the acute harmonics, and of the subordinate vibrations of strings from whence they arise. Whatever be the cause of these, no doubt whatever can remain of the fact itself; and it is to this circumstance that we must perhaps ascribe much of that agreeable effect, so pleasing to the ear, which we experience in the tones of our musical instruments. Regularity of succession may determine a certain pitch in the sound; but it is from the harmonic tones mingling together, and blending with the gravity of the original note, that appears to arise all that sweetness and rich melody which so peculiarly belongs to them. Hence also we can now understand the reason of the musical effect arising from the sound of thin plates, cups, or bells: in all these, when they are examined minutely, we observe numerous vibrations among the parts; the substance of the plate dividing itself into various subdivisions, separated by nodal lines, between which all the parts are thrown into vibration. Hence arise a variety of harmonious notes; and these mingling together, produce that highly musical effect which we observe. It is to Professor Chladni that we owe a variety of curious facts regarding these vibrations of plates; which he observed by strewing them with fine sand: the nodal points and lines were then shown by the sand throwing itself from all the vibrating parts, and accumulating in little heaps along the lines which divide the vibrating surface, and where, therefore, there was no agitation at all. Squares of plate glass are well adapted for showing these effects. If we hold these by the centre in a sort of small wooden vice, as at *Fig.* 13, and then cause them to sound by drawing a bow along any of the edges, which are smoothed for the purpose with emery, the gravest tone is produced by applying the bow to one of the angles; and then the sand assumes the figure represented in *Fig.* 14. The tone next to this in graveness is produced by applying the bow to the middle of one of the sides; and then the sand assumes the figure represented in *Fig.* 15. By varying the points of application in this manner, and the figure of the plates, we obtain many other figures and curves for the nodal lines; such as *Fig.* 16, 17, 18, 19, &c. These effects are extremely curious and interesting: they are also very beautifully exhibited by plates of paper or other flexible membranes, stretched on frames like those of a drum or tambourine. But we must refer for further details on this subject to the *Traité d'Acoustique* of Chladni.

Besides the lateral vibrations above described, of strings, membranes, and plates, all these bodies are capable of vibrating longitudinally, and of emitting sounds which are in general much more acute than the others, and are regulated in their pitch by the length of the rods or strings. In this manner even the air itself, confined in a tube or pipe, is made to vibrate regularly, and to emit musical tones; and from this source arises another extensive and very important class of sounds, namely, those which are produced by the various kinds of wind-instruments, and of which also the tones of the human voice and of that of different animals present interesting examples. One is apt to imagine that the sound of a pipe or flute is emitted from the wood or other material of which it is composed; it really, however, arises from the cylinder of inclosed air, which is thrown into vibration by the current of air striking against the reed of the pipe, or against the sides of the hole in the plate. For a particular account of this class of sounds, see ORGAN, TRUMPET, &c.; and for a more particular account of the scale, and of musical harmony, see HARMONICS, MUSIC, TEMPERAMENT.

(G. B.)

---

ACQS, or AX, a town at the foot of the Pyrenean mountains, in the department of Ariege, and 20 miles south-east of Foix, in France. It takes its name from the hot waters in these parts. Pop. 1991.

ACQUAPENDENTE, a pretty large town of Italy, in the territory of the Church and patrimony of St Peter, with a bishop's see. It is seated on a mountain near the river Paglia, 10 miles west of Orvieto, and 57 north by west of Rome. It takes its name from a fall of water near it, and is now almost desolate. Lat. 42. 46. N. Long. 11. 52. E.

ACQUARA, a Neapolitan town, in the province of Calabria Citra. Pop. 2263.

ACQUARIA, a small town of Italy, in Frigana, a district of Modena, which is remarkable for its medicinal waters. It is 18 miles south-west of the city of Modena.

ACQUAVIVA, a walled Neapolitan town, in the province of Terra di Bari, about 18 miles S.S.W. from Bari. Pop. 5400; has two hospitals, and a *Monte di Pietà.*

ACQUI, one of the provinces into which the continental dominions of the king of Sardinia are divided. It is bounded on the north-east by Alessandria, on the south-east and south by Genoa, on the south-west by Mondovi, on the west by Alba, and on the north-west by Asti. The extent is 444 square miles, or 284,160 acres. In the north the mountains decline to a fine undulating plain, watered by the rivers Bormida, Orba, Erro, and Belba, which in the adjoining province fall into the Tanaro, and then join the Po. The land is productive, and yields wheat, garden vegetables, wine, fruit, chestnuts, and much silk. Some cattle are bred and fattened; but the chief call for labour is in winding and throwing the silk. There are a few mines of iron and of some other minerals, but all inconsiderable. This province, which formerly was Upper Montferrat, contains two cities, 81 towns and villages, and nine hamlets, with a population amounting, in 1848, to 101,202 persons.

Acqui, a town of Italy, in the province of that name, with a bishop's see and commodious baths. It was taken by the Spaniards in 1745, and retaken by the Piedmontese in 1746; but after this it was taken again and dismantled by the French, who afterwards forsook it. It is seated on the river Bormida, 25 miles north-west of Genoa, and 30 south of Casal. Long. 8. 32. E. Lat. 44. 41. N.

ACRA, a considerable country near the eastern extremity of the Gold Coast of Africa. It is fertile and healthy, and the inhabitants are of a more polished and civilized character than the majority of those found upon that coast. While the slave-trade was carried on with activity, there was a great resort of the European nations to Acra, and the factories established by them, Fort James by the English, Crevecœur by the Dutch, and Christiansborg by the Danes, were the centre of an extensive trade. Acra has now greatly declined; and it may be considered, along with the rest of the coast, as dependent upon Dahomey. Adams considers this country as the boundary of the gold trade on the one side, and the ivory trade on the other; and sharing to a certain degree in both, though not to the same extent with some other districts.

Acra, in *Ancient Geography*, one of the hills of Jerusalem, on which stood the lower town, which was the old Jerusalem; to which was afterwards added Zion, or the City of David. It was probably called *Acra*, from the fortress which Antiochus built there in order to annoy the temple, and which Simon Maccabeus took and razed to the ground.

*Acra Japygia*, in *Ancient Geography*, called *Salentia* by Ptolemy; now *Capo di Leuca:* a promontory in the kingdom of Naples, the southernmost point of Otranto.

ACRAGAS, or Agragas, in *Ancient Geography*, so called by the Greeks, and somtimes by the Romans, but more generally *Agrigentum* by the latter; a town on the south coast of Sicily. See Agrigentum.

ACRASIA, among *Physicians*, implies the predominancy of one quality above another, either with regard to artificial mixtures, or the humours of the human body. The word is Greek, and compounded of α, privative, and κεραννυμι, to *mix; q. d.* not mixed in a just proportion.

ACRE, or Akka, or Accho, a town and seaport of Palestine, in the pachalic of Acre, and in ancient times a celebrated city, called *Ptolemais*, from Ptolemy, king of Egypt. It was named Acra from its fortifications; and by the knights of St John of Jerusalem it was called St John d'Acre. No town has experienced greater changes from political revolutions and the calamities of war. It has been successively possessed by Alexander's successors, who ruled in Egypt, by the Romans, the Saracens, the Christian crusaders, and finally by the Turks. According to some travellers, this city was the Accho of the Scriptures, one of the strongholds of which the Israelites could not dispossess the Canaanites; and in confirmation of this supposition, Mr Buckingham, who visited Acre in 1816, found in the ditches which they were then digging around the wall, fragments of houses which bore marks of the highest antiquity; consisting of that highly sun-burnt brick, with a mixture of cement and sand, which was only used in buildings constructed in the remotest ages. It is only, however, during its possession by Ptolemy, and when it was called Ptolemais, that history gives any certain account of it. It was known during those ancient times to be a great city; and although no perfect monument of its grandeur now remains, yet throughout the modern town are seen fine marble and granite pillars, used at the thresholds of door-ways, or in other parts of ordinary buildings, or lying neglected on the ground. When the empire of the Romans began to extend over Asia, Ptolemais came into their possession; and it yielded in like manner to the growing power of the Saracens. They were expelled from it in 1110 by the crusaders, who retained it until 1187, when it was recovered by Saladin, sultan of Egypt. In 1191 it was retaken by Richard I. of England and Philip of France, who purchased this conquest by the sacrifice of 100,000 troops. They gave the town to the knights of St John of Jerusalem, and it afterwards became the principal scene of contest between the crusaders and the Saracens. It was at this time a large and extensive city, on the direct route to Jerusalem, and a place of great resort. It was accordingly populous and wealthy, and contained numerous churches, convents, and hospitals, of which no traces now remain. The city was under a peculiar system of government, being ruled by all the Christian powers both of Europe and Asia, 19 of whom exercised independent authority within its bounds. It was taken by the Saracens after a bloody siege in 1291, during which it suffered severely, and afterwards fell into decay. Under their dominion it remained till 1517, when it fell into the hands of the Turkish sultan, Selim I. So late as the year 1696, Maundrell, who visited it, states that it had never recovered from its last overthrow; and that, with the exception of the residences of the French factors, a mosque, and a few poor cottages, it presented a vast and spacious scene of ruin. After this period Acre again became a considerable city, and was much strengthened and improved. It is memorable in modern history for the gallantry with which it was defended in 1799 by the Turks, animated by the example and advice of Sir Sydney Smith, against Bonaparte, who, after spending sixty-one days before it, was obliged to retreat. It was afterwards strongly fortified by Jezzar Pacha, and continued to enjoy an increasing degree of prosperity till 1832. Though fettered by imposts and monopolies, it carried on a considerable foreign trade, and had resident consuls from most of the great states of Europe. During its siege by Ibrahim Pacha in the winter of 1831–32, which lasted five months and twenty-one days, its public and private buildings were mostly destroyed. The only one that escaped uninjured was the fountain of Djezzar. Its fortifications were subsequently repaired and improved; but on the 3d November 1840, the town was reduced to ruins by a three hours' bombardment from the British fleet, acting as the allies of the sultan.

The town is situate at the extremity of a plain on the edge of the sea-shore, and at the point of a bay formed by the promontory of Mount Carmel on the south-west, and the termination of the plain itself on the north-east. This bay faces the north-west, and from Cape Carmel to the city it may be about ten miles across. The bay affords no shelter in bad weather, being open to the north-west winds, which blow violently on the coast; and the port of Acre is a small hollow basin behind a ruined mole, scarcely capable of containing a dozen boats. Vessels coming to this coast, therefore, either to load or discharge their cargoes, generally frequent the road of Caipha, a place of anchorage on the south side of the bay, near which the river Kishon flows into the sea. Acre is now the chief mart for the cotton of Syria, and the principal commercial nations of Europe have consuls here. It is 80 miles N.N.W. of Jerusalem, and 27 S. of Tyre. Long. 36. 6. E. Lat. 32. 56. N.

Acre, a measure of superficies, and the principal denomination of land-measure in use throughout the whole of Great Britain. The word (formed from the Saxon *acher*, or the German *aker*, a field) did not originally signify a determinate quantity of land, but any open ground, especially a wide campaign; and in this antique sense it seems to be preserved in the names of places, as Castle-acre, West-acre, &c. The English standard acre, now the imperial acre of Britain, is formed by raising a square of which the basis is the chain of 66 feet, or 22 yards, or 1-80th of a mile; and ten of these squares form the acre, which thus contains 4840 square yards. This is divided into *roods*, of which there are four in the acre; and into *poles* or *perches*, of which there are 40 in each rood, or 160 in the acre. The rood will thus measure 1210 square yards, and the pole $30\frac{1}{4}$ square yards, according to the following table, which contains also other denominations useful to be compared with the acre.

| Inches. | Links. | Feet. | Yards. | Poles or Perch. | Chains | Roods. | Acre. |
|---|---|---|---|---|---|---|---|
| 62·726 | 1 | | | | | | |
| 144 | 2·295 | 1 | | | | | |
| 1296 | 20·661 | 9 | 1 | | | | |
| 39204 | 625 | $272\frac{1}{4}$ | $30\frac{1}{4}$ | 1 | | | |
| 627264 | 10000 | 4356 | 484 | 16 | 1 | | |
| 1568160 | 25000 | 10890 | 1210 | 40 | $2\frac{1}{2}$ | 1 | |
| 6272640 | 100000 | 43560 | 4840 | 160 | 10 | 4 | 1 |

The above is the standard acre of England; but various customary acres are in use throughout the different counties, deviating considerably from this standard both in excess and defect, though all of them are now illegal since the act 5 George IV., which establishes the same standard throughout the whole kingdom. In *Bedfordshire*, it is sometimes only two roods; *Cheshire*, formerly, and still in some places, 10,240 square yards; *Cornwall*, sometimes 5760 yards; *Dorsetshire*, generally 134 perches; *Hampshire*, from 107 to 120 perches, but sometimes 180; *Herefordshire*, two-thirds of a statute acre. The acre for *hops* contains 1000 plants, and is only equal to half a statute acre; for *wood*, again, it is 256 perches. *Leicestershire*, $2308\frac{3}{4}$ square yards; *Lincolnshire*, five roods, particularly for copyhold land; *Staffordshire*, nearly $2\frac{1}{4}$ acres; *Sussex*, 107, 110, 120, 130, or 212 perches; the *short* acre 100 or 120 perches, the *forest* acre 180 perches. *Westmoreland*, 6760 square yards, or 160 perches of $6\frac{1}{2}$ yards square; in some parts the Irish acre is used: *Worcester*, the *hop* acre, of 1000 stocks, 90 perches, sometimes 132 or 141 perches.

In North Wales, the *Erw* or true acre is 4320 square yards, the *Stang* or customary acre 3240 square yards, as in Anglesea and Caernarvonshire, making $5\frac{1}{3}$ Llathen, = 160 perches of $4\frac{1}{2}$ yards square, called *paladr:* 8 acres make an *ox-land*, and 8 of these a *plough-land*, in *Pembrokeshire.* In South Wales the Erw varies greatly with the perch; sometimes this is nine feet square, 160 perches making one stangell, and four stangells one erw of 5760 yards; sometimes $10\frac{1}{2}$ feet square, making a quart or quarter of a llath, 40 of which make a stangell, and four stangells an erw, which is thus 7840 yards, equal to the Irish acre; sometimes 11 feet, called bat or eglwys haw, making the erw 9384 yards, as in *Glamorganshire*, one-fifth more = 11,261 yards; sometimes $11\frac{1}{2}$ feet, called a llath, 48 making a quarter cyvar, and four cyvars an erw of 11,776 yards; lastly, 12 feet, giving an erw of 10,240 yards, equal to the Staffordshire acre.

Nothing can show more clearly than the existence of such numerous and useless diversities, the necessity of the late act for establishing a uniform standard throughout Great Britain, and which only requires to be enforced with strictness to abolish for ever every other measure. In Scotland the acre is much more uniform, scarcely deviating in any part more than one per cent. from the standard. It is raised from the chain of 24 ells; and by the verdict of the jury assembled at Edinburgh on the 4th February 1826, to determine the proportion between the existing measures and the imperial, the ell was found, according to an accurate measurement made by Mr Jardine, civil engineer, 37·0598 inches, making the chain 74·1196 feet, and the acre 6104 square yards and ·12789, &c. decimals of a yard. It is considerably larger, therefore, than the imperial acre; and as the act of uniformity establishes this latter in its stead, it makes an important change throughout Scotland, and it becomes necessary to know exactly the proportions between them. The imperial, we have seen, contains 4840 square yards, while the Scottish contains 6104·12789, &c. They are to each other, therefore, as 1 is to 1·26118345; so that 1000 acres Scottish are equal to 1261·18345 imperial; and in every case, to convert Scottish into imperial, multiply by the fraction 1·26118345: such minuteness, however, is seldom required in practice. A ready and very accurate approximation will be obtained by reckoning one acre Scottish equal to five quarters imperial, and $\frac{1}{80}$th part more. This will give the value of the acre almost to one-fourth of a square yard in defect. Hence we have this general rule: *To convert Scottish acres into imperial, add one-fourth; and if that is not sufficiently minute, add $\frac{1}{80}$th more.* Take, for example, 1000 acres, add one-fourth or 250, and we have 1250; add still $\frac{1}{80}$th, or 11, and we have 1261. This rule is obtained by expressing the above fraction in a series of which we take only the first three terms. It is one acre Scottish $= 1 + \frac{1}{4} + \frac{1}{80} + \frac{1}{14000}$, &c. acres imperial. By a similar rule, it is easy to convert the Scottish *money rates or prices* of land into imperial: we have only to multiply the Scottish prices by the fraction 0·792906, the reciprocal of the other; or *deduct one-fifth from the price, and for greater accuracy $\frac{1}{140}$th more; or what is still simpler, deduct $20\frac{3}{4}$ per cent. or 4s. $1\frac{3}{4}$d. in the pound from the Scottish prices.* An estate of 1000 acres, for example, is to be let at 30s. per acre: What is the rent per imperial acre? Deduct 4s. $1\frac{3}{4}$d. and the half of it for the additional 10s., and we have 6s. $2\frac{1}{2}$d. less, or on the whole 23s. $9\frac{1}{2}$d. These rules will apply in every practical case; and for very particular and extremely accurate purposes, recourse must be had to the original fraction 0·792906 and 1·26118345.

Such are the relations of the Scottish standard acre to the imperial; but until of late years, it was the practice of land-surveyors to measure with a chain of 74 feet and 4-10ths of a foot in length, the length of the ell having been erroneously estimated at 37 inches and 2-10ths of an inch. This practice increased the acre from 6104·13448 to 6150·4 square yards; it made the ratio of this acre to the imperial as 1 to 1·27074, &c.; or we may reckon one acre equal to five quarters imperial, and $\frac{1}{60}$th more.

When this error in the length of the chain came to be discovered, surveyors took to the chain of exactly 74 feet; this length being recommended by the round number, and the nearer approach to the standard. By it the acre contains only 6084·4444, &c. yards; it is to the imperial acre as 1 to 1·25711662, &c. or we make one of these acres equal to five quarters imperial, and $\frac{1}{180}$th more.

In Ireland the perch, of which the acre contains as usual 160, is a square of seven yards. The acre, therefore, contains 7840 square yards. See Weights and Measures; *Parliamentary Reports of the Commissioners of Weights and Measures; Act 5 Geo. IV.;* and Buchanan's *Tables of Weights and Measures,* where the conversions are all given by inspection. (G. B.)

*The following table contains the principal foreign land measures, with their equivalents in Imperial measurement.*

In the United States of America the imperial acre is used. The Roman jugerum was somewhat larger than half an imperial acre, containing 2 roods, 19 perches, 189 square feet. Two jugera formed a heredium, so called from its being the quantity of land originally assigned to each Roman citizen; a hundred heredia formed a centuria, and four centuriæ a saltus. The Greek plethron consisted of 4 aruræ, and was equal to 37 perches, 153 square feet.

*Acre-Fight,* an old sort of duel fought by English and Scottish combatants, between the frontiers of their kingdoms, with sword and lance: it was also called *camp-fight,* and the combatants *champions,* from the open field being the stage of trial.

ACRIBEIA, a term purely Greek, literally denoting an exquisite or delicate accuracy; sometimes used in our language, for want of a word of equal signification.

ACRIDOPHAGI, in *Ancient Geography,* an Ethiopian people, represented as inhabiting near the deserts, and to have fed on locusts. This latter circumstance their name imports, the word being compounded of the Greek ακρις, *locust,* and φαγω, *to eat.* Dr Sparrman informs us,[1] that "Locusts sometimes afford a high treat to the more unpolished and remote hordes of the Hottentots; when, as sometimes happens, after an interval of 8, 10, 15, or 20 years, they make their appearance in incredible numbers." The Abbé Poiret, also, in his *Memoir on the Insects of Barbary and Numidia,* informs us that the Moors make locusts a part of their food, that they go to hunt them, fry them in oil and butter, and sell them publicly at Tunis, at Bonne, &c. From these accounts, we may see the folly of that dispute among the divines about the nature of St John's food in the wilderness; some maintaining the original word to signify the fruit of the carobe tree; others, a kind of birds, &c.: but those who adhered to the literal meaning of the text were at least the most orthodox, although their arguments were perhaps not so strong as they might have been had they had an opportunity of quoting such authors as the above.

[1] *Voyage to the Cape,* vol. i. p. 366.

ACRISIUS, in *Fabulous History,* king of Argos, being told by the oracle that he should be killed by his grandchild, shut up his only daughter Danäe in a brazen tower; but Jupiter coming down in a golden shower, begot Perseus by her. Acrisius was accidentally killed by the quoit of Perseus in the games at Larissa, whither he had gone to avoid the consummation of the prophecy.

ACRITAS, in *Ancient Geography,* a promontory of Messenia, running into the sea, and forming the beginning of the bay of Messene; now *Capo de Gallo.*

ACROAMA, in *Antiquity,* signified any thing heard, especially if it gave pleasure, such as music, plays, or reading, for the entertainment of guests. The term was also applied to the performers, and to interludes at the public games.

ACROAMATIC, or Acroatic, in general denotes a thing sublime, profound, or abstruse.

ACROAMATICI, a denomination given to the disciples or followers of Aristotle, &c. who were admitted into the secrets of the inner or acroamatic philosophy.

ACROATIC is a name given to Aristotle's lectures to his disciples, which were of two kinds, *exoteric* and *acroatic.* The acroatic were those to which only his own disciples and intimate friends were admitted; whereas the exoteric were public and open to all. But there are other differences. The acroatic were set apart for the higher and more abstruse subjects; the exoteric were employed in rhetorical and civil speculations. Again, the acroatics were more subtile and exact, evidence and demonstration being here aimed at; the exoterics chiefly aimed at the probable and plausible. The former were the subject of the morning exercises in the Lyceum, the latter of the evening. Besides, the exoterics were published, whereas the acroatics were kept secret, being either entirely concealed, or, if they were published, it was in such obscure terms that few but his own disciples could be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his acroatics, and thus revealing what should have been reserved to his disciples, Aristotle answered, that they were made public and not public; for that none who had not heard them explained by the author *viva voce* could understand them.

ACROBATES, in *Antiquity,* were rope-dancers, who performed various feats by vaulting or tumbling on a rope; sliding down on a rope from a lofty station with arms and legs extended, in imitation of flying; and running, dancing, and leaping, on a rope stretched horizontally.

ACROBATICA, or Acrobaticum, from ακρος, *high,* and βατεω or βαινω, *I go;* an ancient engine whereby people were raised aloft, that they might see more conveniently about them. The *acrobatica* among the Greeks amounted to the same with what they call *scansorium* among the Latins. Authors are divided as to the use of this engine. Turnebus and Barbarus take it to have been of the military kind, raised by besiegers, high enough to overlook the walls and discover the state of things on the other side. Baldus rather supposes it a kind of moveable scaffold, or cradle, contrived for raising painters, plasterers, and other workmen, to the tops of houses, trees, &c. Some suspect that it might have been used for both purposes; which is the opinion of Vitruvius and Aquinas.

ACROCERAUNIA, or MONTES CERAUNII, in *Ancient Geography*, mountains so called from their being often struck by thunder. They are on the western coast of Greece, and terminate at a cape in Lat. 40. 25. N.

ACROCHERISMUS, among the Greeks, a sort of gymnastic exercise, in which the two combatants contended with their hands and fingers only, without closing or engaging the other parts of the body.

ACROCORINTHUS, in *Ancient Geography*, a high and steep hill overhanging the city of Corinth, on which was built the acropolis, or citadel. Height 1885 feet.

ACRODUS, a genus of Placoïd fossil Fish, established by *Agassiz*.

ACROGASTER, a fossil genus of Placoïd Fishes.—*Agassiz*.

ACROGENS (i. e. *point growers*), a botanical term applied to arborescent ferns, &c. that increase only at the top.

ACROGNATHUS, a fossil genus of Cycloïd Fishes.—*Agassiz*.

ACROLEPIS, a fossil genus of Ganoïd Fishes.—*Agassiz*.

ACROLITH, a statue, with the head and extremities of stone, the trunk being usually made of wood, either gilt or draped. Pausanias describes several such, particularly the Minerva Areia of the Platæans.

ACROMION, in *Anatomy*, the upper part of the scapula or shoulder-blade.

ACROMONOGRAMMATICUM, in *Poetry*, a kind of poem, wherein every subsequent verse begins with the letter wherewith the immediately preceding one terminated.

ACRON, a celebrated physician of Agrigentum, in Sicily, who lived about the middle of the fifth century before Christ. The successful measure of lighting large fires, and purifying the air with perfumes, to put a stop to the pestilence that ravaged Athens, originated with him. He wrote two treatises, according to Suidas, in the Doric dialect; the one on physic, and the other on abstinence or diet.

ACRONICAL, ACHRONYCAL, or ACHRONICAL, in *Astronomy*, is a term applied to the rising of a star when the sun is set in the evening; but has been promiscuously used to express a star's rising at sunset, or setting at sunrise.

ACROPOLIS, Ακροπολις, a word signifying the upper town, or chief place of a city, a citadel, which was usually on the summit of a rock or hill. The most celebrated was that in Athens, the remains of which still delight and astonish travellers. It was enclosed by walls, part of which was extremely ancient. It had nine gates; but the principal was a splendid structure of Pentelican marble, in noble Doric architecture, which bore the name of *Propylaion*. Besides other beautiful edifices, it contains the Παρθενων, or temple of the virgin goddess Pallas, the most glorious monument of ancient Grecian architecture. See ARCHITECTURE and ATHENS.

ACROPOLITA, GEORGE, one of the writers in the Byzantine history, was born at Constantinople in the year 1220, and educated at the court of the Emperor John Ducas at Nice. He was employed in the most important affairs of the empire, being sent as ambassador to Larissa to establish a peace with Michael of Epirus; and was constituted judge to try Michael Comnenus, who was suspected of engaging in a conspiracy. Theodorus Lascaris, the son of John, whom he had taught logic, appointed him governor of all the western provinces in his empire. In 1255, he was taken prisoner, in a war with Michael Angelus; but gaining his liberty in 1260, by means of the Emperor Palæologus, he was sent by him as ambassador to Constantine, prince of Bulgaria; and was employed in several other negotiations. He wrote a Continuation of the Greek History, from the taking of Constantinople by the Latins till its recovery by Michael Palæologus in 1261, which makes part of the Byzantine history. He died A.D. 1282.

ACROSPIRE, a vulgar term for what botanists call the *plumes*.

ACROSPIRED, in *Malt-Making*, is the grain's shooting both at the root and blade end.

ACROSTIC, in *Poetry*, a kind of poetical composition, disposed in such a manner that the initial letters of the verses form the name of some person, kingdom, place, motto, &c. The word is compounded of the Greek ακρος, *extremity*, and στιχος, *verse*. The acrostic is considered by the critics as a species of false wit, and is therefore very little regarded by the moderns.

ACROSTICHUM, RUSTYBACK, WALL-RUE, or FORK-FERN.

ACROSTOLIUM, in *Ancient Naval Architecture*, the extreme part of the ornament used on the prows of ships, which was sometimes in the shape of a buckler, helmet, animal, &c. but more frequently circular, or spiral. It was usual to tear them from the prows of vanquished vessels, and fix them to those of the conquerors, as a signal of victory. They were frequently represented on the reverse of ancient medals.

ACROTELEUTIC, among ecclesiastic writers, an appellation given to anything added to the end of a psalm; as the Gloria Patri, or Doxology.

ACROTEMNUS, a fossil genus of Ganoïd Fishes.—*Agassiz*.

ACT, in general, denotes the exertion of power; and differs from power, as the effect from the cause.

ACT, in *Logic*, is particularly understood of an operation of the human mind. Thus, to discern and examine are acts of the understanding; to judge and affirm are acts of the will.

ACT, in the *Universities*, signifies a thesis maintained in public by a candidate for a degree; or to show the capacity and proficiency of a student.

*ACT of Faith*, in Italian *Atto di Fede*, in Portuguese *Auto da Fe*, in the Romish church, is a solemn day held by the inquisition, for the punishment of heretics and the absolution of the innocent accused. They usually contrive the *Auto* to fall on some great festival, that the execution may pass with the more awe and regard; at least it is always on a Sunday.

The Auto da Fe may be called the last act of the inquisitorial tragedy: it is a kind of jail delivery, appointed as often as a competent number of prisoners in the inquisition are convicted of heresy, either by their own voluntary or extorted confession, or on the evidence of certain witnesses. The process as performed last in Lisbon is thus: In the morning they are brought into a great hall, where they have certain habits put on, which they are to wear in the procession. The procession is led up by Dominican friars; after which come the penitents, some with san-benitos and some without, according to the nature of their crimes; being all in black coats without sleeves, and barefooted, with wax candles in their hands. These are followed by the penitents who have narrowly escaped being burnt: over their black coats they have flames painted, with their points turned downwards, *fuego revolto*. Next come the negative and relapsed, who are to be burnt, having flames on their habits pointing upwards. After these come such as profess doctrines contrary to the faith of Rome, who, besides flames pointed upwards, have their picture painted on their breasts, with dogs, serpents, and devils, all open-mouthed, around it.

Each prisoner is attended by a familiar of the inquisition; and those to be burnt have also a Jesuit on each hand, who continually exhorts them to abjure. After the prisoners comes a troop of familiars on horseback; and after them the inquisitors, and other officers of the court, on mules; last of all, the inquisitor-general on a white horse, led by two men with black hats and green hat-bands. A scaffold is erected in the *Terreiro de Paço*, large enough for two or three thousand people; at one end of which are the prisoners, at the other, the inquisitors. After a sermon made up of encomiums on the inquisition, and invectives against heretics, a priest ascends a desk near the middle of the scaffold, and having taken the abjuration of the penitents, recites the final sentence of those who are to be put to death; and delivers them to the secular arm, earnestly beseeching at the same time the secular power not to touch their blood, or put their lives in danger. The prisoners being thus in the hands of the civil magistrate, are presently loaded with chains, and carried first to the jail, and from thence in an hour or two brought before the civil judge; who, after asking in what religion they intend to die, pronounces sentence on such as declare they die in the communion of the church of Rome, that they shall be first strangled, and then burnt to ashes; on such as die in any other faith, that they be burnt alive. Both are immediately carried to the Ribera, the place of execution, where there are as many stakes set up as there are prisoners to be burnt, each surrounded by a pile of dry furze. The stakes of the professed, that is, such as persist in their heresy, are about four yards high, having a small board towards the top for the prisoner to be seated on. The negative and relapsed being first strangled and burnt, the professed mount their stakes by a ladder; and the Jesuits, after several repeated exhortations to be reconciled to the church, part with them, telling them they leave them to the devil, who is standing at their elbow to receive their souls, and carry them with him into the flames of hell. On this a great shout is raised; and the cry is, Let the dogs' *beards be made;* which is done by thrusting flaming furzes fastened to long poles against their faces, till their faces are burnt to a coal, which is accompanied with the loudest acclamations of joy. At last, fire is set to the furze at the bottom of the stake, over which the professed are chained so high that the top of the flame seldom reaches higher than the seat they sit on, so that they rather seem roasted than burnt. There cannot be a more atrocious spectacle, yet it is beheld by all sexes and ages with transports of joy and satisfaction.

Act, in *Dramatic Poetry*, signifies a certain division or part of a play, designed to give some respite both to the actors and spectators. The Romans were the first who divided their theatrical pieces into acts; for no such divisions appear in the works of the first dramatic poets. Their pieces indeed consisted of several parts or divisions, which they called *protasis, epitasis, catastasis*, and *catastrophe;* but these divisions were not marked by any real interruptions in the theatre. Nor does Aristotle mention anything of acts in his *Art of Poetry*. But, in the time of Horace, all regular and finished pieces were divided into five acts.

> *Neve minor, neu sit quinto productior actu*
> *Fabula, quæ posci vult, et spectata reponi.*
> If you would have your play deserve success,
> Give it five acts complete, nor more nor less.
>
> Francis.

The first act, according to some critics, besides introducing upon the stage the principal characters of the play, ought to propose the argument or subject of the piece; the second, to exhibit this to the audience, by carrying the fable into execution; the third, to raise obstacles and difficulties; the fourth to remove these, or raise new ones in the attempt; and the fifth to conclude the piece, by introducing some accident that may unravel the whole affair. This division, however, is not essentially necessary, but may be varied according to the humour of the author or the nature of the subject.

Act, among *Lawyers*, is an instrument in writing for declaring or justifying the truth of any thing; in which sense records, decrees, sentences, reports, certificates, &c. are called *acts*.

*Act of Parliament* is a positive law, passed by the two houses of parliament, and assented to by the Crown, consisting of two parts, the words of the act, and its true sense and meaning; which being joined, make the law. The words of acts of parliament should be taken in a lawful sense. Cases of the same nature are within the intention, though without the letter of the act; and some acts extend by equity to things not mentioned therein. See Legislation and Statute.

*Acta Consistorii*, the edicts or declarations of the council of state of the Roman emperors. These edicts were generally expressed in such terms as these: "The august emperors, *Dioclesian* and *Maximin*, in council declare, That the children of decurions shall not be exposed to wild beasts in the amphitheatre."—The senate and soldiers often swore, either through abject flattery or by compulsion, upon the edicts of the emperor, as we do upon the Bible. The name of Apidius Merula was erased by Nero out of the register of senators, because he refused to swear upon the edicts of the Emperor Augustus.

*Acta Diurna*, was a sort of Roman gazette, containing an authorized narrative of the transactions worthy of notice which happened at Rome. Petronius has given us a specimen of the *acta diurna* in his account of Trimalchi; and as it may not perhaps be unentertaining to see how exactly a Roman newspaper runs in the style of an English one, the following articles are extracted from it:

"On the 26th of July, 30 boys and 40 girls were born at Trimalchi's estate at Cuma.

"At the same time a slave was put to death for uttering disrespectful words against his lord.

"The same day a fire broke out in Pompey's gardens, which began in the night, in the steward's apartment." See *Le Clerc, des Journeaux chez les Romains*, Par. 1838; and *Lieberkühn de Diurnis Romanorum Actis*, Weimar, 1840.

*Acta Eruditorum*, a celebrated literary journal, which was established at Leipzic in 1682 by Professor Otto Mencke. It contains the papers of Leibnitz, and many other learned men. The first series is in 50 volumes. The new series, with supplements, &c. reaches to 77 volumes more, making in all 127 volumes.

*Acta Populi*, among the Romans, were journals or registers of the daily occurrences; as assemblies, trials, executions, buildings, births, marriages, deaths, &c. of illustrious persons, and the like. These were otherwise called *Acta Publica* and *Acta Diurna*, or simply *Acta*. The Acta differed from Annals, in that only the greater and more important matters were in the latter, and those of less note were in the former. Their origin is attributed to Julius Cæsar, who first ordered the keeping and making public the acts of the people. Some trace them higher, to Servius Tullius; who, to discover the number of persons born, dead, and alive, ordered that the next of kin, upon a birth, should put a certain piece of money into the treasury of Juno Lucina; upon a death, into that of Venus Libitina: the like was also to be done upon assuming the toga virilis, &c. Under Marcus Antoninus, this was carried further: persons were obliged to notify the births of their children, with their names and surnames, the day, consul, and whether legitimate or spurious, to the prefects of the *Ærarium Saturni*, to be entered in the public acts; though before this time the births of persons of quality appear to have been thus registered.

Acta Senatus, among the Romans, were minutes of what passed and was debated in the senate-house. These were also called *Commentarii*, and by a Greek name ὑπομνηματα. They had their origin in the consulship of Julius Cæsar, who ordered them to be kept and also published. The keeping of them was continued under Augustus, but the publication was abrogated. Afterwards all writings relating to the decrees or sentences of the judges, or what passed and was done before them, or by their authority, in any cause, were also called by the name *Acta:* in which sense we read of civil acts, criminal acts, intervenient acts; *acta civilia, criminalia, interveniientia*, &c.

*Acts of the Apostles*, one of the sacred books of the New Testament, containing the history of the infant church during the space of 29 or 30 years, from the ascension of our Lord to the year of Christ 63. It was written by St Luke, and addressed to Theophilus, the person to whom the evangelist had before dedicated his gospel. We here find the accomplishment of several of the promises made by our Saviour; his ascension, the descent of the Holy Ghost, the first preaching of the apostles, and the miracles whereby their doctrines were confirmed; an admirable picture of the manners of the primitive Christians; and, in short, every thing that passed in the church till the dispersion of the apostles, who separated themselves in order to propagate the gospel throughout the world. From the period of that separation, St Luke quits the history of the other apostles, who were then at too great a distance from him, and confines himself more particularly to that of St Paul, who had chosen him for the companion of his labours. He follows that apostle in all his missions, and even to Rome itself; for it appears that the Acts were published in the second year of St Paul's residence in that city, or the 63d year of the Christian era, and in the ninth or tenth year of Nero's reign. The style of this work, which was originally composed in Greek, is much purer than that of the other canonical writers; and it is observable that St Luke, who was much better acquainted with the Greek than with the Hebrew language, always, in his quotations from the Old Testament, makes use of the Septuagint version. The council of Laodicea places the Acts of the Apostles among the canonical books, and all the churches have acknowledged it as such without any controversy.

There were several *spurious* Acts of the Apostles; particularly, 1. *Acts*, supposed to be written by Abdias, the pretended bishop of Babylon, who gave out that he was ordained bishop by the apostles themselves when they were upon their journey into Persia. 2. *The Acts of St Peter:* this book came originally from the school of the Ebionites. 3. *The Acts of St Paul;* which is entirely lost. Eusebius, who had seen it, pronounces it of no authority. 4. *The Acts of St John the Evangelist;* a book made use of by the Encratites, Manichæans, and Priscillianists. 5. *The Acts of St Andrew;* received by the Manichæans, Encratites, and Apotactics. 6. *The Acts of St Thomas the Apostle;* received particularly by the Manichæans. 7. *The Acts of St Philip.* This book the Gnostics made use of. 8. *The Acts of St Matthias.* Some have imagined that the Jews for a long time had concealed the original Acts of the life and death of St Matthias, written in Hebrew; and that a monk of the abbey of St Matthias at Treves, having got them out of their hands, procured them to be translated into Latin, and published them; but the critics will not allow them to be genuine.

*Acts of Pilate*, a relation sent by Pilate to the Emperor Tiberius, concerning Jesus Christ, his death, resurrection, ascension, and the crimes of which he was convicted before him.[1] It was a custom among the Romans, that the proconsuls and governors of provinces should draw up acts, or memoirs, of what happened in the course of their government, and send them to the emperor and senate. The genuine *acts* of Pilate were sent by him to Tiberius, who reported them to the senate; but they were rejected by that assembly, because not immediately addressed to them; as is testified by Tertullian in his *Apol.* cap. 5, and 20, 21. The heretics forged acts in imitation of them: in the reign of the Emperor Maximin, the Gentiles, to throw an odium on the Christian name, spread about spurious acts of Pilate; which the emperor, by a solemn edict, ordered to be sent into all the provinces of the empire, and enjoined the schoolmasters to teach and explain them to their scholars, and make them learn them by heart. These acts, both the genuine and the spurious, are lost. There is indeed extant, in the Pseudo-Hegesippus, a letter from Pilate to the Emperor Claudius, concerning Jesus Christ;[2] but it discovers itself at first sight to be spurious.

[1] Eusebii *Hist. Eccl.* lib. ii. cap. 2, and ix. 5.

[2] Cave *Hist. Literar.*

ACTÆ were meadows of remarkable verdure and luxuriancy near the sea-shore, where the Romans used to indulge themselves to a great degree in softness and delicacy of living. The word is used in this sense by Cicero and Virgil; but Vossius thinks it can only be used in speaking of Sicily, as these two authors did.

ACTÆA, Herb-Christopher, or Bane-Berries.

ACTÆON, in *Fabulous History*, son of Aristæus and Autonöe, was a famous hunter. For the crime of looking at Diana while bathing, he was transformed into a stag, and devoured by his own dogs. The effect of impertinent curiosity and expensive pleasures seems to be the moral of the fable. *Ovid. Met.* iii.; *Hygin. Fab.* 181.

ACTIAN Games, in *Roman Antiquity*, were solemn games instituted by Augustus, in memory of his victory over Mark Antony at Actium, held every fifth year, and celebrated in honour of Apollo, surnamed *Actius.* Hence also *Actian* Years, an era commencing from the battle of Actium, called the *Era of Augustus.* Virgil insinuates them to have been instituted by Æneas, from that passage, Æn. iii. v. 280:

Actiaque Iliacis celebramus littora ludis.

But this he only does by way of compliment to Augustus; attributing that to the hero from whom he descended, which was done by the emperor himself; as is observed by Servius.

ACTINIA, in *Zoology*, a genus belonging to the class of *Acalephæ* of Zoophytes, called *Animal Flowers* and *Sea Anemones.*

ACTINOBATIS, a genus of fossil Fishes of the order Placoid of *Agassiz.*

ACTINOCAMAX, a division of Belemnites, according to *Miller.*

ACTINOCERAS, a division of fossil Cephalopodæ.

ACTINOCRINITES, a genus of fossil Crinodea, or lily-shaped animals.—*Miller.*

ACTINOMETER, a *measurer of solar rays.* It is a thermometer with a large bulb, filled with a dark blue fluid, and is enclosed in a box, the sides of which are blackened, and the whole covered with a thick plate of glass. It is the invention of Sir John Herschel; and is described in the *Edinburgh Journal of Science* for 1825. The zero is adjusted by a screw attached to the bulb.

ACTIO, in *Roman Antiquity*, is an action at law in a court of justice. The formalities used by the Romans, in judicial actions, were these: If the difference failed to be made up by friends, the injured person proceeded *in jus reum vocare*, to summon to court the offending party, who was obliged to go, or give bond for his appearance.

The offending party might be summoned into court *viva voce*, by the plaintiff himself meeting the defendant, declaring his intention to him, and commanding him to go before the magistrate and make his defence. If he would not go willingly, the plaintiff might drag and force him, unless he gave security for his appearance on some appointed day. If he failed to appear on the day agreed on, then the plaintiff, whensoever he met him, might take him along with him by force, calling any bystanders to bear witness, by asking them *visne antestari?* The bystanders upon this turned their ear toward him in token of their consent. To this Horace alludes in his satire against the impertinent, lib. i. sat. 9.

Both parties being met before the prætor, or other supreme magistrate presiding in the court, the plaintiff proposed to the defendant the action in which he designed to prosecute him. This was termed *edere actionem;* and was commonly performed by writing it in a tablet, and offering it to the defendant, that he might see whether it were better for him to stand the suit or to compound.

In the next place came the *postulatio actionis,* or the plaintiff's petition to the prætor for leave to prosecute the defendant in such an action. The petition was granted by writing at the bottom of it *actionem do;* or refused, by writing in the same manner *actionem non do.*

The petition being granted, the plaintiff *vadabatur reum, i. e.* obliged him to give sureties for his appearance on such a day in the court; and this was all that was done in public before the day fixed upon for the trial.

In the meantime, the difference was often made up either *transactione,* by letting the cause fall as dubious; or *pactione,* by composition for damages amongst friends.

On the day appointed for hearing, the prætor ordered the several bills to be read, and the parties summoned by an *accensus,* or beadle.

Upon the non-appearance of either party, the defaulter lost his cause: if they both appeared, they were said *se stetisse;* and then the plaintiff proceeded *litem sive actionem intendere, i. e.* to prefer his suit; which was done in a set form of words, varying according to the difference of the actions. After this the plaintiff desired judgment of the prætor, that is, to be allowed a *judex* or *arbiter,* else the *recuperatores* or *centumviri.* These he requested for the hearing and deciding the business: but none of them could be selected without the consent of both parties.

The prætor, having assigned them their judges, defined and determined the number of witnesses to be admitted, to hinder the protracting of the suit; and then the parties proceeded to give their caution, that the judgment, whatever it were, should be admitted and performed on both sides. The judges took a solemn oath to be impartial; and the parties took the *juramentum calumniæ.* Then the trial began with the assistance of witnesses, writings, &c. which was called *disceptatio causæ.*

ACTION, in a general sense, implies nearly the same thing with Act. Grammarians, however, observe some distinction between *action* and *act;* the former being generally restricted to the common or ordinary transactions, whereas the latter is used to express those which are remarkable. Thus, we say it is a good *action* to comfort the unhappy; it is a generous *act* to deprive ourselves of what is necessary for their sake.

Action, in *Commerce,* is a term used abroad for a certain part or share of a public company's capital stock. Thus, if a company has 400,000 livres capital stock, this may be divided into 400 actions, each consisting of 1000 livres.

Action, in *Mechanics,* implies either the effort which a body or power makes against another body or power, or the effect itself of that effort.

All power is nothing more than a body actually in motion, or which tends to move itself; that is, a body which would move itself if nothing opposed it. The action therefore of a body is rendered evident to us by its motion only; and consequently we must not fix any other idea to the word action than that of actual motion, or a simple tendency to motion. The famous question relating to *vis viva* and *vis mortua* owes its existence, in all probability, to an inadequate idea of the word action; for had Leibnitz and his followers observed that the only precise and distinct idea we can give to the word force or action reduces it to its effect, that is, to the motion it actually produces or tends to produce, they would never have made that curious distinction.

*Quantity of Action,* a name given by M. de Maupertuis, in the Memoirs of the Parisian Academy of Sciences for 1744, and those of Berlin for 1746, to the product of the mass of a body by the space which it runs through, and by its celerity. He lays it down as a general law, that "in the changes made in the state of a body, the quantity of action necessary to produce such change is the least possible." This principle he applies to the investigation of the laws of refraction, of equilibrium, &c. and even to the ways of acting employed by the Supreme Being. In this manner M. de Maupertuis attempts to connect the metaphysics of final causes with the fundamental truths of mechanics.

Action, in *Law,* is a demand made before a judge for obtaining what we are legally entitled to demand, and is more commonly known by the name of *law-suit* or *process.*

Action, in *Oratory,* is the outward deportment of the orator, or the accommodation of his countenance, voice, and gesture, to the subject of which he is treating.

Action, in *Painting* and *Sculpture,* is the attitude or position of the several parts of the face, body, and limbs, of such figures as are represented, and whereby they seem to be really actuated by passions. Thus, we say, the action of such a figure finely expresses the passions with which it is agitated; we also use the same expression with regard to animals.

Action, in *Physiology,* is applied to the functions of the body, whether vital, animal, or natural.—The *vital* functions, or actions, are those which are absolutely necessary to life, and without which there is no life; as the action of the heart, lungs, and arteries.—The *natural* functions are those which are instrumental in repairing the several losses which the body sustains; for life is destructive of itself, its very offices occasioning a perpetual waste. The manducation of food, the deglutition and digestion thereof, also the separation and distribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by these our aliment is converted into our nature. They are necessary to the continuance of our bodies.—The *animal* functions are those which, though not absolutely essential to life, are distinctive of animal existence, such as sensation, and voluntary motion.

Action, in *Poetry,* the same with subject or fable. Critics generally distinguish two kinds, the principal and the incidental. The principal action is what is generally called the *fable,* and the incidental an *episode.*

ACTIONARY, or Actionist, a proprietor of stock in a trading company.

ACTIVE denotes something that communicates action or motion to another; in which acceptation it stands opposed to passive.

Active, in *Grammar,* is applied to such words as express action, and is therefore opposed to passive. The active performs the action, as the passive receives it. Thus we say, a verb *active,* a conjugation *active,* &c. or an *active* participle.

*Active Verbs* are such as do not only signify doing, or acting, but have also nouns following them, to be the subject of the action or impression. Thus, *to love, to teach,* are verbs *active;* because we can say, *to love a thing, to teach a man.* See Grammar.

ACTIUM, in *Ancient Geography,* a town situate on the coast of Acarnania, in itself inconsiderable, but famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the same name, in the mouth of the Sinus Ambracius, opposite to Nicopolis, on the other side of the bay. It became famous on account of Augustus's victory over Antony and Cleopatra, and for quinquennial games instituted there, called *Actia*, or *Ludi Actiaci*. Hence the epithet *Actius*, given to Apollo. (Virgil.) *Actiaca æra*, a computation of time from the battle of Actium. See ROMAN HISTORY.

ACTIUS, in *Mythology*, a surname of Apollo, from Actium, where he was worshipped.

ACTON, a large village in the county of Middlesex and hundred of Ossulton, about five miles from London. It was formerly frequented on account of some saline springs, which have now fallen into disuse. The grand junction canal, in its way from Uxbridge to London, passes through the parish. It is a rectory in the patronage of the bishop of London. The number of inhabitants in 1831, was 2453; in 1841, 2665; and in 1851, 2582.

ACTOR, in the *Drama*, is a person who represents some part or character. See DRAMA. Actors were highly honoured at Athens: at Rome they were despised, and not only denied all rank among the citizens, but even when any citizen appeared upon the stage, he was expelled his tribe, and deprived of the right of suffrage by the censors. The French have in this respect adopted the ideas of the Romans; the English those of the Greeks. Female actors were unknown to the ancients, among whom men always performed the female character; and hence one reason for the use of masks among them. Actresses are by some said not to have been introduced on the English stage till after the restoration of King Charles II. who has been charged with contributing to the corrupting of our manners by importing this usage from abroad. But this can be but partly true, for Prynne, in his *Histriomastix*, speaks of women actors as prostitutes; which, as the Queen of Charles I. sometimes acted in the court dramas, was one occasion of the severe prosecution brought against him for that book. See BIBLIOGRAPHY, sect. 6.

ACTOR, the name of several persons in *Fabulous History*. One *Actor* among the Aurunci is described by Virgil as a hero of the first rank.—*Æn*. ix. xii.

ACTORUM TABULÆ, in *Antiquity*, were tables instituted by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturn.

ACTUARIÆ NAVES, a kind of long and light ships among the Romans, thus denominated because they were chiefly designed for swiftness and expedition. They correspond to what the French call *brigantines*.

ACTUARIUS, a celebrated Greek physician of the thirteenth century, and the first Greek author who has treated of mild purgatives, such as cassia, manna, senna, &c. He is the first also who mentions distilled waters. His works were printed in one volume folio, by Henry Stephens, in 1567.

ACTUARIUS, or ACTARIUS, a notary, or officer, appointed to write the acts or proceedings of a court, or the like. In the eastern empire, the actuarii were, properly, officers who kept the military accounts, received the corn from the *susceptores*, or storekeepers, and delivered it to the soldiers.

ACTUARY, an officer of a society or company, usually combining the functions of secretary and adviser. It is most usually applied to the manager of an insurance company, or joint stock association, under a board of directors.

ACTUS, in *Ancient Architecture*, a measure in length equal to 120 Roman feet. In *Ancient Agriculture* the word signified the length of one furrow, or the distance a plough goes before it turns.

*ACTUS Intervicinalis*, a space of ground four feet in breadth, left between the lands as a path or way.

*ACTUS Major*, or *Actus Quadratus*, a piece of ground in a square form, whose side was equal to 120 feet, equal to half the jugerum.

*ACTUS Minimus* was a quantity of land 120 feet in length and four in breadth.

ACUANITES, in *Ecclesiastical History*, the same with those called more frequently MANICHEES. They took the name from Acua, a disciple of Thomas, one of the twelve apostles.

ACULEATE, or ACULEATI, a term applied to any plant or animal armed with prickles.

ACULEI, the prickles of animals or of plants.

ACULER, in the *Manege*, is used for the motion of a horse, when, in working upon volts, he does not go far enough forward at every time or motion, so that his shoulders embrace or take in too little ground, and his croupe comes too near the centre of the volt. Horses are naturally inclined to this fault in making demi-volts.

ACUMINA, in *Antiquity*, a kind of military omen most generally supposed to have been taken from the points or edges of darts, swords, or other weapons.

ACUNA, CHRISTOPHER D', a Spanish Jesuit, born at Burgos. He was admitted into the society in 1612, being then but 15 years of age. After having devoted some years to study, he went to America, where he assisted in making converts in Chili and Peru. In 1640 he returned to Spain, and gave the king an account how far he had succeeded in the commission he had received to make discoveries on the river of the Amazons; and the year following he published, at Madrid, in a quarto volume, a description of this river, entitled *Nuevo Descubrimiento del Gran Rio de las Amazonas*. He was ten months together upon this river, having had instructions to inquire into every thing with the greatest exactness, that his Majesty might thereby be enabled to render the navigation more easy and commodious. He embarked in a boat at Jaen in Quito with Peter Texiera, who had already been so far up the river, and was therefore thought a proper person to accompany him in this expedition. They embarked in February 1639, but did not arrive at Para till the December following. It is thought that the revolution of Portugal, by which the Spaniards lost Brazil, and the colony of Para, at the mouth of the river of the Amazons, led to the suppression of Acuna's narrative; for, as it could not be of any advantage to the Spaniards, they were afraid it might prove of service to the Portuguese, by instructing them in the navigation of that great river. M. de Gomberville, the possessor of one of the few copies that escaped, published a French translation at Paris in 1682, in 2 vols. 12mo. Acuna appears to have returned to Peru, and to have died there; but the year of his death is uncertain.

ACUPUNCTURE, the name of a surgical operation among the Chinese and Japanese, which is performed by pricking the part affected with a silver needle. They employ this operation in headaches, lethargies, convulsions, colics, &c.; and it has more lately been introduced into British practice.

ACUTE, an epithet applied to such things as terminate in a sharp point or edge; and in this sense it stands opposed to obtuse.

*ACUTE-angled*, in *Geometry*, is that which is less than a right angle, or which does not subtend 90 degrees.

ACUTIATOR, in writers of the barbarous ages, denotes a person that whets or grinds cutting instruments; called also in ancient glossaries *acutor*, ακονητης, *samiarius*, *cotiarius*, &c. In the ancient armies there were *acutiatores*, a kind of smiths, retained for whetting or keeping the arms sharp.

AD, a Latin preposition, originally signifying *to*, and frequently used in composition, both with and without the *d*, to express the relation of one thing to another.

*Ad Bestias*, in *Antiquity*, is the punishment of criminals condemned to be thrown to wild beasts.

*Ad Hominem*, in *Logic*, a kind of argument drawn from the principles or prejudices of those with whom we argue.

*Ad Ludos*, in *Antiquity*, a sentence upon criminals among the Romans, whereby they were condemned to entertain the people by fighting either with wild beasts or with one another, and thus executing justice upon themselves.

*Ad Metalla*, in *Antiquity*, the punishment of such criminals as were condemned to the mines, among the Romans; and therefore called *Metallici*.

*Ad Valorem*, a term chiefly used in speaking of the duties or customs paid for certain goods. The duties on some articles are paid by the number, weight, measure, tale, &c.; and others are paid *ad valorem*, that is, according to their value.

ADAGE, a proverb, or short sentence, containing some wise observation or popular saying. Erasmus has made a very large and valuable collection of the Greek and Roman adages; and Mr Ray has done the same with regard to the English. We have also Kelly's Collection of Scots Proverbs.

ADAGIO, in *Music*. See MUSIC.

ADAIR, or ADARE, an ancient town in Ireland, now reduced to a village. It is eight miles S.W. of Limerick, and has a fine old bridge over the river Maig.

ADAIR is also the name of two counties in the United States of America; the first in Kentucky, with a population of 9917; the second in Missouri, with a population of 2351.

ADAL, or ADEL, or ADAIEL, a region between Abyssinia and the Red Sea, to the south of Bab-el-Mandeb. It was little known to Europeans until described in the travels of Isenberg and Krapf in 1839, and later by Beke. It forms the S.W. coasts of the Red Sea for 300 miles, which are composed of coral rock. The country is generally barren, intensely hot, and rather flat. A lofty mountain of 5000 feet high, Mount Gedem, stands isolated in the plain, and is succeeded in the ascent to the table-land of Tigré by a series of conical hills. Some parts of it are fit for pasturage, and those portions are inhabited by tribes possessing many domestic animals; and beasts of prey, and elephants are said not to be uncommon. The route to Abyssinia from Massowah lies through this country; but that from Tajarrah to Ankobar, to the south, is preferable, as less steep. On this route is seen a remarkable salt lake, Bahr Assal, which is 570 feet below the surface of the Red Sea; and volcanic rocks occur in various parts of the route. Two mountains of 4000 feet in height are mentioned, Abida and Aiyala, which occupy the centre of a volcanic district, and have sent down streams of lava on all sides to the distance of 30 miles. The river Hawash runs through this district, and is said to be navigable for boats 300 miles from its embouchure. This country has also been visited by the English missionaries, Messrs Keith and Coffin.

Adal is inhabited by many tribes who call themselves Danâkil and Dankali. Rüppel, who visited this country, mentions only the name of Shohos, whom he describes as strong and muscular, with black, crisp hair, short straight noses, thick lips, but less so than the negro feature, their colour dark brown. They are nomadic, and are Mahomedans. The only traffic in the country is in the salt of the Bahr Assal. (T. S. T.)

ADALBERT, *Saint*, one of the first founders of Christianity in Germany, was sprung of a noble family in pagan Sclavonia, and raised to the see of Prague, A.D. 983. Having laboured incessantly to reclaim the clergy and laity from their licentious ways, he retired in despair to the monastery of St Alexis at Rome; but from this retreat he was speedily recalled by his flock, who received him with public honours.

Finding little amendment, however, in their course of living, and having learnt that all his kinsmen had been massacred in a church, he resolved to end his days in missionary labours. But while engaged in worship with some converts in Pomerania, a pagan priest thrust a spear through his heart, A.D. 997.

ADALIDES, in the Spanish policy, are officers of justice for matters touching the military forces. In the laws of King Alphonsus, the adalides are spoken of as officers appointed to guide and direct the marching of the forces in time of war.

ADAM (אדם), the word by which the Bible designates the first human being.

The meaning of the primary word is, most probably, any kind of *reddish tint*, as a beautiful human complexion; but its various derivatives are applied to different objects of a red or brown hue, or approaching to such. The word *Adam*, therefore, is an appellative noun converted into a proper one.

That men and other animals have existed from eternity, has been asserted by some: whether they really believed their own assertion may well be doubted. Others have maintained that the first man and his female mate, or a number of such, came into existence by some spontaneous action of the earth or the elements, a chance combination of matter and properties, without an intellectual designing cause. We hold these notions to be unworthy of a serious refutation. An upright mind, upon a little serious reflection, must perceive their absurdity, self-contradiction, and impossibility.

It is among the clearest deductions of reason, that men and all dependent beings have been *created*, that is, produced or brought into their first existence by an intelligent and adequately powerful being. A question, however, arises, of great interest and importance. Did the Almighty Creator produce only one man and one woman, from whom all other human beings have descended?—or did he create several parental pairs, from whom distinct stocks of men have been derived? The affirmative of the latter position has been maintained by some, and, it must be confessed, not without apparent reason.

But the admission of the possibility is not a concession of the reality. So great is the evidence in favour of the derivation of the entire mass of human beings from one pair of ancestors, that it has obtained the suffrage of the men most competent to judge upon a question of comparative anatomy and physiology. The late illustrious Cuvier and Blumenbach, and our countryman Lawrence, are examples of the highest order. But no writer has a claim to deference upon this subject superior to that of Dr J. C. Prichard.

It is evident upon a little reflection, and the closest investigation confirms the conclusion, that the first human pair must have been created in a state equivalent to that which all subsequent human beings have had to reach by slow degrees, in growth, experience, observation, imitation, and the instruction of others: that is, a state of prime maturity, and with an infusion, concreation, or whatever we may call it, of knowledge and habits, both physical and intellectual, suitable to the place which man had to occupy in the system of creation, and adequate to his necessities in that place. Had it been otherwise, the new beings could not have preserved their animal existence, nor have held rational converse with each other, nor have paid to their Creator the homage of knowledge and love, adoration and obedience; and reason clearly tells us that the last was the noblest end of existence. Those whom unhappy prejudices lead to reject revelation must either admit this, or must resort to suppositions of palpable absurdity and impossibility. If they will not admit a direct action of divine power in creation and adaptation to the designed mode of existence, they must admit something far beyond the miraculous, an infinite succession of finite beings, or a spontaneous production of order, organization, and systematic action, from some unintelligent origin. The Bible coincides with this dictate of honest reason, expressing these facts in simple and artless language, suited to the circumstances of the men to whom revelation was first granted. That this production in a mature state was the fact with regard to the vegetable part of the creation, is declared in Gen. ii. 4, 5: "In the day of Jehovah God's making the earth and the heavens, and every shrub of the field before it should be in the earth, and every herb of the field before it should bud." The reader sees that we have translated the verbs (which stand in the Hebrew future form) by our potential mood, as the nearest in correspondence with the idiom called by Dr Nordheimer the "Dependent Use of the Future." (*Critical Grammar of the Heb. Lang.*, vol. ii. p. 186; New York, 1841.) The two terms, shrubs and herbage, are put, by the common synecdoche, to designate the whole vegetable kingdom. The reason of the case comprehends the other division of organized nature; and this is applied to man and all other animals, in the words, "Out of the ground—dust out of the ground—Jehovah God formed them."

It is to be observed that there are two narratives at the beginning of the Mosaic records, different in style and manner, distinct and independent; at first sight somewhat discrepant, but when strictly examined, perfectly compatible, and each one illustrating and completing the other. The first is contained in Gen. i. 1. to ii. 3.; and the other, ii. 4. to iv. 26. As is the case with the Scripture history generally, they consist of a few principal facts, detached anecdotes, leaving much of necessary implication which the good sense of the reader is called upon to supply; and passing over large spaces of the history of life, upon which all conjecture would be fruitless.

In the second of these narratives we read, "And Jehovah God formed the man [*Heb.* the Adam], dust from the ground [האדמה, *haadamah*], and blew into his nostrils the breath of life; and the man became a living animal" (Gen. ii. 7). Here are two objects of attention, the organic mechanism of the human body, and the vitality with which it was endowed.

The mechanical material, formed (moulded, or arranged, as an artificer models clay or wax) into the human and all other animal bodies, is called "dust from the ground." This would be a natural and easy expression to men in the early ages, before chemistry was known or minute philosophical distinctions were thought of, to convey, in a general form, the idea of *earthy matter*, the constituent substance of the ground on which we tread. To say, that of this the human and every other animal body was formed, is a position which would be at once the most easily apprehensible to an uncultivated mind, and which yet is the most exactly true upon the highest philosophical grounds. We now know, from chemical analysis, that the animal body is composed, in the inscrutable manner called *organization*, of carbon, hydrogen, oxygen, nitrogen, lime, iron, sulphur, and phosphorus. Now all these are mineral substances, which in their various combinations form a very large part of the solid ground.

In the Scripture narrative, we are told, "God created man in his own image: in the image of God created he him; male and female created he them." (Gen. i. 27.) *The image* (צלם *tselem*, resemblance, such as a shadow bears to the object which casts it) *of God* is an expression which breathes at once archaic simplicity and the most recondite wisdom: for what term could the most cultivated and copious language bring forth more suitable to the purpose? It presents to us man as made in a resemblance to the author of his being, a true resemblance, but faint and shadowy; an outline, faithful according to its capacity, yet infinitely remote from the reality: a distant form of the *intelligence*, *wisdom*, *power*, *rectitude*, *goodness*, and *dominion* of the Adorable Supreme.

On man was also conferred the shadow of the divine *dominion* and *authority* over the inferior creation. The attribute of *power* was given to him, in his being made able to convert the inanimate objects and those possessing only the vegetable life, into the instruments and the materials for supplying his wants, and continually enlarging his sphere of command.

In such a state of things *knowledge* and *wisdom* are implied: above all, *moral excellence* must have been comprised in this "image of God;" and not only forming a part of it, but being its crown of beauty and glory.

In this perfection of the faculties, and with these high prerogatives of moral existence, did human nature, in its first subject, rise up from the creating hand. The whole Scripture-narrative implies that this STATE of existence was one of correspondent *activity* and *enjoyment*. It plainly represents the DEITY himself as condescending *to assume a human form and to employ human speech*, in order to instruct and exercise the happy beings whom God created for immortality in the image of his own nature.

The noble and sublime idea that man thus had his Maker for his teacher and guide, precludes a thousand difficulties. It shows us the simple, direct, and effectual method by which the newly-formed creature would have communicated to him all the intellectual knowledge, and all the practical arts and manipulations, which were needful and beneficial for him. The universal management of the "garden in Eden eastward" (Gen. ii. 8), the treatment of the soil, the use of water, the various training of the plants and trees, the operations for insuring future produce, the necessary implements and the way of using them;—all these must have been included in the words "to dress it and to keep it" (ver. 15.)

Religious knowledge and its appropriate habits also required an immediate infusion: and these are pre-eminently comprehended "in the image of God." It is not to be supposed that the newly-created man and his female companion were inspired with a very ample share of the doctrinal knowledge which was communicated to their posterity by the successive and accumulating revolutions of more than four thousand years: and it is impossible that they could be left in gross ignorance of the existence and excellencies of the Being who had made them, their obligations to him, and the way in which they might continue to receive the greatest blessings from him.

The next important article in this primeval history is the creation of the human female. The narrative is given in the more summary manner in the former of the two documents:—'Male and female created he them." (Gen. i. 27.) It stands a little more at length in a *third* document, which begins the fifth chapter, and has the characteristic heading or title by which the Hebrews designated a separate work. "This, the book of the generations of Adam. In the day God created Adam, he made him in the likeness [דמית, *demuth*, a different word from that already treated upon, and which merely signifies *resemblance*] of God, male and female he created them; and he blessed them, and he called their name Adam, in the day of their being created" (ver. 1, 2.) The reader will observe that, in this passage, we have translated the word for *man* as the proper name, because it is so taken up in the next following sentence.

The second of the narratives is more circumstantial: "And Jehovah God said, it is not good the man's being alone: I will make for him a help suitable for him." Then follows the passage concerning the review and the naming of the inferior animals; and it continues—"but for Adam he found not a help suitable for him. And Jehovah God caused a deep sleep to fall upon the man [the Adam], and he slept: and he took one out of his ribs, and closed up the flesh in its place: and Jehovah God built up the rib which he had taken from the man into a woman, and he brought her to the man: and the man said, this is the hit; bone out of my bones, and flesh out of my flesh;

Adam. this shall be called woman [*ishah*], for this was taken from out of man [*ish*]" (Gen. ii. 18–23).

This *peculiar manner* of the creation of the woman has, by some, been treated as merely a childish fable; by others, as an allegorical fiction intended to represent the close relation of the female sex to the male, and the tender claims which women have to sympathy and love. That such was the intention we do not doubt; but why should that intention be founded upon a mythic allegory? Is it not taught much better, and impressed much more forcibly, by its standing not on a fiction, but on a fact?

Another inquiry presents itself. How long did the state of paradisiac innocence and happiness continue? Some have regarded the period as very brief, not more even than a single day; but this manifestly falls very short of the time which a reasonable probability requires. The first man was brought into existence in the region called Eden; then he was introduced into a particular part of it, the garden, replenished with the richest productions of the Creator's bounty for the delight of the eye and the other senses; the most agreeable labour was required "to dress and to keep it," implying some arts of culture, preservation from injury, training flowers and fruits, and knowing the various uses and enjoyments of the produce; making observation upon the works of God, of which an investigation and designating of animals is expressly specified; nor can we suppose that there was no contemplation of the magnificent sky and the heavenly bodies: above all, the wondrous communion with the condescending Deity, and probably with created spirits of superior orders, by which the mind would be excited, its capacity enlarged, and its holy felicity continually increased. It is also to be remarked, that the narrative (Gen. ii. 19, 20) conveys the implication that some time was allowed to elapse, that Adam might discover and feel his want of a companion of his own species, "a help correspondent to him."

These considerations impress us with a sense of probability, amounting to a conviction, that a period not very short was requisite for the exercise of man's faculties, the disclosures of his happiness, and the service of adoration which he could pay to his Creator. But all these considerations are strengthened by the recollection that they attach to man's solitary state; and that they all require new and enlarged application when the addition of conjugal life is brought into the account. The conclusion appears irresistible that a duration of many days, or rather weeks or months, would be requisite for so many and important purposes.

Thus divinely honoured and happy were the progenitors of mankind in the state of their creation.

The next scene which the sacred history brings before us is a dark reverse. Another agent comes into the field and successfully employs his arts for seducing Eve, and by her means Adam, from their original state of rectitude, dignity, and happiness.

Among the provisions of Divine wisdom and goodness were two vegetable productions of wondrous qualities and mysterious significancy; "the tree of life in the midst of the garden, and the tree of knowledge of good and evil." (Gen. ii. 9.)

We see no sufficient reason to understand, as some do, "the tree of life" collectively, as implying a species, and that there were many trees of that species.

The "tree of the knowledge of good and evil" might be any tree whatever; it might be of any species even yet remaining, though, if it were so, we could not determine its species, for the plain reason that no name, description, or information whatever is given that could possibly lead to the ascertainment. One cannot but lament the vulgar practice of painters representing it as an apple-tree, and thus giving occasion to profane and silly witticisms.

Yet we cannot but think the more reasonable probability to be, that it was a tree having poisonous properties, stimulating and intoxicating, such as are found in some existing species, especially in hot climates. On this ground the prohibition to eat or even touch the tree was a beneficent provision against the danger of pain and death.

But the revealed object of this "tree of the knowledge of good and evil" was that which would require no particular properties beyond some degree of external beauty, and fruit of an immediately pleasant taste. That object was to be a *test of obedience.* For such a purpose, it is evident, that to select an indifferent act to be the object prohibited, was necessary; as the obligation to refrain should be only that which arises simply, so far as the subject of the law can know, from the sacred will of the lawgiver. There was no difficulty in the observance of their Creator's precept. They were surrounded with a paradise of delights, and they had no reason to imagine that any good whatever would accrue to them from their seizing upon any thing prohibited. If perplexity or doubt arose, they had ready access to their Divine benefactor for obtaining information and direction. But they allowed the thought of disobedience to form itself into a disposition, and then a purpose.

Thus was the seal broken,—the integrity of the heart was gone,—the sin was generated,—and the outward act was the consummation of the entire process. Eve, less informed, less cautious, less endowed with strength of mind, became the more ready victim. "The woman, being deceived, was in the transgression;" but "Adam was not deceived" (1 Tim. ii. 14.) He rushed knowingly and deliberately to ruin. The offence had grievous aggravations. It was the preference of a trifling gratification to the approbation of the Supreme Lord of the universe; it implied a denial of the wisdom, holiness, goodness, veracity, and power of God; it was marked with extreme ingratitude; and it involved a contemptuous disregard of consequences, awfully impious as it referred to their immediate connection with the moral government of God, and cruelly selfish as it respected their posterity.

The instrument of the temptation was a serpent; whether any one of the existing kinds, it is evidently impossible for us to know. Of that numerous order many species are of brilliant colours, and playful in their attitudes and manners; so that one may well conceive of such an object attracting and fascinating the first woman. Whether it spoke in an articulate voice, like the human, or expressed the sentiments attributed to it by a succession of remarkable and significant actions, may be a subject of reasonable question.

This part of the narrative begins with the words, "And the serpent was crafty above every animal of the field" (Gen. iii. 1.) It is to be observed that this is not said of the order of serpents, as if it were a general property of them, but of *that* particular serpent. Had the noun been intended generically, as is often the case, it would have required to be without the substantive verb; for such is the usual Hebrew method of expressing universal propositions: of this the Hebrew scholar may see constant examples in the Book of Proverbs.

Indeed, this "cunning craftiness, lying in wait to deceive" (Eph. iv. 14.), is the very character of that malignant creature of whose wily stratagems the serpent was a mere instrument. The existence of spirits, superior to man, and of whom some have become depraved, and are labouring to spread wickedness and misery to the utmost of their power, has been found to be the belief of all nations, ancient and modern, of whom we possess information. It has also been the general doctrine of both Jews and Christians, that one of those fallen spirits was the real agent in this first and successful temptation. Of this doctrine, the declarations of our Lord and his apostles contain abundant confirmation.

After their fearful transgression, the condescending Deity, who had held gracious and instructive communion with the parents of mankind, assuming a human form, visibly stood before them; by a searching interrogatory he drew from them the confession of their guilt, which they aggravated by evasions and insinuations against God himself: he then pronounced sentence on them and their seducer. On the woman he inflicted the pains of child-bearing, and a deeper and more humiliating dependence upon her husband. He doomed the man to hard and often fruitless toil, instead of easy and pleasant labour. On both, or rather on human nature universally, he pronounced the awful sentence of death. The denunciation of the serpent partakes more of a symbolical character, and so seems to carry a strong implication of the nature and the wickedness of the concealed agent. The human sufferings threatened are all, excepting the last, of a remedial and corrective kind.

Of a quite different character are the penal denunciations upon the serpent. If they be understood literally, and of course applied to the whole order of Ophidia (as, we believe, is the common interpretation), they will be found to be flagrantly at variance with demonstrated facts in their physiology and economy.

But all difficulty is swept away when we consider the fact, that the Hebrew is הנחש היה *hannachash haiah*, THE *serpent was*, &c. and that it refers specifically and personally to a rational and accountable being, *the spirit of lying and cruelty, the devil, the Satan, the old serpent*. That God, the infinitely holy, good, and wise, should have permitted any one or more celestial spirits to apostatise from purity, and to be the successful seducers of mankind, is indeed an awful and overwhelming mystery. But it is not more so than the permitted existence of many among mankind, whose rare talents and extraordinary command of power and opportunity, combined with extreme depravity, have rendered them the plague and curse of the earth; and the whole merges into the awful and insolvable problem, Why has the All-perfect Deity permitted evil at all? We are firmly assured, that He will bring forth, at last, the most triumphant evidence that "He is righteous in all his ways, and holy in all his works." In the meantime, our happiness lies in the implicit confidence which we cannot but feel to be due to the Being of infinite perfection.

The remaining part of the denunciation upon the false and cruel seducer sent a beam of light into the agonized hearts of our guilty first parents: "And enmity will I put between thee and the woman, and between thy seed and her seed: he will attack thee [on] the head, and thou wilt attack him [at] the heel." Christian interpreters generally regard this as the *Protevangelium*, the first gospel-promise, and we think with good reason. It was a manifestation of mercy; it revealed a Deliverer, "who should be a human being, in a peculiar sense the offspring of the female, who should also, in some way not yet made known, counteract and remedy the injury inflicted, and who, though partially suffering from the malignant power, should, in the end, completely conquer it, and convert its very success into its own punishment." (J. Pye Smith, *Scripture Testimony to the Messiah*, vol. i. p. 226.)

The awful threatening to man was, "In the day that thou eatest of it, thou wilt die the death." The infliction is *Death*, in the most comprehensive sense,—that which stands opposed to *Life*,—the life of not only animal enjoyment, but holy happiness, the life which comported with the image of God. This was lost by the fall; and the sentence of physical death was pronounced, to be executed in due time. Divine mercy gave a long respite.

The same mercy was displayed in still more tempering the terrors of justice. The garden of delights was not to be the abode of rebellious creatures. But before they were turned out into a bleak and dreary wilderness, God was pleased to direct them to make clothing, suitable to their new and degraded condition, of the skins of animals. That those animals had been offered in sacrifice, is a conjecture supported by so much probable evidence, that we may regard it as a well-established truth.

From this time we have little recorded of the lives of Adam and Eve. Their three sons are mentioned with important circumstances connected with each of them. Cain was probably born in the year after the fall; Abel possibly some years later; Seth, certainly one hundred and thirty years from the creation of his parents. After that Adam lived eight hundred years, and had sons and daughters, doubtless by Eve, and then he died, nine hundred and thirty years old. In that prodigious period, many events, and those of great importance, must have occurred; but the wise providence of God has not seen fit to preserve to us any memorial of them, and scarcely any vestiges or hints are afforded of the occupations and mode of life of men through the antediluvian period.

ADAM *of Bremen* was a canon of the cathedral of Bremen, and lived in the latter part of the eleventh century. He wrote a church history, in four books, treating of the propagation of the Christian faith in the north, entitled *Historia ecclesiastica ecclesiarum Hamburgensis et Bremensis, ab anno* 788 *ad an.* 1072; and also another work particularly interesting to geographers, called *Chronographia Scandinaviæ*, or, *De Situ Daniæ et reliquarum trans Daniam regionum natura.* The time of his death is not known.

ADAM, *Alexander*, Rector of the High School, Edinburgh, and author of several valuable works connected with Roman literature, was born on the 24th of June 1741, on a small farm which his father rented, not far from Forres, in Morayshire. He does not appear to have received any powerful direction to literary pursuits, either from the attainments of his parents or the ability of the parochial schoolmaster; but is referable to a class of men, of which Scotland can produce a very honourable list, whom the secret workings of a naturally active mind have raised above the level of their associates, and urged on to distinction and usefulness under the severest pressure of difficulties. The gentle treatment of an old schoolmistress first taught him to like his book; and this propensity induced his parents to consent that he should learn Latin. To the imperfect instruction which he received at the parish school, he joined indefatigable study at home, notwithstanding the scanty means and poor accommodation of his father's house. Before he was sixteen he had read the whole of Livy, in a copy of the small Elzevir edition, which he had borrowed from a neighbouring clergyman, omitting for the present all such passages as his own sagacity and Cole's *Dictionary* did not enable him to construe. It was before day-break, during the mornings of winter, and by the light of splinters of bog-wood dug out of an adjoining moss, that he prosecuted the perusal of this difficult classic; for, as the whole family were collected round the only fire in the evening, he was prevented by the noise from reading with any advantage; and the day-light was spent at school.

In the autumn of 1757 he was a competitor for one of those bursaries, or small exhibitions, which are given by the university of Aberdeen to young men who distinguish themselves for their classical attainments; but as the prize was awarded to the best written exercises, and as Adam, with all his reading, had not yet been accustomed to write, he was foiled by some youth who had been more fortunate in his means of instruction. About the same time Mr Watson, a relation of his mother's, and one of the ministers of the Canongate, sent him a tardy invitation to come to Edinburgh, "provided he was prepared to endure every hardship for a season,"—a condition not likely to appal one who knew nothing of life but its hardships. The interest of Mr Watson procured him free admission to the lectures of the different professors; and as he had now also access to books in the College Library, his literary ardour made him submit with cheerfulness to the greatest personal privations. Eighteen months of assiduous application enabled him to repair the defects of his early tuition, and to obtain, after a comparative trial of candidates, the head mastership of the foundation known by the name of Watson's Hospital. At this period he was only nineteen, on which account the governors of the institution limited the appointment to half a year; but his steadiness and ability speedily removed their scruples. After holding the situation for three years, he was induced, by the prospect of having more leisure for the prosecution of his studies, to resign it, and become private tutor to the son of Mr Kincaid, a wealthy citizen, and afterwards Lord Provost of Edinburgh; and it was in consequence of this connection that he was afterwards raised to the office for which he was so eminently qualified. He taught in the High School, for the first time, in April 1765, as substitute for Mr Matheson, the rector; in consequence of whose growing infirmities, an arrangement was made, by which he retired on a small annuity, to be paid from the profits of the class; and Mr Adam was confirmed in the rectorship on the 8th of June 1768.

From this period the history of his life is little more than the history of his professional labours and of his literary productions. No sooner was he invested with the office, than he gave himself up with entire devotion to the business of his class, and the pursuits connected with it. For forty years his day was divided with singular regularity between the public duties of teaching and that unwearied research and industry in private which enabled him, amidst the incessant occupation of a High School master's life, to give to the world such a number of accurate and laborious compilations. So entirely did these objects of public utility engross his mind, that he mixed but little with society, and considered every moment as lost that was not dedicated in some way or other to the improvement of youth. Few men certainly could adopt, with more truth and propriety, the language of Horace, both with regard to his own feelings and the objects on which he was occupied.

......mihi tarda fluunt ingrataque tempora, quæ spem
Consiliumque morantur agendi gnaviter id, quod
Æque pauperibus prodest, locupletibus æque,
Æque, neglectum, pueris senibusque nocebit.
*Epist.* i. 1. 23.

The rector's class, which in the High School is the most advanced of five, consisted of no more than between thirty and forty boys when Dr Adam was appointed. His celebrity as a classical teacher, joined to the progress of the country in wealth and population, continued to increase this number up to the year of his death. His class-list for that year contained 167 names,—the largest number that had ever been collected in one class, and, what is remarkable, equal to the amount of the whole five classes during the year when he first taught in the school.

He performed an essential service to the literature of his country by introducing, in his own class, an additional hour of teaching for Greek and Geography; neither of which branches seems to have been contemplated in the original formation of the school. The introduction of Greek, which he effected a year or two after his election, was regarded by some professors of the university as a dangerous innovation, and an unwarrantable encroachment on the province of the Greek chair; and the measure was accordingly resisted (though, it is satisfactory to think, unsuccessfully) by the united efforts of the Senatus Academicus, in a petition and representation to the town-council, drawn up and proposed by the celebrated Principal of the university, Dr Robertson. This happened in 1772.

It is not possible for a man of principle and ordinary affections to be occupied in training a large portion of the youth of his country to knowledge and virtue, without feeling a deep responsibility, and a paramount interest in their progress and welldoing. That such were Dr Adam's feelings is proved, not less by the whole tenor of his life, than by his mode of conducting the business of his class; by the free scope and decided support he gave to talent, particularly when the possessor of it was poor and friendless; by the tender concern with which he followed his pupils into life; and by a test not the least unequivocal, the enthusiastic attachment and veneration which they entertain for his memory. In his class-room, his manner, while it imposed respect, was kindly and conciliating. He was fond of relieving the irksomeness of continued attention by narrating curious facts and amusing anecdotes. In the latter part of his life, he was perhaps too often the hero of his own tale; but there was something amiable even in this weakness, which arose from the vanity of having done much good, and was totally unmixed with any alloy of selfishness.

Dr Adam's first publication was his *Grammar*, which appeared in 1772. Although it met with the approbation of some eminently good judges, particularly of Bishop Lowth, the author had no sooner adopted it in his own class, and recommended it to others, than a host of enemies rose up against him, and he was involved in much altercation and vexatious hostility with the town-council and the four under masters.

His work on *Roman Antiquities* was published in 1791, and has contributed, more than any of his other productions, to give him a name as a classical scholar.

In 1794, he published his *Summary of Geography and History*, in one thick octavo volume of 900 pages, which had grown in his hands to this size from a small treatise on the same subject, printed for the use of his pupils in 1784.

His last work was his *Latin Dictionary*, which appeared in 1805, printed, like every other production of his pen, in the most unassuming form, and with the utmost anxiety to condense the greatest quantity of useful knowledge into the smallest bulk, and afford it to the student at the cheapest rate. It was intended chiefly for the use of schools, and to be followed by a larger work, containing copious illustrations of every word in the language. The MS. of this important work, which he did not survive to complete, is deposited in the library of the school over which he so long and so ably presided. He died on the 18th of December 1809, after an illness of five days. Amidst the wanderings of mind that accompanied it, he was constantly reverting to the business of the class, and addressing his boys; and in the last hour of his life, as he fancied himself examining on the lesson of the day, he stopped short, and said, "But it grows dark, you may go;" and almost immediately expired.

The magistrates of Edinburgh, whose predecessors had not always been alive to his merits, showed their respect for his memory by a public funeral. A short time before his death, he was solicited by some of his old pupils to sit to Mr Raeburn for his portrait, which was executed in the best style of that eminent artist, and placed, as a memorial of their gratitude and respect, in the library of the High School.

He was twice married; first in 1775, to Miss Munro, eldest daughter of the minister of Kinloss, by whom he had several children, the last of whom died within a few days of his father; and in 1789, to Miss Cosser, daughter of Mr Cosser, Comptroller of Excise, by whom he had two daughters and a son. (J. P—S.)

Adam, *Melchior*, lived in the seventeenth century. He was born in the territory of Grotkaw in Silesia, and educated in the college of Brieg, where he became a firm Protestant, and was enabled to pursue his studies by the liberality of a person of quality, who had left several exhibitions for young students. He was appointed rector of a college at Heidelberg, where he published, in the year 1615, the first volume of his *Vitæ Germanorum Philosophorum*, &c. This volume was followed by three others: that which treated of divines was printed in 1619; that of the lawyers came next; and, finally, that of the physicians: the last two were published in 1620. All the learned men whose lives are contained in these four volumes lived in the sixteenth or beginning of the seventeenth century, and are either Germans or Flemings; but he published in 1618 the lives of twenty divines of other countries in a separate volume, entitled *Decades duæ, continentes Vitas Theologorum exterorum principum.* All his divines are Protestants. His industry as a biographer is commended by Bayle, who acknowledges his obligations to his labours. He died in 1622.

Adam, *Robert*, an eminent architect, was born at Edinburgh in the year 1728. He was the second son of William Adam, Esq. of Maryburgh, in the county of Fife, who also has left some respectable specimens of his genius and abilities as an architect in Hopetoun House and the Royal Infirmary of Edinburgh, which were erected from designs executed by him. And it was perhaps owing to the fortunate circumstance of his father's example that young Adam first directed his attention to those studies, in the prosecution of which he afterwards rose to such distinguished celebrity. He received his education at the university of Edinburgh, where he had an opportunity of improving and enlarging his mind, by the conversation and acquaintance of some of the first literary characters of the age, who were then rising into reputation, or have since established their fame as historians and philosophers. Among these were Mr Hume, Dr Robertson, Dr Smith, and Dr Ferguson, who were the friends and companions of the father, and who continued through life their friendship and attachment to the son.

In the year 1754, Mr Adam travelled on the Continent, with a view to extend his knowledge and improve his taste in architecture, and resided in Italy for three years. Here he surveyed and studied those noble specimens of ancient grandeur which the magnificent public edifices of the Romans, even in ruins, still exhibit. In tracing the progress of architecture and the other fine arts among the Romans, Mr Adam observed that they had visibly declined previously to the time of Diocletian; but he was also convinced that the liberal patronage and munificence of that emperor had revived, during his reign, a better taste for architecture, and had formed artists who were capable of imitating the more elegant style of a purer age. He had seen this remarkably exemplified in the public baths at Rome, which were erected by him, the most entire and the noblest of the ancient buildings. Admiring the extent and fertility of genius of the artists from whose designs such magnificent structures had been executed, he was anxious to see and study any remains that yet existed of those masters whose works were striking monuments of an elegant and improved taste, but whose names, amid the wrecks of time, have sunk into oblivion. It was with this view that he undertook a voyage to Spalatro, in Dalmatia, to visit and examine the private palace of Diocletian. Mr Adam sailed from Venice in July 1754, accompanied by M. Clerisseau, a French artist and antiquary, and two experienced draughtsmen. On their arrival at Spalatro, they found, that though the palace had suffered much from the injuries of time, yet it had sustained no less from the dilapidations of the inhabitants to procure materials for building; and even the foundations of the ancient structure were covered with modern houses. Suspecting that their object was to view and make plans of the fortifications, an immediate and peremptory order was issued by the governor, commanding them to desist. This order, however, was soon counteracted through the mediation of General Græme, the commander-in-chief of the Venetian forces. They resumed their labours with double ardour, and in five weeks finished plans and views of the fragments which remain, from which they were enabled to execute perfect designs of the entire building.

Mr Adam now returned to England, and soon rose to very considerable professional eminence. In 1762 he was appointed architect to the king; and the year following he presented to the public the fruit of his voyage to Spalatro, in a splendid work, containing engravings and descriptions of the ruins of the palace.

In the year 1768, Mr Adam obtained a seat in parliament. He was chosen to represent the county of Kinross; and about the same time he resigned his office of architect to the king. But he continued his professional career with increasing reputation; and about the year 1773, in conjunction with his brother James, who also rose to considerable eminence as an architect, he published another splendid work, consisting of plans and elevations of public and private buildings which were erected from their designs. Among these are, Lord Mansfield's house at Caenwood; Luton House in Bedfordshire, belonging to Lord Bute; the new Gateway of the Admiralty Office; the Register Office at Edinburgh, &c.; which are universally admired as striking monuments of elegant design and correct taste. The Adelphi buildings at London, which also are a very fine example of the inventive genius of the Messrs Adam, proved an unsuccessful speculation.

The buildings more lately erected from the designs of Mr Adam afford additional proofs of his invention and skill. We may mention, in particular, the Infirmary of Glasgow, as exhibiting the most perfect symmetry and useful disposition of parts, combined with great beauty and lightness.

To the last period of his life Mr Adam displayed an increasing vigour of genius and refinement of taste; for, in the space of one year preceding his death, he designed eight great public works, besides twenty-five private buildings, so various in their style and beautiful in their composition, that they have been allowed, by the best judges, as sufficient of themselves to establish his fame. The improved taste which now pretty generally prevails in our public and private edifices, undoubtedly owes much to the elegant and correct style introduced by this distinguished artist.

He died on the 3d of March 1792, by the bursting of a blood-vessel, in the 64th year of his age, and was buried in Westminster Abbey. The natural suavity of his manners, joined to the excellence of his moral character, secured to him the affectionate regard of his friends, and the esteem of all who enjoyed his acquaintance. James Adam, already mentioned as associated with his brother in many of his labours, died on the 20th October 1794.

Adam, *William*, nephew of the preceding, was the eldest son of John Adam, Esq. of Blair-Adam (for a short time called Maryburgh), in the county of Kinross, in Scotland. He was born in Kinross-shire on the 2d of August 1751; and, after the usual courses at the colleges of Edinburgh and Glasgow, passed advocate at the Scotch bar in 1773. But he made no serious attempt to practise there, having very soon removed to England, where he obtained a seat in the House of Commons in 1774, and in 1782 was called to the English common-law bar. He continued in parliament till 1795, when he withdrew from it till 1806. Being then chosen to represent the united shires of Kinross and Kincardine, he resumed his seat, and continued in the House, but with some interruptions, till 1811.

His parliamentary life thus lasted about 30 years; during all which period he took a conspicuous part in most of the proceedings of the House. But it would be idle to detail his particular share in them here. It is only in the cases of the few men who leave permanent impressions on their age, that the details of parliamentary exertion, however honourable to him who makes them, and however interesting to his friends, are cared for by general readers. It is enough, therefore, to state that Mr Adam, though a popular speaker, was not an orator, and had far too much sense to try to be thought one. But he was one of the many members who do, by judgment and attention, what eloquence would in vain attempt to accomplish. He made himself of importance by good sense, industry, popularity of manner, and a firm adherence, though not without the incidental differences that will occasionally separate the steadiest partisans, to the Whig principles and the Whig party, which he had adopted, and from which he never swerved. Some inconsiderate words which occurred in a debate in 1779, produced a hostile meeting between him and Mr Fox, when the latter was slightly wounded; but neither before nor after could there be two better friends. They were both of the small but noble band who stood out for the practical exercise of the British constitution, against the encroachments which they thought that, under a real or pretended horror of the first French Revolution, were making upon it by Government. None of his parliamentary exertions were more valuable, or more ably conducted, than those which he made in March 1794, against the shocking proceedings of the Scotch Criminal Court in certain trials for sedition; when that court, while sedition, how often soever committed, could, in England, be only punished by fine and imprisonment, punished a first offence by 14 years' transportation; and this without a statute, and solely in the exercise of judicial discretion, and at a time when New South Wales, where these unfortunate men were sent, as the court understood that they would be, was in a state of desolate and unapproachable barbarism.

After being called to the English bar, he prosecuted its business with the steady assiduity of one who knew that success was necessary for his independence. If he had given himself to this field exclusively, he would have risen still higher in it than he actually did; for this is a profession in which no one can give himself fair play who attempts to combine it with any other occupation. He was known to be deeply engaged with parliament, and with the management of the pecuniary affairs of several members of the royal family, particularly of the Prince of Wales and the Duke of York, to whom his practical sagacity was of the greatest use. But still he rose to very considerable practice, and became a king's counsel in 1796,—counsel to the East India Company in 1802,—and was successively Attorney and Solicitor General to the Prince, afterwards George IV.,—one of the managers of the impeachment of Warren Hastings, and one of the counsel who conducted the defence of the first Lord Melville, when he (as Mr Dundas) was impeached also. During the short period when his party was in power, in 1806, he was Chancellor of the Duchy of Cornwall, and was afterwards a Privy Councillor, and Lord-Lieutenant of Kinross-shire.

In 1814 he withdrew from England, on being made a Baron of Exchequer in Scotland. This was preparatory to his last elevation as Chief Commissioner of the Jury-Court, to which he was appointed in 1815, and in connection with which institution he will be chiefly known historically.

The application of juries to the trial of civil causes was till then unknown in Scotland. The want of them had been long complained of, both by enlightened lawyers and by the public; and, though there were some haters of change to whom their introduction was offensive, it was recommended by all liberal legislators, legal and political, in both quarters of the island; and Baron Adam was selected to preside over the new tribunal. He continued to do so till 1830, by which time he had matured our jury practice sufficiently to enable it to be engrafted into the business of the permanent supreme tribunal, and to admit of his own separate jury-court being abolished.

The general problem of the fitness of juries for the decision of facts involving civil interests, and the success of the effort to introduce them into Scotland, are not questions for discussion here. There has recently been an apparent abatement of the idolatry of jury-trial in England, and there are some who hold the Scotch experiment to have totally failed. The truth probably is, that the English use civil juries too indiscriminately, and that the expectations of what they were to effect in Scotland were extravagant. But their total failure in Scotland is, unquestionably, not a fact. On the contrary, they continue to perform most valuable service in the administration of justice, and could not be given up without an instant revival of the unavoidable and intolerable evils, which, though now forgotten by many, produced the absolute necessity for their establishment.

But whatever may be now thought of the jury principle, there can be but one just opinion of the exact merit of the judge to whom its introduction into Scotland was entrusted. His devotion to his task was ardent and constant. No man ever gave himself more earnestly to the achievement of a great judicial end. He did not bring profound law to the work; one good effect of which was, that it liberated his mind from exclusive addiction to the system in which he had been trained. Unstiffened by previous habits, he was able to relieve Scotch awkwardness by English experience, and to enlarge English narrowness by Scotch reason. His skill in directing juries was not so great as his judgment in the formation of rules for ripening the system. His candour,—the cheerful endurance of his patience,—his simple but dignified urbanity, and his uniform accessibility, were all perfect. He and his court were, at first, so much obstructed by prejudice, that without his protection the measure would have been defeated without ever having had a fair trial.

Personally, he was, in all practical matters an able manager;—and always kind and pleasant,—beloved by his family and a large circle of friends,—of excellent conversation, and delightful in society. His long residence in London, and his acquaintance with almost all the celebrated men of all classes of his time, supplied him with a never-failing store of well-told anecdote. His connection with his native country previously to his final return to it in 1815, had been kept up by regular visits;—as might have been expected of one who never ceased to consider the country of his birth and education as his home, and to whom Blair-Adam was Arabia Felix. It is now, through his tasteful management, adorned by judiciously placed and thriving wood. When his grandfather acquired it, the whole foliage it could boast of was supplied by a single tree. He was one of the very best depositaries of all the old and fast-fading peculiarities of Scotland; the dialect of which, and when he chose, its accent, he retained thoroughly; and remembered and enjoyed all the sayings and customs of the country, its local literature, and all its curious old characters and occurrences. His combination of the social knowledge of both kingdoms, added to his natural shrewdness of observation on all passing subjects, gave him great conversational advantages, and made him a most agreeable companion.

After maintaining a gallant battle against some personal infirmities, and preserving his mental powers unimpaired, he died at Edinburgh on the 17th of February 1839, in his 89th year. He had long survived his wife, a daughter of Lord Elphinstone, and was succeeded by his eldest surviving son, Admiral Sir Charles Adam, governor of Greenwich Hospital; his only other remaining child now surviving being General Sir Frederick Adam. (H. C.)

Adam's *Apple*, a name given to a species of Citrus.

Adam's *Bridge*, or *Rama's Bridge*, in *Geography*, a ridge of sands and rocks, extending across the north end of Manaar gulf, from the island of that name on the north-west coast of Ceylon, to Ramencote or Ramisseram island, off Raman point. The extent of this chain of shoals and islands is about one degree; but some of the sand-banks are dry, while much of it has not more than three or four feet below water; and it is divided by three or four deeper cuts, that in calm weather permit the passage of native boats and small vessels through tortuous and intricate channels.

Adam's *Peak*, the highest mountain in Ceylon, is stated by Dr Davy, who ascended it, to rise to the height of 6680 feet in a very steep acclivity, and to terminate in a point not more than 74 feet by 24 feet. On this small plain is the supposed impression of the foot of *Boodhu*, an object of high veneration to the Cingalese, who make frequent pilgrimages to this sacred spot, where a priest resides to receive the offerings of the devotees, and to bless them on their departure. The *foot-mark* is partly natural, partly artificial, and measures 5 feet 4 inches by 2 feet 6 inches. It has a margin of brass ornamented with some gems of small value, and is covered by a roof. The mountain is wooded almost to the top, and is seen at the distance of twenty leagues from sea. The view from it is very sublime. Long. 80. 39. E. Lat. 6. 55. N.

ADAMANT, a name sometimes given to the diamond. (See Diamond.) It is likewise applied to the scoriæ of gold, the magnet, &c.

ADAMIC Earth, a name given to common red clay, alluding to that species of earth of which the first man is supposed to have been made.

ADAMI Pomum, in *Anatomy*, a protuberance in the fore part of the throat, formed by the os hyoides. It is thought to be so called from a strange conceit that a piece of the forbidden apple which Adam ate stuck by the way and occasioned it.

ADAMITES, or Adamians, in *Ecclesiastical History*, the name of a sect of ancient heretics, supposed to have been a branch of the Basilidians and Carpocratians.

Epiphanius tell us that they were called Adamites from their pretending to be re-established in the state of innocence, and to be such as Adam was at the moment of his creation, whence they ought to imitate him in his nakedness. They rejected marriage, maintaining that the conjugal union would never have taken place upon earth had sin been unknown.

This obscure and ridiculous sect did not at first last long; but it was revived, with additional absurdities, in the twelfth century, by one Tandamus, since known by the name of *Tanchelin*, who propagated his errors at Antwerp in the reign of the emperor Henry V. He maintained that there ought to be no distinction between priests and laymen, and that fornication and adultery were meritorious actions. Tanchelin had a great number of followers, and was constantly attended by 3000 of these profligates in arms. His sect did not, however, continue long after his death; but another appeared under the name of *Turlupins*, in Savoy and Dauphiny, where they committed the most brutal actions in open day.

About the beginning of the fifteenth century, one Picard, a native of Flanders, spread these errors in Germany and Bohemia, particularly in the army of the famous Zisca, notwithstanding the severe discipline he maintained. Picard pretended that he was sent into the world as a new Adam, to re-establish the law of nature; which, according to him, consisted in exposing every part of the body, and having all the women in common. This sect found also some partisans in Poland, Holland, and England: they assembled in the night; and it is asserted, that one of the fundamental maxims of their society was contained in the following verse:—

Jura, perjura, secretum prodere noli.

ADAMS, a township of Berkshire county, in the state of Massachusetts, in North America. It is 140 miles north-west of Boston, and contains 3703 inhabitants. In the northern part of this district, a stream called Hudson's brook has worn a channel through a stratum of white marble, and over the channel the rocks form a fine natural bridge, which is 12 or 15 feet long, 10 feet broad, and more than 60 feet above the water.

Adams, the name of six different counties in the United States of America. 1st, in Pennsylvania, population, in 1850, 25,988; 2d, in the southern district of Mississippi, population, 18,621; 3d, in Ohio, population, 18,943; 4th, in Indiana, population, 5774; 5th, in Illinois, population, 26,537; 6th, in Wisconsin, population, 187.

Adams, *John*, a distinguished statesman of the United States of North America. He was born on the 19th or (new style) 30th of October 1736, in that part of the township of Braintree, in Massachusetts, which on a subsequent division was called Quincy. His parents were of that class, then abounding in New England, who united the profession of agriculture with that of some one of the mechanic arts. His ancestor Henry had emigrated from Devonshire in the year 1632, and had established himself at Braintree with six sons, all of whom married: from one descended the subject of this memoir, and from another that Samuel Adams who, with John Hancock, was by name proscribed by an act of the British parliament, for the conspicuous part he acted in the early stages of the opposition to the measures of the mother country. When about fifteen years of age, his father proposed to his son John either to follow the family pursuits, and to receive in due time, as his portion, a part of the estate which they had cultivated, or to have the expense of a learned education bestowed upon him, with which, instead of any fortune, he was to make his way in future life. The son chose the latter alternative; and having received some preparatory instruction, was admitted a student at Harvard College in the year 1751. After passing about three years in that seminary, he removed to the town of Worcester, where, according to the economical practice of that day in New England, he became a tutor in a grammar school, and at the same time was initiated into the practice of the law in the office of Mr Putnam, then an attorney and a colonel of militia, and subsequently a general of some celebrity in the revolutionary war. A letter of Mr Adams, which has lately come before the public, written at the early age of nineteen, shows a degree of foresight which, like many other predictions, may have led to its own accomplishment. It is dated 12th October 1755, and says, "Soon after the Reformation, a few people came over to this new world for conscience' sake. Perhaps this apparently trivial incident may transfer the great seat of empire to America. It looks likely to me; for if we can remove the turbulent Gallic (the French in Canada), our people, according to the exactest computation, will in another century become more numerous than England itself. Should this be the case, since we have, I may say, all the naval stores of the nation in our hands, it will be easy to obtain the mastery of the seas; and then the united force of all Europe will not be able to subdue us. The only way to keep us from setting up for ourselves is to disunite us."

He was admitted to practice in the year 1758, and gradually rose to the degree of eminence which a local court can confer; and obtained distinction by some essays on the subject of the canon and feudal law, which were directed to point to the rising difference which commenced between the mother country and the colonies, soon after the peace of 1763 had delivered the latter from all disquietude respecting the establishments of France in the adjoining province of Canada. His character rose, both as a lawyer and a patriot, so as to induce Governor Barnard, who wished to gain him over to the royal party, to offer him the office of advocate-general in the Admiralty Court, which was deemed a sure step to the highest honours of the bench. Two years after, he was chosen one of the representatives of his native town to the congress of the province.

His professional integrity was soon after exhibited in the defence of Captain Preston and some soldiers, who were tried before a Boston jury on a charge of murder. In this case Adams was counsel for the defence; and being considered by the people, then in an inflamed state against the troops, as a determined friend of liberty, his eloquence obtained a verdict of acquittal, without lessening his popularity.

When it was determined, in 1774, to assemble a general congress from the several colonies, Mr Adams was one of those solicited for the purpose by the people of Massachusetts. Before departing for Philadelphia to join the congress, he parted with the friend of his youth, his fellow-student and associate at the bar, Jonathan Sewall, who had attained the rank of attorney-general, and was necessarily opposed to his political views. Sewall made a powerful effort to change his determination, and to deter him from going to the congress. He urged, that Britain was determined on her system, and was irresistible; and would be destructive to him and all those who should persevere in opposition to her designs. To this Adams replied: "I know that Great Britain has determined on her system, and that very fact determines me on mine. You know I have been constant and uniform in opposition to her measures; the die is now cast; I have passed the Rubicon; to swim or sink, live or die, survive or perish with my country, is my unalterable determination." The conversation was then terminated by Adams saying to his friend, "I see we must part; and with a bleeding heart, I say, I fear for ever. But you may depend upon it, this adieu is the sharpest thorn on which I ever set my foot."

When the continental congress was assembled, Mr Adams became one of its most active and energetic leaders. He was a member of that committee which framed the declaration of independence, and one of the most powerful advocates for its adoption by the general body; and by his eloquence obtained the unanimous suffrages of that assembly. Though he was appointed chief-justice in 1776, he declined the office, in order to dedicate his talents to the general purpose of the defence of the country.

In 1777, he, with three other members, was appointed a commissioner to France. He remained in Paris about a year and a half, when, in consequence of disagreements among themselves, in which Adams was not implicated, all but Franklin were recalled. In the latter end of 1779, he was charged with two commissions, one as a plenipotentiary to treat for peace, the other empowering him to form a commercial treaty with Great Britain. When arrived in Paris, the French government viewed with jealousy the purpose of the second commission; and Count de Vergennes advised him to keep it secret, with a view to prevail on the congress to revoke it. Mr Adams refused to communicate to the Count his instructions on that subject; and an altercation arose, from a claim made by France for a discrimination in favour of French holders of American paper money in the liquidation of it. The Count complained to congress, transmitted copies of Mr Adams' letters, and instructed the French minister at Philadelphia to demand his recal. The demand was rejected, but afterwards four others were joined with him in the commission. Whilst these negotiations were in progress, he went to Holland, and there, in opposition to the influence and talents of the British minister, Sir Joseph Yorke, succeeded both in negotiating a loan, and in procuring the assistance of that country in the defence against Great Britain. He formed a commercial treaty with that republic, and joined in the ephemeral association called "the armed neutrality."

In 1785 Mr Adams was appointed ambassador to the court of his former sovereign, where his conduct was such as to secure the approbation of his own country, and the respect of that to which he was commissioned. Whilst in London, he published his work entitled *Defence of the American Constitution*, in which he combated ably the opinions of Turgot, Mably, and Price, in favour of a single legislative assembly; and thus perhaps contributed to the division of power and the checks on its exercise, which became established in the United States. At the close of 1787 he returned, after ten years devoted to the public service, to America. He received the thanks of congress, and was elected soon after, under the presidency of Washington, to the office of vice-president. In 1790 Mr Adams gave to the public his *Discourses* on Davila, in which he exposed the revolutionary doctrines propagated by France and her emissaries in other countries. On the retirement of Washington, the choice of president fell on Mr Adams, who entered on that office in May 1797. At that time the government was entangled by the insolent pretensions of the French demagogues, and by their partisans in many of the states. Great differences of opinion arose between the individuals at the head of affairs: one party, with Mr Hamilton at their head, was disposed to resist the pretensions of France by open hostilities; whilst Mr Adams was disinclined to war, so long as there was a possibility of avoiding it with honour. Owing to this division of his own friends, rather than to a want of public confidence, at the conclusion of the four years for which the president is chosen, Mr Adams was not re-elected. Perhaps this was in some measure owing to the preponderance of the slave states, in which Mr Jefferson, his rival, and a proprietor of slaves, had a fellow-feeling among the chief of the people.

He retired with dignity, at sixty-eight years of age, to his native place, formed no political factions against those in power, but publicly expressed his approbation of the measures which were pursued by him who had been his rival, who had become his successor in power, but had never ceased to be his firmly attached friend.

The last public occasion on which Mr Adams appeared, was as a member of the convention for the revision of the constitution of Massachusetts, in which some slight alterations were requisite, in consequence of the province of Maine being separated from it.

He seems to have enjoyed his mental faculties to the close of his protracted life; and even on the last day of it, two hours only before its final close, on the 4th July 1825, the fiftieth anniversary of the act of independence, he dictated to a friend, as a sentiment to be given at the public dinner of the day, "Independence for ever."

Mr Adams was considered a sound scholar, well versed in the ancient languages, and in many branches of general literature. His style in writing was forcible and perspicuous, and, in the latter years of his life, remarkably elegant. In person he was of middling stature; his manners spoke the courtesy of the old school; and his address, at least when he was in England, was dignified and manly. (W. J.)

Adams, *John Quincy*, son of the preceding, was born at Boston in 1767. After spending some years in Europe, he settled as a lawyer in his native city. From 1794 to 1801 he filled the office of American minister at the Hague, and at Berlin. After some years spent in the practice of his profession, and the discharge of various public duties, he was sent, in 1809, as ambassador to St Petersburg, where his influence secured the treaty of peace with Great Britain. He was next ambassador at the court of St James's, from which he was recalled, to act as secretary of state. His distinguished abilities and services finally received their highest acknowledgment, by his election, in 1825, to the president's chair, which high office he discharged with a purity and fidelity that signalised his administration as a pattern of patriotic government. On the expiry of his term of office he retired into private life, acting, however, for many years as a representative in congress. He died at Washington on the 23d of February 1848, in the eighty-second year of his age.

ADAMSON, Patrick, a Scottish prelate, archbishop of St Andrews, was born in the year 1543, in the town of Perth, where he received the rudiments of his education. He afterwards studied philosophy, and took his degree of master of arts at the university of St Andrews. In 1566 he set out for Paris as tutor to a young gentleman. In the month of June of the same year, Mary Queen of Scots being

Adana.

delivered of a son, afterwards James VI. of Scotland and I. of England, Mr Adamson wrote a Latin poem on the occasion. In this poem he gave the prince the title of king of France and England. This proof of his loyalty involved him in difficulties. The French court was offended, and ordered him to be arrested; and he was confined for six months. He was released only through the intercession of Queen Mary and some of the principal nobility, who interested themselves in his behalf. As soon as he recovered his liberty, he retired with his pupil to Bourges. He was in this city during the massacre at Paris; and the same persecuting spirit prevailing among the Catholics at Bourges as at the metropolis, he lived concealed for seven months in a public-house, the aged master of which, in reward for his charity to heretics, was thrown from the roof, and had his brains dashed out. Whilst Mr Adamson lay thus in his sepulchre, as he called it, he wrote his Latin poetical version of the book of Job, and his tragedy of Herod in the same language. In the year 1573, he returned to Scotland, and, having entered into holy orders, became minister of Paisley. In the year 1575, he was appointed one of the commissioners, by the general assembly, to settle the jurisdiction and policy of the church; and the following year he was named, with Mr David Lindsay, to report their proceedings to the Earl of Morton, then regent. About this time the earl appointed him one of his chaplains; and, on the death of Archbishop Douglas, promoted him to the archiepiscopal see of St Andrews. His new dignity brought upon him great trouble and uneasiness. The clamour of the Presbyterian party rose high against him, and many inconsistent and absurd stories were propagated concerning him. Soon after his promotion, he published his catechism in Latin verse, a work highly approved even by his enemies, who nevertheless still continued to persecute him with great violence. In 1578 he submitted himself to the general assembly, which procured him peace but for a very little time; for, the year following, fresh accusations were brought against him. A provincial synod was held at St Andrews in April 1586: the archbishop was here accused and excommunicated. He appealed to the king and the states, but this availed him little. At the next general assembly, a paper being produced containing the archbishop's submission, he was absolved from the excommunication. In 1588 fresh accusations were brought against him. The year following he published the Lamentations of the prophet Jeremiah in Latin verse, which he dedicated to the king, complaining of his hard usage. In the latter end of the same year he published a translation of the Apocalypse in Latin verse, and a copy of Latin verses. The king was unmoved by his application, and granted the revenue of his see to the duke of Lennox; so that the prelate and his family were literally reduced to the want of bread. During the remaining part of his unfortunate life he was supported by charitable contribution, and died in 1591. The character of this prelate has been variously represented, according to the sentiments of religion and politics which prevailed. But there is little doubt that he encouraged and supported, under the authority of the king, oppressive and injurious measures. The panegyric of the editor of his works, Mr Wilson, is extravagant and absurd. He says, that "he was a miracle of nature, and rather seemed to be the immediate production of God Almighty, than born of a woman."

ADANA, a town of Asia Minor. It is a place of considerable trade; and, as commanding the passage of the mountains to the north of Syria, was an important military station in the contest between the Egyptians and Turks in 1832. After the defeat of the Turkish army at Konieh, it was taken possession of by Ibrahim Pacha, and continued to be held by the Egyptians until the treaty of July 1840 compelled them to evacuate it. It is the capital of the province of the same name. It is situate on the river Sihoon, on the banks of which stands a small but strong castle, built on a rock. It has a great number of beautiful fountains brought from the river by means of water-works. Over the river there is a stately bridge of fifteen arches, which leads to the water-works. The climate is pleasant and healthy, and the winter mild and serene; but the summer is so hot as to oblige the principal inhabitants to retire to the neighbouring mountains, where they spend six months among shady trees and grottos, in a most delicious manner. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulse, and herbs of all sorts, all the year round; besides corn, wine, and fruits, in their proper season. It is 30 miles north-east of Tarsus, on the road to Aleppo. Long. 35. 12. E. Lat. 37. 10. N.

Adanson.

ADANSON, Michael, a celebrated naturalist, was descended from a Scottish family which had at the Revolution attached itself to the fortunes of the house of Stuart; and was born the 7th of April 1727, at Aix in Provence, where his father was in the service of M. de Vintimille, then archbishop of that province. On the translation of this prelate to the archbishopric of Paris, about the year 1730, the elder Adanson also repaired thither, accompanied by his infant family of five children, all of whom were provided for by their father's patron. A small canonry fell to the lot of our future naturalist, the revenue of which defrayed the expenses of his education at the college of Plessis. While there, he was distinguished for great quickness of apprehension, strength of memory, and mental ardour; but his genius took no particular bent, until he received a microscope from the celebrated Tuberville Needham, who happened to be present at one of the public examinations, and was struck with admiration of his talents and acquirements. From the moment that young Adanson received this donation, to the last hour of his life, he persevered with a zeal almost unexampled, in the observation and study of nature.

On leaving college, his youthful ardour was well employed in the cabinets of Reaumur and Bernard de Jussieu, as well as in the *Jardin des Plantes*. Such was his zeal, that he repeated the instructions of the professors to such of his fellow-students as could not advance with a rapidity equal to his own; and before he had completed his nineteenth year, he had actually described (for his own improvement) four thousand species of the three kingdoms of nature. In this way he soon exhausted the rich stores of accumulated knowledge in Europe; and having obtained a small appointment in the colony of Senegal, he resigned his canonry, and embarked on the 20th of December 1748 for Africa.

The motives which decided the choice of Senegal as the scene of his observations are recorded by himself, and are too remarkably indicative of his ardent thirst of knowledge not to be noticed. "It was," says he, in a memorandum found after his death, "of all European establishments the most difficult to penetrate, the most hot, the most unhealthy, the most dangerous in every respect, and consequently the least known to naturalists."

His ardour remained unabated during the five years that he remained in Africa, in which period he collected and described an immense number of animals and plants; delineated maps of the country, and made astronomical observations; prepared grammars and dictionaries of the languages spoken on the banks of the Senegal; kept meteorological registers; composed a detailed account of all the plants of the country; and collected specimens of every object of commerce. M. Cuvier mentions that he had seen the produce and results of all these multifarious and laborious exertions.

He founded his classification of all known organized beings on the consideration of each individual organ. As each organ gave birth to new relations, so he established a corresponding number of arbitrary arrangements. Those beings possessing the greatest number of similar organs were referred to one great division, and the relationship was considered more remote in proportion to the dissimilarity of organs.

The chief defect of this method consists in presupposing a knowledge of species and their organization, altogether beyond the existing stage of attainment. It gives, however, distinct ideas of the degree of affinity subsisting between organized beings, independent of all physiological science. Of this *universal method*, as he called it, Adanson gave some account in an essay contained in his Treatise on Shells, published at the end of his *Voyage au Sénégal.*

Until the appearance of this work, the animals inhabiting shells had been much neglected. On this branch of his subject our author exercised his wonted zeal, while his methodical distribution, founded on not less than twenty of the partial classifications already alluded to, is decidedly superior to that of any of his predecessors. Like every first attempt, however, it had its imperfections, and these arose from not having examined the anatomical structure of the animals; from which cause he omitted, in his arrangement of the class of *Mollusca*, all *molluscous* animals without shells.

His original plan was to have published the whole of the observations made during his residence at Senegal, in eight volumes; but being deterred by the difficulties attending so extensive a publication, he abandoned the scheme, and applied himself entirely to his *Families of Plants*, which he published in 1763. In this he found the application of his general principle not less advantageous than in his preceding works.

In 1774 (eleven years after the appearance of his *Families of Plants*), he submitted to the consideration of the Academy of Sciences an immense work, containing what may be called the *universal application of his universal method;* for it extended to all known beings and substances, whether in the heavens or on the earth. Twenty-seven large volumes of manuscripts were employed in displaying the general relations of all these matters, and their distribution. One hundred and fifty volumes more were occupied with the alphabetical arrangement of 40,000 species. There was also a vocabulary, which contained 200,000 words, with their explanations; and the whole was closed by a number of detached memoirs, 40,000 figures, and 30,000 specimens of the three kingdoms of nature. The committee of the academy to which the inspection of this enormous mass had been intrusted, warmly recommended to Adanson to separate and publish all that was peculiarly his own, leaving out what was merely compilation: but he obstinately rejected this reasonable advice; by which means science has been deprived of many essays, which, if we may judge from others which he at different times gave to the world, would have possessed great merit. But his life was now drawing near to its close. He died, after many months of severe suffering, on the 3d of August 1806.

Adanson was never married. In his will he requested, as the only decoration of his grave, a garland of flowers gathered from the fifty-eight families which he had established;—"a touching though transitory image," says Cuvier, "of the more durable monument which he has erected to himself in his works." His zeal for science, his unwearied industry, and his talents as a philosophical observer, are conspicuous in all his writings. The serenity of his temper, and the unaffected goodness of his heart, endeared him to the few who knew him intimately.

His most important works are, his *Voyage to Senegal*, and his *Families of Plants.* To the former some essays, already noticed, were subjoined; and various others were published, at different times, in the *Transactions of the Academy of Sciences.* The volumes for the years 1759 and 1761 contain his observations upon the *Taret*, (a species of shell-fish exceedingly destructive to vessels,) and his account of the *Baobab*, an enormous African tree, now known under the name of *Adansonia.* The volume for 1769 contains an interesting discussion by Adanson, upon the origin of the varieties of cultivated plants; and in those for 1773 and 1779 will be found his valuable observations on gum-bearing trees. In the Transactions of 1767 he gave an account of the *Oscillatoria Adansonii*, which he considered a self-moving vegetable; but which ought, according to some observations of M. Vaucher, to be ranked as a zoophyte. Besides these essays, Adanson contributed several valuable articles in natural history to the earlier part of the Supplement to the first *Encyclopédie;* and he is also supposed to have been the author of an essay on the *Electricity of the Tourmaline* (Paris 1757), which bears the name of the Duke of Noya Caraffa. See *Eloge Historique de M. Adanson*, par Cuvier; *Mém. Mathem. et Physiques de l'Inst. National*, tom. vii. (C. M'K.)

ADANSONIA, Ethiopian Sour Gourd, Monkeys' Bread, or African Calabash Tree. (See Botany.)

ADAPIS, an extinct quadruped, described by Cuvier in his *Ossemens Fossiles.* It seems to have been about the size of a hare, but belonged to the *Pachydermata.*

ADAR, the name of a Hebrew month, answering to the end of February and beginning of March, the 12th of their sacred and 6th of their civil year. On the 7th day of it the Jews keep a fast for the death of Moses; on the 13th they have the feast of Esther; and on the 14th they celebrate the feast of Purim, for their deliverance from Haman's conspiracy. As the lunar year, which the Jews followed in their calculations, is shorter than the solar by about eleven days, which at the end of three years make a month, they then intercalate a thirteenth month, which they call *Veadar*, or the *second Adar.*

ADARCON, or Daric, δραχμή, the most ancient gold coin of which any specimens have been preserved to the present day. It was the earliest coined money known among the Jews; the impression on the coin is a crowned archer, in a garb such as is seen in the sculptures of Persepolis. The specimens weighed by Dr Bernard were fifteen grains heavier than our English guinea; their intrinsic value may therefore be reckoned at twenty-five shillings.—Eckhel, *Doctrina Nummorum Veterum;* Bernard, *De Mensuris et Ponderibus.*

ADARME, in *Commerce*, a small weight in Spain, which is also used at Buenos Ayres, and in all Spanish America. It is the 16th part of an ounce, which at Paris is called the *demi-gros.* But the Spanish ounce is seven per cent. lighter than that of Paris. Stephens renders it in English by a *drachm.*

ADATAIS, Adatis, or Adatys, in *Commerce*, a muslin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. It comes from the East Indies, and the finest is made in Bengal.

ADCORDABILES Denarii, in old law-books, signify money paid by the vassal to his lord, upon the selling or exchanging of a feud.

ADCRESCENTES, among the Romans, denoted a kind of soldiery, entered in the army, but not yet put on duty: from these the standing forces were recruited.

ADDA, the ancient *Addua*, a river of Switzerland and Italy, which rises in Mount Braulio, in the country of the Grisons, and passing through the Valteline, traverses the lake Como and the Milanese, and falls into he Po near Cremona.

ADDECIMATE, to ascertain or levy tithes.

ADDEPHAGIA, in *Medicine*, a term used by some physicians for gluttony, or a voracious appetite.

ADDER, in *Zoology*, a name for the VIPER.

ADDER'S GRASS, ADDER'S TONGUE, and ADDER'S WORT, are English names for the cryptogamian plant, *Ophioglossum vulgatum.*

ADDEXTRATORES, in the court of Rome, the pope's mitre-bearers; so called, according to Ducange, because they walk at the pope's right hand when he rides to visit the churches.

ADDICE, or ADZE, a kind of crooked axe used by shipwrights, carpenters, coopers, &c.

ADDICTI, in *Antiquity*, a kind of slaves, among the Romans, adjudged to serve some creditor whom they could not otherwise satisfy, and whose slaves they became till they could pay or work out the debt.

ADDICTIO IN DIEM, among the Romans, the adjudging a thing to a person for a certain price, unless by such a day the owner, or some other, give more for it.

ADDICTION, among the Romans, was the making over goods to another, either by sale or by legal sentence: the goods so delivered were called *bona addicta.* Debtors were sometimes delivered over in the same manner, and thence called *servi addicti.*

ADDISCOMBE COLLEGE is situate about a mile east of Croydon in the county of Surrey. It was established by the East India Company in 1809, for the purpose of providing a suitable education for officers intended for the scientific branches of the Indian army. The present system of education at Addiscombe is considered to be very efficient, and includes the following branches:—mathematics and classics; fortification and artillery; military drawing; military surveying; landscape drawing; French and Hindustani languages; geology and mineralogy; chemistry; and the sword exercise. There is also a chaplain in connection with the college. The appointment of the professors is vested in the court of directors, which has also the sole power of removing them. Pupils are admitted only on obtaining a nomination either from a director of the company or from the president of the board; and must be between 14 and 18 years of age. On entering they have to undergo a preliminary examination on the following subjects, viz.:—English, Latin, writing, the ordinary rules of arithmetic, with fractions, and the extraction of the square root; besides these, it is of great advantage to the cadet in his future studies to have some knowledge of mathematics and drawing. The academical course extends over four terms, comprised in two years study. The number of students at Addiscombe is 150; and, on an average, it annually furnishes the army with 75 cadets. All the officers of the engineers and artillery are required to study at Addiscombe; but those designed for the cavalry and the infantry generally do not study here. Appointments in the corps of engineers and artillery are given as prizes to those students who pass the highest examinations; the most distinguished being selected for the engineers according to the vacancies in that branch; those immediately following in succession are promoted to the artillery; and the others receive commissions in the infantry. The company receive annually L.100 from each pupil for his board and education. The average expenses of a pupil for the year may be estimated at a total of L.120, which includes uniform, books, instruments, and every contingent expense.

ADDISON, JOSEPH, was the eldest son of Dean Addison, the subject of the following article. He was born at his father's rectory of Milston in Wiltshire, on the 1st day of May 1672. After having passed through several schools, the last of which was the Charter-house, he went to Oxford, when he was about fifteen years old. He was first entered of Queen's College, but after two years was elected a scholar of Magdalen College, having, it is said, been recommended by his skill in Latin versification. He took his master's degree in 1693, and held a fellowship from 1699 till 1711.

The eleven years extending from 1693, or his twenty-first year, to 1704, when he was in his thirty-second, may be set down as the first stage of his life as a man of letters. During this period, embracing no profession, and not as yet entangled in official business, he was a student, an observer, and an author; and though the literary works which he then produced are not those on which his permanent celebrity rests, they gained for him in his own day a high reputation. He had at first intended to become a clergyman; but his talents having attracted the attention of leading statesmen belonging to the Whig party, he was speedily diverted from his earlier views by the countenance which these men bestowed on him. His first patron (to whom he seems to have been introduced by Congreve) was Charles Montague, afterwards Earl of Halifax, who was himself a dabbler in literature, and a protector of literary men; and he became known afterwards to the accomplished and excellent Somers. While both of them were quite able to estimate justly his literary merits, they had regard mainly to the services which they believed him capable of rendering to the nation or the party; and accordingly they encouraged him to regulate his pursuits with a view to public and official employment. For a considerable time, however, he was left to his own resources, which cannot have been otherwise than scanty.

His first literary efforts were poetical. In 1693, a short poem of his, addressed to Dryden, was inserted in the third volume of that veteran writer's *Miscellanies.* The next volume of this collection contained his translation, in tolerable heroic couplets, of "all Virgil's Fourth Georgic, except the story of Aristæus." Two-and-a-half books of Ovid were afterwards attempted; and to his years of early manhood belonged also his prose *Essay on Virgil's Georgics*, a performance which hardly deserved, either for its style or for its critical excellence, the compliment paid it by Dryden, in prefixing it to his own translation of the poem. The most ambitious of those poetical assay-pieces is the "Account of the Greatest English Poets," dated April 1694, and addressed affectionately to Sacheverell, the poet's fellow-collegian, who afterwards became so notorious in the party-quarrels of the time. This piece, spirited both in language and in versification, is chiefly noticeable as shewing that ignorance of old English poetry which was then universal. Addison next, in 1695, published one of those compositions, celebrating contemporary events, and lauding contemporary great men, on which, during the half-century that succeeded the Revolution, there was wasted so much of good writing and of fair poetical ability. His piece, not very meritorious even in its own class, was addressed "To the King," and commemorates the campaign which was distinguished by William's taking of Namur. Much better than the poem itself are the introductory verses to Somers, then lord keeper. This production, perhaps intended as a remembrancer to the writer's patrons, did not at once produce any obvious effect; and we are left in considerable uncertainty as to the manner in which about this time Addison contrived to support himself. He corresponded with Tonson the bookseller about projected works, one of these being a Translation of Herodotus. It was probably at some later time that he purposed compiling a Dictionary of the English language. In 1699 a considerable collection of his Latin verses was published at Oxford, in the "Musæ Anglicanæ." These appear to have interested some foreign scholars; and several of them show curious symptoms of his characteristic humour.

In the same year, his patrons, either having still no office to spare for him, or desiring him to gain peculiarly high qualifications for diplomatic or other important business, provided for him temporarily by a grant, which, though bestowed on a man of great merit and promise, would not pass unquestioned in the present century. He obtained, on the recommendation of Lord Somers, a pension of L.300 a year, designed (as Addison himself afterwards said in a memorial addressed to the crown) to enable him "to travel, and qualify himself to serve His Majesty." In the summer of 1699 he crossed into France, where, chiefly for the purpose of learning the language, he remained till the end of 1700; and after this he spent a year in Italy. In Switzerland, on his way home, he was stopped by receiving notice that he was to be appointed envoy to Prince Eugene, then engaged in the war in Italy. But his Whig friends were already tottering in their places; and, in March 1702, the death of King William at once drove them from power and put an end to the pension. Indeed Addison asserted that he never received but one year's payment of it, and that all the other expenses of his travels were defrayed by himself. He was able, however, to visit a great part of Germany, and did not reach Holland till the spring of 1703. His prospects were now sufficiently gloomy: he entered into treaty, oftener than once, for an engagement as a travelling tutor; and the correspondence in one of these negotiations has been preserved. Tonson had recommended him as the best person to attend in this character the son of the Duke of Somerset, commonly called "The Proud." The duke, a profuse man in matters of pomp, was economical in questions of education. He wished Addison to name the salary he expected; this being declined, he announced, with great dignity, that he would give a hundred guineas a-year; Addison accepted the munificent offer, saying, however, that he could not find his account in it otherwise than by relying on his Grace's future patronage; and his Grace immediately intimated that he would look out for some one else. Towards the end of 1703 Addison returned to England.

Works which he composed during his residence on the Continent, were the earliest that showed him to have attained maturity of skill and genius. There is good reason for believing that his tragedy of *Cato*, whatever changes it may afterwards have suffered, was in great part written while he lived in France, that is, when he was about twenty-eight years of age. In the winter of 1701, amidst the stoppages and discomforts of a journey across the Mount Cenis, he composed, wholly or partly, his *Letter from Italy*, which is by far the best of his poems, if it is not rather the only one among them that at all justifies his claim to the poetical character. It contains some fine touches of description, and is animated by a noble tone of classical enthusiasm. While in Germany, he wrote his *Dialogues on Medals*, which, however, were not published till after his death. These have much liveliness of style, and something of the gay humour which the author was afterwards to exhibit more strongly; but they show little either of antiquarian learning or of critical ingenuity. In tracing out parallels between passages of the Roman poets and figures or scenes which appear in ancient sculptures, Addison opened the easy course of inquiry which was afterwards prosecuted by Spence; and this, with the apparatus of spirited metrical translations from the classics, gave the work a likeness to his account of his travels. This account, entitled *Remarks on Several Parts of Italy, &c.*, he sent home for publication before his own return. It wants altogether the interest of personal narrative: the author hardly ever appears. The task in which he chiefly busies himself is that of exhibiting the illustrations which the writings of the Latin poets, and the antiquities and scenery of Italy, mutually give and receive. Many of the landscapes are sketched with great liveliness; and there are not a few strokes of arch humour. The statistical information is very meagre; nor are there many observations on society; and politics are no further meddled with than to show the moderate liberality of the writer's own opinions.

With the year 1704 begins a second era in Addison's life, which extends to the summer of 1710, when his age was thirty-eight. This was the first term of his official career; and, though very barren of literary performance, it not only raised him from indigence, but settled definitively his position as a public man. His correspondence shows that, while on the Continent, he had been admitted to confidential intimacy by diplomatists and men of rank: immediately on his return he was enrolled in the Kitcat Club, and brought thus and otherwise into communication with the gentry of the Whig party. Although all accounts agree in representing him as a shy man, he was at least saved from all risk of making himself disagreeable in society, by his unassuming manners, his extreme caution, and that sedulous desire to oblige, which his satirist Pope exaggerated into a positive fault. His knowledge and ability were esteemed so highly, as to confirm the expectations formerly entertained of his usefulness in public business; and the literary fame he had already acquired soon furnished an occasion for recommending him to public employment. Though the Whigs were out of office, the administration which succeeded them was, in all its earlier changes, of a complexion so mixed and uncertain, that the influence of their leaders was not entirely lost. Not long after Marlborough's great victory at Blenheim, it is said that Godolphin, the lord treasurer, expressed to Lord Halifax a desire to have the great duke's fame extended by a poetical tribute. Halifax seized the opportunity of recommending Addison as the fittest man for the duty; stipulating, we are told, that the service should not be unrewarded, and doubtless satisfying the minister that his protégé possessed other qualifications for office besides dexterity in framing heroic verse. *The Campaign*, the poem thus written to order, was received with extraordinary applause; and it is probably as good as any that ever was prompted by no more worthy inspiration. It has indeed neither the fiery spirit which Dryden threw into occasional pieces of the sort, nor the exquisite polish that would have been given by Pope, if he had stooped to make such uses of his genius: but many of the details are pleasing; and in the famous passage of the Angel, as well as in several others, there is even something of force and imagination.

The consideration covenanted for by the poet's friends was faithfully paid. A vacancy occurred by the death of another celebrated man, John Locke; and in November 1704, Addison was appointed one of the five commissioners of appeal in Excise. The duties of the place must have been as light for him as they had been for his predecessor; for he continued to hold it with all the appointments he subsequently received from the same ministry. But there is no reason for believing that he was more careless than other public servants in his time; and the charge of incompetency as a man of business, which has been brought so positively against him, cannot possibly be true as to this first period of his official career. Indeed the specific allegations refer exclusively to the last years of his life; and, if he had not really shown practical ability in the period now in question, it is not easy to see how he, a man destitute alike of wealth, of social or fashionable liveliness, and of family interest, could have been promoted, for several years, from office to office, as he was, till the fall of the administration to which he was attached. In 1706, he became one of the under-secretaries of state, serving first under Hedges, who belonged to the Tory section of the government, and afterwards under Lord Sunderland, Marlborough's son-in-law, and a zealous follower of Addison's early patron, Somers. The work of this office however, like that of the commissionership, must often have admitted of performance by deputy. For in 1707, the Whigs having become stronger, Lord Halifax was sent on a mission to the Elector of Hanover; and, besides taking Vanbrugh the dramatist with him as king-at-arms, he selected Addison as his secretary. In 1708 he entered parliament, sitting at first for Lostwithiel, but afterwards for Malmesbury, which, being six times elected, he represented from 1710 till his death. Here unquestionably he did fail. What part he may have taken in the details of business we are not informed; but he was always a silent member, unless it be true that he once attempted to speak and sat down in confusion. In 1709, Lord Wharton, the father of the notorious duke, having been named lord-lieutenant of Ireland, Addison became his secretary, receiving also an appointment as keeper of records. This event happened only about a year and a-half before the dismissal of the ministry; and the Irish secretary would seem to have transacted the business of his office chiefly in London. But there are letters showing him to have made himself acceptable to some of the best and most distinguished persons in Dublin; and he escaped without having any quarrel with Swift, his acquaintance with whom had begun some time before. In the literary history of Addison, those seven years of official service are almost a blank, till we approach their close. He defended the government in an anonymous pamphlet on *The Present State of the War;* he united compliments to the all-powerful Marlborough with indifferent attempts at lyrical poetry in his opera of *Rosamond;* and, besides furnishing a prologue to Steele's comedy of *The Tender Husband*, he perhaps gave some assistance in the composition of the play. Irish administration, however, allowed, it would seem, more leisure than might have been expected. During the last few months of his tenure of office, Addison contributed largely to the *Tatler*. But his entrance on this new field does nearly coincide with the beginning of a new section in his history.

Even the coalition-ministry of Godolphin was too Whiggish for the taste of Queen Anne; and the Tories, the favourites of the court, gained, both in parliamentary power and in popularity out of doors, by a combination of lucky accidents, dexterous management, and divisions and double-dealing among their adversaries. The real failure of the prosecution of Addison's old friend Sacheverell, completed the ruin of the Whigs; and in August 1710, an entire revolution in the ministry had been completed. The Tory administration, which succeeded, kept its place till the Queen's death in 1714; and Addison was thus left to devote four of the best years of his life, from his thirty-ninth year to his forty-third, to occupations less lucrative than those in which his time had recently been frittered away, but much more conducive to the extension of his own fame, and to the benefit of English literature. Although our information as to his pecuniary affairs is very scanty, we are entitled to believe that he was now independent of literary labour. He speaks, in an extant paper, of having had (but lost) property in the West Indies; and he is understood to have inherited several thousand pounds from a younger brother, who was governor of Madras. In 1711 he purchased, for L.10,000, the estate of Bilton, near Rugby; the same place which, in our own day, became the residence of Mr Apperley, better known by his assumed name of "Nimrod."

During those four years he produced a few political writings. Soon after the fall of the ministry, he contributed five numbers to *The Whig Examiner*, a paper set up in opposition to the Tory periodical of the same name, which was then conducted by the poet Prior, and afterwards became the vehicle of Swift's most vehement invectives against the party he had once belonged to. These are certainly the most ill-natured of Addison's writings; but they are neither lively nor vigorous. There is more spirit in his allegorical pamphlet, *The Trial and Conviction of Count Tariff.*

But from the autumn of 1710 till the end of 1714, his principal employment was the composition of his celebrated Periodical Essays. The honour of inventing the plan of such compositions, as well as that of first carrying the idea into execution, belongs to Richard Steele, who had been a school-fellow of Addison at the Charter-house, continued to be on intimate terms with him afterwards, and attached himself with his characteristic ardour to the same political party. When, in April 1709, Steele published the first number of the *Tatler*, Addison was in Dublin, and knew nothing of the design. He is said to have detected his friend's authorship only by recognising, in one of the early papers, a critical remark which he remembered having himself communicated to Steele. He began to furnish essays in a few weeks, assisted occasionally while he held office, and afterwards wrote oftener than Steele himself. He thus contributed in all, if his literary executor selected his contributions correctly, more than sixty of the 271 essays which the work contains. The *Tatler* exhibited, in more ways than one, symptoms of being an experiment. The projector, imitating the news-sheets in form, thought it prudent to give, in each number, news in addition to the essay; and there was a want, both of unity and of correct finishing, in the putting together of the literary materials. Addison's contributions, in particular, are in many places as lively as anything he ever wrote; and his style, in its more familiar moods at least, had been fully formed before he returned from the Continent. But, as compared with his later pieces, these are only what the painter's loose studies and sketches are to the landscapes which he afterwards constructs out of them. In his invention of incidents and characters, one thought after another is hastily used and hastily dismissed, as if he were putting his own powers to the test, or trying the effect of various kinds of objects on his readers; his most ambitious flights, in the shape of allegories and the like, are stiff and inanimate; and his favourite field of literary criticism is touched so slightly, as to show that he still wanted confidence in the taste and knowledge of the public.

The *Tatler* was dropped at the beginning of 1711; but only to be followed by the *Spectator*, which was begun on the 1st day of March, and appeared every week-day till the 6th day of December 1712. It had then completed the 555 numbers usually collected in its first seven volumes. Addison, now in London and unemployed, co-operated with Steele constantly from the very opening of the series; and the two, contributing almost equally, seem together to have written not very much less than five hundred of the papers. Emboldened by the success of their former adventure, they devoted their whole space to the essays. They relied, with a confidence which the extraordinary popularity of the work fully justified, on their power of exciting the interest of a wide audience by pictures and reflections drawn from a field which embraced the whole compass of ordinary life and ordinary knowledge; no kind of practical themes being positively excluded except such as were political, and all literary topics being held admissible, for which it seemed possible to command attention from persons of average taste and information. A seeming unity was given to the undertaking, and curiosity and interest awakened on behalf of the conductors, by the happy invention of the Spectator's Club, in which Steele is believed to have drawn all the characters. The figure of Sir Roger de Coverley, however, the best even in the opening group, is the only one that was afterwards elaborately depicted; and Addison was the author of all the papers in which his oddities and amiabilities are so admirably delineated. To him, also, the *Spectator* owed a very large share of its highest excellences. His were many, and these the most natural and elegant, if not the most original, of its humorous sketches of human character and social eccentricities, its good-humoured satires on ridiculous features in manners, and on corrupt symptoms in public taste; these topics, however, making up a department in which Steele was fairly on a level with his more famous coadjutor. But Steele had neither learning, nor taste, nor critical acuteness, sufficient to qualify him for enriching the series with such literary disquisitions, as those which Addison insinuated so often into the lighter matter of his essays, and of which he gave an elaborate specimen, in his celebrated and agreeable criticism on *Paradise Lost.* Still further beyond the powers of Steele were those speculations on the theory of literature and of the processes of thought analogous to it, which, in the essays *On the Pleasures of the Imagination*, Addison prosecuted, not, indeed, with much of philosophical depth, but with a sagacity and comprehensiveness which we shall undervalue much, unless we remember how little of philosophy was to be found in any critical views previously propounded in England. To Addison, further, belong those essays which (most frequently introduced in regular alternation in the papers of Saturday) rise into the region of moral and religious meditation, and tread the elevated ground with a step so graceful as to allure the reader irresistibly to follow; sometimes, as in the *Walk through Westminster Abbey*, enlivening solemn thought by gentle sportiveness; sometimes flowing on with an uninterrupted sedateness of didactic eloquence; and sometimes shrouding sacred truths in the veil of ingenious allegory, as in the majestic *Vision of Mirza.* While, in a word, the *Spectator*, if Addison had not taken part in it, would probably have been as lively and humorous as it was, and not less popular in its own day, it would have wanted some of its strongest claims on the respect of posterity, by being at once lower in its moral tone, far less abundant in literary knowledge, and much less vigorous and expanded in thinking. In point of style, again, the two friends resemble each other so closely as to be hardly distinguishable, when both are dealing with familiar objects, and writing in a key not rising above that of conversation. But, in the higher tones of thought and composition, Addison showed a mastery of language raising him very decisively, not above Steele only, but above all his contemporaries. Indeed, it may safely be said, that no one, in any age of our literature, has united, so strikingly as he did, the colloquial grace and ease which mark the style of an accomplished gentleman, with the power of soaring into a strain of expression nobly and eloquently dignified.

On the cessation of the *Spectator*, Steele set on foot *The Guardian*, which, started in March 1713, came to an end in October, with its 175th number. To this series Addison gave fifty-three papers, being a very frequent writer during the latter half of its progress. None of his essays here aim so high as the best of those in the *Spectator;* but he often exhibits both his cheerful and well-balanced humour, and his earnest desire to inculcate sound principles of literary judgment. In the last six months of the year 1714, the *Spectator* received its eighth and last volume; for which Steele appears not to have written at all, and Addison to have contributed twenty-four of the eighty papers. Most of these form, in the unbroken seriousness both of their topics and of their manner, a contrast to the majority of his essays in the earlier volumes; but several of them, both in this vein and in one less lofty, are among the best known, if not the finest, of all his essays. Such are the *Mountain of Miseries;* the antediluvian novel of *Shallum and Hilpa;* the *Reflections by Moonlight on the Divine Perfections.*

In April 1713, Addison brought on the stage, very reluctantly, as we are assured, and can easily believe, his tragedy of *Cato.* Its success was dazzling: but this issue was mainly owing to the concern which the politicians took in the exhibition. The Whigs hailed it as a brilliant manifesto in favour of constitutional freedom. The Tories echoed the applause, to show themselves enemies of despotism, and professed to find in Julius Cæsar a parallel to the formidable Marlborough. Even with such extrinsic aids, and the advantage derived from the established fame of the author, Cato could never have been esteemed a good dramatic work, unless in an age in which dramatic power and insight were almost extinct. It is poor even in its poetical elements, and is redeemed only by the finely solemn tone of its moral reflections, and the singular refinement and equable smoothness of its diction.

The literary career of Addison might almost be held as closed soon after the death of Queen Anne, which occurred in August 1714, when he had lately completed his forty-second year. His own life extended only five years longer; and this closing portion of it offers little that is pleasing or instructive. We see him attaining the summit of his ambition, only to totter for a little and sink into an early grave. We are reminded of his more vigorous days by nothing but a few happy inventions interspersed in political pamphlets, and the gay fancy of a trifling poem on Kneller's portrait of George I.

The Lord Justices who, previously chosen secretly by the Elector of Hanover, assumed the government on the Queen's demise, were, as a matter of course, the leading Whigs. They appointed Addison to act as their secretary. He next held, for a very short time, his former office under the Irish Lord-Lieutenant; and, early in 1715, he was made one of the Lords of Trade. In the course of the same year occurred the first of the only two quarrels with friends, into which the prudent, good-tempered, and modest Addison is said to have ever been betrayed. His adversary on this occasion was Pope, who, only three years before, had received, with an appearance of humble thankfulness, Addison's friendly remarks on his *Essay on Criticism;* but who, though still very young, was already very famous, and beginning to show incessantly his literary jealousies, and his personal and party hatreds. Several little misunderstandings had paved the way for a breach, when, at the same time with the first volume of Pope's *Iliad*, there appeared a translation of the first book of the poem, bearing the name of Thomas Tickell. Tickell, in his preface, disclaimed all rivalry with Pope, and declared that he wished only to bespeak favourable attention for his contemplated version of the *Odyssey.* But the simultaneous publication was awkward; and Tickell, though not so good a versifier as Pope, was a dangerous rival, as being a good Greek scholar. Further, he was Addison's under-secretary and confidential friend; and Addison, cautious though he was, does appear to have said (quite truly) that Tickell's translation was more faithful than the other. Pope's anger could not be restrained. He wrote those famous lines in which he describes Addison under the name of Atticus; and, as if to make reconciliation impossible, he not only circulated these among his friends, but sent a copy to Addison himself. Afterwards, he went so far as to profess a belief that the rival translation was really Addison's own. It is pleasant to observe that, after the insult had been perpetrated, Addison was at the pains, in his *Freeholder*, to express hearty approbation of the *Iliad* of Pope: who, on the contrary, after Addison's death, deliberately printed the striking but malignant lines in the Epistle to Dr Arbuthnot. In 1715, there was acted, with little success, the comedy of *The Drummer, or the Haunted House*, which, though it appeared under the name of Steele, was certainly not his, and was probably written in whole or chiefly by Addison. It contributes very little to his fame. From September 1715 to June 1716, he defended the Hanoverian succession, and the proceedings of the government in regard to the rebellion, in a paper called *The Freeholder*, which he wrote entirely himself, dropping it with the fifty-fifth number. It is much better tempered, not less spirited, and much more able in thinking, than his *Examiner*. The finical man of taste does indeed show himself to be sometimes weary of discussing constitutional questions; but he aims many enlivening thrusts at weak points of social life and manners; and the character of the Fox-hunting Squire, who is introduced as the representative of the Jacobites, is drawn with so much humour and force that we regret not being allowed to see more of him.

In August 1716, when he had completed his forty-fourth year, Addison married the Countess-Dowager of Warwick, a widow of fifteen years' standing. She seems to have forfeited her jointure by the marriage, and to have brought her husband nothing but the occupancy of Holland House at Kensington. We know hardly anything positively in regard to the affair, or as to the origin or duration of his acquaintance with the lady or her family. But the current assertion that the courtship was a long one, is very probably erroneous. There are better grounds for believing the assertion, transmitted from Addison's own time, that the marriage was unhappy. The Countess is said to have been proud as well as violent, and to have supposed that, in contracting the alliance, she conferred honour instead of receiving it. To the uneasiness caused by domestic discomfort, the most friendly critics of Addison's character have attributed those habits of intemperance, which are said to have grown on him in his later years to such an extent as to have broken his health and accelerated his death. His most recent biographer, who disbelieves his alleged want of matrimonial quiet, has called in question, with much ingenuity, the whole story of his sottishness; and it must at any rate be allowed that all the assertions which tend to fix such charges on him in the earlier parts of his life, rest on no evidence that is worthy of credit, and are in themselves highly improbable. Sobriety was not the virtue of the day; and the constant frequenting of coffee-houses, which figures so often in the *Spectator* and elsewhere, and which was really practised among literary men as well as others, cannot have had good effects. Addison, however, really appears to have had no genuine relish for this mode of life; and there are curious notices, especially in Steele's correspondence, of his having lodgings out of town, to which he retired for study and composition. But, whatever the cause may have been, his health was shattered before he took that which was the last, and certainly the most unwise step, in his ascent to political power.

For a considerable time dissensions had existed in the ministry; and these came to a crisis in April 1717, when those who had been the real chiefs passed into the ranks of the opposition. Townshend was dismissed; and Walpole anticipated dismissal by resignation. There was now formed, under the leadership of General Stanhope and Lord Sunderland, an administration which, as resting on court-influence, was nicknamed the "German ministry." Sunderland, Addison's former superior, became one of the two principal secretaries of state; and Addison himself was appointed as the other. His elevation to such a post had been contemplated on the accession of George I., and prevented, we are told, by his own refusal; and it is asserted, on the authority of Pope, that his acceptance now was owing only to the influence of his wife. Even if there is no ground, as there probably is not, for the allegation of Addison's inefficiency in the details of business, his unfitness for such an office in such circumstances was undeniable and glaring. It was impossible that a government, whose secretary of state could not open his lips in debate, should long face an opposition headed by Robert Walpole. The decay of Addison's health, too, was going on rapidly; being, we may readily conjecture, precipitated by anxiety, if no worse causes were at work. Ill health was the reason assigned for retirement, in the letter of resignation which he laid before the King in March 1718, eleven months after his appointment. He received a pension of fifteen hundred pounds a-year.

Not long afterwards, the divisions in the Whig party alienated him from his oldest friend. The Peerage bill, introduced in February 1719, was attacked, on behalf of the opposition, in a weekly paper, which was called the *Plebeian*, and written by Steele. Addison answered it temperately enough in the *Old Whig;* provocation from the *Plebeian* brought forth angry retort from the *Whig;* Steele charged Addison with being so old a Whig as to have forgotten his principles; and Addison sneered at Grub Street, and called his friend "little Dicky." How Addison felt after this painful quarrel we are not told directly; but the *Old Whig* was excluded from that posthumous collection of his works, for which his executor Tickell had received from him authority and directions. In that collection was inserted a treatise on the evidences of the faith, entitled *Of the Christian Religion.* Its theological value is very small; but it is pleasant to regard it as the last effort of one who, amidst all weaknesses, was a man of real goodness as well as of eminent genius.

The disease under which Addison laboured appears to have been asthma. It became more violent after his retirement from office; and was now accompanied by dropsy. His death-bed was placid and resigned, and comforted by those religious hopes which he had so often suggested to others, and the value of which he is said, in an anecdote of doubtful authority, to have now inculcated in a parting interview with his stepson. He died at Holland House, on the 17th day of June 1719, six weeks after having completed his forty-seventh year. His body, after lying in state, was interred in the Poets' Corner of Westminster Abbey.

*The Biographia Britannica* gives an elaborate memoir of him; particulars are well collected in the article under his name in the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge;* and a good many new materials, especially letters, will be found in *The Life of Joseph Addison, by Lucy Aikin,* 1843. (W. S.)

ADDISON, *Lancelot*, father of the preceding, a clergyman, was born in the parish of Crosby-Ravensworth, in Westmorland, in the year 1632. He was educated at Queen's College, Oxford, and at the restoration of King Charles II. accepted of the chaplainship of the garrison of Dunkirk; but that fortress being delivered up to the French in 1662, he returned to England, and was soon after made chaplain to the garrison of Tangier, where he continued seven years, and was greatly esteemed. In 1670 he returned to England, and was made chaplain in ordinary to the king; but his chaplainship of Tangier being taken from him on account of his absence, he found himself straitened in his circumstances, when he seasonably obtained the rectory of Milston in Wiltshire, worth about L.120 per annum. He afterwards became a prebendary of Sarum, took his degree of doctor of divinity at Oxford, and in 1683 was made dean of Lichfield, and the next year archdeacon of Coventry. His life was exemplary, his conversation and writings were pleasing and instructive, and his behaviour as a gentleman, a clergyman, and a neighbour, did honour to the place of his residence. He died 20th April 1703.

ADDISON, a county in the state of Vermont, North America, on the banks of Lake Champlain. It has an area of 700 square miles; and, in 1850, contained 26,549 inhabitants.

ADDITION, in *Law*, is that name or title which is given to a man over and above his proper name and surname, to show of what estate, degree, or mystery he is; and of what town, village, or country.

ADDITIONS *of Place* are, of Thorpe, of Dale, of Woodstock. Where a man has household in two places, he shall be said to dwell in both, so that his addition in either may suffice. By stat. 1st Hen. V., cap. 5, it was ordained, that in such suits or actions where process of outlawry lies, such addition should be made to the name of the defendant, to show his estate, mystery, and place where he dwells; and that the writs not having such additions should abate if the defendant take exception thereto, but not by the office of the court.

ADDIX, a Greek measure of capacity, equal to 4 χοινικες, each of which equalled 4 κοτυλαι. As this last was about half an English pint, the αδδιξ was about a gallon.

ADDLE EGGS, such as have not received impregnation from the semen of the cock.

ADDUCENT MUSCLES, or ADDUCTORS, in *Anatomy*, muscles which pull one part of the body towards another.

ADEIA (*freedom from fear*), at Athens, was an indemnity such persons as possessed not the full rights of citizenship were obliged to obtain, before they could publicly accuse another of an offence. A citizen also having incurred ἀτιμιὰ, or ignominy, was under the same obligation before he could take part in public affairs.

ADELAIDE, a town in a county of the same name in Australia. It has rapidly increased within a few years, and is now the seat of government of the province of *South Australia*. The town occupies the steep banks on both sides of an impetuous stream called the Torrens, which is, however, very scanty of water in the dry season. Adelaide is six miles from the Gulf of St Vincent, and from its two harbours, Port Adelaide on the N., and Glenelg on the S.W. of the town. The reason of fixing its site here is not obvious; for it stands on a rather bare soil, resting on limestone, and is inconveniently distant from the sea. The population in 1850 was about 14,000, although the town was only founded in 1836. It contains several substantial structures of stone and brick, among which we may mention the two Episcopal churches of St John and the Trinity, and four commodious chapels built by other religious bodies. The Government House is a commodious structure in a park of 10 acres, and adjoining a public promenade called N. Terrace. The principal seat of business is Windley street, in which are many substantial mercantile establishments, and the two banks of this rising town. Two bridges cross the Torrens; and there are many good private houses in various streets. The manners and appearance of the inhabitants are quite British, here and there diversified with groups of the sable aborigines,—a race perhaps the least comely, and one of the most degraded of the human family, but not so deficient in estimable qualities as they have been sometimes represented. Adelaide has Presbyterian, Roman Catholic, Baptist, Independent, Methodist, and other chapels, a synagogue, a mechanics' institution, botanical garden, and several schools. It has also manufactories of woollen goods, starch, soap, &c., several breweries, and tanneries. In its vicinity are extensive copper and lead mines. Lat. 34. 57. S. Long. 138. 38. E.

Port Adelaide is about seven miles N.W. from the city, on an inlet of the Gulf of St Vincent. It has a number of warehouses and wharfs, and in 1850 had about 2500 inhabitants. The harbour is safe and commodious; but a bar at its mouth, with a depth varying with the tides from 8 to 16 feet, prevents large vessels from entering. Its principal exports are grain, copper and lead ores, wool, tallow, beer, &c. In 1849, the value of its exports was L.403,167, and of its imports L.599,548.

ADELARD, or ATHELARD, a learned monk of Bath, in the time of Henry I., who travelled much, and translated from the Arabic the *Elements of Euclid*, before the Greek original had been discovered. Some of his MSS. are preserved at Oxford.

ADELFORS, a town in Sweden, in the province of Jönköping and district of Oestra, wherein are two gold mines worked but very sluggishly; whilst the iron mines found there are very productive, and give employment both to the forges in making bar-iron, and to individuals as nail-makers.

ADELIE, a tract of desolate land in the Antarctic Ocean, discovered by the French in 1840. Lat. 66. 30. S. Long. 136. to 142. E.

ADELME. See ALDHELM.

ADELNAU, a circle in the province of Posen, in Prussia. It extends over 357 square miles, or 228,480 acres, and contains, in four cities and 107 villages, 52,530 inhabitants. The river Proszna waters the east side, and the Ollabok the centre of the circle. There are several smaller rivers, and some lakes, the most considerable of which bears the name of the chief place near to which it is found. It is a poor district, abounding with woods and game, and yielding fresh-water fish in plenty. It is very deficient in corn and cattle. The capital, of the same name, contains two Catholic and one Lutheran church, and a synagogue, with 200 houses, and 1930 inhabitants.

ADELPHIANI, in *Church History*, a sect of ancient heretics, who fasted always on Sundays.

ADELSBERG, a market town of Illyria, capital of a circle of the same name in the government of Laybach. Pop. 1500. At the distance of about a mile from the town is the entrance to the famous grotto of Adelsberg, said to be the largest and most magnificent in Europe. It has been explored to the distance of 1310 fathoms, where it is terminated by a lake. About 180 yards from the entrance is the *Dom*, a vast hall upwards of 300 feet long, and 100 feet high; which was the only part of the cavern known previous to 1819, when a partition of stalactite was broken through, and the magnificence of the interior exposed. It consists of a series of chambers of various dimensions, enriched by stalactites of the greatest purity and most fantastic shapes, and frequently uniting with the stalagmites below.

ADELSCALC, in ancient customs, denotes a servant of the king. The word is also written *adelscalche*, and *adelscalus*. It is compounded of the German *adel*, or *edel*, noble, and *scalc*, servant. Among the Bavarians, *adelscalcs* appear to have been the same with royal *thanes* among the Saxons, and those called *ministri regis* in ancient charters.

ADELSO, an island in Sweden, in the same lake in which the city of Stockholm is built, a little to the west of Munso, containing a parish of the same name.

ADELUNG, JOHN CHRISTOPHER, a very eminent German grammarian, philologer, and general scholar, was born at Spantekow in Pomerania, on the 30th of August 1734. He acquired his elementary instruction at the public school of Anclam, and that of Closterbergen, near Magdeburg, and completed his academical education at the university of Halle. In the year 1759 he was appointed professor at the gymnasium of Erfurt, but relinquished this situation two years after, and went to reside in a private capacity at Leipsic, where he continued to devote himself for a long period to the cultivation of letters, and particularly to those extensive and laborious philological researches which proved so useful to the language and literature of his native country. In 1787 he received the appointment of principal librarian to the elector of Saxony at Dresden, with the honorary title of Aulic Counsellor. Here he continued to reside during the remainder of his useful life, discharging with diligence and integrity the duties of his situation, and prosecuting his laborious studies to the last with indefatigable industry and unabated zeal. He died at Dresden on the 10th of September 1806, at the age of 72.

The life of a mere scholar is generally destitute of interest; and that of Adelung, which was spent entirely in literary seclusion, presents no variety of incident to the pen of the biographer. Of his private character and habits, few memorials have been preserved; but in these few he is represented as a man of an amiable disposition. He was never married. His constitution, which was remarkably robust, rendered him capable of the most intense and unremitted application to study, insomuch that, down to the period of his death, he is said to have devoted fourteen hours of every day to literary labour. He was a lover of good cheer, and spared neither pains nor expense in procuring a variety of foreign wines, of which his cellar, which he facetiously denominated his *Bibliotheca Selectissima*, is said to have contained no less than forty different kinds. His manners were easy and affable, and the habitual cheerfulness of his disposition rendered his society most acceptable to a numerous circle of friends.

The works of Adelung are very voluminous; and there is not one of these, perhaps, which does not exhibit some proofs of the genius, industry, and erudition of the author. But although his pen was usefully employed upon a variety of subjects in different departments of literature and science, it is to his philological labours that he is principally indebted for his great reputation; and no man ever devoted himself with more zeal and assiduity, or with greater success, to the improvement of his native language.

In a country which is subdivided into so many distinct sovereign states, possessing no common political centre, and no national institution whose authority could command deference in matters of taste,—in a country whose indigenous literature was but of recent growth, and where the dialect of the people was held in contempt at the several courts,—it was no easy task for a single writer to undertake to fix the standard of a language which had branched out into a variety of idioms, depending in a great measure upon principles altogether arbitrary. Adelung effected as much in this respect as could well be accomplished by the persevering labours of an individual. By means of his excellent grammars, dictionary, and various works on German style, he contributed greatly towards rectifying the orthography, refining the idiom, and fixing the standard of his native tongue. Of all the different dialects, he gave a decided preference to that of the margraviate of Misnia, in Upper Saxony, and positively rejected every thing that was contrary to the phraseology in use among the best society of that province, and in the writings of those authors whom it had produced. In adopting this narrow principle, he is generally thought to have been too fastidious. The dialect of Misnia was undoubtedly the richest, as it was the earliest cultivated, of any in Germany; but Adelung probably went too far in restraining the language within the limits of this single idiom, to the exclusion of others, from which it might have, and really has, acquired additional richness, flexibility, and force.

His dictionary of the German language is generally allowed to be superior to our English dictionary by Dr Johnson. It is eminently so in its etymologies; and is, perhaps, upon the whole, the best work of the kind of which any nation can boast. Indeed, the patient spirit of investigation which Adelung possessed in so remarkable a degree, together with his intimate knowledge of the ancient history and progressive revolutions of the different dialects from which the modern German is derived, rendered him peculiarly qualified for the successful performance of the duties of a lexicographer.

It would greatly exceed our limits, and lead us into far too wide a field, were we to attempt to present our readers with an analysis of the several productions of this voluminous author; but we should do injustice to his memory, were we to pass over in total silence his last very learned work, entitled *Mithridates, or a General History of Languages, with the Lord's Prayer, as a specimen, in nearly five hundred languages and dialects.* The hint of this work appears to have been taken from a publication, with a similar title, published by the celebrated Conrad Gesner in 1555; but the plan of Adelung is much more extensive. Unfortunately, he did not live to finish what he had undertaken; but the work has been continued with much ability by that eminent philologer, Professor Vater, formerly of Halle, now of Königsberg. The first volume, which contains the Asiatic languages, was published immediately after the death of Adelung; the second, which comprehends the European dialects, was published by Professor Vater in 1809; the first part of the third volume, which is almost entirely the work of the last-mentioned scholar, appeared in 1812. This third and last volume contains the languages of Africa and America, and is enriched with some very valuable materials, communicated to the editor by Baron Humboldt.

Many of the works of Adelung were published anonymously, but we believe the following list will be found to be complete and correct.

1. Neue Schaubühne der vorfallenden Staats-Kriegs und Friedenshändel.—Erfurt, 1759–61, 8vo.—2. Neues Lehrgebäude der Diplomatik, aus dem Franz. übersetzt, und mit Anmerk. versehen. Vols. i. ii. iii. Erfurt, 1760–63, 4to.—3. Neue Denkwürdigkeiten der gegenwärtigen Geschichte von Europa. 1761, 2 vols. 8vo.—4. Geschichte der Streitigkeiten zwischen Dänemark und den Herzogen von Holstein-Gottorp. Frankf. Leipsic, 1762, 4to.—5. Pragmatische Staatsgeschichte Europens von dem Ableben Kaiser Karls des 6ten an. Vols. i.–ix. Gotha, 1762–9, 4to.—6. Auserlesene Staatsbriefe. . Gotha, 1763–4, 3 vols. 8vo.—7. Vollständige Geschichte der Schifffahrten nach den Südländern. Halle, 1767, 4to.—8. Mineralogische Belustigungen. Vols. i.–vi. Copenhagen and Leipsic, 1767–71, 8vo.—9. Einleitung zur allgemeinen Weltgeschichte. Berlin, 1767, 2 vols. (*The first volume by Prof. Franz.*)—10. Werke des Philosophen von Sans Souci. (*Translated from the French.*) Erfurt, 1768.—11. Staatsmagazin, 14 Stücke. Leipsic, 1766–8.—12. Geschichte der Schiffahrten und Versuche, welche zur Entdeckung des nordöstlichen Wegs nach Japan und China unternommen worden. Halle, 1768, 4to.—13. Versuch einer neuen Geschichte des Jesuiter-ordens. Vols. i. and ii. Berlin and Halle, 1769–1770, 8vo.—14. Natürliche und bürgerliche Geschichte von Californien. (*Translated from the English.*) Lemgo, 1769–70, 3 vols. 4to.—15. Unterweisung in den vornehmsten Künsten und Wissenschaften, zum Nutzen der niedern Schulen. Frankfort and Leipsic, 1771, 8vo.—16. Glossarium Manuale ad Scriptores mediæ et infimæ Latinitatis, ex magnis Glossariis Caroli du Fresne Domini Ducange et Carpentarii, in compendium redactum, multisque verbis et dicendi formulis auctum. Tomi v. Halle, 1772–78.—17. Versuch eines vollständigen grammatisch-kritischen Wörterbuchs der Hoch Teutschen Mundart, mit beständiger Vergleichung der übrigen Mundarten, besonders aber der Ober Teutschen. 1774–86, 5 vols. 4to.—18. Wallerius Chemie. (*Translated from the Latin.*)—19. Allgemeines Verzeichniss neuer Bücher, mit kurzen Anmerkungen, nebst einem gelehrten Anzeiger. Leipsic, 1776–81, 8vo.—20. Schauplatz des Baierischen Erbfolge Kreigs, u. s. w. Leipsic, 1778, 1780, 4to.—21. Militarisches Taschenbuch auf das Jahr 1780. Leipsic, 12mo.—22. J. Williams Ursprung, Wachsthum und Gegenwärtiger Zustand der Nordischen Reiche. (*Translated and corrected from the English.*) Leipsic, 1779–81, 2 vols. 8vo.—23. Kurzer Begriff menschlicher Kenntnisse und Fertigkeiten, so fern sie auf Erwerbung des Unterhalts, auf Vergnügen, auf Wissenschaft, und auf Regierung der Gesellschaft abzielen. Leipsic, 1778–81, 4 vols. 8vo.—24. Ueber die Geschichte der Teutschen Sprache, über Teutsche Mundarten und Teutsche Sprachlehre. *Ibid.* 1781, 8vo.—25. Ueber den Ursprung der Sprache und den Bau der Wörter. *Ibid.* 1781, 8vo.—26. Teutsche Sprachlehre, zum Gebrauch der Schulen in den Königl. Preuss. Landen. Berlin, 1781.—27. Auszug aus der Teutschen Sprachlehre für Schulen. 1781, 8vo.—28. Lehrgebäude der Teutschen Sprache, zur Erläuterung der Teutschen Sprachlehre für Schulen.—29. Tindals und Mores Anmerkungen zu Rapins Geschichte von England. (*Trans-*

*lated from the English.)* 30. Versuch einer Geschichte der Cultur des Menschlichen Geschlechts. 1782, 8vo.—31. Leipziger Politische Zeitung und Allerlei.—32. Neues Grammatisch-kritisches Wörterbuch der Englischen Sprache, für die Teutschen. Leipsic, 1783, 8vo.—33. Beyträge zur Bürgerlichen Geschichte, zur Geschichte der Cultur, zur Naturgeschichte, Naturlehre, und dem Feldbaue; aus den Schriften der Akademie der Wissenschaften zu Brüssel. Leipsic, 1783, 8vo.—34. Fortsetzung und Ergänzungen zu Christ. Gottl. Jöchers allgemeinem Gelehrten Lexico. Leipsic, 1784, 2 vols. 4to.—35. Ueber den Teutscheu Styl. Berlin, 1785, 3 vols. 8vo.—36. Neue Leipziger Gelehrte Zeitung. 1785, &c.—37. Grundsätze der Teutschen Orthographie. Leipsic, 1782, 8vo.—38. Geschichte der Menschlichen Narrheit oder Lebens beschreibungen berühmter Schwarzkünstler, Goldmacher, Teufelsbanner, Zeichen und Liniendeuter, Schwärmer, Wahrsager, und anderer philosophischer Unholden. Leipsic, 1785–87–89, 7 vols.—39. Geschichte der Philosophie für Liebhaber. 1786–87, 3 vols.—40. Vollständige Anweisung zur Teutschen Orthographie, nebst einem kleinen Wörterbuche für die Aussprache, Orthographie, Biegung und Ableitung. Leipsic, 1786, 2 vols.—41. Jacob Püterich von Reicherzhausen, ein Kleiner Beytrag zur Geschichte der Teustchen Dichtkunst im Schwäbischen Zeitalter. Leipsic, 1788, 4to.—42. Auszug aus dem Grammatisch-kritischen Wörterbuch der Hohen Teutscheu Mundart. Leipsic, 1793, 1 vol. 1795, 2 vols. 8vo.—43. Mithridates, oder Allgemeine Sprachenkunde. 3 vols. Berlin, 1806–1812.

It is observed by Madame de Stael, that the English are much better acquainted than the French with the literature of Germany; but we have met with very few possessed of any knowledge of the works of this learned and celebrated writer; and, with the exception of one or two of his smaller essays, none of them, we believe, has ever been translated into the language of this country. In the above list there are more works than one which might probably be published with advantage in the English tongue. (J. C.)

ADEMPTION, in the *Civil Law*, implies the revocation of a grant, donation, or the like.

ADEN, a town and sea-port of Arabia, in the province of Yemen, situate to the east of the Straits of Bab-El-Mandeb. According to the Arabians, it derives its name from Aden the son of Saba, and grandson of Abraham. It was formerly an opulent and flourishing city, covering as much space as Mocha, Jedda, or Suez, but subsequently dwindled into insignificance. It is built on a small flat, probably the bottom of a crater, surrounded by precipitous rocks, on the east side of a peninsula formed by two fine bays, in the one of which, opposite the town, is the fortified island of *Sirah*, which commands the approach. The peninsula consists chiefly of a mass of volcanic rocks, extending five miles east and west, and three broad, and having as its most southern point, *Ras Sanailah* or *Cape Aden*, in Lat. 12. 45. 10. N. Long. 45. 3. E. The highest part of the peninsula is *Jebel Shamshan*, a rocky promontory of limestone, rising 1776 feet above the level of the sea. The peninsula is connected with the mainland by a neck of flat sandy ground only a few feet high. But both the peninsula and the mainland present the most desolate aspect; not a tree or a shrub is to be seen; and the heat is intolerable. The place, however, is healthy. In a military point of view, Aden presents one of the strongest positions in Arabia. Its possession affords the means of blockading the Red Sea, and of controlling the trade of the coast of Malabar. Its commercial advantages are superior to those of the neighbouring port of Mocha. Since its occupation by the British, Aden has been constituted a free port, and no duties of customs are now levied there; its trade has steadily increased, and there seems little doubt that it must again become the principal emporium for the products of Arabia and the shores of the Red Sea. As a coal depot no place on the coast is so advantageous; it divides the distance between Bombay and Suez, and steamers may load and unload at all seasons with perfect security.

Aden has not unfrequently changed its rulers. At the commencement of the sixteenth century, a Portuguese naval force proceeding to the Red Sea, touched at Aden. The Arabian chief offered to surrender the town, but the Portuguese proposed to defer its occupation till the return of the expedition. In the meantime, however, reinforcements were received, and the chief refused to fulfil his engagement. Subsequently, however, the Portuguese became its possessors, but after a brief tenure were expelled by the Turks in 1538. In the following century the Turks relinquished their conquests in Yemen, and withdrew their troops from the province, when the sultan of Senna established a supremacy over Aden, which was maintained until towards the middle of the last century. The sheik of Lahidge then threw off his allegiance, and established in his own family the line of independent sultans of Aden. The circumstances under which the British became masters of the place may be briefly stated. In 1837 a ship under British colours was wrecked near Aden, her cargo plundered, and the crew and passengers grievously maltreated by the sultan's people. An explanation of the outrage being demanded by the Bombay government, the sultan promised compensation for the plunder of the vessel, and moreover agreed to make a formal cession of the town and port of Aden to the British for a pecuniary consideration. Captain Haines of the Indian navy had been deputed to Aden to complete these arrangements, but the sultan's son, who now exercised the powers of government, met the requisition of the British agent by language and conduct the most violent and insulting. A combined naval and military force was thereupon despatched to Aden, and the place was captured on the 16th January 1839, with trifling loss on the part of the British. A stipendiary allowance was made to the sultan in consideration of his loss, he, however, retaining the whole of his other territories. (E. T.)

ADENAU, a circle in the department of Coblentz, in the Prussian province of the Lower Rhine. It extends over 212 square miles, and in 1849 contained 21,882 inhabitants, all Catholics, except 8 Jews and 64 Protestants, in one city, four market towns, and 104 villages. It is watered by the river Ahr. It is generally a hilly and woody country, where little corn except oats grows, and where the chief subsistence is potatoes. Cattle and sheep are bred with tolerable success; and potashes and charcoal are made from the forests. There is some little employment furnished by spinning and weaving both linens and woollens on a small scale. The chief place of the same name contains 1450 inhabitants.

ADEPTS, a term among alchemists for those who pretended to have found the panacea and philosopher's stone.

ADERNO, a city at the foot of Mount Ætna in Sicily, in the intendancy of Catania. It is built in an unhealthy situation, but contains 8000 inhabitants. It has several churches, the chief of which is supported by beautiful pillars of polished lava. It is the site of the ancient city Hadranum, whose ruins are still visible. On the river Giarretta, which passes the city, is a remarkable waterfall.

ADERSBACH FELSEN, a remarkable group of rocks in the form of detached or isolated columnar rocks in a valley of the Riesengebirge, in the district of Glatz in Silesia. The mountain for several miles appears divided into detached masses by perpendicular cuts, varying in depth from 600 to 1200 feet. These masses have a diameter from a few feet to several hundred yards. The part called the labyrinth consists of smaller masses confusedly grouped into columnar forms, from 100 to 200 feet in height, resting on each other. The descent into this wild scene is by a few narrow footpaths of great sublimity. Geologists suppose that the whole area has once been a tabular mass of sandstone, of unequal hardness; that the soft parts, which formed perpendicular veins or seams, have been washed away by water, leaving the harder portions in their natural position. Others suppose that this process has been begun by some subterranean commotion that split the rock, and that the fissures have been enlarged by the action of water.

ADES, or HADES, denotes the invisible state. In the heathen mythology, it comprehends all those regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elysium. (See HELL.)

ADESSENARIANS, ADESSENARII, in *Church History*, a sect of Christians who hold the real presence of Christ's body in the eucharist, though not by way of transubstantiation. They differ considerably as to this presence; some holding that the body of Christ is in the bread, others that it is about the bread, and others that it is under the bread.

ADHA, a festival which the Mahometans celebrate on the 10th day of the month *Dhoulhegiat*, which is the 12th and last of their year. This month being particularly destined for the ceremonies which the pilgrims observe at Mecca, it derives its name from this; for the word signifies *the month of Pilgrimage*. On that day they sacrifice with great solemnity, at Mecca, and nowhere else, a sheep, which is called by the same name as the festival itself. The Turks commonly call the festival the *Great Bairam*, to distinguish it from the lesser, which ends their fast, and which the Christians of the Levant call the *Easter of the Turks*. The Mahometans celebrate this festival, out of the city of Mecca, in a neighbouring valley; and sometimes they sacrifice there a camel.

ADHESION, a term chiefly used to denote the force with which the surface of a solid remains attached to the surface of a liquid, after they have been brought into contact. Suppose a polished glass plate to be suspended horizontally from one extremity of a balance, and to be exactly counterpoised by weights put into the opposite scale; if we bring this plate in contact with the surface of a quantity of mercury, we shall find that a certain additional weight must be placed in the opposite scale in order to separate the glass from the mercury. The force which kept the two bodies in contact is called *adhesion*. Three sets of experiments on this subject have been published by different philosophers.

Dr Brook Taylor, in a paper on *Magnetism*, inserted in the Philosophical Transactions for 1721, describes the result of his trials to determine the weight necessary to separate fir-boards of different sizes from the surface of water. The result of his experiments was, that the weight necessary is proportional to the surface of the fir-board to be raised.

In the year 1773, Guyton-Morveau ascertained experimentally the force of adhesion of eleven different metals of mercury. The metals which he employed were pure. The surface of each was an inch (French) in diameter, and polished. The following table exhibits the weight in French grains necessary to separate each metal from the mercury.

| | | | |
|---|---|---|---|
| Gold | 446 | Zinc | 204 |
| Silver | 429 | Copper | 142 |
| Tin | 418 | Antimony | 126 |
| Lead | 397 | Iron | 115 |
| Bismuth | 372 | Cobalt | 8 |
| Platinum | 282 | | |

M. Morveau ascertained likewise that the adhesive force is not diminished by removing the pressure of the air.

A great number of experiments on the same subject were made at a still later period by Mr Achard of Berlin. He measured the force of adhesion between various substances and water. He found that when the temperature was increased, the adhesion proportionally diminished. He even attempted to determine the diminution occasioned by the elevation of temperature, amounting to a single degree of the thermometer; and gives us a formula denoting that diminution. But it is not necessary to enter into any details respecting his experiments here, for a reason that will appear immediately.

Besides these three philosophers, many others have examined the rise of liquids in capillary tubes, a phenomenon which is nothing else than a peculiar case of adhesion, though we cannot with propriety treat of it here. Laplace published a dissertation on the subject in the year 1805, in which he has given us an historical detail, which, however, is far from accurate. His reasoning appears to us in general correct; though several very plain propositions are rather obscured than elucidated by his mathematical demonstrations.

When we make experiments on the adhesion of solids to liquids, and endeavour to ascertain the force requisite to separate them from each other, two cases may occur: the solid body may separate from the liquid *dry*, or its surface may be covered with a thin coating of the liquid, which it retains. If a surface of tallow be placed in contact with water, and separated from it by weights successively introduced into the opposite scale, we shall find, after the separation has taken place, that the surface of the tallow is *dry*, or that it has not carried along with it a thin coating of the water. But when we employ a fir-board, as Dr Brook Taylor did in his experiments, and as Mr Achard did in many of his, the case is very different; we shall find the whole surface of the board thoroughly *wetted;* that is to say, a thin film of the liquid remains adhering to the wood. Now, it is only the first of these two cases that can be considered as exhibiting the true force of adhesion. In the second case, it is not the solid which separates from the liquid, but one portion of the liquid which separates from the other. Such experiments, therefore, really show the force of cohesion between the particles of the liquid, not the force of adhesion between the solid and the liquid. Now, as the experiments of Brook Taylor and Achard belong all to this last case, it is obvious that they cannot be considered as experiments on adhesion. We must therefore leave them out of our consideration at present. The cohesion of the particles of liquids is well known to diminish as the temperature increases, till at a certain temperature this cohesion disappears altogether, and the liquids assume the state of elastic fluids, the particles of which repel each other. Hence the reason why, in Achard's experiments, the adhesive force diminished as the temperature increased.

Adhesion is obviously an attractive force, by which the two surfaces are kept in contact. It must evidently increase as the surfaces adhere, because the number of adhering particles increases in the same ratio. This force is insensible when the two surfaces are at any perceptible distance from one another; so that it acts only at insensible distances. From Morveau's experiments it appears, that it differs very much in intensity when different solids are made to adhere to the same liquid. Thus, gold adheres to mercury with a force more than twice as great as zinc does, and almost fifty-six times as great as cobalt does. Now these two properties, namely, acting only at insensible distances, and varying in intensity in different bodies, characterize that peculiar force known by the name of *chemical affinity*. But there is one particular in which chemical affinity appears at first sight to differ from adhesion. Chemical affinity is confined to the ultimate particles or atoms of bodies; whereas adhesion takes place between surfaces of any size whatever.

But if we consider that these surfaces consist each of a congeries of atoms united into a large mass by the force of cohesion; that adhesion is not sensible at any perceptible distance, however great the extent of surfaces may be; and that its strength increases in proportion to the surfaces;—if we consider these phenomena, we shall find reason to conclude that adhesion is a force which acts only between the atoms or integrant particles of bodies. It is therefore merely a case of *chemical affinity*.

The phenomena of adhesion depend upon the strength of affinity between the adhering bodies. If the affinity be weak, the two surfaces will separate by a small force applied, and the solid will retain no impression of the liquid whatever. This happens when cobalt is brought in contact with mercury, or tallow with water. If the affinity be strong, a considerable force will be requisite to separate the two surfaces. This is the case when gold or silver is brought in contact with mercury. So great is the affinity, indeed, in these cases, that if the adhesion continue for a short time, a combination actually takes place between the two metals. In that case the gold comes away white, or coated over with a film of mercury; the experiment is no longer an example of the force of adhesion between mercury and gold, but exhibits the cohesive force of the particles of mercury to each other. We have even found that this holds with platinum, though it be a metal which has a much weaker affinity for mercury than gold has. If a clean surface of platinum be kept for some time in contact with that of mercury, a very evident amalgamation takes place.

When a surface of wood, marble, or metal, comes in contact with water, on removing it we find that surface moist; that is to say, it has carried with it a thin film of water. This shows us that the adhesive force of water, or the affinity of water to these different bodies, is greater than the cohesive force of the particles of water to each other. Yet this force is not sufficiently strong to produce a chemical combination between the respective bodies. When a surface of sugar or common salt comes in contact with water, this surface is not merely wetted. If the contact be continued for a sufficient time, the solid loses its cohesion, and is dissolved by the liquid. This is a complicated case. The water by capillary attraction insinuates itself through the pores of the sugar. The minute crystals of sugar are deprived of their cohesion to each other by this intervening liquid. Being separated from each other, they gradually dissolve or enter into a chemical combination with the water. (T. T.)

ADHIL, in *Astronomy*, a star of the sixth magnitude, upon the garment of Andromeda, under the last star in her foot.

ADIABENE, one of the provinces into which the country of Assyria was divided. It was situate east of the Tigris, between the rivers Lycus, or Zabatus, and Caprus; and was so important as sometimes to give name to the whole of Assyria.

ADIANTUM, a family of widely-diffused ferns, being found in Europe, Asia, America, the South Sea Islands, Australia, and New Zealand; but the greatest number are natives of tropical forests. Our *Maiden-Hair* belongs to this genus.

ADIAPHORISTS, in *Church History*, a name importing lukewarmness, given in the 16th century to the moderate Lutherans, who embraced the opinion of Melancthon, whose disposition was much more pacific than that of Luther.

ADIGE, the ancient *Athesis*, a large river of Italy, formed by several rivulets which rise in the Rhætian Alps and unite near Glarus, where it has the name of Etsch. After flowing eastward to Bolsano it takes the name of Adige, and, receiving the Eisach, becomes navigable. Then flowing southwards, and afterwards in an eastern direction, it passes Trent and Verona, and at length falls into the Gulf of Venice, after a course of about 250 miles.

ADIMANTIUS, a Greek physician about A.D. 415, wrote a treatise on Physiognomy. See *Scriptores Physiognomiæ Veteres*, edited by Franzius, 1780.

ADIPOCIRE, derived from *adeps*, fat, and *cera*, wax, denotes a substance which has been lately examined by chemists. It is formed by a certain change which the soft parts of animal bodies undergo when kept for some time in running water, or when animals are buried, especially in damp soil, as in a common churchyard. Great quantities of this substance were found on removing the animal matters from a burial-ground at Paris in the year 1787. In this burial-ground 1200 or 1500 bodies were thrown together into the same pit, and being decomposed, were converted into this substance. It has some of the properties of wax or spermaceti.

ADIPOSE, a term used by anatomists for any cell, membrane, &c., that is remarkable for its fatness.

ADIRONDACK, a name recently given to a group of mountains in the north-eastern part of the state of New York, in North America, and to the south-west of Lake Champlain. They are connected with the Catskill Mountains. Their chief summits are Whiteface, 5000 feet; and Mount Marcy, 5460.

ADIT, in a general sense, the passage to, or entrance of, any thing.

ADIT *of a Mine*, the hole or aperture whereby it is entered and dug, and by which the water and ores are carried away. The term is sometimes used for the *air-shaft*, which is a hole driven perpendicularly from the surface of the earth into some part of the mine, to give entrance to the air.

ADJAZZO, ADRAZZO. See AJACCIO.

ADJECTIVE, in *Grammar*, a kind of noun joined with a substantive, either expressed or implied, to denote its qualities or incidents.

ADJOURNMENT, the putting off a court or other meeting till another day. There is a difference between the adjournment and the prorogation of parliament; the former not only being for a shorter time, but also done by the house itself; whereas the latter is an act of royal authority.

ADJUDICATION, in *Scottish Law*, the name of that action by which a creditor attaches the heritable estate of his debtor, or his debtor's heir, in order to appropriate it to himself either in payment or security of his debt; or that action by which the holder of an heritable right, labouring under any defect in point of form, may supply that defect.

ADJUSTMENT, the act of adjusting; a reducing to just form or order, a making fit, or conformable to, any assumed standard.

ADJUSTMENT, in *Commerce*, the settlement of a loss incurred at sea on insured goods. If the policy be what is called an *open one*, and the loss of the goods be total, the insurer must pay for them, at the value of prime cost, which includes not only the invoice price of the goods, but all duties paid, the premium of insurance, and all expenses incurred on them when put on board. In the case of a loss, the insurer is to be put in just the same position in regard to the property insured, as he was before the policy was effected. If the policy be a *valued one*, and a total loss be incurred, then they are settled for at the valuation fixed at the time of the insurance, unless the insurers can prove that the insured had not a real interest in the goods, or that they were overvalued. In case of a partial loss, the value of the goods must be proved. See Park on *Marine Insurance, &c.*

ADJUTAGE. The effect of a tube fitted to an aperture on a vessel from which water is flowing, as in a jet or fountain. The term seems to have been derived from the effect of pipes, dilated at their extremity, in promoting the discharge of the fluid. (See *Venturi & Michelotti Sperimenti Idraul.—Gilb. An. II. III.—Prony, Recher. Phys. Math.*)

ADJUTANT, in the *Military Art*, is an officer whose business it is to assist the major. Each battalion of foot and regiment of horse has an adjutant, who receives the orders every night from the brigade-major; which, after carrying them to the colonel, he delivers out to the serjeants. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous.

*Adjutants-general*, among the Jesuits, a select number of fathers, who resided with the general of the order, each of whom had a province or country assigned him, as England, Holland, &c.; and their business was to inform the father-general of state occurrences in such countries. To this end they had their correspondents delegated, emissaries, visitors, regents, provincials, &c.

ADLEGATION, a term formerly used in the public law of the German empire, to denote the right claimed by the states of the empire of adjoining plenipotentiaries, in public treaties and negotiations, to those of the emperor, for the transacting of matters which relate to the empire in general; in which sense *adlegation* differs from *legation*, which is the right of sending ambassadors on a person's own account.

ADLOCUTION, Adlocutio, in *Antiquity*, is chiefly understood of speeches made by Roman generals to their armies, to encourage them before a battle. We frequently find those adlocutions expressed on medals by the abbreviature Adlocut. Coh.—The general is sometimes represented as seated on a tribunal, often on a bank or mound of turf, with the cohorts ranged in order around him, in *manipuli* and *turmæ*. The usual formula in adlocutions was, *Fortis esset ac fidus.*

ADMINICLE, a term used chiefly in old law-books to imply an aid, help, assistance, or support. The word is Latin, *adminiculum;* and derived from *adminiculor*, to prop or support.

Adminicle, in *Scottish Law*, signifies any writing or deed referred to by a party, in an action of law, for proving his allegations.

ADMINISTRATOR, in *English Law*, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor. The origin of administrators is derived from the civil law. Their establishment in England is owing to a statute made in the 31st year of Edward III. Till then, no office of this kind was known besides that of executor; in default of whom, the ordinary had the disposal of goods of persons intestate, &c.

Administrator, in *Scottish Law*, a person legally empowered to act for another whom the law presumes incapable of acting for himself.

Administrator is sometimes used for the president of a province; for a person appointed to receive, manage, and distribute the revenues of an hospital or religious house; for a prince who enjoys the revenues of a secularized bishop; and for the regent of a kingdom during the minority of a prince or a vacancy of the throne.

ADMIRABILIS Sal, the same with Glauber's Salt.

ADMIRAL, a great officer or magistrate, who has the government of a navy, and the hearing of all maritime causes.

Anciently there were generally three or four admirals appointed for the English seas, all of them holding the office *durante beneplacito*, and each of them having particular limits under his charge and government; as admirals of the fleet of ships from the mouth of the Thames, northward, southward, or westward. Besides these, there were admirals of the Cinque Ports. We sometimes find that one person had been admiral of the fleets to the southward, northward, and westward; but the title of *Admiralis Angliæ* was not frequent till the reign of Henry IV., when the king's brother had that title given him, which in all commissions afterwards was granted to the succeeding admirals. It may be observed, that there was a title above that of admiral of England, which was, *locum tenens regis super mare*, the king's lieutenant-general of the sea: this title we find mentioned in the reign of Richard II. Before the use of the word *admiral* was known, the title of *custos maris* was made use of.

Of the rank of admiral there are three degrees; admiral, vice-admiral, rear-admiral. Each of these degrees consists of three divisions, which are distinguished by as many different colours or flags; hence all admirals assume the common title of *flag-officers*, and take rank and command in the following order:—

Admirals of the Red, of the White, of the Blue Squadrons, bearing their respective flags at the main-top-gallant-mast head; Vice-admirals of the Red, of the White, of the Blue Squadrons, bearing their respective flags at the fore-top-gallant-mast head; Rear-admirals of the Red, of the White, of the Blue Squadrons, bearing their respective flags at the mizen-top-gallant-mast head.

It may be remarked, that for nearly a century we had no Admiral of the Red Squadron; that flag, according to a vulgar error, having been taken from us by the Dutch in one of those arduous struggles for naval superiority which that nation was once able to maintain against the naval power of England. But the fact is, the red flag was laid aside on the union of the two crowns of England and Scotland, when the Union flag was adopted in its place, and usually hoisted by the admiral commanding in chief. The red flag, however, has recently been revived, on an occasion worthy of the event; namely, on the promotion of naval officers which took place in November 1805, in consequence of the memorable victory off Trafalgar. (See Navy.)

Admiral of the Fleet is a mere honorary distinction, which gives no command, but an increase of half-pay, his being three guineas a day, and that of an admiral two guineas. It is sometimes conferred, but not always, on the senior admiral on the list of naval officers, and was a short time held by the duke of Clarence, afterwards William IV. In 1851 were appointed, for the first time, two admirals of the fleet, Sir Thomas Byam Martin, G.C.B., and Sir George Cockburn, G.C.B., the last having been appointed for his long and highly distinguished services. If the admiral of the fleet should happen to serve afloat, he is authorised to carry the union flag at the main-top-gallant-mast head; which was the case when the duke of Clarence escorted Louis XVIII. across the Channel to take possession of the throne of France.

The comparative rank which flag-officers hold with officers in the army has been settled as follows by his Majesty's order in council, in the reign of George IV.

The admiral and commander-in-chief of the fleet has the rank of a field-marshal in the army; admirals with flags at the main take rank with generals of horse and foot; vice-admirals with lieutenant-generals; rear-admirals with major-generals; commodores of the first and second class with broad pendants with brigadier-generals. (See Navy.)

On the active list of admirals, there are at present (1853) seven of the Red, seven of the White, and seven of the Blue squadron. Of the vice-admirals nine of each squadron, and of the rear-admirals seventeen.

In addition to these, there are on the *reserved half-pay list*, fifty-eight flag-officers; thirty-six *retired* rear-admirals (to be reduced to twenty-five), and eighty-two *additional retired* rear-admirals, with the pay of *retired captains.*

ADMIRAL, THE LORD HIGH, OF ENGLAND, an ancient officer of high rank in the state, who not only is vested with the government of the navy, but who, long before any regular navy existed in England, presided over a sovereign court, with authority to hear and determine all causes relating to the sea, and to take cognizance of all offences committed thereon.

There can be little doubt of the Asiatic origin of the name given to this officer, which does not appear to have been known in the languages of Europe before the time of the holy wars. *Amir*, in Arabic, is a chief or commander of forces; it is the same word as the *ameer* of the peninsula of India (as *ameer al omrah*, the chief of lords or princes), and the *emir* of the Turks or Saracens, who had, and still have, their *emir* or *ameer'l dureea*, commander of the sea, *amir'l asker dureea*, commander of the naval armament. The incorporation of the article with the noun appears, we believe, for the first time in the Annals of Eutychius, patriarch of Alexandria, in the tenth century, who calls the Caliph Omar *Amirol munumim*, seu, *Imperator fidelium*. Spelman says, "In regno Saracenorum quatuor prætores statuit, qui *admiralli* vocabantur." The *d* is evidently superfluous, and is omitted by the French, who say *Amiral*. The Spanish write *Almirante;* the Portuguese the same. Milton would seem to have been aware of the origin of the word, when he speaks of "the mast of some great Ammiral." It is obvious, then, that the supposed derivations of αλμυρος from the Greek, *aumer* from the French, and *aen mereal* from the Saxon, are fanciful and unauthorised etymologies.

The period of time about which this officer first makes his appearance in the governments of European nations, corroborates the supposition of its having been adopted in imitation of the Mediterranean powers, at the return of the Christian heroes from the holy wars. According to Moreri, Florent de Varenne, in the year 1270, was the first admiral known in France; but by the most approved writers of that nation, the title was unknown till, in 1284, Enguerand de Coussy was constituted Admiral. The first admiral by name that we know of in England was W. de Leybourne, who was appointed to that office by Edward I. in the year 1286, under the title of *Admiral de la mer du Roy d'Angleterre*. Mariana, in his *History of Spain*, says that Don Sancho, having resolved to make war on the barbarians (Moors), prepared a great fleet; and as the Genoese were at that time very powerful by sea, and experienced and dexterous sailors, he sent to Genoa to invite, with great offers, Benito Zacharias into his service; that he accepted those offers, and brought with him twelve ships; that the king named him his admiral (*Almirante*), and conferred on him the office for a limited time. This happened in the year 1284. Several Portuguese authors observe, that their office of *Almirante* was derived from the Genoese, who had it from the Sicilians, and these from the Saracens; and it appears, from Souza's *Historia Genealogica da Caza Real*, that, in 1322, Micer Manuel Piçagow was invited from Genoa into Portugal, and appointed to the office of *Almirante*, with a salary of three thousand pounds (*livras*) a year, and certain lands, &c., on condition that he should furnish, on his part, twenty men of Genoa, all experienced in sea affairs, and qualified to be *alcaidis* (captains) and *arraises* (masters) of ships: all of which terms, *almirante*, *alcaidi*, and *arrais*, are obviously of Arabic derivation.

Edward I. who began his reign in 1272, went to the Holy Land, and visited Sicily on his return. He must therefore have had an opportunity of informing himself concerning the military and naval science of the various countries bordering on the Mediterranean—an opportunity which so able and warlike a prince would not neglect; but whether the title and office of admiral existed in England before his time, as some are inclined to think, or whether W. de Leybourne was first created to that office in 1286, as before mentioned, we believe there is no authentic record to enable us to decide. Supposing him, however, to be the first, Edward may either have adopted the office and title from the Genoese, or the Sicilians, or the Spaniards, or the French; or even had it directly from the Saracens, against whom he had fought, and with whom he had afterwards much amicable intercourse. It would seem, however, that the office was in Edward's time merely honorary; for that monarch, in 1307, orders the lord mayor of London, at his peril and without delay, to provide a good ship, well equipped, to carry his pavilions and tents; and, in the same year, another order is addressed to the *Vicecomes Kantiæ*, to provide, for immediate passage across the seas, *tot et tales pontes et claias* as the constable of Dover Castle should demand, without one word being mentioned of the admiral. (Rymer, vol. iii. p. 32.)

Admiral.

From the 34th Edward II. we have a regular and uninterrupted succession of admirals. In that year he appointed Edward Charles Admiral of the North, from the mouth of the river Thames northward, and Gervase Allard Admiral of the West, from the mouth of the Thames westward; and these two admirals of the north and the west were continued down to the 34th Edward III., when John de Beauchamp, lord warden of the Cinque Ports, constable of the Tower of London, and of the Castle of Dover, was constituted *High Admiral of England;* but nine years afterwards the office was again divided into north and west, and so continued until the 10th Richard II., when Richard, son of Alain earl of Arundel, was appointed Admiral of England. Two years after this it was again divided as before; and in the 15th year of the same reign, Edward earl of Rutland and Cork, afterwards duke of Albemarle, was constituted *High Admiral of the North and West;* and after him the marquis of Dorset, and earl of Somerset, son of John of Gaunt, duke of Lancaster; Percy earl of Winchester next succeeded to the same title, which once more was dropped in the 2d of Henry IV., and divided as before. But in the 6th of the same reign the office of Admiral of England became permanently vested in one person. In the 14th Henry VI., John Holland duke of Exeter was created Admiral of England, Ireland, and Aquitaine, for life; and in the third year of Edward VI., John Dudley earl of Warwick was constituted High Admiral of England, Ireland, Wales, Calais, Boulogne, the marches of the same, Normandy, Gascony, and Aquitaine, also Captain-general of the navy and seas of the king, &c. In the 27th Elizabeth, Charles Lord Howard had all the aforesaid titles, with the addition of Captain-general of the navy and seas of the said kingdoms.

On the 20th November 1632, the office of high admiral was for the first time put in commission, all the great officers of state being the commissioners. During the Commonwealth, a committee of parliament managed the affairs of the admiralty. At the Restoration, in 1660, his royal highness James duke of York was constituted *Lord High Admiral of England*. The commission was revoked on the 22d May 1684, and King Charles II. held the admiralty in his own hands, and managed it by the great officers of his privy council until his death. He took this occasion of reserving for his own use all the droits and perquisites claimed by the lord high admiral. King James II. declared himself in council *Lord High Admiral and Lord General;* and he managed the affairs of the admiralty and navy by Mr Secretary Pepys all the time of his reign. In the 1st William and Mary, the admiralty was again put in commission. In the 6th Anne (1707), his royal highness George prince of Denmark was appointed *High Admiral of Great Britain* (in consequence of the union of the two crowns), with a council to assist him;

Admiral. and at his death the queen acted in the office by Mr Burchett. On the 29th November 1708, it was again put in commission, or rather, the earl of Pembroke was constituted High Admiral, with a council to assist him; since which time the office of lord high admiral continued to be executed by lords commissioners of the admiralty, until the 2d of May 1827, when his royal highness the duke of Clarence was appointed *Lord High Admiral*, with a council of four members to assist him; in which office he continued to act, to the great satisfaction of the navy at large, until, at his own request, he was permitted by his Majesty to resign his high office, on the 19th September 1828, when it was again put in commission, and so it still remains.

Prince George of Denmark, when lord high admiral, having surrendered, by a formal instrument, all the rights, profits, perquisites, and advantages whatsoever, appertaining to the office, for the benefit and use of the public, with the exception of the sum of L.2500 a-year, to be disposed of in such manner, and for such particular uses, as her Majesty, under her sign manual, should direct; the salary of the lord high admiral, which had hitherto been no more than 300 marks, was now fixed, by warrant under privy seal, at L.7000 a-year; which sum, by 1st George II. was divided equally among seven commissioners, and continued to be so down to the present time, the part of the commissioner who stood first in the patent having, however, been made up from other funds to L.3000 a-year, and, in the year 1806, further increased by Lord Howick, then first lord commissioner, to L.5000 a-year. Since the surrender above mentioned, all the *droits of admiralty*, as they are called, with all the fees, emoluments, perquisites, &c. whatsoever, have been taken from the admiral, and applied to public purposes.

These droits and perquisites are by no means inconsiderable. As enumerated in the patent, they consist of flotson, jetson, lagon, treasure, deodands, derelicts, found within his jurisdiction; all goods picked up at sea; all fines, forfeitures, ransoms, recognizances, and pecuniary punishments; all sturgeons, whales, porpesses, dolphins, rigs, and grampusses, and all such large fishes; all ships and goods of the enemy coming into any creek, road, or port, by stress of weather, mistake, or ignorance of the war; all ships seized at sea, salvage, &c. together with his shares of prizes; which shares were afterwards called *tenths*, in imitation probably of the French, who gave their admiral, for supporting the dignity of his office, *son droit de dixième*. All prizes are now wholly given up by the crown to the captors, and such share of the *droits* as from circumstances may be thought proper. The lord high admiral also claimed, and enjoyed as his due, the cast ships; and the subordinate officers of the navy, as their perquisites, all other decayed and unserviceable stores.

Though by act of 2d William and Mary, st. 2, c. 2 (extended by the 1st Geo. IV., c. 90, and 7th and 8th Geo. IV., c. 65), the lords commissioners of the admiralty are vested with all and singular authorities, jurisdictions, and powers, which have been and are vested, settled, and placed in the lord high admiral of England for the time being, to all intents and purposes, as if the said commissioners were lord high admiral of England; yet there is this remarkable difference in the two patents by which they are constituted, that the patent of the lord high admiral mentions very little of the military part of his office, but chiefly details his judicial duties as a magistrate; whilst, on the contrary, the patent to the lords commissioners of the admiralty is very particular in directing them to govern the affairs of the navy, and is almost wholly silent as to their judicial powers.

These powers, as set forth in the patent to the earl of Pembroke in 1701, are, the power to act by deputy; to take cognizance of all causes, civil and maritime, within his jurisdiction; to arrest goods and persons; to preserve public streams, ports, rivers, fresh waters, and creeks whatsoever, within his jurisdiction, as well for the preservation of the ships, as of the fishes; to reform too straight nets, and unlawful engines, and punish offenders; to arrest ships, mariners, pilots, masters, gunners, bombardiers, and any other persons whatsoever, able and fit for the service of the ships, as often as occasion shall require, and wheresoever they shall be met with; to appoint vice-admirals, judges, and other officers, *durante beneplacito;* to remove, suspend, or expel them, and put others in their places, as he shall see occasion; to take cognizance of civil and maritime laws, and of death, murder, and maim. Admiralty.

It was by no means necessary that the lord high admiral should be a professional man. Henry VIII. made his natural son, the duke of Richmond, lord high admiral of England, when he was but six years old. When the high admiral, however, went to sea in person, he had usually a commission under the great seal, appointing him Admiral and Captain-general of the fleet, sometimes with powers to confer knighthood, and generally to punish with life and limb. Such a commission was granted by Henry VIII. to Sir Edward Howard, who executed indenture with the king to furnish 3000 men, 18 captains, 1750 soldiers, 1232 mariners and gunners; his own pay to be 10s. a day, that of a captain 1s. 6d., of the rest 5s. as wages, and 5s. for victuals each man for twenty-eight days, together with certain dead shares.

It appears, from Mr Pepys's *Naval Collections*, that the lord high admiral did anciently wear, on solemn occasions, a gold whistle, set with precious stones, hanging at the end of a gold chain. The whistle, it would seem, has long since descended to the boatswain and his mates.

The salary of the first lord commissioner is L.4500 a-year, and of each of the five lords L.1000. (J. B—W.)

Admiral is also an appellation given to the most considerable ship of a fleet of merchantmen, or of the vessels employed in the cod fishery of Newfoundland. This last has the privilege of choosing what place he pleases on the shore to dry his fish; gives proper orders, and appoints the fishing places to those who come after him; and as long as the fishing season continues, he carries a flag on his main-mast.

Admiral, in *Conchology*, the English name of a species of mollusca belonging to the order of *Gasteropoda*, *conus ammiralis*.

ADMIRALTY, High Court of. This is a court of law, in which the authority of the lord high admiral is exercised, in his *judicial* capacity. Very little has been left on record of the ancient prerogative of the admirals of England. For some time after the first institution of the office, they judged all matters relating to merchants and mariners, which happened on the main sea, in a summary way, according to the laws of Oleron (so called because promulgated by Richard I. at that place). These laws, which were litttle more than a transcript of the Rhodian laws, became the universally received customs of the western part of the world. "All the sea-faring nations," says Sir Leoline Jenkins, "soon after their promulgation, received and entertained these laws from the English, by way of deference to the sovereignty of our kings in the British ocean, and to the judgment of our countrymen in sea affairs."

In the patents granted to the early admirals between the latter end of the reign of Henry III., and until the close of that of Edward III., no mention is made of marine perquisites or of civil power, nor does it appear that the admirals enjoyed either; but after the death of the latter, new and extraordinary powers were granted to them, and it would appear that they usurped others. The preamble to the statute of 13th Richard II., stat. 1, c. 5, sets forth, that "forasmuch as a great and common clamour and complaint hath been oftentimes made before this time, and yet is, for that

Admiralty. the admirals and their deputies hold their sessions within divers places of this realm, as well within the franchise as without, accroaching to them greater authority than belongeth to their office, in prejudice of our lord the king, and the common law of the realm, and in diminishing of divers franchises, and in destruction and impoverishing of the common people;" and it is therefore directed "that the admirals and their deputies shall not meddle from henceforth of any thing done within the realm, but only of a thing done upon the sea." And two years afterwards (15th R. II., c. 3), in consequence, as stated in the preamble of the statute, "of the great and grievous complaint of all the commons," it was ordained that the admiral's court should have no cognizance of any contracts, pleas, or quarrels, or of any thing done or arising within the bodies of counties, whether by land or by water, nor of wreck of the sea; but that the admiral should have cognizance of the death of a man, and of maihem done in great ships being and hovering in the main stream of great rivers, yet only beneath the bridges of the same rivers nigh to the sea. He may also arrest ships in the great flotes for the great voyages of the king and of the realm, saving always to the king all maroner of forfeitures and profits thereof coming, and have jurisdiction over the said flotes, but during the said voyages only. But if the admiral or his lieutenant exceed that jurisdiction, then, by 2d Henry IV., c. 11, the statute and the common law may be holden against them; and if a man pursues wrongfully in the admiralty court, his adversary may recover double damages at common law, and the pursuant, if attainted, shall incur the penalty of L.10 to the king.

The place which, according to Spelman, is absolutely subject to the jurisdiction of the admiral, is the sea; which, however, comprehends public rivers, fresh waters, creeks, and all places whatsoever, within the ebbing and flowing of the sea, at the highest water, the shores or banks adjoining, from all the first bridges to the seaward; and in these, he observes, the admiralty hath full jurisdiction in all causes, criminal and civil, except treasons and the right of wreck. Lord Coke observes (5 Rep. 107), that between the high water mark and the low water mark, the admiral hath jurisdiction *super aquam, ad plenitudinem maris*, and as long as it flows, though the land be *infra corpus comitatus* at the reflow, so as of one place there is *divisum imperium* interchangeably.

But though the statute restraineth the lord high admiral, that he shall not hold plea of a thing rising in the body of a county, he is not restrained from making execution upon the land, but is empowered to take either body or goods upon the land; otherwise his jurisdiction would often prove a dead letter. He also can and does hold his court in the body of a county. So, likewise, the civil power may apprehend and try persons who may have been guilty of offences cognizable at common law, though committed in the fleet, in any port or harbour of Great Britain, or at sea, provided such persons have not already been tried for such offences, either by court-martial or in the admiralty court; and in all ports, harbours, creeks, &c. lying in any county, the high admiral and the sheriff, or coroner, as the case may be, have concurrent jurisdiction.

By the 6th and 7th Will. IV., c. 53, the admiralty jurisdiction is extended to Prince of Wales' Island, Singapore, and Malacca; and under the 3d and 4th Vict., c. 65, the court has jurisdiction in the following cases:—

Whenever a vessel is arrested by process issuing from the said court, or the proceeds of any vessel are brought into the registry, to take cognisance of all claims in respect of any mortgage of such vessel.

To decide all questions as to the title to, or ownership of, such vessel, or the proceeds thereof remaining in the registry, arising in any cause of possession, salvage, damage, wages, or bottomry, instituted in the said court.

To decide all claims and demands whatsoever in the nature of salvage, or in the nature of towage, or for necessaries supplied to any foreign vessel, and enforce the payment of the same, whether such vessel may have been in the body of the county, or upon the high seas at the time when the service was rendered, or damage received, or necessaries furnished, in respect of which claim is made.

To decide all matters and questions concerning booty of war, or the distribution thereof, which it shall please her Majesty by the advice of the privy council, to refer to the judgment of the said court, who shall proceed therein as in cases of prize of war.

And under § 40 of the 9th and 10th Vict., c. 99, to decide on all claims and demands whatsoever in the nature of salvage for services performed, whether on sea or land.

The Lord High Admiral was assisted in his *judicial* functions by the following principal officers:—1. The Vice-admiral; 2. the Judge; 3. the Registrar: 4. the Marshal; 5. Advocate-general; 6. Procurator-general; 7. Counsellor; 8. Solicitor; which officers are continued.

1. *The Vice-admiral.* This officer is the admiral's deputy or lieutenant, mentioned in the statutes of 13th and 15th Richard II., and was the person, most probably, who presided in the court. At present the office of vice-admiral of England is a perfect sinecure, generally conferred on some naval officer of high rank and distinguished character in the service, having a salary of L.434, 1s. 9d. per annum, attached to it in addition to his half-pay. That of rear-admiral of England is the same, and the salary in addition to his half-pay is L.342, 9s. per annum. Each county of England has its vice-admiral, which is little more than an honorary distinction, though the patent gives to him all the powers vested in the admiral himself. Similar powers were also granted to the judges of the admiralty county-courts; but this was found so inconvenient and prejudicial to those who had suits to commence or defend before them, that the duke of York, when lord high admiral, in 1663, caused instructions to be drawn up in order to ascertain to each his province, whereby the whole judicial power remained with the judge, and the upholding of the rights of the admiral, and levying and receiving the perquisites, &c. appertained to the vice-admiral.

Each of the four provinces of Ireland has its vice-admiral. There is one vice-admiral for all Scotland, who has a salary of L.1000 a year on the ordinary estimate of the navy, and one for the Shetland and Orkney islands. The governor of most of our colonies had a commission of vice-admiral granted to him by the lord high admiral or lords commissioners of the admiralty, and generally a commission from the king under the great seal, grounded on the 11th and 12th William III., c. 7, and further confirmed by 46th Geo. III., c. 54, by which he was authorized to try all treasons, piracies, felonies, robberies, murders, conspiracies, and other offences, of what nature or kind soever, committed on the seas, where the parties were taken into custody in places remote from England. The court consisted of seven persons at the least, of whom the governor, the lieutenant-governor, the vice-admiral, the flag-officer, or commander-in-chief of the squadron, the members of the council, the chief-justice, judge of the vice-admiralty court, captains of men-of-war, and secretary of the colony, were specially named in the commission; but any three of these, with four others selected from known merchants, factors, or planters, captains, lieutenants, or warrant officers of men-of-war, or captains, masters, or mates of merchant ships, constituted a legal court of piracy. By the 12th and 13th Vict., c. 96, all persons charged in any colony with offences committed on the sea may be dealt with in the same manner as if the offences had been committed on waters within the local jurisdiction of the courts of the colony.

The vice-admiralty courts in the colonies are of two descriptions. The one has power to inquire into the causes of detention of enemies or neutral vessels, to try and condemn the same for the benefit of the captors, as well as to take cognizance of all matters relating to the office of the lord high admiral. The other has power only to institute inquiries into misdemeanours committed in merchant vessels, and to determine petty suits, &c., and to guard the privileges of the admiral. The former are usually known by the name of *Prize Courts*, the latter by that of *Instance Courts.*

The following are the colonies and foreign possessions in which *Prize Courts* have been established in the course of the last war:—Gibraltar, Malta, Newfoundland, Halifax, Bermuda, Bahama Islands, Barbadoes, Antigua, Tortola, Jamaica, Cape of Good Hope, Ceylon, Bombay, Madras, and Calcutta. The following colonies had *Instance Courts* only:—Dominica, Grenada, St Vincent, St Christopher, Trinidad, St Cervix, Martinique, Berbice, Demerara, and Essequibo; in addition to which is a court established at Sierra Leone for the trial and condemnation of captured slaves only; and since that time, Gibraltar, Malta, St Helena, Berbice, Demerara, and Essequibo, Sierra Leone (this court has jurisdiction only over ships concerned in the slave trade), Newfoundland, Halifax, Nova Scotia, Prince Edward's Island, Lower Canada, Barbadoes, Tobago, and St Lucca, Antigua, Montserrat, and Barbadoes, Tortola, Jamaica, Bahamas, Falkland Islands, Cape of Good Hope, Gambia, Gold Coast, Ceylon, Bombay, Calcutta, Madras, New South Wales, Van Diemen's Land, Western Australia, South Australia, New Zealand, Vancouver's Island, Hong Kong, Lahuan.

In none of the patents to the lord high admiral, vice-admiral, or judge, is any mention made of prize jurisdiction. Lord Mansfield had occasion to search into the records of the court of admiralty in Doctors' Commons, to ascertain on what foundation this jurisdiction was exercised by the judge of the admiralty; but he could not discover any prize-act books farther back than 1643; no sentences farther back than 1648. The registrar could go no farther back than 1690. "The prior records," says his lordship, "are in confusion, illegible, and without index." The prize jurisdiction may therefore be considered as of modern authority, and distinct altogether from the ancient powers given to the admiral. To constitute the authority for trying prize causes, a commission under the great seal issues to the lord high admiral, at the commencement of every war, to will and require the court of admiralty, and the lieutenant and judge of the said court, his surrogate or surrogates, to proceed upon all manner of captures, seizures, prizes, and reprisals, of all ships and goods that are or shall be taken; and to hear and determine according to the course of the admiralty, or the law of nations; and a warrant issues to the judge of the admiralty accordingly.

The admiralty court being in this respect a court in which foreigners of all nations may become suitors, an appeal may be had from its decisions to a committee of the lords of the privy council, who hear and determine according to the established laws of nations.

At the breaking out of a war, the lord high admiral also receives a special commission from the crown, under the great seal, to empower him to grant letters of marque and reprisals against the enemy, he having no such power by his patent. These letters are either general or special; general, when granted to private men to fit out ships at their own charge to annoy the enemy; special, when in the case of any of our merchants being robbed of their estates or property by foreigners, the king grants them letters of reprisal against that nation, though we may be in amity with it. Before the latter can be sued for, the complainant must have gone through the prosecution of his suit in the courts of the state whose subjects have wronged him; where, if justice be denied, or vexatiously delayed, he must first make proof of his losses and charges in the admiralty court here; whereupon, if the Crown is satisfied he has pursued all lawful means to obtain redress, and his own interceding should produce no better effect, special letters of reprisal are granted; not, however, as must be evident, until a very strong case has been made out. This custom, which we may now consider as obsolete, seems to be a remnant of the law of ancient Greece, called *androlepsia*, by which, if a man was slain, the friends and relations of the deceased might seize on any three citizens of the place where the murderer took refuge, and make them slaves, unless he was delivered up. Both Oliver Cromwell and King Charles II. granted letters of reprisal. In 1638 the Duc d'Epernon seized on the ship Amity of London, for the service of the French king against the Spaniards, promising full satisfaction; but none being made, the owners obtained letters of reprisal from the usurper, and afterwards, in 1665, from Charles II. In 1666 Captain Butler Barnes had letters of reprisal against the Danes. The Dutch having burnt six English merchant vessels in the Elbe, within the territories of Hamburg, which city, instead of giving any assistance or protection, hindered the English from defending themselves, letters of reprisal were granted to the sufferers against that city. Lastly, one Justiniani, a noble Genoese, being indebted in a great sum to Joseph Como, a merchant in London, which he had several years solicited for, but could get no satisfaction, Captain Scott, commander of his Majesty's ship the Dragon, stationed at that time in the Mediterranean, received orders to make reprisals upon the ships of that republic; upon which the debt was paid.

2. *The Judge.* The patents to the judge of the admiralty and vice-admiralty courts run pretty nearly in the same manner as those of the lord high admiral, and point out the several matters of which he can take cognizance. The parliament of 1640 established the office of judge of the admiralty court in three persons, with a salary of L.500 a year to each. At the Restoration there were two judges of the high court of admiralty, which sometimes proved inconvenient; for when they differed in opinion no judgment could be had. These judges, before the Revolution, held their appointment only during pleasure. At that period Sir Charles Hedges was constituted judge under the great seal of England, *quamdiu se bene gesserit*, with a salary of L.400 a year, and an additional L.400 out of the proceeds of prizes and perquisites of the admiralty; but in the year 1725 the latter sum was diminished from the ordinary estimate by the House of Commons. Lord Stowell, the late judge, in consequence of the extraordinary increase of the business in the admiralty court, had a salary of L.2500 a year on the ordinary estimate of the navy. Under the 3d and 4th Vict., c. 66, § 1, the salary is fixed at L.4000 per annum.

The judges of the vice-admiralty courts in certain of the colonies, limited by 41st George III., c. 96, are allowed a salary not exceeding to each the sum of L.2000 a year, to be paid out of the consolidated fund of Great Britain; together with profits and emoluments not exceeding to each the further sum of L.2000 *per annum*, out of the fees to be taken by the said judges, of which a table is directed to be hung up in some conspicuous place in the court; and no judge is to take any fee beyond those specified, directly or indirectly, on pain of forfeiture of his office, and being proceeded against for extortion; and on his retirement from office, after six years' service, or from some permanent infirmity, the Crown may, by authority of the act above mentioned, grant unto such judge an annuity for the term of his life, not exceeding L.1000 *per annum*. This liberal provision puts the judges of the colonial courts of vice-admiralty above all suspicion of their decisions being influenced by unworthy motives; a suspicion they were not entirely free from when their emoluments depended mainly on their fees.

During the late war, a session of oyer and terminer to try admiralty causes was held at the Old Bailey, now the central criminal court, twice a year. The commission for this purpose is of the same nature with those which are granted to the judges when they go the circuits; that is to say, to determine and punish all crimes, offences, and misdemeanours, and abuses; the *end* of both being the same, their *limits* different; the one relating to things done upon the land, the other to things done upon the water. The lords commissioners of the admiralty, all the members of the privy council, the chancellor and all the judges, the lords of the treasury, the secretary of the admiralty, the treasurer and commissioners of the navy, some of the aldermen of London, and several doctors of the civil law, are the members of this commission; any four of whom make a court, the quorum being the lords of the admiralty, judge of the admiralty, the twelve judges, and the doctors of the civil law.

The proceedings of the court are continued *de die in diem*, or, as the style of the court is, from tide to tide.

3. *The Registrar of the Admiralty* has hitherto held his place by patent from the lord high admiral generally for life, though the admiral himself and the lords commissioners of admiralty hold their places only during pleasure; and, what is still more remarkable, the office of registrar has sometimes been granted, and is now vested in reversion. He had no salary, the amount of his emoluments depending on the number of captures, droits, &c. condemned by the court; which, during the late war, were so enormous, that in 1810 an act was passed for regulating the offices of registrars of admiralty and prize courts, by which it is enacted, "that no office of registrar of the high court of admiralty, or of the high court of appeals for prizes, or high court of delegates in Great Britain, shall, after the expiration of the interest now vested in possession or reversion therein, be granted for a longer term than during pleasure, nor be executed by deputy; that an account be kept in the said offices respectively of all the fees, dues, perquisites, emoluments, and profits received by and on account of the said registrars, out of which all the expenses of their offices are to be paid; that one-third of the surplus shall belong to the registrar and to his assistant (if an assistant should be necessary), and the remaining two-thirds to the consolidated fund of Great Britain, to be paid quarterly into the exchequer; the account of such surplus to be presented to the court at least fourteen days before each quarter day, and verified on oath. Under the 3d and 4th Vict. c. 66, § 2, a yearly salary of L.1400 is substituted for "all fees, dues, perquisites, emoluments, and profits," and which may be increased in time of war to L.2000.

4. *The Advocate-general.* This officer is appointed by warrant of the lords commissioners of the admiralty. His duties are, to appear for the lord high admiral in his court of admiralty, court of delegates, and other courts; to move and debate in all causes wherein the rights of the admiral are concerned; for which he had anciently a salary of twenty marks (L.13, 6s. 8d.) a year. In May 1803, Dr William Battine, who was appointed in 1791, had an addition of L.200 to his salary, "for his extraordinary trouble and attendance during the present hostilities." His salary was continued to him and his successor, Dr Arnold, till 1816; since that time the allowance has been reduced to its original amount of L.13, 6s. 8d. Formerly the admiral's advocate was always retained as leading counsel, but since the droits were transferred to the crown, he has gradually been supplanted by the king's advocate, who is generally retained in all cases, the admiralty advocate acting only as junior counsel; and while the former, during the war, made sometimes from L.15,000 to L.20,000 a year, the latter rarely received from his professional duties more than from L.1500 to L.2000 a year. 

5. *The Counsel of the Admiralty* is the law officer who is chiefly consulted on matters connected with the military duties of the lord high admiral; his salary is L.100 a year, besides his fees, which in time of war may be reckoned to amount to from L.1200 to L.1800 a year.

6. *The Solicitor to the Admiralty* is also an officer more immediately connected with the military functions of the admiralty. He is styled sometimes assistant to the counsel: his salary is L.1600 a year, in lieu of all fees, bills, and disbursements, with an allowance of L.1000 a year for an office and assistance of clerks.

7. *The Procurator.* The admiralty's proctor stands precisely in the same situation to the king's proctor that his advocate does to that of the king, though there is not quite so great a difference in their emoluments. They act as the attorneys or solicitors in all causes concerning the king's and the lord high admiral's affairs in the high court of admiralty and other courts. All prize causes are conducted by the king's proctor, which the captors are disposed to consider as a grievance, but which the gentlemen of Doctors' Commons, on the contrary, maintain to be for their convenience and advantage. It is supposed that in some years of the war the king's proctor did not receive less than L.20,000 a year.

8. *The Marshal.* This officer receives his appointment from the lord high admiral or lords commissioners of the admiralty, and holds his situation by patent under the seal of the high court of admiralty during pleasure. His duties are, to arrest ships and persons, to imprison in the Marshalsea, to bear the mace before the judge, and to attend executions. His emoluments depended chiefly on the number of prizes brought into port for condemnation, and the number of ships embargoed, and might probably be reckoned in time of war. *communibus annis*, from L.1500 to L.2000 a year, out of which he had to pay about L.400 a year to a deputy. The office can, however, be no longer performed by deputy, except in case of illness, § 9 of the 3d and 4th Vict., c. 66. He is now paid by a salary of L.500, besides his travelling expenses of attending the judge, which may be raised to L.800 in time of war.

*The Judge Advocate* of the fleet is a sinecure appointment, with a salary of L.182, 10s. a year, on the ordinary estimate of the navy; but the *Deputy Judge Advocate* resides at Portsmouth, and assists at all courts-martial held at that port, for which he is allowed an annual salary of L.146. See Navy. (J. B—W.)

*Admiralty Bay*, a spacious bay, with good anchorage, on the west coast of Cook's straits, in the southern island of New Zealand. Long. 174. 54. E. Lat. 40. 37. S.—There is a bay of the same name on the north-west coast of America, in Long. 140. 81. W. Lat. 59. 31. N.

*Admiralty Inlet*, the entrance to the supposed straits of Juan de Fuca, on the west coast of New Georgia, in Long. 124. 15. W. Lat. 48. 30. N. It was visited by Captain Vancouver in 1792, who found the soil on the shores rich and fertile, well watered, and clothed with luxuriant vegetation.

*Admiralty Island*, in Russian America, is about 90 miles in length from north to south, and 25 in breadth. Lat. 58. N. Long. 134. W.—See *Vancouver's Voyage*, vol. iii.

*Admiralty Islands* lie in about Long. 146. 44. E. and Lat. 2. 18. S. There are between 20 and 30 islands said to be scattered about here, the largest of which is about 60 miles in length. Captain Carteret, who first discovered them, was prevented from touching at them, although their

Admiralty || Adonia.

appearance was very inviting, on account of the condition of his ship, and his being entirely unprovided with the articles of barter which suit an Indian trade. He describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, interspersed with spots that have been cleared for plantations, groves of cocoa-nut trees, and houses of the natives, who seem to be very numerous.

*Admiralty, Scotland.* At the Union, while the National functions of the lord high admiral were merged in the English office, there remained a separate court of admiralty, with subsidiary local courts, having civil and criminal jurisdictions in maritime questions. The separate courts were abolished in 1831, and their powers merged in the courts of session and justiciary, and the local courts.

ADMONITION, in *ecclesiastical affairs*, a part of discipline much used in the ancient church. It was the first act or step towards the punishment or expulsion of delinquents. In private offences it was performed, according to the evangelical rule, privately; in case of public offence, openly, before the church. If either of these sufficed for the recovery of the fallen person, all further proceedings in the way of censure ceased: if they did not, recourse was had to excommunication.

*Admonitio Fustium*, a military punishment among the Romans, not unlike our whipping, but performed with vine branches.

ADMORTIZATION, the settling of lands or tenements in mortmain.

ADNATA, in *Anatomy*, one of the coats of the eye, called also *albuginea*. See Anatomy.

Adnata is also used for any hair, wool, or the like, which grows upon animals or vegetables.

Adnata, or *Adnascentia*, among gardeners, denote those offsets which, by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards become true roots.

ADOLESCENCE, the state of growing youth, or that period of a person's age commencing from his infancy and terminating at his full stature or manhood. The word is formed of the Latin *adolescere*, to grow. The state of adolescence lasts so long as the fibres continue to grow either in magnitude or firmness. The fibres being arrived at the degree of firmness and tension sufficient to sustain the parts, no longer yield or give way to the efforts of the nutritious matter to extend them; so that their further accretion is stopped, from the very law of their nutrition. Adolescence is commonly computed to be between 15 and 25, or even 30 years of age; though in different constitutions its terms are very different. The Romans usually reckoned it from 12 to 25 in boys, and to 21 in girls, &c. And yet, among their writers, *juvenis* and *adolescens* are frequently used indifferently for any person under 45 years.

ADONAI, one of the names of the Supreme Being in the Scriptures. The proper meaning of the word is *my lords* in the plural number, as *Adoni* is *my lord* in the singular. The Jews, who, either from reverence or superstition, do not pronounce the name of *Jehovah*, read *Adonai* in the room of it as often as they meet with Jehovah in the Hebrew text. But the ancient Jews were not so scrupulous; nor is there any law which forbids them to pronounce the name of God in a religious service.

ADONIA, in *Antiquity*, solemn feasts in honour of Venus, and in memory of her beloved Adonis. The Adonia were observed with great solemnity by the Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. From Syria they are supposed to have passed into India. The prophet Ezekiel[1] is understood to speak of them. They were still observed at Alexandria in the time of St Cyril, and at Antioch in that of Julian the Apostate, who happened to enter that city during the solemnity, which was taken for an ill omen. The Adonia lasted two days; on the first of which certain images of Venus and Adonis were carried, with all the pomp and ceremonies practised at funerals: the women wept, tore their hair, beat their breasts, &c. imitating the cries and lamentations of Venus for the death of her paramour. This lamentation they called Αδωνιασμος. The Syrians were not contented with weeping, but subjected themselves to severe discipline, shaved their heads, &c. The second day was spent in merriment and feasting. This festival was a symbol of the dying and revival of nature; hence Adonis is said to have spent a part of the year in the lower world, and part in the upper, with Aphrodite, who represented the fructifying principle. See Adonis.

[1] Ch. viii. 14.

Adonic || Adoptiani.

ADONIC VERSE, consists of a dactyle, and a spondee or trochee, as *rāră jŭvēntūs*, and is adapted to gay and sprightly poetry. It is seldom used alone, but construed with other kinds of verse. The adonic verse of the Anglo-Saxons consisted of one long, two short, and two long syllables.

ADONIJAH, fourth son of David king of Israel, put to death by his brother Solomon, for conspiring against the throne, 1 Kings i. ii. 13–25.

ADONIS, son of Cinyras, king of Cyprus, the favourite of Venus. Being killed by a wild boar in the Idalian woods, he was turned into a flower of a blood-colour, supposed to be the anemone. Venus was inconsolable; and no grief was ever more celebrated than this, most nations having perpetuated the memory of it by a train of anniversary ceremonies.[1] The text of the Vulgate, in Ezekiel viii. 14, says that this prophet saw women sitting in the temple and weeping for Adonis; but according to the reading of the Hebrew text, they are said to weep for Thammuz, or *the hidden one.* Among the Egyptians, Adonis was adored under the name of Osiris, the husband of Isis. But he was sometimes called by the name of Ammuz, or Thammuz, *the concealed*, to denote probably his death or burial. The Hebrews, in derision, call him sometimes *the dead*, Psal. cvi. 28. and Lev. xix. 28, because they wept for him, and represented him as one dead in his coffin; and at other times they call him the *image of jealousy*, Ezek. viii. 3, 5, because he was the object of the god Mars' jealousy. The Syrians, Phœnicians, and Cyprians, called him Adonis; and F. Calmet is of opinion that the Ammonites and Moabites gave him the name of Baal-peor.

[1] See Adonia.

Adonis, *Adonius*, in *Ancient Geography*, a river of Phœnicia, rising in Mount Lebanon, and falling into the sea, after a south-west course, at Byblus. When in flood, its waters exhibited a deep red tinge; hence the legend that connects the river with the wound of Adonis the minion of Venus. (*Vide Lucian.*)

> "While smooth Adonis from his native rock,
> Ran purple to the sea, suppos'd with blood
> Of Thammuz yearly wounded."—Milton.

Adonis, in *Botany*, *Bird's Eye*, or *Pheasant's Eye.*

ADONISTS, a sect or party among divines and critics, who maintain that the Hebrew points ordinarily annexed to the consonants of the word Jehovah are not the natural points belonging to that word, nor express the true pronounciation of it, but are the vowel points belonging to the words *Adonai* and *Elohim*, applied to the consonants of the ineffable name Jehovah, to warn the readers, that instead of the word Jehovah, which the Jews were forbidden to pronounce, and the true pronounciation of which had been long unknown to them, they are always to read *Adonai.* They are opposed to *Jehovists;* of whom the principal are Drusius, Capellus, Buxtorf, Alting, and Reland, who has published a collection of their writings on this subject.

ADOPTIANI, in *Church History*, a sect of ancient heretics, followers of Felix of Urgel and Elipand of Toledo, who, towards the end of the eighth century, advanced the notion that Jesus Christ in his human nature is the Son of God, not by nature, but by adoption.

ADOPTION, an act by which any one takes another into his family, owns him for his son, and appoints him for his heir.

The custom of adoption was very common among the ancient Greeks and Romans; yet it was not practised but for certain causes expressed in the laws, and with certain formalities usual in such cases. It was a sort of imitation of nature, intended for the comfort of those who had no children: wherefore, he that was to adopt was to have no children of his own, and to be past the age of getting any; nor were eunuchs allowed to adopt, as being under an actual impotency of begetting children: neither was it lawful for a young man to adopt an elder, because that would have been contrary to the order of nature; nay, it was even required that the person who adopted should be eighteen years older than his adopted son, that there might at least appear a probability of his being the natural father.

Among the Greeks it was called υἱοτης, *filiation.* It was allowed to such as had no issue of their own, excepting those who were not *κυριοι ἑαυτων, their own masters, e. g.* slaves, women, madmen, infants, or persons under twenty years of age; who being incapable of making wills, or managing their own estates, were not allowed to adopt heirs to them. Foreigners being incapable of inheriting at Athens, if any such were adopted, it was necessary first to make them free of the city. The ceremony of adoption being over, the adopted had his name enrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the festival *θαργηλια*. To prevent rash and inconsiderate adoptions, the Lacedemonians had a law, that adoptions should be transacted, or at least confirmed, in the presence of their kings. The children adopted were invested with all the privileges, and obliged to perform all the duties, of natural children. Being thus provided for in another family, they ceased to have any claim of inheritance or kindred in the family which they had left, unless they first renounced their adoption, which by the laws of Solon they were not allowed to do, unless they had first begotten children to bear the name of the person who had adopted them. This provided against the ruin of the families, which would otherwise have been extinguished by the desertion of those who had been adopted to preserve them. If the children adopted happened to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the adopter. It would seem that, by the Athenian law, a person, after having adopted another, was not allowed to marry without permission from the magistrate; and there are instances of persons who, being ill used by their adoptive children, petitioned for such leave. However this may be, it is certain that some men married after they had adopted sons; in which case, if they begat legitimate children, their estates were equally shared between the begotten and the adopted.

The Romans had two forms of adoption; the one before the prætor, the other at an assembly of the people, in the times of the commonwealth, and afterwards by a rescript from the emperor. In the former, the natural father addressed himself to the prætor, declaring that he emancipated his son, resigned all his authority over him, and consented that he should be translated into the family of the adopter. The latter was practised where the party to be adopted was already free; and this was called *adrogation.* The person adopted changed all his names, assuming the prename, name, and surname, of the person who adopted him.

Besides the formalities prescribed by the Roman law, various other methods have taken place, which have given denominations to different species of adoption among the Gothic nations, in different ages. Thus,

*Adoption by Arms* was when a prince made a present of arms to a person, in consideration of his merit and valour. The obligation here laid on the adoptive son was to protect and defend the father from injuries, affronts, &c. And hence, according to Selden, the ceremony of dubbing knights took its origin as well as name.

*Adoption by Baptism* is that spiritual affinity which is contracted by godfathers and godchildren in the ceremony of baptism. This kind of adoption was introduced into the Greek church, and came afterwards into use among the ancient Franks, as appears by the capitulars of Charlemagne.

*Adoption by Hair* was performed by cutting off the hair of a person, and giving it to the adoptive father. It was thus that Pope John VIII. adopted Boson, king of Arles, which perhaps is the only instance in history of adoption in the order of the ecclesiastics; a law that professes to imitate nature not daring to give children to those in whom it would be thought a crime to beget any.

*Adoption by Matrimony* is the taking of the children of a wife or husband by a former marriage into the condition of proper or natural children, and admitting them to inherit on the same footing with those of the present marriage.

*Adoption by Testament*, that performed by appointing a person heir by will, on condition of his assuming the name, arms, &c. of the adopter; of which kind we meet with several instances in the Roman history. Among the Turks, the ceremony of adoption is performed by obliging the person adopted to pass through the shirt of the adopter. Hence, among that people, to adopt is expressed by the phrase, *to draw another through my shirt.* It is said that something like this has also been observed among the Hebrews, where the prophet Elijah adopted Elisha for his son and successor, and communicated to him the gift of prophecy, by letting fall his cloak or mantle on him. But adoption, properly so called, does not appear to have been practised among the ancient Jews. Moses says nothing of it in his laws; and Jacob's adoption of his two grandsons, Ephraim and Manasseh, is not so properly an adoption as a kind of substitution, whereby those two sons of Joseph were allotted an equal portion in Israel with his own sons.

ADOPTIVE denotes a person or thing adopted by another. Adoptive children, among the Romans, were on the same footing with natural ones, and accordingly were either to be instituted heirs or expressly disinherited, otherwise the testament was null. The emperor Adrian preferred adoptive children to natural ones; because we choose the former, but are obliged to take the latter at random.—M. Menage has published a book of eloges or verses addressed to him, which he calls *Liber Adoptivus*, an adoptive book, and adds it to his other works. Heinsius, and Furstemberg of Munster, have likewise published adoptive books.—In ecclesiastical writers we find adoptive women or sisters (*adoptivæ fœminæ* or *sorores*) used for those handmaids of the ancient clergy, otherwise called *sub-introductæ.*

*Adoptive Arms* are those which a person enjoys by the gift or concession of another, and to which he was not otherwise entitled.—They stand contradistinguished from arms of alliance. We sometimes meet with adoptive *heir* by way of opposition to natural heir, and adoptive *gods* by way of contradistinction to domestic ones. The Romans, notwithstanding the number of their domestic, had their adoptive gods, taken chiefly from the Egyptians: such were Isis, Osiris, Anubis, Apis, Harpocrates, and Canopus.

ADORAIM, in Judah, one of the cities fortified by Rehoboam. It is called Adora in the *Apocrypha*, and by Josephus; since which time it was unknown, until its recent discovery by the American traveller, the Rev. Dr. Robinson, under the name of Dura. It is now a large village about five miles W.S.W. of Hebron, on the eastern slope of a cultivated hill.—*Biblical Researches.*

ADORATION, the act of rendering divine honours, or of addressing a being, as supposing it a god. The word is compounded of *ad*, to, and *os*, *oris*, mouth; and literally signifies to apply the hand to the mouth; *manum ad os admovere*, to kiss the hand; this being in the eastern countries one of the great marks of respect and submission.—The Romans practised adoration at sacrifices and other solemnities; in passing by temples, altars, groves, &c.; at the sight of statues, images, or the like, whether of stone or wood, wherein anything of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in or out to pay their respects to. The ceremony of adoration among the ancient Romans was thus:—The devotee, having his head *coverd*, applied his right hand to his lips, the fore-finger resting on his thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called *osculum labratum;* for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet, or even knees, it being held an incivility to touch their mouths; so that the ceremony passed at some distance. Saturn, however, and Hercules, were adored with the head *bare;* whence the worship of the last was called *institutum peregrinum*, and *ritus Græcanicus*, as departing from the customary Roman method, which was to sacrifice and adore with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony by the sight of unlucky objects.—The Jewish manner of adoration was by prostration, bowing, and kneeling. The Christians adopted the Grecian rather than the Roman method, and adored always *uncovered*. The ordinary posture of the ancient Christians was kneeling, but on Sundays standing; and they had a peculiar regard to the east, to which point they ordinarily directed their prayers.

Adoration is also used for certain extraordinary *civil honours* or respects which resemble those paid to the Deity, yet are given to men.

The Persian manner of adoration, introduced by Cyrus, was by bending the knee and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This ceremony, which the Greeks called προσκυνειν, Conon refused to perform to Artaxerxes, and Callisthenes to Alexander the Great, as reputing it impious and unlawful.

The adoration performed to the Roman and Grecian emperors consisted in bowing or kneeling at the prince's feet, laying hold of his purple robe, and presently withdrawing the hand and pressing it to the lips. Some attribute the origin of this practice to Constantius. It was only persons of some rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition was also called adoration.

The practice of adoration may be said still to subsist in England, in the ceremony of kissing the king or queen's hand, and in some other acts which are performed kneeling.

Adoration is also used among Roman writers for a high species of *applause* given to persons who had spoken or performed well in public. See Acclamation. We meet with adoration paid to orators, actors, musicians, &c. The method of expressing it was by rising, putting both hands to the mouth, and then returning them towards the person intended to be honoured.

Adoration is also used in the court of Rome for the ceremony of *kissing the pope's feet.* It is said of Diocletian, that he had gems fastened to his shoes that divine honours might be more willingly paid him, by kissing his feet. The like usage was afterwards adopted by the popes, and is observed to this day. These prelates, finding a vehement disposition in the people to fall down before them and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem the adoration intended for the pope's person is supposed to be transferred to Christ.

Adoration is also used for a method of *electing a pope.* The election of popes is performed two ways; by *adoration* and by *scrutiny*. In election by adoration, the cardinals rush hastily, as if agitated by some spirit, to the adoration of some one among them to proclaim him pope. When the election is carried by scrutiny, they do not adore the new pope till he is placed on the altar.

*Barbarous Adoration* is a term used, in the laws of king Canute, for that performed after the manner of the heathens, who adored idols. The Romish church is charged with the adoration of saints, martyrs, images, crucifixes, relics, the virgin, and the host; all which by Protestants are generally aggravated into idolatry, on a supposition that the honour thus paid to them is absolute and supreme, called by way of distinction *Latria*, which is due only to God. The Roman Catholics, on the contrary, explain them as only a relative or subordinate worship, called *Dulia* and *Hyperdulia*, which terminates ultimately in God alone. But may not the same be said of the idol worship of the heathens? The Phœnicians adored the winds, on account of the terrible effects produced by them: the same was adopted by most of the other nations, Persians, Greeks, Romans, &c. The Persians chiefly paid their adorations to the sun and fire; some say also to rivers, the wind, &c. The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage.

ADOREA, in *Roman Antiquity*, a word used in different senses: sometimes for all manner of grain; sometimes for a kind of cakes made of fine flour, and offered in sacrifice; and finally, for a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

ADORF, the chief town of a district of the same name in the circle of Zwickau in Saxony. In 1849 the town contained 2829 inhabitants, and the district 18,737, of whom 18,604 were Lutherans, and the rest Romanists. Its chief manufactures are cottons, woollens, and musical instruments.

ADOSCULATION, a term used by Dr Grew to imply a kind of impregnation without intromission; and in this manner he supposes the impregnation of plants is effected, by the falling of the farina fœcundans on the pistil.

ADOSSEE, in *Heraldry*, signifies two figures or bearings being placed back to back.

ADOUR, the name of a river of France, which rises in the mountains of Bigorre, in the department of the Upper Pyrenees, and running north by Tarbes through Gascony, afterwards turns west, and passing by Dax, falls into the Bay of Biscay below Bayonne.

ADOWA, the capital of Tigré in Abyssinia, is situate on the declivity of a hill, on the west side of a small plain, which is surrounded on every side by mountains. The name, signifying *pass* or *passage*, is characteristic of its situation; for the only road from the Red Sea to Gondar passes by Adowa. The town consists of 500 houses, is the residence of the governor, and has a manufactory of coarse cotton cloth, which circulates in Abyssinia as the medium of exchange in place of money. Long. 39. 5. E. Lat. 14. 7. N.

ADOXA, in *Botany*, Tuberous Moschatel, Hollow-root, or Inglorious.

ADRA, a seaport town of the province of Granada, in Spain, 47 miles south-east of Granada. In its vicinity are extensive lead mines. Population 9113.

ADRACHNE, in *Botany*, a species of the strawberry tree.

ADRAMMELECH, one of the gods of the inhabitants of Sepharvaim, who were settled in the country of Samaria in the room of those Israelites who were carried beyond the Euphrates. The Sepharvaites made their children pass through the fire in honour of this idol and another called *Anammelech*. It is supposed that Adrammelech meant the sun, and Anammelech the moon.

ADRAMYTTIUM, in *Ancient Geography*, now *Adramiti*, a town of Mysia, at the foot of Mount Ida, an Athenian colony, with a harbour and dock.

ADRASTEA, in *Mythology*, was the daughter of Jupiter and Necessity, and, according to Plutarch, the only fury who executed the vengeance of the gods. The name is derived from King Adrastus, who first erected a temple to that deity.

*Adrastea Certamina*, in *Antiquity*, a kind of Pythian games instituted by Adrastus, king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon. These are to be distinguished from the Pythian games celebrated at Delphi.

ADRASTUS, in *Ancient History*, king of Argos, son of Talaus and Lysianassa, daughter of Polybus, king of Sicyon, acquired great honour in the famous war of Thebes, in support of Polynices his son-in-law, who had been excluded from the sovereignty of Thebes by Eteocles his brother, notwithstanding their reciprocal agreement. Adrastus, followed by Polynices, and Tydeus his other son-in-law, by Capaneus and Hippomedon his sister's sons, by Amphiaraus his brother-in-law, and by Parthenopæus, marched against the city of Thebes; and this is the expedition of the *Seven Worthies*, which the poets have so often sung. They all lost their lives in this war except Adrastus, who was saved by his horse *Arion*. This war was revived ten years after by the sons of those deceased warriors, which was called the *war of the Epigones*, and ended with the taking of Thebes. None of them perished in this war except Ægialeus, the son of Adrastus; which afflicted him so much that he died of grief in Megara, as he was leading back his victorious army.

ADRAZZO. See Ajaccio.

ADRIA, a town of Lombardy, in the government of Venice, and delegation of Rovigo; situate between the rivers Po and Adige, in Lat. 45. 3. 22. N. Long. 12. 3. 40. E. This is a very ancient city, and was, at an early period, a seaport of such importance and celebrity as to give name to the sea on which it stood. It is said by some Greek writers to have been of Grecian origin; but the Roman writers, who are of much greater authority, agree in describing it as an Etruscan colony. Under the Romans it appears never to have been of much importance, and after the fall of the Western Empire it rapidly declined. The dykes which protected the surrounding country from inundation were neglected, and it became marshy and unhealthy. The mud and other deposits brought down by the waters of the Po and Adige, caused a gradual extension of the land into the Adriatic; so that Adria ceased to be a seaport, and is now 16 miles from the sea, on whose shores it formerly stood. By the draining of the neighbouring lands, the place has latterly been much improved, and has now begun to revive. It has a population of 10,400, and some trade in grain, cattle, fish, wine, and earthenware; is the seat of a bishopric; and has a museum of Greek and Roman antiquities. A little to the south of the present town, remains of the ancient city have been discovered at a considerable depth. They are all of Roman date, and include part of the ancient walls, ruins of a theatre, baths, and mosaic pavements.

ADRIAN, Publius Ælius. See Hadrian.

Adrian I. *Pope*, ascended the papal throne a. d. 772. He was the son of Theodore, a Roman nobleman, and possessed considerable talents for business. He maintained a steady attachment to Charlemagne, which provoked Desiderius, a king of the Lombards, to invade the state of Ravenna, and to threaten Rome itself. Charlemagne rewarded his attachment by marching with a great army to his aid; and having gained many considerable advantages over Desiderius, he visited the pope at Rome, and expressed his piety by the humiliating ceremony of kissing each of the steps as he ascended to the church of St Peter. The affairs of the church now claimed Adrian's particular attention; for Irene, who in 780 assumed the regency at Constantinople, during the minority of her son Constantine, wishing to restore the worship of images, applied to Adrian for his concurrence. The pontiff readily acquiesced in her proposal for calling a council, and commissioned two legates to attend it. The first council, however, was dispersed by an insurrection of the citizens; but at the next meeting in the city of Nice, in 787, which was protected by a military force, a decree was passed for restoring the worship of images. Adrian approved the decree, but in the western church it was deemed heretical and dangerous. Charlemagne condemned the innovation, and the French and English clergy concurred in opposing it. A treatise, containing 120 heads of refutation, was circulated as the work of Charlemagne, under the title of *The Caroline Books*, in opposition to the decree of the council. This work was presented to the pope by the king's ambassador, and the pope wrote a letter to Charlemagne by way of reply. The king, and also the Gallican and English churches, retained their sentiments; and in 794 a council was held at Frankfort-on-the-Maine, consisting of about 300 western bishops, by which every kind of image-worship was condemned. Adrian did not live to see a termination of this contest; for he died in 795, after a pontificate of nearly 24 years. Adrian seems to have directed his chief attention to the embellishment of the churches and the improvement of the city of Rome; and he was probably furnished by Charlemagne, out of the plunder of his conquests, with ample means for this purpose.

Adrian II. *Pope*, succeeded Nicholas I. a. d. 867. Having twice refused the dignity, he accepted it in the 76th year of his age, at the united request of the clergy, nobility, and people. The contest for power between the Greek and Latin churches had been very violent some years before his accession to the papal chair. Adrian, during this contest with the eastern patriarch, was extending his authority over the kings and princes of the west. He employed his whole interest to induce Charles the Bald, who had taken possession of the kingdom of Lorraine, and who had been crowned at Rheims by the archbishop Hincmar, to relinquish it in favour of the emperor; and he even sent legates to the king, after having attempted to engage Hincmar, the clergy, and the nobility, to desert him, ordering him to surrender to the emperor's right. The king was invincible; and the pope was obliged to give up the contest. He also further interfered in the concerns of princes, by taking Charles's rebellious son Carloman, and the younger Hincmar, bishop of Laon, under the protection of the Roman see. He proceeded in this business so far, that he was under the necessity of submitting without gaining his point. Death terminated his ambitious projects and his life of inquietude a. d. 872, after a pontificate of five years.

Adrian III. *Pope*, was a Roman by birth, and succeeded

Marinus, or Martin II. in 884. His virtue, zeal, and firmness, gave favourable presages of his future career; but he was cut off by death in the 13th month of his pontificate, during a journey to Worms, whither he was proceeding to hold a diet. He was at variance, like his predecessor, with the patriarch Photius, who rejected the doctrine that the Holy Ghost proceeds from the Father *and the Son.*

Adrian IV. *Pope*, the only Englishman who ever had the honour of sitting in the papal chair. His name was Nicholas Brekespere, and he was born at Langley, near St Albans, in Hertfordshire. His father having left his family and taken the habit of the monastery of St Albans, Nicholas was obliged to submit to the lowest offices in that house for daily support. After some time he desired to take the habit in that monastery, but was rejected by the abbot Richard. Upon this he resolved to try his fortune in another country, and accordingly went to Paris; where, though in very poor circumstances, he applied himself to his studies with great assiduity, and made a wonderful proficiency. But having still a strong inclination to a religious life, he left Paris and removed to Provence, where he became a regular clerk in the monastery of St Rufus. He was not immediately allowed to take the habit, but passed some time by way of trial, recommending himself to the monks by a strict attention to all their commands. This behaviour, together with the beauty of his person and prudent conversation, rendered him so acceptable to the monks, that after some time they entreated him to take the habit of the canonical order. Here he distinguished himself so much by his learning and strict observance of the monastic discipline, that upon the death of the abbot he was chosen superior of that house; and we are told that he rebuilt the convent. Pope Eugenius III. being apprised of the great merit of Nicholas, and thinking he might be serviceable to the church in a higher station, created him cardinal-bishop of Alba in 1146. In 1148 the Pope sent him as legate to Denmark and Norway, where, by his fervent preaching and diligent instructions, he converted those barbarous nations to the Christian faith, and erected Upsal into an archiepiscopal see. When he returned to Rome, he was received by the pope and cardinals with great marks of honour; and Pope Anastasius, who succeeded Eugenius, happening to die at this time, Nicholas was unanimously chosen to the holy see in November 1154, and assumed the name of *Adrian.* When the news of his promotion reached England, King Henry II. sent Robert, abbot of St Albans, and three bishops, to Rome, to congratulate him on his election; upon which occasion Adrian granted very considerable privileges to the monastery of St Albans, particularly an exemption from all episcopal jurisdiction, excepting to the see of Rome. In virtue of the pretensions of the Roman see in those days to dispose of kingdoms, Adrian, by a papal bull, conferred on Henry II. of England the sovereignty of Ireland; and that prince, stimulated by the success with which some of his own subjects had established themselves in that distracted country, eagerly closed with the pope's proposal to resign for this bull the long-contested point of lay investiture to ecclesiastical offices. The consequence of this agreement was the speedy reduction of Ireland, by a trifling force, to the crown of England. Adrian, in the beginning of his pontificate, boldly withstood the attempts of the Roman people to recover their ancient liberty under the consuls, and obliged those magistrates to abdicate their authority, and leave the government of the city to the pope. In 1155 he drove the heretic Arnold of Brescia, and his followers, out of Rome. The same year he excommunicated William, king of Sicily, who ravaged the territories of the church, and absolved that prince's subjects from their allegiance. About the same time Frederick, king of the Romans, having entered Italy with a powerful army, Adrian met him near Sutrium, and concluded a peace with him. At this interview Frederick consented to hold the pope's stirrup whilst he mounted on horseback. After this, his holiness conducted that prince to Rome, and in St Peter's church placed the imperial crown on his head, to the great mortification of the Roman people, who assembled in a tumultuous manner, and killed several of the imperialists. The next year a reconciliation was brought about between the pope and the Sicilian king, that prince taking an oath to do nothing further to the prejudice of the church, and Adrian granting him the title of *King of the Two Sicilies.* He built and fortified several castles, and left the papal dominions in a more flourishing condition than he found them. But notwithstanding all his success, he was extremely sensible of the disquietudes attending so high a station; and declared to his countryman, John of Salisbury, that all the former hardships of his life were mere amusement to the misfortunes of the popedom, that he looked upon St Peter's chair as the most uneasy seat in the world, and that his crown seemed to be clapped burning on his head.[1] He died September 1. 1159, in the fourth year and tenth month of his pontificate, and was buried in St Peter's church, near the tomb of his predecessor Eugenius. There are extant several letters and some homilies written by this pope.

[1] Baronii *Annales*, tom. xii. ann. 1154.

Adrian V. *Pope*, a Genoese, whose name was Ottoboni Fiesci, succeeded Innocent V. A. D. 1276. He was by his uncle Innocent IV. created cardinal-deacon of St Adrian, and in 1254 sent by him to England, to settle the disputes between Henry III. and his barons. He was employed again for the same purpose by Clement III., when he issued a sentence of excommunication against the king's enemies. When he was congratulated on his accession to the papal chair, he said, "I wish you had found me a healthy cardinal rather than a dying pope." After his election he went to Viterbo to meet the emperor Rodolphus, for the purpose of opposing the usurpation of Charles, king of the Two Sicilies; but died soon after his arrival, having enjoyed his dignity only 38 days. He zealously encouraged the crusade to the Holy Land, and upon his election sent a large sum to Constantinople towards building galleys.

Adrian VI. *Pope*, was born at Utrecht in 1459. His father was not able to maintain him at school, but he got a place at Louvain, in a college in which a certain number of scholars were maintained *gratis.* It is reported that he used to read in the night-time by the light of the lamps in the churches or streets. He made considerable progress in all the sciences, led an exemplary life, and there never was a man less intriguing or less forward than he. He took his degree of doctor of divinity at Louvain, was soon after made canon of St Peter's and professor of divinity at Utrecht, and then dean of St Peter's and vice-chancellor of the university. He was obliged to leave an academical life to be tutor to the archduke Charles. This young prince made no great progress under him: but never was a tutor more eminently rewarded; for it was by Charles V.'s interest that he was raised to the papal throne. Leo X. had given him the cardinal's hat in 1517. After this pope's death, several cabals in the conclave ended in the election of Adrian, with which the people of Rome were very much displeased. He would not change his name, and in every thing he showed a dislike to all ostentation and sensual pleasures, in marked contrast to the general temper of the times. He was very partial to Charles V., and did not enjoy much tranquillity under the triple crown. He lamented much the wicked morals of the clergy, and wished to establish a reformation of manners among them. He died September 14. 1523, it is said, by poison.

Adrian || Adrianople.

Adrian, *Cardinal*, an Italian of great learning and ability, was a native of Cornetto, in Tuscany, and studied at Rome. He was sent by Innocent VIII. as nuncio into England, where Henry VII. rewarded his services with the bishopric of Hereford, and afterwards with that of Bath and Wells; but he never resided in either of these dioceses. On his return to Rome, he became secretary to Pope Alexander VI., who employed him in various missions, and subsequently invested him with the purple. He narrowly escaped death on the day that Alexander VI. fell a victim to his own wickedness, in the plot which he had contrived, in concert with his son Cæsar Borgia, against Adrian and several other cardinals, in order to seize upon their possessions; but although Adrian likewise partook of the poison, he recovered. He then took refuge in the mountains of Trent, where he remained until the elevation of Leo X. to the papal chair; but, not long after, he was implicated in the conspiracy of cardinal Petrucci against that pontiff, and obliged a second time to fly from Rome. His subsequent history has not been ascertained; but it is generally supposed that he was murdered by a domestic, who coveted his wealth. Adrian was one of the first who restored the Latin tongue to its original purity. He wrote two good works,—*De Vera Philosophia*, a religious treatise, printed at Cologne in 1548; and *De Sermone Latino*, a learned work, published at Rome in 1515, in folio.

ADRIANI, Giambattista, was born of a patrician family of Florence in 1503. He wrote a history of his own times in Italian, which is a continuation of Guicciardini, beginning at the year 1536, and continued to 1574; to which Thuanus acknowledges himself greatly indebted: besides which, he composed six funeral orations on the Emperor Charles V. and other noble personages; and is thought to have been the author of a long letter on ancient painters and sculptors, prefixed to the third volume of Vasari. He died at Florence in 1579, at the age of seventy-six.

ADRIANISTS, in *Ecclesiastical History*, a sect of heretics, divided into two branches. The first were disciples of Simon Magus, and flourished about the year 34. Theodoret is the only person who has preserved their name and memory, but he gives us no account of their origin. Probably this sect, and the six others which sprung from the Simonians, took their name from the particular disciples of Simon. The second were the followers of Adrian Hamstead the anabaptist, and held some particular errors concerning Christ.

ADRIANOPLE (called by the Turks Edreneh), a city of European Turkey, in the province of Rumelia 137 miles W.N.W. of Constantinople; Lat. 41. 41. 26. N.; Long. 26. 35. 41. It is pleasantly situated partly on a hill and partly on the banks of the Tundja, near its confluence with the Maritza. Next to Constantinople, it is the most important city of the empire. The streets are narrow, crooked, and filthy; and its ancient citadel, with the walls which formerly surrounded the town, are now in ruins. Of its public buildings the most distinguished are the ancient palace of the sultans, now in a state of decay; the famous bazaar of Ali Pacha, appropriated to the warehousing and sale of various kinds of commodities; and the mosque of Sultan Selim II., a magnificent specimen of Turkish architecture, and ranked among the finest Mohammedan temples. It has numerous baths, caravanseries, and bazaars, and considerable manufactures of silk, leather, tapestry, woollens, linen, and cotton, and an active general trade. Its exports include raw silk, cotton, opium, rose-water, attar of roses, fruits, and agricultural produce. The city is supplied with fresh water by means of a noble aqueduct carried by arches over an extensive valley. There is also a fine stone bridge here over the Tundja. During winter and spring the Maritza is navigable up to the town, but Enos at the mouth of that river is properly its seaport, and formerly admitted large vessels; but owing to the carelessness of the Turks, a sand-bank has accumulated, so that now it is accessible only to vessels of comparatively small burden. The population is said to amount to 130,000, of whom about 30,000 are Greeks. Adrianople was called Uskadama previous to the time of the Emperor Hadrian, who improved and embellished the town, and changed its name to Hadrianopolis. Uskadama was the capital of the Bessi, a fierce and powerful Thracian people. In 1360 it was taken by the Turks, who, from 1366 till 1453, when they got possession of Constantinople, made it the seat of their government. In the campaign of 1829, so disastrous to the Turks, Adrianople surrendered on the 20th of August to the Russians, under Diebitsch, without making any resistance. It was restored after the treaty of peace, definitively signed on the 14th September 1829. For the terms of this treaty, so humiliating to the Porte, see Turkey.

Adriatic Sea || Adule.

ADRIATIC SEA, or Gulf of Venice, the *Adriaticum Mare* of the ancients, is an arm of the Mediterranean which separates Italy from Illyria, Croatia, Dalmatia, and Albania. It extends from N. Lat. 40. to 45. 50. in a N.W. direction. Its western or Italian coasts are generally low and deficient in harbours; but the eastern shores are steep, rocky, and abounding in creeks and inlets, forming numerous islands. The prevalence of sudden squalls from the N.E., and sometimes from the S.E., renders its navigation hazardous. Its ebbs and flows are inconsiderable, but more observable than in the Mediterranean generally; and its saltness is a little greater than that of the ocean. The Adriatic receives no considerable rivers, except the Po, Adige, and Narenta. Its chief emporia of trade are Venice, Trieste, and Ancona. The ancients seem to have originally applied the name of Adriaticum to that part of the sea which is in the vicinity of Adria, or to the northern part of the modern Adriatic; but in its extended signification it corresponded to the modern sea, and sometimes even included that part of the Mediterranean which lies between Sicily and Crete. There is no doubt that its name is derived from the town of Adria, which was situate on its coast, between the mouths of the Po and Adige, and not from Adria in Picenum as some writers have supposed.—See *Livy*, *Pliny*, *Strabo*, &c.

ADRIPALDA, a city in the province of Principato Ulteriore, in the kingdom of Naples. It is situate on the river Sabato, near Avellino. The number of inhabitants is 4236, who carry on trade in cloth and paper, in iron and copper goods, and make large quantities of nails.

ADROGATION, in *Roman Antiquities*, a species of adoption, whereby a person who was capable of choosing for himself was admitted by another into the relation of a son. The word is compounded of *ad*, to, and *rogare*, to ask, on account of a question put in the ceremony, Whether the adopter would take such a person for his son? and another to the adoptive, Whether he consented to become such a person's son?

ADSIDELÆ, in *Antiquity*, the tables at which the flamens sat during the sacrifices.

ADSTRICTION, among *Physicians*, a term used to denote the rigidity of any part.

ADULA, in *Ancient Geography*, a mountain in Rhætia, or the country of the Grisons, part of the Alps, in which are the fountains of the Rhine; now *St Gothard*.

ADULE, or Adulis, in *Ancient Geography*, a town of Æthiopia, built by fugitive slaves, distant from its port on the Red Sea 20 stadia. Pliny calls the inhabitants *Adulitæ*. The epithet is either *Adulitanus*, as *Monumentum Adulitanum*, on the pompous inscription of the statue of Ptolemy Euergetes, published by Leo Allatius at Rome in 1631, and to be found in Spon and Thevenot; or *Adulicus*, as *Adulicus Sinus*, a part of the Red Sea.

ADULLAM, an ancient city in the plain country of the tribe of Judah, and one of those fortified by Rehoboam. The "cave of Adullam," in which David took refuge when pressed by the Philistines, is believed not to have been near the city, but towards the Dead Sea, not far from Bethlehem.

ADULT, an appellation given to any thing that is arrived at maturity: thus, we say an adult person, an adult plant, &c. Among civilians, it denotes a youth between 14 and 25 years of age.

ADULTERATION, the act of debasing, by mixing with any pure and genuine commodity a spurious article, or an inferior one of the same kind, for pecuniary profit; but it may also occur accidentally, as, for instance, by the action of acids and oils on vessels of copper or lead in culinary and other operations. (See *Medical Jurisprudence*.) But few articles of commerce, comparatively, are exempt from fraudulent deterioration; and although the adulteration of exciseable commodities and of food are offences punishable by law, the risk too frequently is outweighed by the temptation of gain. In Paris, malpractices connected with the adulteration of food are investigated by the Conseil de Salubrité, and punished; but our laws are directed chiefly to the protection of such articles as affect the revenue. Adulterations of food, when wilful, have been made punishable by the laws of most countries. In Great Britain numerous acts have been passed for the prevention of adulterations: they are usually punished by a fine, determined by a summary process before a magistrate. In Turkey a culprit baker has his ears nailed to his door. By 5th and 6th Vict. c. 93, §§ 1, 3, 8, manufacturers of tobacco or snuff are liable to a penalty of L.200 for having in their possession any substance or liquid to be used, or capable of being used, as a substitute for tobacco or snuff, or to adulterate or give them weight. The preparer, vender, or disposer of such articles, is liable to the same. For actual adulteration the penalty is L.300, and for having such adulterated goods in possession, L.200. After a similar manner beer is protected by still heavier penalties; which laws extend to chemists, druggists, and beer retailers. See *56th Geo. III. c.* 58, *1st Will. IV. c.* 51, 64, *4th and 5th Will. IV. c.* 85. Tea, coffee, cocoa, pepper, &c. are protected by law, but the adulterations of these, as of most other articles of food, are almost endless. The mixture of chicory with coffee, is, however, authorized under certain conditions. A treasury minute of 27th July 1852 prohibiting the sale of "chicory or other vegetable substances mixed with coffee," was rescinded by a subsequent minute of 25th Feb. 1853, which permits dealers in coffee "to keep and sell chicory prepared and mixed with coffee, provided the packages in which such mixture is delivered to purchasers have printed distinctly thereon, according to directions which will be given by the Board of Inland Revenue, the whole of the following words, 'Mixture of Coffee and Chicory.'"

The following results were obtained by a recent series of analyses of some articles of common domestic consumption, purchased from different dealers, chiefly in the metropolis. In the several kinds of tea were found (partly, perhaps, accidentally present) exhausted tea-leaves, leaves of the beech, elm, horse-chestnut, plane, bastard-plane, fancy oak, willow, poplar, hawthorn, and sloe; catechu, rose-pink, blacklead, soapstone, sulphate of iron, logwood, indigo, starch, rice husks, excrement of silkworms, Prussian blue, sulphate of lime, verdegris, &c. Of 18 samples of chicory procured from manufactories, 5 were adulterated with roasted wheat-flour; and of 16 samples of chicory purchased from different grocers, several were coloured with Venetian red, or reddle. Of 68 samples of cocoa and chocolate, 39 contained coloured earthy substances; in some samples of cocoa, sugar and starch constituted more than half the article. Of 24 samples of bread, all contained more or less alum; and it may be observed that the quartern loaf, as delivered at houses by 13 different bakers, showed deficiency in weight, the maximum being between 3 and 4 ounces. Out of 30 samples of oatmeal, 16 were adulterated with barley-meal; in one instance, apparently, much more than one-half. Of 36 samples of arrowroot, 18 were mixed with potato-flour, or potato-starch, sago-powder, or tapioca-starch, &c.; and 5 were almost entirely potato-starch. Of 26 samples of milk, 11 were mixed with water, in proportions varying from 10 to 50 per cent. Of 28 samples purchased as isinglass, 10 consisted entirely of gelatine. (See *Lancet*, vol. i. 1851.) It is well known that quack medicines frequently contain ingredients they are guaranteed not to contain; hence the evils resulting from their indiscriminate use. Nor are woollen, linen, and silk goods, exempt from inferior admixture; various substances are employed to give body to silk fabrics; as in China a gluey preparation from the *Fucus Tenax* is used to give them weight and gloss. The above facts will give some idea of the extent to which adulteration is practised in the most common articles of consumption. We may add that all legislative enactments on the subject will prove ineffectual unless the public exercise their own discrimination, and dealers who are discovered to have imposed spurious commodities are made to feel that honesty is the best policy.

*Adulteration of Wines.* The various substances used in the manufacture to flavour and to colour wines (such as almonds, raisins, orris root, burnt sugar, brandy, logwood, whortleberries, elderberries, &c.), must be distinguished from others which are directly deleterious, such as alum, used to impart astringency, and litharge and ceruse, to dulcify "pricked" or sour wines. The following is an excellent test for any of the preparations of lead: mix an aqueous solution of tartaric acid with liquid sulphuretted hydrogen; when added to the suspected wine, should any copper or iron be present, they are kept in solution by the tartaric acid, while the lead is thrown down by the sulphuretted hydrogen as a dark precipitate. Red wine should be decolorized before using the test, which is conveniently done by mixing the wine with an equal weight of milk, and filtering it. When the tartrate of lead is found in the bottom of the cask, it may easily be detected by calcining a portion of the insoluble matter, and reducing it by the blowpipe on charcoal. A portion of the sediment may be digested with vinegar, which would give, by evaporation, acetate of lead; and it may be tried by sulphuretted hydrogen. Alum may be precipitated from white wine by carbonate of soda gradually added until no more falls down; filter; on the filter will be found alumine. The sulphate of potassa remains in the solution; but the quantity present may be found by precipitating the sulphuric acid by muriate of baryta. Iron is sometimes accidentally present in wines; but it is not dangerous, and may be detected by nutgalls. Copper sometimes occurs from the use of copper stopcocks: it is detected by the addition of ammonia; and, if much, by a plate of polished iron left some time in the wine. Arsenic has occasionally occurred from the sulphuring of the cask. After decoloration by animal charcoal, pass a stream of sulphuretted hydrogen through the wine, and a yellow precipitate will fall, which may be reduced to the metallic state by charcoal and soda. The same tests are applicable to all fermented liquors. —See *Henderson's Hist. of Ancient and Modern Wines.*

*Adulteration of Coin.* This has been accounted among all nations, both in ancient and modern times a very grave offence, and punishable by death in several ways. It was formerly considered as treason in Great Britain, and rigorously punished with death; but in the amelioration of our criminal code by Lord John Russell's act (Will. IV., c. 34, Vict. 1), the punishment has been commuted to transportation for any period not less than seven years, or by imprisonment for not more than four years, at the discretion of the judge.

The specific gravity of pure gold = 19·30; standard gold = 18·88; pure silver = 10·51; standard silver = 10·34. The proportion of alloy in the gold and silver coin of Britain is $\frac{1}{12}$ copper, which gives durability, A genuine coin, unless it be cracked, is quite sonorous; yet even this quality is not an invariable test for counterfeit money. Much false coin is in circulation, especially in the metropolis, a statement confirmed by its very frequent reception as change. Besides the frauds by clipping, filing, casing, electroplating, &c. the debasement of coin has been effected by boring the edge of a piece, and plugging the cavity with inferior metal: in this manner has platinum been inserted in gold. Another method has been practised by sawing a gold piece laterally, and skilfully filling the centre with platinum; a fraud which cutting alone could detect.

To ascertain the adulteration of silver and gold coin by excess of copper, the following processes will suffice: dissolve a given weight of the silver in nitric acid, and precipitate by a solution of common salt; dry, and weigh the precipitate, which is the *chloride of silver*, and contains 75·5 per cent. of the metal; or it may be reduced on charcoal before the blowpipe, when a button of pure silver will be obtained, by weighing which, the proportions of silver and of copper will be known. Silver coin is very frequently imitated by some white alloy, generally of tin, antimony, and lead: it may be known by its pliancy and dull appearance, or it may be tested for silver, as described above. German silver, a beautiful imitation of silver by nickel and copper, may be detected by its deficient specific gravity, and its emitting, when briskly rubbed, a faint, coppery odour; or by dissolving it in nitric acid, and adding a solution of common salt, when it will give no precipitate. The amount of alloy in gold may readily be ascertained, for ordinary purposes, by the *streak* on touchstone, and comparing that with the streak of the gold needles made for the purpose; or more nicely by this process; file off a given weight of the gold, and dissolve in *aqua regia*, then precipitate the gold by immersing in the solution a plate of silver or copper; or more quickly, by weak galvanic action; or the gold may be thrown down by addition of an alkaline solution, or by adding the muriate of tin, which throws down the purple powder of Cassius, from which the quantity of gold may be easily ascertained, by oxidating with the blowpipe a given weight of the powder, and so obtaining a button of pure gold.

The purity of copper is ascertained by dissolving a given weight in any of the mineral acids, and obtaining copper of cementation by immersing a plate of iron or zinc in the solution; or by decomposing the salt of copper by charcoal, alkali, and heat, in the usual way. See CHEMISTRY. It may be noticed as a curious fact, that the copper coinage of Will. IV. was found to contain gold, from which discovery these coins speedily became scarce.

ADULTERINE, in the *Civil Law*, is particularly applied to a child issued from an adulterous amour or commerce. Adulterine children are more odious than the illegitimate offspring of single persons. The Roman law even refuses them the title of natural children, as if nature disowned them, and the Canon law discouraged their admission to orders. Those are not deemed adulterine who are begotten of a woman openly married through ignorance of a former wife being alive. By a decree of the parliament of Paris, adulterine children are declared not legitimated by the subsequent marriage of the parties, even though a papal dispensation be had for such marriage, wherein is a clause of legitimation.

*ADULTERINE Marriages*, in St Augustine's sense, denote second marriages contracted after a divorce.

ADULTERY, an unlawful commerce between one married person and another, or between a married and unmarried person.

Punishments have been annexed to adultery in most ages and nations, though of different degrees of severity. In many it has been capital; in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind. Even contrary things have been enacted as punishments for adultery. By some laws the criminals are forbidden marrying together in case they become single; by others they are forbidden to marry any besides each other; by some they are incapacitated from ever committing the like crime again; by others they are glutted with it till it becomes nauseous.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dower he had received from her husband, which some think was refunded by the adulterer. Another punishment was putting out the eyes of adulterers.

The Athenians had an extraordinary way of punishing adulterers, called αποραφανιδωσις και παρατιλμος, practised at least on the poorer sort who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest radishes up the anus of the adulterer, or, in defect thereof, a fish with a large head, called *mugil*, mullet. One Alcæus is said to have died in this way, though it is doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom as received also among the Romans, though not authorized by an express law, as it was among the Greeks.

There are various conjectures concerning the ancient punishment of adultery among the Romans. Some will have it to have been made capital by a law of Romulus, and again by the twelve tables; others, that it was first made capital by Augustus; and others, not before the time of Constantine. The truth is, the punishment of it in early days was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the acquiescence and countenance of the magistrate, than by any formal authority from him. Thus, we are told the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far; but mutilating, castrating, cutting off the ears, noses, &c. served the turn. The punishment allotted by the *lex Julia* was not, as many have imagined, death, but rather banishment or deportation, being interdicted fire and water, though Octavius appears in several instances to have gone beyond his own law, and to have put adulterers to death. Under Macrinus, many were burnt at a stake. Constantine first by law made the crime capital. Under Constantius and Constans, adulterers were burnt, or sewed in sacks and thrown into the sea. Under Leo and Marcian, the penalty was abated to perpetual banishment, or cutting off the nose. Under Justinian, a further mitigation was granted, at least in favour of the wife, who was only to be scourged, lose her dower, and be shut up in a monastery. After two years, the husband was at liberty to take her back again: or, if he refused, she was shaven, and made a nun for life. In the case of the husband the crime continued capital. The reason alleged for this difference was, that the woman is the weaker vessel. Matthæus declaims against the Empress Theodora, who is supposed to have been the cause of this law, as well as of others in favour of that sex by the emperor.

Under Theodosius, women convicted of this crime were punished after a very singular manner; being locked up in a narrow cell, and forced to admit to their embraces all the men that would offer themselves. This custom was abolished by the same prince.

By the Jewish law, adultery was punished with death in both parties, where they were both married, or only the woman. The Jews had a particular trial or ordeal for a woman suspected of the crime, by making her drink the bitter waters of jealousy; which were supposed, in the case of guilt, to cause the body to swell.

Amongst the Mingrelians, according to Chardin, adultery is punished with the forfeiture of a hog, which is usually eaten in good friendship between the paramour, the adulteress, and the husband. In some parts of the East, it is said any man's wife is permitted to prostitute herself to him who will give an elephant for the use of her; and it is reputed no small glory to her to have been rated so high. Adultery is said to be so frequent in Ceylon, that there is not a woman who does not practise it, notwithstanding its being punishable with death. Among the Japanese, and divers other nations, adultery is only penal in the woman. In the Marian islands, the woman is not punishable for adultery; but if the man go astray he pays severely; the wife and her relations waste his lands, turn him out of his house, &c.

In Spain they punished adultery in men by cutting off the instrument of the crime. In Poland, before Christianity was established, they punished adultery and fornication in a peculiar manner: they carried the criminal to the market-place, and there fastened him by the offending part with a nail, laying a razor within his reach, and leaving him under a necessity either of doing justice upon himself, or of perishing in that condition.

In England adultery by the ancient laws was severely punished. King Edmund the Saxon ordered it to be punished in the same manner as homicide; and Canute the Dane ordered that a man who committed adultery should be banished, and that the woman should have her nose and ears cut off. In the time of Henry I. it was punished with the loss of eyes and genitals.

In Britain adultery is now reckoned a spiritual offence, that is, cognizable by the spiritual courts, where it is punished by fine and penance. The common law takes no farther notice of it than to allow the party aggrieved an action and damages. This practice is often censured by foreigners, as making too light of a crime, the bad consequences of which, public as well as private, are so great. It has been answered, that perhaps this penalty, by civil action, joined with the ignominy attached to it, is more calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a severer punishment.

Adultery is, both in England and Scotland, a ground of divorce. In England, a *complete* divorce or dissolution of the marriage can only be obtained through an act of parliament; but in Scotland, a complete divorce may be effected by proceedings in the Court of Session, as succeeding to the old commissary jurisdiction. The adulterous parties are by the law of Scotland prohibited from intermarrying. Fraser *on Personal and Domestic Relations*, vol. i. p. 82. See Divorce.

Adultery is used in Scripture for idolatry, or departing from the true God to the worship of a false one.

Adultery is used by ecclesiastical writers for a person's invading or intruding into a bishopric during the former bishop's life. The reason of the appellation is, that a bishop is supposed to contract a kind of spiritual marriage with his church. The translation of a bishop from one see to another was also reputed a species of adultery, on the supposition of its being a kind of second marriage, which in those days was esteemed a degree of adultery. This conclusion was founded on the text of St Paul, *Let a bishop be the husband of one wife;* by a forced construction of church for wife, and of bishop for husband.

Adultery is used by ancient naturalists for the act of ingrafting one plant upon another; in which sense Pliny speaks of the adulteries of trees, *arborum adulteria*, which he represents as contrary to nature, and a piece of luxury or needless refinement.

ADUNATI, ἀδυνατοι, those persons at Athens who from bodily defects or infirmity, were unable to support themselves, and had a maintenance from the state.

ADVANCED, in a general sense, denotes something posted or situated before another. Thus,

*Advanced Ditch*, in *Fortification*, is that which surrounds the glacis or esplanade of a place.

*Advanced Guard*, or *Vanguard*, in the art of war, the first line or division of an army, ranged or marching in the order of battle; or, it is that part which is next the enemy, and marches first towards them.

*Advanced Guard* is more particulary used for a small party of horse stationed before the main guard.

ADVENT, in the calendar, properly signifies the approach of the feast of the nativity. It includes four Sundays, and begins on St Andrew's day, or on the Sunday before or after it. During advent, and to the end of the octaves of epiphany, the solemnizing of marriage is forbidden without a special licence. It is intended to direct the thoughts of Christians to the first advent or coming of Christ in the flesh, and to his second advent or coming to judge the world. The primitive Christians practised great austerity during this season.

Ad ventrem inspiciendum, in *Law*, a writ by which a woman is to be searched whether she be with child by a former husband, on her withholding lands from the next, failing issue of her own body.

*Adventure Bay*, the name of a bay in Van Diemen's Land, so called by Captain Cook. Lat. 43. 20. S. Long. 147. 30. E.

ADVENTURER, in a general sense, denotes one who hazards something.

Adventurers is particularly used for an ancient company of merchants and traders, erected for the discovery of lands, territories, trades, &c. unknown. The society of adventurers had its rise in Burgundy, its first establishment from John duke of Brabant, in 1248, being known by the name of the *Brotherhood of St Thomas a Becket*. It was afterwards translated into England, and successively confirmed by Edwards III. and IV. Richard III. Henries IV. V. VI. and VII. who gave it the appellation of *Merchant Adventurers*.

ADVERB, in *Grammar*, a particle joined to a verb, adjective, or participle, to explain their manner of acting or suffering, or to mark some circumstance or quality signified by them. The word is formed from the preposition *ad*, to, and *verbum*, a verb; and signifies literally a word joined to a verb, to show how, when, or where, one is, does, or suffers; as, the boy paints *neatly*, writes *ill;* the house stands *there*, &c.

ADVERSARIA, among the ancients, a book of accounts not unlike our journals or day-books. It is also used as a title for books of miscellaneous remarks and observations.

ADVERSATIVE, in *Grammar*, a word expressing some difference between what goes before and what follows it.

Thus in the phrase, *he is an honest man, but a great enthusiast*, the word *but* is an adversative conjunction.

ADVERSITOR, in *Antiquity*, a servant who attended the rich in returning from supper, to give them notice of any obstacles in the way, which might cause them to stumble.

ADVERTISEMENT, in a general sense, denotes any information given to individuals or the public. In a commercial sense it refers to intimations of the sale of articles, and to other matters connected with trade, inserted in the newspapers.

To advertise advantageously requires both experience and judgment; without a knowledge of the character and circulation of the public journals, much expenditure may be wasted, by either advertising in papers that have a very limited circulation, or are generally read by persons to whom the intimation is inappropriate. The expense of advertising falls very heavily on particular commodities, especially, and very deservedly, on quack medicines, on some of which it has been said that if the vender has the courage to continue advertising to the extent of L.20,000, he will make his fortune by the worthless drug.

Advertising is also a very heavy burden on books, as it is absolutely necessary that notice of new publications should be circulated if they are to be sold: on small low priced books the expense is particularly heavy, one advertisement of a book which sells at two shillings costing as much as one of a work that sells at two guineas. From this, and their generally ephemeral character, it may be said that ninety-nine pamphlets out of a hundred are published at a loss.

The advertising of the last edition of the Encyclopædia Britannica, during its publication, cost above L.3000.

It is the profit derived from advertisements which supports the large number of newspapers (533) published in the United Kingdom. While some of these drag out a sickly existence, others of them yield a princely revenue from this source; the lowest price for an advertisement in a London daily newspaper being 5s. (for servants wanting places 4s.) The *Times*, whose daily circulation reaches nearly 40,000, had, on 1st February 1853 (which was a fair average number), 1086 advertisements, of which 125 were from servants wanting places, and 185 from masters wanting servants.

The duty upon advertisements is one of those which has been branded as a tax upon knowledge. It is certainly very unequal and oppressive, being the same upon that of the sale of an estate worth L.100,000, and that of a servant wanting a place; the same upon an advertisement of a sixpenny pamphlet and of the Encyclopædia Britannica.

Previous to 1833 the duty was, on each advertisement, 3s. 6d. in Great Britain, and 2s. 6d. in Ireland; in which year it was reduced to 1s. 6d. in Great Britain, and 1s. in Ireland. In 1832, the last year of the high duty, the total number of newspaper advertisements in the United Kingdom was 921,943: viz. 787,649 in England, 108,914 in Scotland, and 125,380 in Ireland; the amount of duty paid in that year was L.172,570. In 1841 the number of advertisements had increased to 1,778,957: viz. 1,386,625 for England, 188,189 for Scotland, and 204,143 for Ireland; and the total duty paid amounted to L.128,318. The amount of duty in 1851 had risen to L.175,094, 10s. 8d.; being for England, L.142,365, 3s. 6d.; Scotland, L.19,940, 11s.; Ireland, L.12,788, 16s. 2d.

It is now proposed to reduce the duty to 6d. for each advertisement; but it would be better that this obstacle to the circulation of information of much importance to the community were entirely removed. See NEWSPAPERS.

ADVICE, in *Commercial Language*, signifies information communicated, generally by letter, on matters of business; as between bankers and merchants.

ADVICE *Boat*, in *Nautical Affairs*, is a small vessel employed to convey despatches or information between places, corresponding to the *Naves Tabellariæ* of the Romans.—*Senecæ Epist.* 77.

ADVOCATE, a lawyer authorised to plead the causes of litigants in courts of law. The word is used technically in Scotland, and a derivative from the same Latin source is so used in most of the countries of Europe where the civil law is in force. In England, the word is used colloquially instead of barrister. The *advocatus* of the Romans meant, as the word implies, a person whose assistance was called in or invoked. The word is not often used among the earlier jurists, and appears not to have had a strict meaning. It is not always associated with legal proceedings, and might apparently be applied to a supporter or coadjutor in the pursuit of any desired object. When it came to be applied with a more specific limitation to legal services, the position of the *advocatus* was still uncertain. It was different from, and evidently inferior to, that of the *juris-consultus*, who gave his opinion and advice in questions of law, and may be identified with the consulting counsel of the present day. Nor is the merely professsional advocate to be confounded with the more distinguished *orator*, who came forward in the guise of the disinterested vindicator of justice. This distinction, however, appears to have arisen in later times, when the profession became mercenary. By the *lex Cincia*, passed about two centuries before Christ, and subsequently renewed, the acceptance of remuneration for professional assistance in law suits was prohibited. This law, like all others of the kind, was evaded. The skilful debater was propitiated with a present; and though he could not sue for the value of his services, it was ruled that any *honorarium* so given could not be demanded back, even though he died before the anticipated service was performed. The traces of this evasion of a law may be found in the existing practice of rewarding counsel by fees in anticipation of services. In the Justinian collection, we find that legal provisions had been made for the remuneration of advocates. (*Dig. Lib.* 50. *Tit.* 12 §, 10–13. *Brissonius de verb. Sig. Heineccius ad Pand. Lib.* III. *Tit.* I.) The *advocatus fisci*, or fiscal advocate, was an officer, whose function, like that of a solicitor of taxes at the present day, was connected with the collection of the revenue.

The term advocate is of frequent use in the chronicles, capitularies, chartularies, and other records of ecclesiastical matters, during the middle ages. Whoever wishes to have a key to the learning on this subject may consult Du Cange, who affords a profuse supply of references to original authorities. It appears that the term was applied in the primitive church to those who defended the Christians against malignants or persecutors. As the church waxed rich and powerful, its temporal supporters assumed a more important position. The advocate, defender, or patron, was of a temporal rank, corresponding to the power of the ecclesiastical body who sought his advocacy. Princes sought the distinction from Rome; and it was as a relic of the practice of propitiating temporal sovereigns by desiring their protection, that Henry VIII. received his title of *Defender of the Faith.* The office of advocate to any of the great religious houses, possessed of vast wealth, was one of dignity and emolument, generally held by some feudal lord of power and influence. This kind of protection, however, was sometimes oppressive. In the authorities quoted by Du Cange, we find that, so early as the twelfth century, the advocates were accused of rapine and extortion; and by a capitulary of the popedom of Innocent III., they are prohibited from taking and usurping rewards and privileges beyond use and wont. The office at length assumed a fixed character in its powers and emoluments; and it became the practice for the founders of churches and other ecclesiastical endowments to reserve the office of advocate to themselves and their representatives.

The term advocate was subsequently superseded by the word patron; but a relic of it still exists in the term *advowson*, and the word *advowee*, which is the form in which the Latin *advocatus* found its way into the technicalities of English law. The term advocate came afterwards to be applied in ecclesiastical, as in other matters, to those who gave their clients professional legal assistance.

In France, corporations or faculties of avocats were attached to the parliaments and other tribunals. They formed, before the revolution, a part of the extensive and powerful body commonly called the nobility of the robe. It was not necessary that the avocat should be born noble, and his professional rank was little respected by the hereditary aristocracy; but as a middle rank, possessed of great powers and privileges, which it jealously guarded, the profession acquired great influence. In the *Encyclopédie Methodique*, the avocat is called "the tutelary genius of the repose of families, the friend of man, his guide and protector." The avocats, as a body, were re-organised under the empire by a decree of 15th December 1810.

The Faculty of Advocates is the collective term by which the members of the bar are known in Scotland. They professionally attend the supreme courts in Edinburgh; but they are privileged to plead in any cause before the inferior courts, where counsel are not excluded by statute. They may act in cases of appeal before the House of Lords, and in some of the British colonies where the civil law is in force, it is customary for those who practise as barristers to pass as advocates in Scotland. This body has existed by immemorial custom. Its privileges are constitutional, and are founded on no statute or charter of incorporation. The body formed itself gradually, from time to time, on the model of the French corporations of avocats, appointing like them a Dean or doyen, who is their president and principal officer. No curriculum of study, residence, or professional training, is required on entering this profession; but the faculty have the power, believed to be liable to control by the Court of Session, of rejecting any candidate for admission. The candidate undergoes two private examinations; the one in Roman law, and the other, at the interval of a year, in Scottish law. He has then to undergo the old academic form of the public impugnment of theses on some title of the pandects; but this ceremony, called the public examination, has degenerated into a mere form. The fees of entrance are considerable, the greater part of them being devoted to the magnificent library belonging to the faculty, which literary investigators in Edinburgh find so eminently useful. The number of members is fluctuating; but for some years past (1852), it has been upwards of four hundred. (J. H. B.)

*Lord Advocate*, or *King's Advocate*, is the principal law-officer of the crown in Scotland. His business is to act as a public prosecutor, and to plead in all causes that concern the crown. He is at the head of the system of public prosecutions by which criminal justice is administered in Scotland, and thus his functions are of a far more extensive character than those of the English law-officers of the crown. He is aided by a solicitor-general and subordinate assistants called advocates-depute. The office of king's advocate is not very ancient: it seems to have been established about the beginning of the sixteenth century. Originally he had no power to prosecute crimes without the concurrence of a private party; but, in the year 1597, he was empowered to prosecute crimes at his own instance. He has the privilege of pleading in court with his hat on.

ADVOCATION, in *Scottish Law*, a mode of appeal from certain inferior courts to the supreme court. The writ employed is called a *Note of Advocation.*

ADVOWEE. See ADVOCATE; ADVOWSON.

ADVOWSON, or ADVOWZEN, in *Common Law*, signifies a right to present to a vacant benefice. Advowson is so called because the right of presenting to the church was first gained by such as were founders, benefactors, or maintainers of the church. Though the nomination of fit persons to officiate in every diocese was originally in the bishop, yet they were content to let the founders of churches have the nomination of the persons to the churches so founded, reserving to themselves a right to judge of the fitness of the persons nominated.—Advowsons formerly were most of them appendant to manors, and the patrons were parochial barons. The lordship of the manor and patronage of the church were seldom in different hands, until advowsons were given to religious houses. But of late times the lordship of the manor and advowsons of the church have been divided.—Advowsons are *presentative, collative,* or *donative: presentative,* where the patron presents or offers his clerk to the bishop of the diocese, to be instituted in his church; *collative,* where the benefice is given by the bishop, as original patron thereof, or by means of a right he has acquired by lapse; *donative,* where the king or other patron does, by a single donation in writing, put the clerk into possession, without presentation, institution, or induction.

Sometimes, anciently, the patron had the sole nomination of the prelate, abbot, or prior, either by investiture (*i.e.* delivery of a pastoral staff) or by direct presentation to the diocesan; and if a free election was left to the brotherhood, yet a *congé d'élire*, or licence of election, was first to be obtained of the patron, and the person elected was confirmed by him. If the founder's family became extinct, the patronage of the convent went to the lord of the manor.—Advowsons are temporal inheritances and lay fees: they may be granted by deed or will, and are assets in the hands of heirs or executors. Presentations to advowsons for money or other reward are void. (31st Eliz. cap. 6.) In Scotland this right is called *patronage.*

ADY, a name that has been given to a species of palm which grows at St Thome, on the coast of Calabar. It is a tall tree, with a bare, upright stem, growing single on its root, of a thin light timber, and full of juice. The head of this tree shoots into a multitude of leaves, which on being cut off, or having an incision made in them, afford a great quantity of sweet juice; and this, when fermented, supplies the place of wine among the Indians. The fruit of this tree is called by the Portuguese *caryoces* and *cariosse*, and by the black natives *abanga.* This fruit is of the size and shape of a lemon, and contains a kernel, which is good to eat. The fruit itself is eaten roasted, and the raw kernels are often mixed with mandioc meal. These kernels are esteemed very cordial. An oil is also prepared from the fruit, which answers the purpose of butter. This oil is also used for anointing stiff and contracted parts of the body.

ADYNAMIA, in *Medicine* (α, privative, and δυναμις, *strength*), want of power, debility or weakness from sickness.

ADYNAMON, among *Ancient Physicians*, a kind of weak factitious wine, prepared from must boiled down with water, to be given to patients to whom genuine wine might be hurtful.

ADYTUM, in *Pagan Antiquity*, the most retired and sacred place of temples, into which none but the priests were allowed to enter. The *Sanctum Sanctorum* of the temple of Solomon was of the nature of the pagan adytum, none but the high-priest being admitted into it, and he but once a year.

ADZE, or ADDICE, a cutting tool of the axe kind, having its blade made thin and arching, and its edge at right angles to the handle; chiefly used for taking off thin chips of timber or boards, and for paring away certain irregularities which the axe cannot come at. The adze is used by carpenters, but more by coopers, as being convenient for cutting the hollow sides of boards, &c. It is ground from a base on its inside to its outer edge; so that, when it is blunt, they cannot conveniently grind it without taking its helve out of the eye.

AE, or Æ, a diphthong compounded of A and E. Authors are by no means agreed as to the use of the *æ* in English words. Some, out of regard to etymology, insist on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a consideration that it is no proper diphthong in our language (its sound being no other than that of the simple *e*), contend that it ought to be entirely disused; and in fact the simple *e* has of late been adopted instead of the Roman *æ*, as in the word *equator*, &c.

ÆACEA, in *Grecian Antiquity*, solemn festivals and games celebrated at Ægina in honour of Æacus.

ÆACUS, the son of Jupiter by Ægina. When the isle of Ægina was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called *Myrmidones*, from μυρμηξ, *an ant*. The foundation of the fable is said to be, that when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and by commerce and industry to recover what they had lost. His character for justice was such, that, in a time of universal drought, he was nominated by the Delphic oracle to intercede for Greece, and his prayer was answered. See the article Ægina. The Pagans also imagined that Æacus, on account of his impartial justice, was chosen by Pluto one of the three judges of the dead; and that it was his province to judge the Europeans.

ÆCHMALOTARCHA (αιχμαλωτος and αρχος), a title given to the principal leader or governor of the Hebrew captives residing in Chaldea, Assyria, and the neighbouring countries. This magistrate was called by the Jews *rasch-galuth*, *i. e.* the chief of the captivity; but the above term, of like import in the Greek, is that used by Origen and others who wrote in the Greek tongue.

ÆDES, in *Roman Antiquity*, besides its more ordinary signification of a house, likewise signified an inferior kind of temple, consecrated to some deity.

ÆDICULA, a term used to denote the inner part of the temple, where the altar or statue of the deity stood.

ÆDILE (*ædilis*), in *Roman Antiquity*, a magistrate whose chief business was to superintend buildings of all kinds, but more especially public ones, as temples, aqueducts, bridges, &c. To the ædiles likewise belonged the care of the highways, public places, weights and measures, &c. They also fixed the prices of provisions, took cognizance of debauches, punished lewd women and such persons as frequented gaming-houses. The custody of the *plebiscita*, or decrees of the people, was likewise committed to them. They had the inspection of comedies and other pieces of wit; and were obliged to exhibit magnificent games to the people, at their own expense, whereby many of them were ruined. They had the power, on certain occasions, of issuing edicts, and by degrees they procured to themselves a considerable jurisdiction. All these functions, which rendered the ædiles so important, belonged at first to the ædiles of the people, *ædiles plebeii*, or *minores*. These were only two in number, and were first created in the same year as the tribunes, B.C. 494; for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers to whom they might intrust matters of less importance; and accordingly two ædiles were created; and hence it was that the ædiles were elected every year at the same assembly as the tribunes. But these plebeian ædiles having refused, on a signal occasion, to treat the people with shows, pleading that they were unable to support the expense, the patricians made an offer to do it, provided they would admit them to the honours of the *ædilate*. On this occasion there were two new ædiles created, of the number of the patricians, in the year of Rome 388. They were called *ædiles curules*, or *majores*, as having a right to sit on a curule chair, enriched with ivory, when they gave audience; whereas the plebeian ædiles only sat on benches. Besides that the curule ædiles shared all the ordinary functions with the plebeian, their chief employment was to procure the celebration of the grand Roman games, and to exhibit comedies, shows of gladiators, &c. to the people; and they were also appointed judges in all cases relating to the selling or exchanging of estates. To assist these first four ædiles, Cæsar (B.C. 45) created a new kind, called *ædiles cereales*, as being deputed chiefly to take care of the corn, which was called *donum Cereris;* for the heathens honoured Ceres as the goddess who presided over corn, and attributed to her the invention of agriculture. These ædiles cereales were also taken out of the order of patricians. In the municipal cities there were ædiles, and with the same authority as at Rome.

We also read of an *ædilis alimentarius*, expressed in abbreviature by *Ædil. alim.* whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office. —In an ancient inscription we also meet with *ædile* of the camp, *ædilis castrorum.*

ÆDILITIUM Edictum, among the Romans, was that whereby a remedy was given to a buyer in case a vicious or unsound beast or slave was sold to him. It was called *ædilitium*, because the preventing of frauds in sales and contracts belonged especially to the curule ædiles.

ÆDITUUS, in *Roman Antiquity*, an officer belonging to the temple, who had the charge of the offerings, treasure, and sacred utensils. The female deities had a female officer of this kind called *Æditua.*

ÆGADES or Ægates, islands off the western coast of Sicily, between Trapani and Marsala, consisting of Maritimo, Levanso, and Favignana, which were of some note during the first Punic war.

ÆGAGROPILA, a ball composed of hair, generated in the stomach of the chamois goat, and very similar to those found in cows, hogs, &c. There is another species of ball found in some animals, particularly horses, which is a calculous concretion.

ÆGEAN SEA, in *Ancient Geography*, now the *Archipelago*, a part of the Mediterranean, bounded on the north by Thrace and Macedonia, on the west by Greece, and on the east by Asia Minor. The origin of the name is greatly disputed. Festus advances three opinions: one, that it is so called from the many islands therein appearing at a distance like so many goats; another, because Ægea, queen of the Amazons, perished in it; a third, because Ægeus, the father of Theseus, threw himself headlong into it. See Archipelago.

ÆGEUS, in *Fabulous History*, was king of Athens, and the father of Theseus. The Athenians having basely killed the son of Minos, king of Crete, for carrying away the prize from them, Minos made war upon them; and being victorious, imposed this severe condition on Ægeus, that he should annually send into Crete seven of the noblest of the Athenian youths, chosen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theseus; or, as others say, he himself entreated to be sent. The king, at his son's departure, gave orders, that as the ship sailed with black sails, it should return with the same in case he perished; but, if he came back victorious, he should change them into white. When Theseus returned to Crete, after killing the Minotaur, and forgot to change the sails in token of his victory, according to the agreement with his father, the latter, who watched the return of the vessel, supposing by the black sails that his son was dead, cast himself headlong into the sea, which afterwards obtained the name of the *Ægean Sea*. The Athenians decreed Ægeus divine honours, and sacrificed to him as a marine deity and adopted son of Neptune.

ÆGIAS, among *Physicians*, a white speck on the pupil of the eye, which occasions a dimness of sight.

ÆGIDA, now *Capo d'Istria*, the principal town on the north of the territory of Istria, situate in a little island, joined to the land by a causeway. In an inscription it is called *Ægidis Insula*. Long. 13. 43. E. Lat. 45. 31. N. It was afterwards called *Justinopolis*, after the emperor Justinus II.

ÆGILOPS, the name of a tumour in the great angle of the eye, either with or without an inflammation. The word is compounded of αιξ, *goat*, and ωψ, *eye;* as goats are supposed to be extremely liable to this distemper. If the ægilops be accompanied with an inflammation, it is supposed to take its rise from the abundance of blood which a plethoric habit discharges on the corner of the eye. If it be without an inflammation, it is supposed to proceed from a viscous pituitous humour thrown upon this part. The method of cure is the same as that of the ophthalmia. But before it has reached the lachrymal passages, it is managed like other ulcers. If the ægilops be neglected, it bursts, and degenerates into a fistula, which eats into the bone.

ÆGIMURUS, in *Ancient Geography*, an island in the bay of Carthage, about 30 miles distant from that city, (Livy); now *Zowamour*. This island being afterwards sunk in the sea, two of its rocks remained above water, which were called *Aræ*, because the Romans and Carthaginians entered into an agreement or league to limit their respective boundaries by these rocks.

ÆGINA, in *Fabulous History*, the daughter of Asopus, king of Bœotia, was beloved by Jupiter, who ravished her in the similitude of a lambent flame, and then carried her from Epidaurus to a desert island called *Œnopia*, which afterwards obtained her own name.

ÆGINA, or EGINA, or ENGIA, an island in the Saronic gulf, 20 miles distant from the Piræus, formerly vying with Athens in naval power, and, at the sea-fight of Salamis, disputing the palm of victory with the Athenians. It was the country and kingdom of Æacus, who called it *Ægina*, from his mother's name, it being before called *Œnopia*. (Ovid.) The inhabitants were called *Æginetæ* and *Æginenses*.

Ægina is about 8 miles from N.W. to S.E., and about 6 in a transverse direction. Strabo states its periphery at 180 stadia, which would give a circumference of about 22½ English miles. Its western side consists of stony but yet fertile plains, which are well cultivated, and produce luxuriant crops of grain, with some cotton, vines, almonds, and figs. The rest of the island is mountainous: the southern end rises in the conical Mount Oros; and the Panhellenian ridge stretches to the north; from which fertile narrow valleys descend on either hand. From the absence of marshes, and its insularity, the climate is mild, and the most salubrious of Greece.

The ruins of the ancient Ægina extend along two small ports, still protected by well-built ancient moles, and the shores of an open bay, defended by an ancient breakwater, near the N.W. cape of the island. On the land side, the city-walls are still distinctly traceable, 10 feet in thickness, strengthened by towers at unequal distances, and pierced by three gates. They abutted on those of the ports, which were thus included within the line of fortifications; as at Athens and elsewhere in ancient Greece. Two elegant Doric columns and sub-structures are all that remain of the buildings noticed by Pausanias within the precincts of a city that was long the greatest and most opulent maritime power of Greece; but the ruins of seventeen Christian churches, still visible, prove that after the glories of the proud city had passed away,—after what it suffered from the jealousy of its rival, Athens, and from an earthquake about the beginning of our era,—a considerable modern town had occupied its site. Some of these may perhaps only date from the time that Ægina remained under its Venetian masters, as does a tower erected at the entrance of the largest port; but they resigned possession of the island to the Turks in 1715, under whom it became the prey of Mainote and other pirates; until the emancipation of Greece made it, in 1828-29, the seat of the Greek government. On a hill near the N.E. corner of the island, stands the modern little town of Ægina (as it is pronounced by the modern Greeks). It is separated by a ravine from the hill, on which rises in lonely majesty the ruins of the noble temple of *Jupiter Panhellenius*, occupying, at the extremity of the mountain ridge known by that name, the rocky summit of a hill, in the midst of a forest of pines. The temple was a ruin in the days of Cicero, as mentioned in one of his letters; and seems to have been thrown down by an earthquake at an unknown epoch. This temple is conspicuous from a distance, and was visited by Chandler in the last century; but has been chiefly known to us by the successful excavations of our countrymen Cockerell and Foster, assisted by Baron Haller, and M. Linckh of Stuttgard in 1811. These gentlemen united in clearing away the rubbish which the lapse of 2000 years had accumulated on the basement and floor of the cell; and after 20 days exertion they were rewarded by the discovery not only of many interesting details relating to Grecian architecture, but also of many statues in most wonderfully energetic action, that had once adorned the fallen pediments of this celebrated temple. These consist of the 11 figures of the eastern, and 5 statues of the western pediment, almost entire; besides fragments of the rest, and two statuettes, and other ornaments of the acroteria. These sculptures supply an important link in the history of ancient art, and connect the schools of early Greece with that of Etruscan sculpture. The efforts of Messrs Cockerell and Foster to secure those treasures to their country are well known; and how they were defeated by the unlucky mistake of the agent sent out to purchase them for the British Museum. They now form one of the most interesting acquisitions of the magnificent *Glyptothek* of Munich.

The temple stands on a stylobate of 94 feet by 45 feet. The original number of columns in the peristyle was 32, of which 12 were ranged on each side, and six in each front; 17 feet 2 inches high, including the wide-spreading ovolo of the capital, and a diameter of 3 feet 3 inches at the base. Two other columns of 3 feet 2 inches between antæ, are in the pronaos, and two similar in the opisthodomos or *posticum*. The cella had a door at each end; a double row of smaller columns 2 feet 4 inches in diameter, were within the cella to support its partial roof; but the greatest portion of the cella was open, as this temple was *hypæthral*. There still remain 21 columns of the peristyle with their architraves; six of the eastern front, and continuously with them are five columns of the north side; the four columns of the pronaos and opisthodomos; and the lower part of the shafts of five within the cella. The tympana had been painted of a bright azure to give relief to the statues, and the drapery of Minerva, the middle figure of each group, had been painted red and blue. The whole of the ornaments on the cornices and upper mouldings of the pediment had been painted in *encaustic*, not carved.

The subject of the groups of statuary appears to be the contest for the body of Patroclus, one of the *Æacidæ* (or royal progeny of Ægina of old) as described by Horner.—*Cockerell on the Ægina Marbles. Brand's Journal.*

This magnificent structure undoubtedly belongs to the brilliant period of Æginetan power, when its navy and its commerce were the pride of Greece, and carried its citizens to the remotest shores of the Mediterranean and the Euxine. Money was struck at Ægina long before it was fabricated even at Athens. The victory of Salamis was mainly owing to the 30 ships of Ægina, and the voice of grateful Greece assigned to her warriors on that eventful day the prize of valour. Yet not long after, the rivalry of Athens began to cloud the prosperity of the haughty islanders, whose fleet she had before defeated; and Ægina at length sunk under the enmity of a relentless commercial rival, that banished her citizens, and supplied their place with Attic colonists. (T. S. T.)

ÆGINETA, PAULUS, a celebrated surgeon of the island of Ægina, from whence he derived his name. According to M. le Clerc's calculation, he lived in the fourth century; but Abulfaragius the Arabian, who is allowed to give the best account of those times, places him with more probability in the seventh. His knowledge in surgery was very great, and his works are deservedly famous. Fabricius ab Aquapendente has thought fit to transcribe him in a great variety of places. Indeed, the doctrine of Paulus Ægineta, together with that of Celsus and Albucasis, make up the whole text of this author. He is the first writer who takes notice of the cathartic quality of rhubarb; and, according to Dr Milward, is the first in all antiquity who deserves the title of accoucheur.

ÆGINETARUM FERIÆ, a festival in honour of Neptune, originally instituted at Ægina after the Trojan war, when those families whose friends returned in safety dismissed their attendants, and held their rejoicings in private, out of respect to such as mourned.—Plutarch, *Quæst. Græc.* 44.

ÆGINHARD, the celebrated secretary and supposed son-in-law of Charlemagne. He is said to have been carried through the snow on the shoulders of Imma, to prevent his being traced from her apartments by the emperor her father; a story which the elegant pen of Addison has copied and embellished in the third volume of the Spectator. There is a letter of Æginhard's still extant, lamenting the death of his wife, written in the tenderest strain of connubial affection: but it does not say that this lamented lady was the princess; and indeed some critics have supposed that Imma was not the daughter of Charlemagne. He was a native of Germany, and educated by the munificence of his imperial master, of which he has left the most grateful testimony in his preface to the life of that monarch. Æginhard, after the loss of his wife, is supposed to have passed the remainder of his days in religious retirement, and to have died soon after the year 840. His life of Charlemagne, his annals from 741 to 889, and his letters, are all inserted in the 2d volume of Duchesne's *Scriptores Francorum.* An improved edition of this valuable historian, with the annotations of Hermann Schmincke, in 4to, was published in 1711.

ÆGIPHILA, in *Botany*, GOAT-FRIEND.

ÆGIS, in *Ancient Mythology*, a name given to the shield or buckler of Jupiter and Pallas. The goat Amalthæa, which had suckled Jove, being dead, that god is said to have covered his buckler with the skin; whence the appellation *ægis*, from αιξ, αιγος, *she-goat.* Jupiter afterwards restored the animal to life, covered it with a new skin, and placed it among the stars. He made a present of his buckler to Minerva; whence that goddess's buckler is also called *ægis.* Perseus, having killed Medusa, Minerva nailed her head in the middle of the ægis, which thenceforth had the faculty of converting into stone all those who looked upon it; as Medusa herself had during her life. Others suppose the ægis not to have been a buckler, but a cuirass or breastplate; and it is certain that the ægis of Pallas, described by Virgil, *Æn.* lib. viii. v. 435, must have been a cuirass, since that poet says expressly that Medusa's head was on the breast of the goddess. But the ægis of Jupiter, mentioned a little higher, v. 354, seems to have been a buckler. The words—

> ......Cum sæpe nigrantem
> *Ægida* concuteret dextra,

are descriptive of a buckler, but not at all of a cuirass or breastplate. Servius makes the same distinction on the two passages of Virgil; for on verse 354 he takes the ægis for the buckler of Jupiter, made, as above mentioned, of the skin of the goat Amalthæa; and on verse 435 he describes the ægis as the armour which covers the breast, and which in speaking of men is called *cuirass*, and *ægis* in speaking of the gods. Many authors have overlooked these distinctions for want of going to the sources.

ÆGISTHUS, in *Ancient History*, was the son of Thyestes by his own daughter Pelopea, who, to conceal her shame, exposed him in the woods. Some say he was taken up by a shepherd, and suckled by a goat; whence he was called *Ægisthus.* He seduced Clytemnestra, the wife of Agamemnon, and lived with her during the siege of Troy. Afterwards, with her assistance, he slew her husband, and reigned seven years in Mycenæ. He was slain, together with Clytemnestra, by Orestes. Pompey used to call Julius Cæsar *Ægisthus*, on account of his having seduced his wife Mutia, whom he afterwards put away, though he had three children by her.

ÆGIUM, in *Ancient Geography*, a town of Achaia Propria, five miles from the place where Helice stood, and famous for the council of the Achæans, which usually met there, on account probably of the commodious situation of the place.

ÆGOBOLIUM, in *Antiquity*, the sacrifice of a goat offered to Cybele. The ægobolium was an expiatory sacrifice, which bore a near resemblance to the taurobolium and criobolium, and seems to have been sometimes joined with them.

ÆGOPODIUM, in *Botany*, SMALL WILD ANGELICA, GOATWORT, GOATSFOOT.

ÆGOSPOTAMOS, in *Ancient Geography*, a river in the Thracian Chersonesus, falling with a south-east course into the Hellespont, to the north of Sestos; with a town, and a station or road for ships, at its mouth. Here the Athenians under Conon, through the fault of his colleague Philocles, received a signal overthrow from the Lacedemonians under Lysander (B.C. 405), which was followed by the taking of Athens, and put an end to the Peloponnesian war.

ÆGYPTUS, in *Fabulous History*, was the son of Belus, and brother of Danaus.

AEINAUTÆ, in *Antiquity*, αειναυται, *always mariners*, a denomination given to the senators of Miletus, because they held their deliberations on board a ship, and never returned to land till matters had been agreed on.

ÆLFRIC, an eminent ecclesiastic of the tenth century, was the son of an earl of Kent, and a monk of the Benedictine order in the monastery of Abingdon. In 993 he was settled in the cathedral of Winchester, under Athelwold the bishop, and undertook the instruction of the youth of the diocese; for which purpose he compiled a Latin-Saxon vocabulary, and some Latin colloquies. He also translated from the Latin into Saxon many of the historical books of the Old Testament. While he resided at Winchester he drew up Canons, which are a kind of charge to be delivered by the bishops to their clergy. He was afterwards abbot of St Albans, then bishop of Wilton, and finally, in 1022, was translated to the see of York. Here he had a hard struggle for some years in bravely defending his diocese against the incursions of the Danes. Ælfric is held up as one of the most distinguished prelates of the Saxon church. His learning for the times, was considerable, his morals pure, and his religious sentiments untainted with many of the corruptions of his age. Besides the works already mentioned, he translated two volumes of Homilies from the Latin Fathers. He was born in 964, and died in 1050.—*Allan's York.*

ÆLIA CAPITOLINA, a name given to the city built by the emperor Hadrian, A.D. 134, near the spot where the ancient Jerusalem stood, which he found in ruins when he visited the eastern parts of the Roman empire. A Roman colony was settled here, and a temple, in place of that of Jerusalem, was dedicated to Jupiter Capitolinus. Hence the name, to which he prefixed that of his own family.

ÆLIANUS, CLAUDIUS, born at Præneste, in Italy. He taught rhetoric at Rome, according to Perizonius, under the Emperor Alexander Severus. He was surnamed Μελιγλωσσος, *Honey-tongued*, on account of the sweetness of his style in his discourses and writings. He was likewise honoured with the title of *Sophist*, an appellation in his days given only to men of learning and wisdom. He loved retirement, and devoted himself to study. He greatly admired and studied Plato, Aristotle, Isocrates, Plutarch, Homer, Anacreon, Archilochus, &c. and, though a Roman, gives the preference to the writers of the Greek nation. His curious and entertaining work entitled *Variæ Historiæ* has been frequently republished, as well as his treatise *De Natura Animalium.* A very useful edition of the latter was published by Schneider, at Leipsic, in 1784, in 8vo; another at Jena, in 1832, by Fr. Jacobs. The collated edition of his works, by Gesner, 1556, fol., contains his *Epistolæ Rusticæ.*

ÆLIANUS, *Tacticus*, a Greek writer on military tactics, in the reign of the Emperor Hadrian.

AELTERE, a town with 6383 inhabitants, in the arrondissement of Ghent, and province of East Flanders.

ÆLURUS, the Latinised Greek name of the cat deity of Egypt; represented sometimes like a cat, and sometimes as a human body with a cat's head. The Egyptians had so superstitious a regard for this animal, that the killing of it, whether by accident or design, was punished with death; and Diodorus relates, that, in a time of famine, they chose rather to eat one another than touch these sacred animals. The cat was sacred to the goddess Pasht or Bubastis.

ÆMILIUS L. PAULLUS, son of that L. Paullus Æmilius who was killed at the battle of Cannæ. He was twice consul. In his first consulate he triumphed over the Ligurians, and in the second subdued Perseus, king of Macedonia, and reduced that country to a Roman province, for which he obtained the surname of Macedonicus. He died B.C. 160, at the age of seventy.

ÆMILIUS, *Paulus*, or *Paolo Emilio*, a celebrated historian, born at Verona, who obtained such reputation in Italy, that he was invited into France by the cardinal of Bourbon, in the reign of Louis XII., in order to write the history of the kings of France in Latin, and was presented to a canonry in the cathedral of Paris. He died at Paris on the 5th of May 1529. His work entitled *De Rebus gestis Francorum* was translated into French by Renard in 1581, and has also been translated into Italian and German.

ÆMOBOLIUM, in *Antiquity*, the blood of a bull or ram offered in the sacrifices, called *taurobolia* and *criobolia;* in which sense the word occurs in ancient inscriptions.

ÆNEAS, in *Fabulous History*, a Trojan prince, the son of Venus and Anchises. He plays a conspicuous part in the Iliad, and is represented, along with Hector, as the chief bulwark of the Trojans. Virgil has chosen him as the hero of his great epic, and the story of the Æneid, though not only at variance with other traditions, but inconsistent with itself, can never lose its place as a biography of the mythical founder of the Latin power. Æneas is described in the Æneid as escaping from the destruction of Troy, bearing his aged father on his shoulders, carrying in one hand his household gods, while with the other he leads his little son Ascanius or Iülus. His wife Crëusa is separated from them and lost in the tumult. After a perilous voyage he lands in Africa, and is kindly received by Dido, queen of Carthage; who, on his forsaking her to seek a new home, destroys herself. Again escaping the dangers of the sea, he arrives in Italy, where he forms an alliance with Latinus, a prince of the country, marries his daughter Lavinia, and founds a city which he calls after her, Lavinium. Turnus, king of the Rutuli, a rejected suitor of Lavinia, makes war on Latinus, and both are slain in battle. Æneas assumes the sovereignty of Latium, and the Trojan and Latin powers are united in one nation. After a reign of three years, Æneas falls in a battle with the Rutuli, assisted by Mezentius, king of Etruria, and is carried up into heaven.

ÆNEAS SYLVIUS, *Pope.* See PIUS II.

ÆNEID, the name of Virgil's epic poem, in celebration of the settlement of Æneas in Italy. See VIRGIL.

ÆNIGMA denotes any dark saying, wherein some well-known thing is concealed under obscure language. The word is Greek, Αινιγμα, from αινιττεσθαι, *obscure innuere*, to hint a thing darkly (αινος, a tale, saying, or proverb). The popular name is *riddle;* from the Belgic *raeden*, or the Saxon *araethan*, to interpret.

*Painted ÆNIGMAS* are representations of the works of nature or art, concealed under human figures, drawn from history or fable.

*A Verbal ÆNIGMA* is a witty, artful, and abstruse description of any thing. In a general sense, every dark saying, every difficult question, every parable, may pass for an ænigma. Hence obscure laws are called *ænigmata juris.* The alchemists are great dealers in the ænigmatic language, their processes for the philosopher's stone being generally wrapt up in riddles: *e. g. Fac ex mare et fœmina circulum, inde quadrangulum, hinc triangulum, fac circulum, et habebis lapidem philosophorum.*

ÆNITHOLOGIUS, in *Poetry*, a verse of two dactyls and three trochæi; as *Prælia dira placent truci juventæ.*

ÆOLIÆ INSULÆ, now *Isole di Lipari*, in *Ancient Geography*, seven islands situate between Sicily and Italy; so called from Æolus, the god of the winds, who was supposed to have ruled there. The Greeks call them *Hephæstiades;* and the Romans *Vulcaniæ*, from their fiery eruptions. They are also called *Liparæorum Insulæ*, from their principal island Lipari. Dionysius Periegetes calls them Πλωται, because circumnavigable.

ÆOLIAN HARP, a musical instrument consisting of catgut strings stretched over a wooden sound-box. When exposed to a current of air, the strings produce a variety of pleasing harmonic sounds in wild succession and combination. See MUSIC.

ÆOLIC, in a general sense, denotes something belonging to Æolis.

ÆOLIC, or ÆOLIAN, in *Grammar*, denotes one of the five dialects of the Greek tongue. It was first used in Bœotia, whence it passed into Æolia, and was that in which Sappho and Alcæus wrote. The Æolic dialect generally throws out the aspirate or sharp spirit, and agrees in so many things with the DORIC dialect, that the two are usually confounded.

The *Æolic digamma* is a name given to the letter F, which the Æolians used to prefix to words beginning with vowels, as Fοινος for οινος; also to insert between vowels, as οFις for οις.

*ÆOLIC Verse*, in *Prosody*, a verse consisting of an iambus or spondee; then of two anapæsts, separated by a long syllable; and, lastly, of another syllable: such as, *O stelliferi conditor orbis.* It is also called *eulogic* verse; and, from the chief poets who used it, *Archilochian* and *Pindaric.*

ÆOLIPILE, in *Hydraulics*, is a hollow ball of metal, generally used in courses of experimental philosophy, in order to demonstrate the possibility of converting water into an elastic steam or vapour by heat. The instrument, therefore, consists of a slender neck or pipe, having a narrow orifice inserted into the ball by means of a shouldered screw. This pipe being taken out, the ball is filled almost full of water and the pipe being again screwed in, the ball is placed on a pan of kindled charcoal, where it is well heated, and there issues from the orifice a vapour, with prodigious violence and great noise, which continues till all the included water is discharged. The stronger the fire is, the more elastic and violent will be the steam; but care must be taken that the small orifice of the pipe be not by any accident stopped up, because the instrument would in that case infallibly burst in pieces, with dangerous violence. Another way of introducing the water is to heat the ball red-hot when empty, which will drive out almost all the air; and then, by suddenly immersing it in water, the pressure of the atmosphere will force in the fluid, till it is nearly full. Descartes and others have used this instrument to account for the natural cause and generation of the wind: and hence it was called *Œolipila:* q. d. *pila Æoli*, the ball of Æolus.

ÆOLIS, or ÆOLIA, in *Ancient Geography*, a country of Asia Minor, settled by colonies of Æolian Greeks. Taken widely, it comprehends all Troas and the coast of the Hellespont to the Propontis, because in those parts there were several Æolian colonies. In a more limited sense it is applied to the district between Troas to the N. and Ionia to the S.

ÆOLUS, in *Heathen Mythology*, the god of the winds, was said to be the son of Jupiter by Acasta or Sigesia, the daughter of Hippotas; or, according to others, the son of Hippotas by Meneclea, daughter of Hyllus, king of Lipara. He dwelt in the island now called Stromboli, one of the Æolian islands. Others place his residence at Rhegium, in Italy; and others, again, in the island Lipara. He is represented as having authority over the winds, which he held enchained in a vast cavern. Strabo, and some other writers, consider him to have had a real existence; and derive the fable of his power over the winds, from his skill in meteorology and the management of ships.

> Hîc vasto rex Æolus antro,
> Luctantis ventos tempestatesque sonoras
> Imperio premit, ac vinclis et carcere frenat.
> Illi indignantes magno cum murmure montis
> Circum claustra fremunt; celsâ sedet Æolus arce
> Sceptra tenens, mollitque animos, et temperat iras:
> Ni faciat, maria ac terras cœlumque profundum
> Quippe ferant rapidi secum, verrantque per auras.
>
> ÆNEID, *Lib.* i. 52.

ÆON, a Greek word, properly signifying the age or duration of any thing.

ÆON, among the followers of Plato, was used to signify any virtue, attribute, or perfection: hence they represented the deity as an assemblage of all possible æons, and called him *pleroma*, a Greek term signifying *fulness.* The Valentinians, who, in the first ages of the church, blended the conceits of the Jewish cabalists, the Platonists, and the Chaldean philosophers, with the simplicity of the Christian doctrine, invented a kind of Theogony, or Genealogy of Gods (not unlike that of Hesiod), whom they called by several glorious names, and all by the general appellation of ÆONS: among which they reckoned Ζωη, *life;* Λογος, *word;* Μονογονης, *only-begotten;* Πληρωμα, *fulness;* and many other divine powers and emanations, amounting in number to thirty; which they fancied to be successively derived from one another, and all from one self-originated deity, named *Bythus*, i. e. *profound* or *unfathomable;* whom they called likewise, *the most high and ineffable father.*

ÆORA, among ancient writers on medicine, is used for gestation; which sort of exercise was often prescribed by the physicians of those days. Other exercises consisted principally in the motion of the body; but in the *æora* the limbs were at rest, while the body was carried about and moved from place to place, in such a manner as the physician prescribed. It had therefore the advantage of exercise, without the fatigue of it. This exercise was promoted several ways; sometimes the patient was laid in a sort of hammock, supported by ropes, and moved backward and forward; sometimes his bed ran nimbly on its feet; and sometimes he was carried in a litter, in a boat or ship, or on even ground in a chariot. Asclepiades was the first who brought gestation into practice, which was used as a means to recover strength after a fever, &c.

ÆPINUS, FRANCIS ULRICH THEODORE, eminent in the mathematics, and in natural philosophy, was born at Rostock in Lower Saxony in 1724, and died at Dorpt in Livonia in 1802. We regret that our means of information do not enable us to communicate any particulars in regard to his personal history; but we shall give some account of his contributions to science; and these, after all, form the most interesting memorials of a philosopher's life.

The work by which he is best known is entitled *Tentamen Theoriæ Electricitatis et Magnetismi*, published at Petersburg in 1759. It appeared under the sanction of the Imperial Academy, to which the theory had been in part communicated; and it is said on the title-page to be *Instar Supplementi Comment. Acad. Petropolitanæ.* The work indeed merited this distinction, as being the first systematic and successful attempt to apply mathematical reasoning to the subjects of electricity and magnetism. Already the theory of Franklin with regard to the former was very generally received, and was supposed to afford a satisfactory explanation of the phenomena. But though it seemed sufficient for this purpose in the common and somewhat loose manner in which the matter had hitherto been treated, it was not certain that the same would hold when the conclusions were accurately and mathematically deduced. To apply this test was what Æpinus undertook, and what he has executed in a manner very satisfactory and complete. He has treated very fully, and perhaps has nearly exhausted, what may be called the *statics* of electricity and magnetism, or the equilibrium of their forces. A great field yet remains, where the motion of the electric fluid is to be considered, and its distribution over the surfaces of bodies of a given figure; where greater difficulties are to be encountered, and where the latest improvements of the integral calculus in the hands of Laplace and Poisson have begun to be applied. The investigations of Æpinus in their own department led to very satisfactory results, and the exact agreement between them and the phenomena actually exhibited was extensively observed. Notwithstanding this agreement, we cannot consider the theory of positive and negative electricity as being yet sufficiently established. Though the assumption on which it is founded appear very simple at first, it is found more complex on a nearer inspection. The assumption is, that a fluid resides in the surfaces of all the bodies termed electrics, which is highly elastic, and strongly attracted, at the same time, by the particles of the body; and that while this fluid remains equally diffused over the surface of the body, no phenomenon whatever gives any information of its existence. By certain mechanical opera-

Æpinus.

tions, however, the equilibrium of this fluid may be destroyed; the fluid may be accumulated at one end, or on one side of a body, and entirely withdrawn from the opposite. It is when an electric is brought into this state that it exhibits the phenomena of electricity, between which and the calculus instituted on the suppositions just laid down, Æpinus has everywhere remarked the most exact agreement. One great difficulty, however, still remains: the negative ends of two electrified bodies repel one another just as much as the ends which are reckoned positive. But such an effect cannot result from the mere absence of a substance: when the electric fluid is withdrawn, if repulsion still continue, it must arise from the mutual action of the particles of the body itself. Thus it would appear, that, in the absence of the electric fluid, the tendency of the particles of matter is to repel one another. This is an essential part of the theory; and it is not accurate to say, that the doctrine of Franklin or Æpinus supposes no more than the existence of an elastic fluid diffused over the surfaces, and strongly attracted by the particles, of bodies. It supposes, besides, that those particles, in the absence of this fluid, mutually repel one another. This not only takes away from the simplicity of the hypothesis, but it is obviously a very unnatural, not to say a contradictory supposition; because, when the electric matter is removed, how comes it to pass that the particles of the body, notwithstanding their mutual repulsion, still cohere together as firmly as before? This difficulty is acknowledged by Æpinus himself; but it would seem that the theory had taken a strong hold of his mind before he was aware of this consequence from it, so that he became by degrees reconciled to a supposition which appeared to him at first not a little incongruous. This must not surprise us: it is not always that, even among philosophers, we meet with the candour, or perhaps we should say the courage, with which Newton suspended his belief in his own great discovery, the principle of universal gravity, as long as the erroneous opinion then existing about the magnitude of the earth made the moon's motion in her orbit appear inconsistent with the descent of falling bodies.

Another remark, made by Æpinus himself, involves in it a difficulty which should have induced him to view his theory with considerable diffidence. Though he considers the difference of the two electricities to be the same as between excess and defect, or to consist in this, that the fluid which is deficient in the one part is in excess in the other, he admits that no phenomenon points out on which side the excess, or on which the defect lies. This is a strong indication that the difference is not of the kind supposed. We are not left at a loss to tell whether cold is the absence of a substance which we call heat, or heat the absence of a substance which we call cold. If there were just as much reason for asserting the one of these propositions as the other, one would certainly be inclined to reject both. The same should be done with respect to electricity and magnetism.

The investigations of Æpinus, however, are by no means rendered useless, even if the theory of positive and negative electricity, or of positive and negative magnetism, be exchanged for that of two elastic fluids, each attracting the other, and both attracted by the particles of bodies. Most of his investigations may be easily accommodated to this supposition, and, therefore, they are, fortunately for themselves and for their author, of a more permanent nature than the principles from which they were deduced.

It is to be added to this, that Æpinus was the first who saw the affinity between electricity and magnetism in its full extent, and perceived the light that these two mutually cast on one another. He instituted a regular series of experiments on the nature of the tourmaline, on which he wrote a small treatise, published in 1762. He is to be regarded also as the inventor of the condenser of electricity, and of the electrophorus, of which he gave the complete theory.

Æpinus.

A very excellent view of the theory of Æpinus was published at Paris by M. Haüy in 1787, in 8vo. The same author has, however, adopted the theory of the two fluids in his own treatise, *Leçons de Physique.* There is a remarkable coincidence between Æpinus's work on electricity and magnetism, and that of Mr Cavendish, given in the *Philosophical Transactions* for 1771, p. 584. The principles from which they set out, and the conclusions at which they arrive, are in a great measure the same. It appears, however, quite certain, that Mr Cavendish knew nothing of the work of the Russian philosopher till his own was completed. His mode of proceeding is more geometrical, and in some parts he has gone farther.

The researches of Æpinus were not confined to the subjects now mentioned, but extended to most of the branches of natural philosophy. Beside the treatise on the tourmaline, he published, in 1762, a work, in 4to, *On the distribution of heat at the surface of the earth;* a work which, though translated into French, has hardly, we believe, made its way into this country, and of which we are therefore unable to speak from our own knowledge. He is also the author of many valuable memoirs on different subjects in pure mathematics, in astronomy, mechanics, optics, meteorology, contained in the 7th, 8th, 9th, 10th, and 12th volumes of the *Novi Commentarii Petropolitanæ*, and in the volumes of the *Berlin Memoirs* for 1755, 1756. In a memoir contained in the last of these, is the first account of his experiments on the tourmaline, which were conducted with great accuracy and judgment, and do honour to the author as a man of a sound and philosophical understanding, well instructed in the true principles of inductive investigation. Indeed, notwithstanding the objections we have made to his theories of electricity and magnetism, we must acknowledge that this is the general impression produced by the perusal of his works. He appears to have been well acquainted with practical astronomy, and sometimes to have had the charge of the imperial observatory. He made improvements on the micrometer and the reticulum, and wrote a memoir on the effects of parallax in the transit of a planet over the sun; a difficult subject, and one rendered at that time (1764) peculiarly interesting, on account of the transit of Venus which was just past, and that which was soon expected. (*Novi Com. Pet.* tom. x. p. 433.) In the same volume he has a memoir on the subject of *accidental colours*, which at that time had hardly been treated of by any author but Buffon; and another on the affinity between electricity and magnetism. In the 12th volume he notices, we believe for the first time, the electric property of the Brazilian emerald. He was not aware that this emerald is in reality the green tourmaline (*Brogniart*, tom. i. p. 418.); a variety of that mineral on which he had already exercised his ingenuity with so much success.

It is rare, in an advanced state of science, to have the satisfaction of making a new discovery with regard to a subject quite elementary, and one that has been long a subject of attention. This, however, happened to Æpinus with respect to the *lever*, and to the simplest kind of lever—that which has equal arms; of which he has demonstrated a new property, in the 8th volume of the *Commentaries* above referred to. It is this:—If a lever with equal arms be acted on at its opposite ends by forces in a given ratio to one another, and having their directions parallel to straight lines given in position; and if these forces be resolved each into two, one at right angles to the lever, and the other in the direction of it; in the case of equilibrium, the sum of the two forces, having the same direction with the lever, will be the *greatest possible.* This theorem, remarkable for its simplicity, and for illustrating the connection between the equilibrium of bodies, and certain problems concerning the maxima or minima of variable quantities, occurred when he was pursuing some of his inquiries concerning magnetism. He seems not to have been very fortunate, however, in his investigation, which is more complex than is necessary, as the proposition admits of a geometrical demonstration remarkable for its simplicity. (J. P.)

ÆQUI, a brave ancient people of Italy, inhabiting the upper valley of the Anio, who, in confederacy with the Volsci carried on a long series of hostilities with the early Romans; but were finally subdued in the year B.C. 302.

ÆQUIMELIUM, in *Antiquity*, a place in Rome where stood the house of Spurius Mælius, who, by largesses corrupting the people, affected the supreme power. Refusing to appear before the dictator Cincinnatus, he was slain by Servilius Ahala, master of the horse; his house was razed to the ground, and the spot on which it stood was called *Area Æquimelii.—Livy*, iv. 13-16.

ÆRA, in *Chronology*, a fixed point of time from whence any number of years is begun to be counted. It is sometimes also written in ancient authors *Era*. The origin of the term is contested, though it is generally allowed to have had its rise in Spain. Sepulveda supposes it formed from A. ER. A. the notæ or abbreviatures of the words *annus erat Augusti*, occasioned by the Spaniards beginning their computation from the time their country came under the dominion of Augustus, or that of receiving the Roman calendar. This opinion, however ingenious, is rejected by Scaliger, not only on account that in the ancient abbreviatures *A* never stood for *annus*, unless when preceded by *V* for *vixit;* but that it seems improbable they should put ER for *erat*, and the letter A, without any discrimination, both for *annus* and *Augustus.* Vossius nevertheless favours the conjecture, and judges it at least as probable as either that of Isidore, who derives *æra* from *æs*, the tribute-money wherewith Augustus taxed the world; or that of Scaliger himself, who deduces it likewise from *æs*, though in a different manner. *Æs*, he observes, was used among the ancients for an *article* or *item* in an account; and hence it came also to stand for a sum or number itself. From the plural *æra*, came the corruption *æra, æ, æram*, in the singular; much as *Ostia, æ, Ostiam*, the name of a place, from *Ostia*, the mouths of the Tiber.

The difference between the terms *æra* and *epoch* is, that the æras are certain points fixed by some people or nation, and the epochs are points fixed by chronologists and historians. The idea of an æra comprehends also a certain succession of years proceeding from a fixed point of time, and the epoch is that point itself. Thus the Christian æra began at the epoch of the birth of Jesus Christ. See CHRONOLOGY.

ÆRARIUM, the treasury or place where the public money was deposited amongst the Romans.

*Ærarium Ilithyæ*, or *Junonis Lucinæ*, was where the moneys were deposited which parents paid for the birth of each child.

*Ærarium Privatum* was the emperor's privy purse, or the place where the money arising from his private patrimony was deposited.

*Ærarium Sanctius* contained the moneys arising from the twentieth part of all legacies: this was kept for the extreme necessities of the state.

*Ærarium Vicesimarum*, the place where the money arising from the taxes levied from foreign countries was laid up; so called because it most commonly consisted of a twentieth part of the produce.

There are several other treasuries mentioned in history, as the *Ærarium Juventutis, Veneris*, &c. The temple of Saturn was the public treasury of Rome, either because Saturn first taught the Italians to coin money, or, which is most likely, because this temple was the strongest and most secure, and therefore the fittest place for that purpose.

*Ærarium* differs from *Fiscus*, as the first contained the public money, the second that of the prince. The two are, however, sometimes indiscriminately used for each other.

ÆRARIUS, a name given by the Romans to a degraded citizen, who had been struck off the list of his century. Such persons were so called, because they were still liable to all the taxes (*æra*), though deprived of the privileges of citizens.

The *ærarii* were incapable of making a will, of inheriting, of voting in assemblies, or of enjoying any post of honour or profit; in effect, they were only subject to the burdens, without the benefits of society; yet they retained their freedom, and were not reduced to the condition of slaves. To be made an *ærarius* was a punishment inflicted for some offence, and reputed one degree more severe than to be expelled a tribe, *tribu moveri.*

ÆRARIUS was likewise an officer instituted by Alexander Severus, for the distribution of the money given in largesses to the soldiery or people.

ÆRARIUS was also used for a person employed in coining or working brass. These are sometimes called *ærarii fusores.* At other times, *ærarius* is distinguished from *fusor;* the former answering to what we now call coppersmiths, the latter to founders.

ÆRARIUS was also applied to a soldier who receives pay.

AERIA, or EERIA, in *Ancient Geography*, the ancient name of Egypt. The scholiast on Apollonius Rhodius says, that not only Thessaly, but Egypt, was called Ηερια by the Greeks, which Eusebius also confirms; and hence Apollinarius, in his translation of the 114th Psalm, uses it for Egypt. Hesychius applies this name to Ethiopia.

AERIE. See AIRY.

AERNEN, a market town near the river Rhone, in the canton of Wallis or Valais, in Switzerland, in the district of Gambs. It has a state-house and other good buildings, and is the seat of justice for the district.

AERODYNAMICS. See DYNAMICS.

AEROLITE, a term recently, but perhaps improperly, applied to those singular substances commonly called METEORIC STONES. See METEOROLITE.

AEROMANCY, a species of divination performed by means of air, wind, &c.

AEROMETRY, the science of measuring the air. It comprehends not only the doctrine of the air itself, considered as a fluid body, but also its pressure, elasticity, rarefaction, and condensation. But the term is at present not much in use, this branch of natural philosophy being more frequently called Pneumatics.

AERONAUTICA, from αηρ, and ναυτικος, derived from ναυς, *ship;* the art of sailing in a vessel or machine through the atmosphere, sustained as a ship in the sea. See AERONAUTICS.

# AERONAUTICS.

Aëronautics.

Gradual discovery of navigation.

IN every stage of society men have eagerly sought, by the combination of superior skill and ingenuity, to attain those distinct advantages which nature has conferred on the different tribes of animals, by endowing them with a peculiar structure and a peculiar force of organs. The rudest savage learns from his very infancy to imitate the swimming of a fish, and plays on the surface of the water with an agility and a perseverance which seem to decline with the advancement of civilisation. But an art so confined in its exercise, and requiring such a degree of bodily exertion, could not be considered of much avail. It was soon perceived, that the fatigue of impulsion through the water could be greatly diminished, by the support and floating of some light substance. The trunk of a tree would bear its rude proprietor along the stream; or, hollowed out into a canoe, and furnished with paddles, it might enable him even to traverse a river. From this simple fabric, the step was not great to the construction of a boat or barge, impelled by the force of oars. But it was a mighty stride to fix masts and apply sails to the vessel, and thus substitute the power of wind for that of human labour. The adventurous sailor, instead of plying on the narrow seas, or creeping timidly along the shore, could now launch with confidence into the wide ocean. Navigation, in its most cultivated form, may be fairly regarded as the consummation of art, and the sublimest triumph of human genius, industry, courage, and perseverance.

Vain attempts to fly through the air.

Having by his skill achieved the conquest of the waters that encompass the habitable globe, it was natural for man to desire likewise the mastery of the air in which we breathe. In all ages, accordingly, has ingenuity been tortured in vain efforts at flying. The story of Icarus testifies how fatal such daring attempts had generally proved to their projectors. Trials made with automatons, though less liable to risk and danger, were yet equally fallacious. Archytas, a most eminent Greek geometer and astronomer, who perished by shipwreck on the coast of Calabria, was believed by his admiring contemporaries to have constructed an artificial dove, which, by the action of a system of internal springs, wafted itself through the air. If such a piece of mechanism was ever made, we may be sure that its flight was really produced, as in the scenes of the opera, by means of invisible strings or wires.

Flying ascribed to demons,

So thoroughly were the ancients convinced of the impossibility of men being able to fly, that they ascribed the absolute rule of the sky to divinities of the first order. The supreme Jupiter alone reposed on his empyreal throne, far above the heights of Olympus; and to him was it given, from the region of the clouds, to point the winged lightning, and to hurl the flaming thunderbolt. On special missions he dispatched Mercury, as his messenger, through the wide range of atmosphere. The oriental nations, from whom we have borrowed the greater part of our vulgar mythology, likewise committed such journeys to certain genii or ministering spirits. But the glowing visions of the East received a darker tinge from the character and climate of our Gothic ancestors. The arch-fiend himself was, at no very distant period, firmly believed to have the especial control of the air, and to career in the whirlwind and impel the howling tempest. Those wretched creatures whom the unfeeling credulity of our ancestors, particularly during the prevalence of religious fanaticism, stigmatized and murdered under the denomination of witches, were supposed to work all their enchantments, to change their shapes at will, and to transport themselves through the air with the swiftness of thought, by a power immediately derived from their infernal master. At a period somewhat earlier, every person in possession of superior talents and acquirements was believed to deal in magic, and to perform his feats of skill chiefly through the secret aid granted him by the prince of darkness. In spite of the incurable perverseness of his conduct, it must be confessed that the devil has always had the credit of retaining some little inclination to assist the efforts of genius.

Aëronautics.

and to magicians.

During the darkness of the middle ages, every one at all distinguished by his knowledge in physics was generally reputed to have attained the power of flying in the air. Our famous countryman Friar Bacon, among other dreams engendered in his fervid brain, has not scrupled to claim the invention of that envied and transcendent art. To these pretensions the credulity and indulgent admiration of some authors have lent more credit than they really deserved. Any person who will take the trouble to examine the passages of Bacon's obscure though ponderous works, must soon be convinced, that the propositions advanced by him are very seldom founded on reality, but ought rather to be considered as the sportive illusions of a lively and teeming fancy. Albertus Magnus, who lived about the same period, and was esteemed in Germany as a perfect prodigy, pretended also to the art of flying. More than a century afterwards, John Müller of Königsberg, and thence styled *Regiomontanus*, one of the chief restorers of genuine mathematical learning in Europe, was reported by some writers of note to have, like Archytas, fashioned an artificial dove, which displayed its wings, and flew before the emperor Charles V. at his public entrance into Nüremburg. But, unfortunately for the veracity of the story, Regiomontanus died in early life, full sixty years before that visit took place.

Dark features of that art.

While the belief in necromancy prevailed, such tales assumed colours of the most lurid hue. Fiery dragons, created by infernal machination, were imagined to rush impetuous through the sky, vomiting flames, and widely scattering the seeds of pestilence. Grave writers, in those benighted ages, even ventured to describe the method of imitating the composition of such terrific monsters. A mass of large hollow reeds were to be disposed and bound together, then sheathed completely in skin, and smeared over with pitch and other inflammable matters: this light and bulky engine, partially set on fire, and launched in the thickest darkness into the air, might be sufficient, when borne along by the force of the wind, to strike the ignorant populace with affright and horror. But such spectacles would come to lose their terrors by repeated failure and the insensible progress of knowledge. So late as the year 1750, a small Catholic town in Swabia was almost entirely burnt to ashes by an unsuccessful experiment of that sort, instigated, and probably directed, no doubt for the edification of their flock, by the lowest order of priests. It was attempted to represent the effigy of Martin Luther, whom the monks firmly believe to be the very imp of Satan, under the form of a winged serpent, furnished with all the requisite appendages of a forked tail and hideous claws. Unluckily for the skill of the machinist, this phantom directly fell against the chimney of a house, to which it set fire; and the flames spreading furiously in every direction, the people had soon cause to lament bitterly their intemperate zeal.

Later attempts at flying.

The scheme of flying in the air, which men of the first genius had once entertained, appears to have gradually descended to a lower class of projectors. Those who afterwards occupied themselves with such hopeless attempts, had commonly a smattering of mechanics, with some little share of ingenuity, but wrought up by excessive conceit.

In the beginning of the sixteenth century, an Italian adventurer visited Scotland, during the reign of James IV.; and being a man of some address, and at the same time a pretender to alchemy, he contrived to insinuate himself into the favour of that gay and needy prince, by holding out hopes of augmenting his scanty treasury by the acquisition of the philosopher's stone. He was collated by royal favour to the abbacy of Tungland in Galloway; but not having succeeded in creating artificial riches, he resolved, in the height of his enthusiasm, at once to gratify and astonish the courtiers, by the display of a feat still more extraordinary. Having constructed a set of ample wings, composed of various plumage, he undertook, from the walls of Stirling Castle, to fly through the air to France. This experiment he had actually the folly or hardihood to try; but he soon came to the ground, and broke his thigh-bone by the violence of the fall. For his unlucky failure, however, the abbot had the dexterity to draw a very plausible excuse from the wretched sophistry, termed science in that age. "My wings," said the artful Italian, "were composed of various feathers; among them were the feathers of dunghill fowls, and they, by a certain sympathy, were attracted to the dunghill; whereas, had my wings been composed of the feathers of eagles alone, the same sympathy would have attracted them to the region of the air." This anecdote has furnished to Dunbar, the Scotish poet, the subject of one of his rude Satires.

A century afterwards, Fleyder, rector of the grammar-school at Tübingen, entertained, in 1617, the worshipful magistrates of that city with a lecture on the art of flying, which he published at the lapse of eleven years, yet prudently contented himself with barely explaining his theory. A poor monk, however, ambitious to reduce this theory into practice, having provided himself with spacious wings, took his flight from the top of a high tower; but encountering a cross wind, his machinery misgave, and falling precipitously to the ground, he broke both his legs, and perished miserably. An accident of a similar kind is related to have happened not long since near Vienna.

Impossibility of flying first demonstrated by Borelli.

The impossibility of rising, or even remaining suspended in the air, by the action of any machinery impelled by human force, was first demonstrated by Borelli, a most eminent Italian mathematician and philosopher, who lived in the fertile age of discovery, and was thoroughly acquainted with the true principles of mechanics and pneumatics. In his celebrated and excellent work *De Motu Animalium*, published in 1670, he showed, by accurate calculation, the prodigious force which the pectoral muscles of birds must exert and maintain. The same principles, applied to the structure of the human frame, proved how very disproportionate was the strength of the corresponding muscles in man. It is not, therefore, the mere difficulty of contriving and combining machinery which should perform the peculiar motions of wings, that has rendered all attempts of the kind futile, but the utter want of adequate force in the human body to give such impulsion to those extended vanes as would be necessary for supporting so great a weight in the thin medium of the atmosphere.

Having found by experience the impossibility, from any application of inherent strength, of ascending into the atmosphere, it was natural for men of ardent minds, who still pursued that dazzling project, to look for some extraneous aid among the varied powers of the elements.

Cosmological notions of the ancients.

The notions entertained by the ancients respecting the composition of the world might have suggested important hints for realizing the scheme of aërial navigation. The four elements—earth, water, air, and fire or ether, arranged according to their several qualities and tendencies, were supposed to constitute this universal frame. Earth, being heavy and inert, occupies the centre of the system, and above it flowed the waters; air, from its lightness, rose upwards, and invested the globe with an atmosphere; while the diffuse ethereal substance soared, by its extreme buoyancy, to the celestial regions, and filled with splendour their pure expanse. Every portion of these distinct elements, if transported from its place, was conceived as having a natural and constant appetency to return to its original situation. Earth and water sink downwards by their gravity, while air and fire, endued with an opposite principle, as invariably rise to the higher spaces. A portion of fire, joined to water or to air, communicates, in a corresponding degree, its levity, or disposition to ascend. Thus, warm air always rises; water, subdued by excessive heat, flies upwards in the form of vapour; and the volatile parts of inflamed bodies are borne to the sky in smoke.

Idea of sailing through the air first given by Albert of Saxony,

The first person that seems to have formed a just idea of the principle on which a balloon could be constructed was Albert of Saxony, a monk of the respectable order of St Augustin, who lived in the fourteenth century, and wrote a learned commentary on the physical works of Aristotle. Since fire is more attenuated than air, and floats above the region of our atmosphere, this ingenious person conceived that a portion of such ethereal substance, inclosed in a light hollow globe, would raise it to a certain height, and keep it suspended in the sky. But the same philosopher rightly subjoined, that a greater mixture of air introduced into the balloon, by rendering this heavier than before, would cause it to descend proportionally, in the same way precisely as water admitted through the seams of a ship makes the vessel to sink in the ocean. It is evident that nothing was wanted for completing Montgolfier's discovery, but to carry those fine views into execution.

and adopted by Mendoza

The ideas of Albert of Saxony were long afterwards zealously embraced by Francis Mendoza, a Portuguese Jesuit, who died at Lyons in the course of a tour through France in 1626, at the age of 46. He maintained that the combustible nature of fire was no real obstacle to its application in balloons, since its extreme levity, and the exclusion of the air, would hinder it from supporting inflammation. Casper Schott, a Jesuit likewise, pursued more soberly the same speculation in Germany. He stated that no air of these lower regions is ever light enough to produce an ascent, and that the lucid ethereal matter which swims above our atmosphere is alone fitted for aërial navigation. Were any superhuman power, therefore, to bring down a store of that buoyant substance, to be inclosed in a hollow ball of wood or thin lead, the vessel, being furnished with a rudder and sails, might then, he conceived, boldly navigate the sky.

and Casper Schott.

Blended with alchemical notions.

Similar notions have been renewed at different times. They were likewise often blended with the alchemical tenets so generally received in the course of the fifteenth, sixteenth, and part of the seventeenth centuries. Conceiving with the ancients that the dew which falls during the night is of celestial origin, and shed by the stars, speculative men still imagined this pure humidity to be drawn up again to the heavens by the sun's rays in the heat of the day. Many persons, imbued with the wretched learning of that age, had the simplicity to believe that an egg-shell filled with the morning dew, and placed at the foot of a ladder leaning against the roof of a house, would, as the day advanced, spontaneously rise along the bars, and mount to the chimney-tops.

**Whimsical projects of Father Laurus.**

This whimsical fancy is confidently related as an observed fact by Father Lauretus Laurus. "Take," says he, very gravely, "a goose egg, and, having filled it with dew gathered fresh in the morning, expose it to the sun during the hottest part of the day, and it will ascend, and rest suspended for a few moments." To perform the experiment on a greater scale, however, he proposed to employ the largest swan's egg, or a bag artificially prepared from the thinnest and lightest skin, into which, instead of dew, he would introduce the three alchemical elements, nitre, sulphur, and mercury; and he imagined that these active bodies, expanded and sublimed by the mere heat of the sun, must spring powerfully upwards. In this way he thought the dove of Archytas might be constructed. But the visionary priest had yet another scheme to advance for effecting the ascent of the automaton: he proposed to cram the cavity of the dove with highly condensed air; and was so grossly ignorant of the principles of motion as to suppose that this imprisoned fluid would impel the machine in the same manner as wind does a sail. Should such a force be found not sufficiently efficacious, he finally recommended the application of fire; not, however, on account of its buoyant property, but because of the propulsive power which it exerts. To prevent the fire from consuming the wooden machine, he recommends lining the inside with cloth of asbestos or other incombustible materials; and to feed and support steadily this fire, he suggested a compound of butter, salts, and orpiment, lodged in metallic tubes, which he imagined would at the same time heighten the whole effect, by emitting a variety of musical tones like an organ.

**Proposals of Cardan and Fabry.**

Influenced by the same views, other authors, and particularly the famous Cardan, have proposed, for aërial ascents, to apply fire acting as in a rocket. Still later, but in the same country, Honoratus Fabry, penitentiary of the pope, and teacher in the gymnasium at Rome, who died about the end of the seventeenth century, described a huge apparatus, consisting of very long tin pipes, in which air was compressed by the vehement action of fire below. In a boat suspended from the machine, a man was to sit and direct the whole, by the opening or shutting of valves.

**Philosophical romance of Cyrano de Bergerac.**

The projects and vagaries of learned men about the misty period of the restoration of science were finely ridiculed by Cyrano de Bergerac, a very witty and eloquent French writer, in a philosophical romance, entitled *The Comical History of the States and Kingdoms in the Sun and Moon.* This eccentric genius, born at Perigord in 1620, was noted for his impetuous temper and boiling courage. He spent his youth in dissipation and feats of arms; but afterwards, in riper life, he quitted the military profession, and betook himself to the study of poetry and philosophy, which he prosecuted with great ardour and success till he died, at the early age of 35. In his romance, from which perhaps Swift borrowed the idea of Gulliver's voyage to Laputa, Bergerac introduced a good deal of the Cartesian philosophy, then just coming into vogue; but lashed severely the pedantry and ignorance of various pretenders to science. To equip himself for performing the journey to the moon, the French traveller fastens round his body a multitude of very thin flasks filled with the morning's dew. The heat of the sun, by its attractive power exerted on the dew, raised him up to the middle region of the atmosphere; where some of his flasks happening unluckily to break, the adventurer sunk again to the ground, and alighted in Canada. There he constructed a new machine, acting by a train of wheels, with which he mounted to some height; but falling down, he had the misfortune to break his leg. He crept aside, in search of ox-marrow to compose a salve, with which he instantly healed his bruises; and returning again, he found his engine in the possession of some soldiers, who had fixed to it a number of sky-rockets. Replacing himself now in the car, he applied fire to the rockets, and darted upwards with inconceivable swiftness: the earth retired gradually from view, while the orb of the moon appeared proportionally to expand, till, approaching the sphere of her activity, he was borne softly along, and descended on the lunar surface into a most delicious and luxuriant grove. Here, of course, he met with angelic personages, endowed with every perfection of body and mind, and far exalted above the mean vices and the rancorous passions which poison and inflame the inhabitants of this blood-stained globe. In the conversations which Bergerac held with those supernal beings, he was informed that a native of our planet, utterly disgusted at the crimes which pollute its "sin-worn mould," had once on a time provided himself with a pair of very large and thin metallic vessels, which he filled with smoke, and sealed in the light; and having attached himself below them, the buoyant power of the confined smoke carried him to the highest region of our atmosphere, where the attraction of the moon at length prevailing, drew him to her surface, while the great extent of the machinery, by opposing resistance, served to break the force of his fall. The moment, however, those slender capacious vessels were liberated from his weight, they rose again by the action of the smoke, till they reached a medium of the same density, and finally took their station in the bright fields of ether, where they form the constellation now called the *Balance.*

In further discourse with his sublime instructor, our romantic voyager was shown how to obtain the power of ascension from the loadstone. He was directed to take two magnets, each about a foot square, to roast them in the fire, to separate their impurities by solution, and thus concentrate their attractive virtue in a mere calx, which could be formed into a ball. Aided by such counsels, he now resolved to visit the sun. With much labour and perseverance he constructed a chest of very thin steel, six feet high and three feet wide; an icosahedron of crystal, the highest of all the regular solids, being fitted into the top, and the bottom having a small valve which opened outwards. Into this chest he shut himself, while the sun's rays, concentrated and multiplied by reflection from the numerous facets of the crystal, heated the air intensely, and drove a great part of it out below; and he ascended rapidly towards the glorious luminary, breathing ecstaticly in divine light, which gleamed with the richest tints of enamelled gold and purple. But it would be foreign to our purpose to follow the rest of the narrative, which, though disguised and mingled with fantastic visions, evidently contains the true principles of aëronautics.

**Lana's scheme for navigating the air.**

The most noted and elaborate scheme for navigating the atmosphere was proposed by the Jesuit Francis Lana, in a book written in the Italian language, and printed at Brescia in 1670, with the aspiring title of *Prodromo dell' Arte Maestra.* His project was to procure four copper balls of very large dimensions, yet so extremely thin, that, after the air had been extracted, they should become, in a considerable degree, specifically lighter than the surrounding medium. He entered into some calculations to prove that the buoyant power thus obtained would be

Aëronautics.

fully adequate to produce the desired effect. Yet he seems to have had only a slender knowledge of geometry, and but little acquaintance with the progress of physical science. For instance, he founds his computations entirely on the pneumatical discoveries of Galileo and Toricelli, without making any reference to those important facts which the invention of the air-pump by Otto Guericke had successively detected in the course of near 30 years. He assumes that air is 640 times lighter than water; that a cubic foot of water weighs 80 pounds, and consequently that the weight of the same bulk of air is an ounce and a half. If we rectify the estimate of Lana, and reduce it to English measures, each of his copper balls had about 25 feet in diameter, with the thickness of only the 225th part of an inch, the metal weighing 365 pounds avoirdupois, while the weight of the air which it contained must amount to 670 pounds, leaving, after a vacuum had been formed, an excess of 305 pounds, for the power of ascension. Those four balls would therefore rise together into the atmosphere with a combined force of 1220 pounds, which was thought sufficient by the projector to transport a boat completely furnished with masts, sails, oars, and rudders, and carrying several passengers. To extract the air from their cavities, the method proposed was, to procure a Toricellian vacuum, by connecting each globe, fitted with a stop-cock, to a tube of at least thirty-five feet long; the whole being filled with pure water, and raised gently into a vertical position, the mass of liquid, exceeding the pressure of the atmosphere, would flow out, and subside to some point below the cock, which could then be shut.

His calculations.

His attempts to answer objections.

Lana enumerates the different objections which might be urged against his scheme, and endeavours to answer them. He thinks that the spherical and perfectly arched form of the shell of copper would, notwithstanding its extreme thinness, enable it, after the exhaustion was effected, to sustain the enormous pressure of the external air, which, acting equally on every point of the surface, would rather tend to consolidate than to crush or tear the metal. As the atmosphere becomes always lighter in the upper regions, the machinery could only rise to a certain limit; and if this were found too high for easy breathing, the ascent could be regulated by opening occasionally the cocks to admit some air into the cavity of the balls, and thus increase their specific gravity. There seemed to him no very great difficulty in directing and impelling the aërial bark, by means of rudders, oars, and sails; but the objection was more serious on account of the hazards of tremendous shipwreck, from the violence of winds and tempests. Yet what most alarmed the insinuating Jesuit, and which he earnestly prays God to avert, was the danger that would result, from the successful practice of the art of aëronautics, to the existence of civil government, and of all human institutions. No walls or fortifications could then protect cities, which might be completely subdued or destroyed, without having the power to make any sort of resistance, by a mere handful of daring assailants, who should rain down fire and conflagration from the region of the clouds.

So sanguine was Lana, as to conceive that the very moderate sum of a hundred ducats would be sufficient to defray the expense of all this huge and delicate apparatus. But his poverty, fortunately, no doubt, for his credit as a man of learning, prevented him from proceeding further than mere speculation; and none of the foreign princes, who about that period often squandered, like gamesters, much of their wealth in the dark and chimerical search after the philosopher's stone, seemed any way disposed to engage in the magnificent scheme of aërial navigation.

The project of Lana appears to have in some degree excited the attention of the learned, though it was at the same time very generally condemned. Hooke, Borelli, Leibnitz, and Sturmius, examined it, and severely exposed its defects. Indeed, any person at all acquainted with actual experiment must see that it was absolutely impracticable. Passing over other circumstances, the attenuated shell of copper, from its size and excessive thinness, could not have strength enough to support even its own weight, far less the slightest pressure of the atmosphere. The plate, however, that Lana has given of his whole combined apparatus appears very striking; and after Montgolfier's discovery, it could not fail to attract a greater share of notice than it was otherwise entitled to claim.

Project of Galien.

So late as the year 1755, and not very long before the final invention of balloons, a very fanciful scheme, yet on the grandest scale, for navigating the atmosphere, was published with most circumstantial detail, in a small pamphlet, by Joseph Galien, a Dominican friar, and professor of philosophy and theology in the papal university of Avignon. This visionary proposed to collect the fine diffuse air of the higher regions, where hail is formed, above the summit of the loftiest mountains, and to inclose it in a bag of a cubical shape, and of the most enormous dimensions, extending more than a mile every way, and composed of the thickest and strongest sail-cloth. With such a vast machine, far outrivalling in boldness and magnitude the ark of Noah, it would be possible, he thought, to transport a whole army, and all their ammunitions of war. But we need not stop one moment to consider a project so perfectly chimerical, which involves, besides, the erroneous supposition that the air of the upper regions is, independently of its diminished compression, essentially thinner and more elastic than the air below.

It cannot fail to strike the reader, that the persons who have occupied themselves the most with attempts at aërial navigation, were all of them Catholic priests;—whether this pursuit is to be explained from their habits of seclusion and their ignorance of the affairs of real life, or from their familiar acquaintance with the relations of miracles and other legendary tales, which might lead them to see nothing very extraordinary in the art of flying through the air. The various schemes of that kind, produced at different times, contain a few just principles, generally mixed up, however, with a large portion of absurdity. But very wide is the distance from such speculations to the real exhibition of the experiment itself.

Confused ideas of Lord Bacon on aëronautics.

Some writers have stated that Lord Bacon first published the true principles of aëronautics. This round assertion we cannot help noticing, because it has really no foundation, except in the propensity, fostered by indolence, which would gladly refer all the discoveries ever made to a few great names. They mistake, indeed, the character of Bacon, who seek to represent him as an inventor. His claim to immortality rests chiefly on the profound and comprehensive views which he took of the bearings of the different parts of human knowledge; for it would be difficult to point out a single fact or observation with which he enriched the store of physical science. On the contrary, being very deficient in mathematical learning, he disregarded or rejected some of the noblest discoveries made in his own time.

We can find only two passages in Lord Bacon's works which can be considered as referring to aëronautics, and they both occur in that collection of loose facts and inconclusive reasonings which he has entitled *Natural History*. The *first* is styled *Experiment Solitary, touching Flying in the Air*, and runs thus: "Certainly many birds of good wing (as kites and the like) would bear up a good weight as they fly; and spreading feathers thin and close, and in great breadth, will likewise bear up a great weight, being even laid, without tilting up on the sides. *The further extension of this experiment might be thought upon.*" This hint is not in fairness obnoxious to stricture, since the ingenious Bishop Wilkins, twenty years afterwards, still believed that men could acquire the art of flying. Nor was there any reason to despair, till Borelli at length demonstrated its absolute impossibility.—The second passage is more diffuse, but less intelligible: it is styled *Experiment Solitary, touching the Flying of unequal Bodies in the Air.* "Let there be a body of unequal weight (as of wool and lead, or bone and lead); if you throw it from you with the light end forward, it will turn, and the weightier end will recover to be forwards, unless the body be over long. The cause is, for that the more dense body hath a more violent pressure of the parts from the first impulsion; which is the cause (though heretofore not found out, as hath been often said) of all violent motions: and when the hinder part moveth swifter (for that it less endureth pressure of parts) than the forward part can make way for it, it must needs be that the body turn over; for (turned) it can more easily draw forward the lighter part." The fact here alluded to is the resistance that bodies experience in moving through the air, which depending on the quantity of surface merely, must exert a proportionally greater effect on rare substances. The passage itself, however, after making every allowance for the period in which it was written, must be deemed confused, obscure, and unphilosophical.

True theory of balloons.

That a body must remain suspended in a fluid denser than itself, was first established by Archimedes, whose propositions in hydrostatics were further extended in modern times by Stevinus and other early mathematicians. But the principles on which a balloon could be made to rise in the atmosphere were scarcely understood till very long afterwards, when chemistry, near the latter part of the last century, had succeeded in ascertaining the properties of the different kinds of aëriform substances. The Greeks of the lower empire knew that air is greatly dilated by warmth; and Sanctorio, the ingenious medical professor at Padua, by applying this expansion, about the year 1590, to the construction of the thermometer, had happily placed it in a strong light. His countryman Borelli remarked, almost a century afterwards, that a heated iron or a burning taper brought near one of the scales of a well-poised balance, by exciting a vertical current, will cause it to mount up with force,—a fact which affords the only true explication of the numerous experiments of Buffon with the weighing of red-hot balls, whose regular and constant results appeared to that eloquent philosopher to exhibit a conclusive demonstration of the actual ponderability of heat. Yet warm air, alone and unassisted, has still no very great power of ascension. The buoyancy communicated to that fluid by the distensible vapour of water and other more volatile liquids is in some cases considerable, especially when combined at the same time with heat. But those aëriform substances which are more elastic than common air display the most steady and powerful tendency to rise in the atmosphere. Such, in a remarkable degree, is the hydrogen gas, owing probably to the expansive force communicated by the very large share of heat which is embodied with it. The late most ingenious and accurate Mr Cavendish, in 1766, found, by a nice observation, this fluid to be at least seven times lighter than atmospheric air. It therefore occurred to Dr Black of Edinburgh, that a very thin bag filled with hydrogen gas would rise to the cieling of a room

Lightness of hydrogen gas found by Cavendish.

He provided, accordingly, the allantois of a calf, with the view of showing, at a public lecture, such a curious experiment before his numerous auditors; but, owing to some unforeseen accident or imperfection, it chanced to fail, and that celebrated professor, whose infirm state of health and cold or indolent temper more than once allowed the finest discoveries, when almost within reach, to escape his penetration, did not attempt to repeat the exhibition, or seek to pursue the project any farther. Several years afterwards, a similar idea occurred to Mr Cavallo, who found, however, that bladders, though carefully scraped, are too heavy, and that China paper is permeable to the gas. It is rather singular that he did not think of gold-beater's skin, which had for like purposes been recommended two centuries before by the grammarian Joseph Scaliger and some other writers. But in 1782 this ingenious person succeeded with the pretty experiment of elevating soap-bubbles, by inflating them with hydrogen gas.

Power of ascension.

To construct an aëronautic machine, it is only required, therefore, to provide a thin bag, of sufficient capacity, and to fill it with hydrogen gas, or with air which is kept in a rarefied state. The form and strength of the material are not so essential as in Lana's project, since it here suffers an equal pressure on both its outer and its inner side. Nor is it an absolute condition that the substance of the bag should be quite impervious to the gas or confined air; though such a defect, by allowing the partial escape of the buoyant fluid, must inevitably diminish the vigour and abridge the duration of the power of the balloon's ascent. This power is evidently the excess of the weight of an equal bulk of atmospheric air above the aggregate weight of the included gas, joined to that of the bag, and of all its appendages: in other words, the final power of ascent is the difference between the weight of the included gas and of that of an equal volume of external air, further diminished by the weight of the whole apparatus. But supposing the form of the balloon to remain the same, this counteracting load, as it depends on the quantity of surface contained in the bag, must be proportioned to the *square* of the diameter; whereas the difference between the internal and external volume of fluid, which constitutes the whole of the buoyant force, increases in a faster ratio, being proportioned to the capacity of the bag, or the *cube* of its diameter. It hence follows, that however small the excess may be of the specific gravity of the external air above that of the collected fluid, there must always exist some corresponding dimension which would enable a balloon to mount in the atmosphere.

The theory of aëronautics, considered in its detail, includes three distinct things: *first,* the power of a balloon to rise through the air; *second,* the velocity of its ascent; and, *third,* the stability of its suspension at any given height in the atmosphere. These points we shall examine separately.

Buoyancy of balloons

I. *The buoyant force of balloons.* Since balloons in their shape generally approach to the spherical form, it will be more convenient to ground our calculations on that figure. A globe of common air at the level of the sea, and of the mean density and temperature, is found to weigh about the 25th part of a pound avoirdupois. Consequently, if a perfect vacuum could be procured, a balloon of ten feet diameter must rise with a force of 40 pounds; one of twenty feet diameter, with that of 320 pounds; and a balloon of thirty feet in diameter would mount in the atmosphere with the power of 1080 pounds:—thus augmenting always in the ratio of the cube of the diameters. But air expands by heat about the 450th part

Aëronautics. of its bulk for each degree on Fahrenheit's scale. Supposing, therefore, that the air included within the bag were heated 50 degrees, which is as much perhaps as could be well supported, it would follow that one ninth part of this fluid would be driven out by the warmth, and consequently, that the tendency of the balloon to rise upwards would be equal only to the ninth part of the entire power of ascension. Were it possible to maintain a heat of 75 degrees within the balloon, the buoyant force would yet not exceed the sixth part of the absolute ascensional power.

from humidity; The dilatation which the presence of humidity communicates to air will, during fine weather in this climate, amount generally to one eighteenth part, though it may sometimes reach to more than the double of this quantity. But, in the tropical regions, such dilatation will commonly exceed the twentieth part of the volume of fluid. Hence moist air thrown into a bag, likewise wetted, and sufficiently large, would cause it to rise in the atmosphere. To succeed, however, in this way, the balloon constructed of coarse linen would require enormous dimensions; not less than three hundred feet in diameter.

from heat joined to moisture. But it is the union of heat and moisture that gives to air the greatest expansion. The white smoke with which the balloons are filled on Montgolfier's plan, was found, by computation, to be at least one-third specifically lighter than the external air. This purer sort of smoke is scarcely any thing but air itself charged with vapour, being produced by the burning of chopped straw or vine twigs in a brasier, under the orifice of the bag. It would have required no fewer than 150 degrees of heat alone to cause the same extent of rarefaction.

Smoke balloons. We have therefore sufficient data for calculating the buoyant force of the common fire, or rather smoke balloons. This force, being estimated about $12\frac{1}{2}$ pounds avoirdupois when the diameter of the bag is ten feet, would amount to $1562\frac{1}{2}$ pounds if the diameter were fifty feet, and to 12,500 pounds if it were a hundred feet. The weight of the linen case may be reckoned at two-fifths of a pound for a sphere of one foot in diameter. Consequently, a balloon of ten feet diameter would, without its appendages, weigh 40 pounds; one of fifty feet diameter, 1000 pounds; and one of a hundred feet diameter, 4000 pounds. Such a balloon of ten feet diameter would need $27\frac{1}{2}$ pounds to make it rise, but one of fifty feet diameter would ascend with a force of $562\frac{1}{2}$ pounds, and one of a hundred feet diameter would exert an ascending power of not less than 8500 pounds. There is besides to be deducted the weight of the cordage, the car, the ballast, and the passengers. It would require, on these estimates, a diameter of $33\frac{1}{3}$ feet, to procure merely an equilibrium between the weight of the canvass and the buoyant force of the rarefied air.

The hydrogen gas obtained from the action of dilute sulphuric acid upon iron filings is only six times lighter than atmospheric air; but the gas evolved during the solution of zinc in that acid is not less than twelve times lighter than the standard fluid. The ordinary way of examining the specific gravity of the different gases requires a very delicate operation of weighing with the most exquisite balance; a serious difficulty, which long retarded our knowledge of their comparative densities. In one of the notes to his *Treatise on Heat*, Professor Leslie has pointed out a very simple method, founded on the principles of pneumatics, for discovering the relative specific gravities of the aëriform fluids. This consists in observing the time that a given portion of the gas, under a determinate pressure, takes to escape through a very small aperture. The density of the gaseous fluid must be inversely as the square of the interval elapsed. Thus, the hydrogen gas procured from zinc, but without any depuration, was found, under a pressure of the same column of water, to flow thrice as fast as atmospheric air. This experiment is very striking, and requires no more apparatus than a cylindrical glass jar, open below, and surmounted by a cap terminating in a fine tubular orifice.

Balloons with hydrogen gas On a very moderate supposition, therefore, and after making every allowance for imperfect operation, we may consider the hydrogen gas which fills a balloon as six times lighter than the like bulk of common air. Consequently, such a balloon must exert five-sixths of the whole buoyant force corresponding to its capacity, or will have a tendency to mount in the atmosphere, that is equal to the thirtieth part of a pound avoirdupois for a globe of one foot diameter. A spherical balloon of fifteen feet diameter would hence have a buoyancy of $112\frac{1}{2}$ pounds; one of thirty feet, 900 pounds; and one of sixty feet no less than 7200 pounds. But thin silk, varnished with caoutchouc or elastic gum, to render it impervious to air, is found to weigh only the twentieth part of a pound when formed into a globe of one foot diameter. A silk balloon of fifteen feet diameter would hence weigh $11\frac{1}{4}$ pounds; one of thirty feet, 45 pounds; and one of sixty feet diameter, 180 pounds. Wherefore, the power of ascension exerted by such balloons would, in pounds avoirdupois, be respectively $101\frac{1}{4}$, 855, and 7020. It follows, also, that a balloon of a foot and a half in diameter would barely float in the atmosphere, the weight of its varnished silk being then exactly balanced by the buoyant effort of the body of hydrogen gas.

But the calculations now given would in strictness require a small modification. The weight of the bag and of all the appendages must evidently compress the included gas, and thereby render it in some degree denser. To compute this minute effect, we have only to consider, that the pressure of a column of atmosphere, at the mean temperature, and near the level of the sea, is 1632 pounds, on a circle of a foot diameter. Thus, in the large balloon of sixty feet diameter, if we suppose the whole load to have been 6000 pounds, the compression of the bag would only amount to five-thirds of a pound for each circle of a foot diameter in the horizontal section, or correspond to the 979th part of the entire pressure of the atmosphere. But the weight of the confined gas being 1200 pounds, its buoyancy must have suffered a diminution of somewhat more than a pound, or $\frac{1}{11}$ from the encumbrance opposed to it. This correction is therefore a mere theoretical nicety, which may be totally disregarded in practice.

Celerity of the ascent of balloons. II. The next circumstance to be considered in aëronautics is, *the celerity with which balloons make their ascent.* It is obvious that the efficient power of ascension, or the excess of the whole buoyant force above the absolute weight of the apparatus, would, by acting constantly, produce always an accelerated motion. But this acceleration is very soon checked, and a uniform progress maintained, by the increasing resistance which the huge mass must experience in its passage through the air. The velocity which a balloon would gain from unobstructed acceleration must, from the theory of dynamics, be to that which a falling body acquires in the same time, as the efficient buoyancy is to the aggregate weight of the apparatus and of the contained fluid. Thus, if the balloon were to rise with a force equal to the eighth part of its compound weight, the celerity resulting from a constant acceleration would be expressed by multiplying four feet into the number of seconds elapsed since it was launched into the air. Its accelerating advance, however, being opposed,

Aëronautics.

Terminal velocity.

the balloon may to all appearance attain, though still affected with partial oscillations, the final velocity in perhaps little more than double the time required without such obstruction.

This final velocity, or the velocity at which the ascent becomes uniform, the resistance from the air being then equal to the efficient buoyancy of the balloon, is easily calculated. The resistance a circle encounters in moving through any fluid in the direction perpendicular to its plane, is measured by the weight of a column of that fluid, having the circle for its base, and an altitude equal to the height from which a heavy body in falling would acquire the given celerity. But near the level of the sea, and at the mean temperature, a column of atmospheric air 17 feet high, and incumbent on a circle of one foot diameter, weighs a pound avoirdupois; which is therefore the resistance that such a circle would suffer if carried forwards with the celerity of 33 feet each second. According to the same theory, however, which we owe to the sagacity of Newton, the resistance of a sphere is just the half of that of its generating circle, and consequently a velocity of $46\frac{2}{3}$ feet in a second through the air would, in ordinary cases, create a resistance of one pound to a ball of one foot diameter. In other circumstances, the quantity of resistance must be proportional to the squares of the velocities and of the diameters. Whence, if the buoyant force were always the same, the velocity of the ascent of a balloon would be inversely as its diameter.

Example. General formula.

Suppose a balloon to have thirty feet in diameter, and an ascensional power of 100 pounds. This effort is evidently the same as the ninth part of a pound for a globe of a foot diameter, and would therefore be countervailed by the resistance corresponding to a velocity of $46\frac{2}{3}$ divided by 3, the square root of 9, or $15\frac{5}{9}$ feet each second. The balloon would therefore reach the altitude of a mile in about six minutes. Its accelerating force being only the sixteenth part of its total weight, it might have acquired the uniform motion of ascent in twenty seconds, or before it had attained the height of 200 feet. This example differs very little from reality, and the method of computation will easily be transferred to other cases.

But the resistance of the air assigned by theory is, from the circumstances omitted in the simplification of the problem, generally somewhat less than the results of observation. In low velocities this difference amounts seldom to the fifth part of the whole effect; but in the high velocities it increases considerably, exceeding even the third part in certain extreme cases. From the numerous and accurate experiments of Dr Charles Hutton, we may, however, deduce a simple formula for expressing the terminal velocity of balloons, or the celerity of their uniform ascent. Let $a$ denote the diameter of the balloon in English feet, and $f$ its ascensional power, measured in pounds avoirdupois; then $\frac{40}{a}\sqrt{f}$ will very nearly represent in feet the velocity each second of its regular ascent, or that velocity which would cause a resistance from the air precisely equal to the buoyant force. Or, to express the rule in words: As the diameter of the balloon in feet is to the constant number 40, so is the square root of the ascensional power in pounds to the terminal or uniform velocity of ascent each second. To illustrate the application of the formula by an easy example; suppose the balloon to have a diameter of 60 feet, with an accelerating power of 144 pounds; the corresponding rate of uniform ascent becomes $\frac{40}{60}\sqrt{144}$, or $\frac{2}{3}\times 12$, that is, 8 feet each second, or about a mile in eleven minutes.

Stability of suspension.

III. The last point which demands attention in aëronautics is, *the stability of the suspension of a balloon at any given height in the atmosphere.* The circumstances which might regulate or determine that stability, requiring some little exercise of thought, have been commonly neglected, and very seldom examined with due care. It will be proper to consider, *first,* the fire or smoke balloons, and, *secondly,* the balloons filled with hydrogen gas.

Smoke balloons.

1. The warm humified air of the balloon constructed after Montgolfier's plan suffering less external compression as it approaches the upper strata of the atmosphere, must at the same time necessarily expand, and partly escape by the orifice above the brasier. The weight of the included fluid, and that of the part expelled, constituting its buoyant force, will hence be reduced, in proportion to the diminished density of the medium in which it floats. The balloon will continue to ascend till its enfeebled buoyancy is no longer able to support the incumbent load. At the height of a mile above the surface, the power of ascension would be diminished rather more than one fifth part; but at an altitude of three miles and a half it would be reduced to one-half. At the ordinary temperature, this buoyancy would suffer a reduction of the hundredth part for each ascent of 278 feet. Resuming the data formerly stated, and supposing the balloon to have a spherical shape, its actual power of ascension, estimated in pounds avoirdupois, will be denoted by $\frac{a^3}{80}$, where $a$ signifies the diameter in feet, or the cube of the diameter divided by the constant number 80. If $m : n$ express the ratio of atmospheric density at the surface and at any given height, then will $\frac{n}{m}\cdot\frac{a^3}{80}$ denote the diminished buoyant force at that altitude.

We shall select, for example, a balloon of 100 feet diameter, which is one of the largest dimensions ever actually constructed. Near the level of the sea, and at the ordinary temperature, its power of ascension would be 12,500 pounds; but at the height of 8000 feet, or somewhat more than a mile and a half, when the density is diminished one-fourth, or $\frac{n}{m}=\frac{3}{4}$, that power becomes reduced to $\frac{3}{4}\times 12{,}500$, or 9375 pounds, being a deficiency of 3125 pounds. On the supposition that the balloon was at first so much loaded as to rest just suspended at the ground, a ballast of 3125 pounds must have been thrown out, to make it rise to the altitude of a mile and a half. Hence also the rejection of 125 pounds would have been sufficient to give the balloon an elevation of 278 feet. For the same reason, 10 pounds of ballast heaved out would raise it 22 feet at the surface, 29 feet at the height of a mile and a half, and 44 feet at that of three miles and a half.

Balloons charged with hydrogen gas

2. The stability of the suspension of balloons filled with hydrogen gas must depend on principles which are very different and less marked. In these aëronautic machines, after the gas has been once introduced, it is closely shut up; and therefore, having constantly the same absolute weight, it should likewise, in all situations, exert the same buoyant force. Hence, if the balloon were capable of indefinite extension, it would still continue its ascent through unbounded space. The determinate capacity of the bag alone can oppose limits to its rise in the atmosphere. The upper strata being rarer than those below, will have less power to keep any given bulk suspended; and the actual buoyancy being diminished from that cause, the balloon will find its station at a corresponding height in the diffuse medium. But this diminution of the buoyant force,

Aëronautics.

and the consequent increase in the density of the hydrogen gas, must necessarily be confined within very moderate limits, otherwise the thin silk case would be torn to shreds by the expansive efforts of the imprisoned fluid. A safety-valve is accordingly placed at the top of the balloon, calculated to give vent to the gas before the distension has become such as to endanger the bursting of the case.

should not be completely filled;

A balloon should not at first be filled completely with hydrogen gas, but allowed to begin its ascent in a flaccid state. As it mounts into the rarer atmosphere, it will gradually swell, till it has attained its full distension, when the safety valve may come to act. But such dissipation of the gas ought, by a previous arrangement, to be as much as possible avoided. If the balloon were intended to rise to the height of four miles, it would not be requisite to fill more than half its capacity with the elastic fluid. To push the charge any farther in this case, would only occasion a superfluous waste of materials. By throwing out part of his ballast, the aëronaut may raise himself higher; and by opening the valve to permit some of the imprisoned gas to escape, he may descend again: but both those expedients are attended by a wasteful expenditure of power.

unstable when flaccid.

It is evident that a balloon can have no stability of equipoise, so long as it remains in a loose or flaccid state. The slightest action would then be sufficient to make it rise or fall, since, under such circumstances, any change of its station could not in the smallest degree affect the measure of its buoyant force. The general elevation to which the balloon will ascend must be determined by its quantity of ballast, conjoined with the regulation of the safety-valve; but the strain of the silk case itself would be sufficient to confine the ascent within certain limits, and to procure the stability of the floating mass. Thus, if a balloon fully distended had yet a slight disposition to rise, the imprisoned gas, suffering more and more compression as it gradually ascends, would become proportionally denser, and therefore lose a corresponding part of its previous buoyancy. An equilibrium would hence soon obtain, which must arrest the floating machine at a determinate height in the atmosphere.

Mode of adjusting balloons.

Suppose a balloon to be capable, without any danger of bursting, of sustaining an expansion equal to the hundredth part of the elasticity of the included fluid; the whole buoyancy would, by such an alteration, be diminished one five hundredth part, or this floating machine would subside 55 feet near the surface, and sink proportionally more in the upper regions. To produce the effect, it would only be requisite to throw common air into the bag, without suffering any portion of the hydrogen gas to escape. On this principle Meusnier, an ingenious French chemist, very soon after the first discovery of balloons, proposed to regulate with nicety their ascent and position of equilibrium in the atmosphere. The mode which he suggested was, to place within the principal balloon a much smaller one, to be filled occasionally with common air by help of bellows, or emptied again by opening an exterior valve. The aëronaut would thus have it in his power, without expending the charge of hydrogen gas, either to sink gently through a short space, or to rise again at will, by inflating the inner balloon, or allowing it to collapse. The adjustment of the height of a balloon could hence be managed with great precision.

The command possessed by the aëronaut of raising or depressing his machine at pleasure, might afford him the means of influencing the direction of its course. From the various motions of the several ranges of clouds, we may infer that different currents exist at the same time in the atmosphere. The aëronaut has, therefore, in his ascent, only to seek the current best suited to his purpose, and, taking his station in that stratum, to commit his flimsy vessel to the guidance of the stream.

Futility of applying sails or rudders.

Any other attempts to direct or control the flight of a balloon are altogether fallacious. Since it is carried along with the swiftness of the wind, no rudders or sails can have any action whatever. The aëronaut might fancy himself to float in a perfect calm, unless he chances to encounter irregular currents. The application of oars may turn a balloon, but can have no sensible effect in diverting or impelling its course. How vastly disproportionate is the force of the human arm to the overwhelming pressure of the wind against so huge a machine! To adapt machinery under these circumstances would be preposterous, and to look for help from such a quarter is visionary in the extreme. It must be admitted, however, that after a balloon has once gained its station of equilibrium, or passively floats in the air, the vigorous action of broad vanes, downwards or upwards, might serve to raise or depress the machine through a small space. Thus, a vertical force, exerted equal to nine pounds, would lift a balloon of thirty feet in diameter 278 feet higher. The application of ballast is hence infinitely preferable to any such bulky and unmanageable apparatus.

The Montgolfiers actually discover the balloon.

At the period where we left our narrative, the principles on which a balloon could be constructed were therefore pretty generally known to men of science. But to reduce these principles to complete effect, was still an enterprise of the most dazzling kind. This experiment seemed unfit for a cabinet or a laboratory, and it could succeed only on a large scale, exposed to the gaze of the multitude. Without the toil of investigation, or indeed any exercise of thought, all the world might witness the result, and admire the magnificent spectacle which it would present. This triumph over matter was at length achieved by the skill and perseverance of Stephen and Joseph Montgolfier, sons of the proprietor of an extensive and very celebrated paper manufactory established at Annonay, on the banks of a rivulet which flows into the Rhone, near forty miles below Lyons. These remarkable persons, though bred in a remote provincial town, possessed in a high degree ingenuity and the spirit of observation. Without having the benefit of a liberal education, their active curiosity had led them to acquire a more extensive and accurate stock of knowledge than is usually found in the same condition of life. Stephen was more attached to mathematics, but Joseph directed his studies chiefly to chemistry and natural philosophy. They were associated in business with their father, who passed his quiet days, like a patriarch, amidst a large family, and a numerous body of workmen, and reached the very advanced age of 93. Of the younger brother, who survived the other, and lived to make the very valuable yet much neglected discovery of the hydraulic ram, we may venture to speak from personal acquaintance. He was a man of great modesty and simplicity of character, yet firm and undaunted, of a calm and sedate aspect, tall and athletic in his person, and of a swarthy complexion, not unlike the celebrated Mr Watt, whom he resembled in some other particulars of his fortune. He was too speculative, perhaps, to succeed in the details of business; for, after trying various schemes of improvement, he quitted his paper manufactory and repaired to the capital, where he obtained a situation of trust under the late imperial government, at the chamber of models, as inspector of patents and internal improvements. In 1809 he had a stroke of palsy, which induced him to resort to the waters of Bourbonne; but receiving no benefit from them, he gladly preferred those of Balaruc,

Aëronautics.

near his old friends, where he died on the 26th of June in the following year, at the age of 60.

Their successive experiments.

The two brothers, who were accustomed to form their plans in concert, had long contemplated the floating and ascent of clouds in the atmosphere. It seemed to them, that a sort of factitious cloud, formed of very thin vapour, inclosed in a light bag of immense size, would mount to the higher regions. In pursuit of this idea, they selected a fluid specifically lighter than atmospheric air; and, accordingly, introduced hydrogen gas into large bags of paper and of thin silk, which rose up, as had been expected, to the cieling, but fell down in a few seconds, owing to the rapid escape of the gas through the cracks and pores of the case. This great facility with which hydrogen gas makes its way through any substance of a loose and incompact texture, is partly due to its extreme fluidity, but is chiefly occasioned by its strong and obstinate attraction for common air. The mode of preventing, or at least checking that escape, by the application of a proper varnish, was yet unknown. The prospect of overcoming the difficulty was so discouraging, that our experimenters had recourse to another scheme, more analogous to their original ideas, and it rewarded their continued efforts with the most complete success. In the month of November 1782, Joseph Montgolfier, happening, in the course of his frequent excursions, to be then at Avignon, procured a small silk bag, of the form of a parallelopipedon, open below, like a lady's hoop, and having a capacity of about forty-five cubic feet; under its orifice he burnt some paper, and saw, with inexpressible transport, the bag quickly swell, and mount rapidly to the height of seventy-five feet, where it remained till by cooling it lost its buoyancy. Returning to Annonay, he communicated the happy result to his brother, and it was resolved by them to prosecute the experiment on a large scale. Having provided a large quantity of coarse linen, they formed it into the shape of a globe, about thirty feet in diameter, which they lined with paper. On lighting a fire within its cavity, to warm and expand the air, they had the delightful satisfaction of seeing the bag ascend with a force equivalent to 500 pounds.

It was very natural that the brothers should now desire an occasion for exhibiting this grand experiment in their native town. They invited the members of the provincial meeting of the states of the Vivarais, then assembled at Annonay, to witness the first public aërial ascent.

First public ascent of a balloon.

On the 5th June 1783, amidst a very large concourse of spectators, the spherical bag or balloon, consisting of different pieces of linen, merely buttoned together, was suspended from cross poles; two men kindled a fire under it, and kept feeding the flames with small bundles of chopped straw; the loose bag gradually swelled, assuming a graceful form, and in the space of five minutes it was completely distended, and made such an effort to escape, that eight men were required to hold it down. On a signal being given, the stays were slipped, and the balloon instantly rose with an accelerating motion, till it reached some height, when its velocity continued uniform, and carried it to an elevation of more than a mile. All was admiration and transport. Amidst the shouts of unbounded acclamation, the progress of the artificial cloud retiring from sight arrested every eye. It was hurried along by the wind; but, its buoyant force being soon spent, it remained suspended only ten minutes, and fell gently in a vineyard, at the distance of about a mile and a half from the place of its ascension. So memorable a feat lighted up the glow of national vanity, and the two Montgolfiers were hailed and exalted by the spontaneous impulse of their fellow-citizens.

Of this splendid experiment a very hasty and imperfect account was transmitted to Paris, and quickly circulated over Europe. In those halcyon days, during the transient calm of political turmoils, and the happy absence of all military events, the prospect of navigating the atmosphere excited a very general ferment, and engrossed the conversation of all ranks. Yet the tale appeared so extraordinary as to leave some doubts of its veracity. In many places, and especially in this country, the more ignorant class of men, and those who affected superior wisdom, both agreed in considering the relation of Montgolfier's discovery as nothing but an imposition practised on the public credulity. To dispel the suspicions which infected the subject, it was necessary to repeat the experiment in every large capital.

The impression made by it in Europe.

When the intelligence of the first ascent of a balloon reached St Petersburg, it found the venerable Euler in a state of great debility, worn out with years and unremitting intellectual toil. Having lost, in the middle of his career, the sight of an eye, he had been for several years visited with total blindness. But in this afflicting situation his mind was still entire, and found delightful exercise in his former habits of calculation. It was in training a domestic to act as his amanuensis, that this great genius now condescended to dictate, in the German language, to his humble pupil, a work of the highest merit, *The Elements of Algebra*. During his last illness, Euler made an expiring effort, and applied his favourite analysis to determine the ascending motion of a balloon. He dictated the preliminary steps of the problem to one of his grandchildren: but the hand of death was already stretched over the patriarch;—no farther could he proceed with his investigation;—and composing himself for nobler scenes, he calmly expected the moment of dissolution.

Imitated at Paris.

The virtuosi at Paris were eager to repeat the experiment of the ascension of a balloon. M. Faujas de St Fond, an active and zealous naturalist, set on foot a subscription for defraying the expense, which was soon filled up. The construction of the machine was intrusted to the skill of two brothers of the name of Robert, under the superintendence of M. Charles, an ingenious lecturer in natural philosophy. It had at first been proposed merely to copy the process of Montgolfier, but Charles preferred the application of hydrogen gas; a resolution which afterwards occasioned much difficulty and delay. The balloon consisted of thin silk or tiffany, varnished with a solution of elastic gum, disposed into a globular shape, of about thirteen feet in diameter. The hydrogen gas was procured from the action of dilute sulphuric acid upon iron-filings, and was introduced through leaden pipes. But this gas, being rapidly formed, without having been made to pass through a body of cold water, entered the cavity of the balloon excessively hot, and charged with acid fumes, which afterwards condensed against the inside of the bag, injuring its texture, and loading it with superfluous humidity. Not fewer than 500 pounds of sulphuric acid were used, and twice this weight of iron-filings; yet several days were spent in abortive attempts to fill the balloon completely. At last it rose, and was kept suspended at the height of 100 feet above the ground. In this state it was conveyed with acclamations to the Place des Victoires, where it rested, and underwent some repair. About midnight it was thence transported in silent procession, preceded by torch-lights, and guarded by a detachment of horse and foot soldiers, to the Champ de Mars, at the distance of near two miles. The few passengers found at that still hour on the streets gazed with astonishment at the floating mass; and the very coachmen, filled with a sort of awe, respectfully saluted it as they passed.

Next day, being the 27th of August 1783, an immense

Balloon of Charles and Robert.

concourse of people covered the Champ de Mars, and innumerable spectators had planted themselves along the banks of the Seine and the amphitheatre of Passy. By three o'clock every avenue was filled with carriages, and all the beauty and fashion of Paris flocked towards the Ecole Militaire. The preparations being finished, a cannon was discharged as the signal of ascent. The balloon, liberated from its stays, shot upwards with such rapidity as in two minutes to reach, according to calculation, the height of 3000 feet, where it seemed lost in a dark cloud. It re-appeared at a greater elevation, but was soon obscured again amidst other clouds; and after performing a flight of about fifteen miles in the space of three quarters of an hour, it sunk to the ground in a field near Ecouen, where the peasants secured it, having noticed a rent in the upper part of the bag, to which its fall might be imputed. The success of the experiment was complete. The incredulous were sadly mortified; but every minor reflection was drowned in the tumult of excessive joy and exultation. It began to rain immediately after the balloon was launched, yet this unlucky circumstance had no effect to abate the curiosity of the spectators. Regardless of the torrents that fell, they were wholly absorbed in following with eager gaze the progress of the machine through the air. Even elegant ladies, dressed in their finest attire, stood exposed, looking intently the whole time, and were drenched to the skin. This small balloon weighed only thirty pounds, and had at first a buoyant force of forty pounds avoirdupois. If we employ the formula before given, the terminal velocity would be $\frac{40}{13}\sqrt{40} = 19\frac{6}{13}$ feet in a second, or 1168 feet each minute; which appears to correspond very well with fact.

Joseph Montgolfier constructs one of his balloons at Paris.

About this time Joseph Montgolfier visited Paris, and was invited by the Royal Academy of Sciences to repeat his experiment of Annonay on a larger scale. He constructed, with coarse linen and a paper lining, a balloon of a pear shape, and about 43 feet wide and 75 feet high. The smoke of fifty pounds of dry straw, in small bundles, joined to that of twelve pounds of wool, was found sufficient to fill it in the space of ten minutes. The bag duly swelled, and made an effort to rise equivalent to the weight of 500 pounds; but being reserved for exhibition the next day, it was totally destroyed, by its exposure during the night to incessant and violent rain. It became necessary, therefore, to prepare another balloon; and such was the expedition of the artist, that in five days he got the whole completed. Early on the morning of the 19th of September, it was placed upon an octagon scaffold, in front of the palace of Versailles. It had a very showy appearance, being painted with ornaments in oil colours. By ten o'clock the road from Paris was crowded with carriages of all descriptions. Every person of any note or fashion hurried from the metropolis to view the experiment; ladies of distinguished rank filled the windows; and the spacious courts and walks, and even the tops of the houses, were covered with impatient spectators. The royal family and their attendants came forth, and examined the details of the apparatus. About one o'clock the discharge of a mortar gave notice that the filling of the balloon was to commence. In eleven minutes another discharge announced that it was completely inflated; and on the third discharge of the mortar, the cords were cut, and the balloon instantly liberated. After balancing at first in a moment of anxious expectation to the spectators, it rose majestically, in an oblique direction, under the impulse of the wind, till it reached the height of 1500 feet, where it appeared for a while suspended; but in the space of eight minutes it dropped to the ground, at the distance of two miles from the point of its ascent. A sheep, a cock, and a duck, which had been put into the basket, the first animals ever carried up into the air, were found perfectly safe and unhurt by the journey, and the sheep even feeding at perfect ease. See Plate II. for a view of this balloon and the following ones.

This successful experiment encouraged Montgolfier to prepare, on a more solid construction, another balloon, of a spheroidal form, 45 feet wide and 75 feet high. While it was filling with smoke, Pilatre de Rozier, a young naturalist of great promise, and full of ardour and courage, leaped into the car, and was borne up to the height of 300 feet, where he continued some minutes suspended, the balloon being held down by long cords till it gently descended. The dangers of navigating the balloon being thus brought to a more correct estimate, it was resolved speedily to attempt the daring but sublime experiment. The badness of the weather, however, at this late season of the year, made the project be deferred several days. At last, on the 21st of November, every thing was ready for the ascent in the spacious gardens of the chateau of Muette, belonging to the court of the Dauphin. The sky had a lowering aspect, being loaded with heavy clouds, driven about by irregular winds. But the adventurers were not to be easily discouraged. After a first trial, which had nearly proved fatal to them, the balloon was again filled; and Rozier, with the marquis d'Arlandes, a major of infantry, who had volunteered to accompany him, took their seats in the car, having a store of ballast, and a provision of straw to supply the fire. About two o'clock the machine was launched, and it mounted with a steady and majestic pace. Wonder, mingled with anxiety, was depicted in every countenance; but when, from their lofty station in the sky, the navigators calmly waved their hats, and saluted the spectators below, a general shout of acclamation burst forth on all sides. As they rose much higher, however, they were no longer discernible by the naked eye.

Makes the first aërial voyage.

> .................. in the surging smoke
> Uplifted spurn the ground; thence many a league,
> As in a cloudy chair ascending, ride
> Audacious.

This balloon soared to an elevation of more than 3000 feet, and traversed, by a circuitous and irregular course, the whole extent of Paris, whose gay inhabitants were all absorbed in admiration and amazement. A curious circumstance occurred during the passage of the floating mass: to the gazers planted on the towers of the metropolitan church of Notre Dame, it chanced to intercept the body of the sun, and thus gave them, for a few seconds, the spectacle of a total eclipse. It has been alleged, that when the balloon had reached so high that the objects on earth were no longer distinguishable, the marquis d'Arlandes began to think that his curiosity and ambition were sufficiently gratified. He was therefore anxious to descend, and murmured against his companion, who still kept feeding the fire. At last, on hearing some cracks from the top of the balloon, and observing holes burning in the sides, the major became outrageously alarmed at his imminent danger, and applying wet sponges to stop the progress of combustion, he compelled the *savant* to desist from his officious operations. As they now descended too fast, however, M. d'Arlandes was not less anxious and diligent in throwing fresh straw upon the fire, in order to gain such an elevation as would clear the different obstacles. The navigators dexterously avoided the lofty buildings of Paris, by supplying fuel as occasion required; and, after a journey of 20 or 25 minutes, they safely alighted beyond the Boulevards, having described a track of six miles.

Such was the prosperous issue of the first aërial navigation ever achieved by mortals. It was a conquest of science which all the world could understand; and it flattered extremely the vanity of that ingenious people, who hailed its splendid progress, and enjoyed the honour of their triumph. The Montgolfiers had the annual prize of six hundred livres adjudged to them by the Academy of Sciences; the elder brother was invited to court, decorated with the badge of St Michael, and received a patent of nobility; and on Joseph a pension was bestowed, with the further sum of forty thousand livres, to enable him to prosecute his experiments with balloons.

The facility and success, however, of the smoke or fire balloons appeared to throw into the shade the attempts made by the application of hydrogen gas. M. Charles, the promoter of this plan, was keenly reproached by M. Faujas de St Fond, for departing from the method practised by the original inventor; and he was, moreover, with his associates the Roberts, held up to public derision in the smaller theatres of Paris. To silence the cavils and insinuations of his antagonists, he resolved, therefore, on making some new efforts. A subscription was opened to defray the expense of a globe twenty-eight feet in diameter, and formed of tiffany, with elastic varnish. After repeated accidents and delays, this balloon was planted, on the 1st of December 1783, at the entrance of the great alley of the Tuilleries; and the diffuse fluid was this time introduced into it from a sort of gasometer. The dilute sulphuric acid and the iron-filings being put into wooden casks, disposed round a large cistern, the gas was conveyed in long leaden pipes, and made to pass through the water under a glass bell plunged in it. The whole apparatus cost about L.400 sterling, one-half of which was expended on the production of the gas alone. An immense concourse of spectators had collected from all parts. The discharge of a cannon at intervals announced the progress in filling the balloon. To amuse the populace, and quiet their impatience, M. Montgolfier was desired to let off a small fire-balloon, as a mark of his precedence. At last, the globe being sufficiently inflated, and a quantity of ballast, consisting of small sand bags, lodged in the car, leaving only $22\frac{1}{2}$ pounds for the measure of the buoyant force, MM. Charles and Robert placed themselves in the appended boat or car, and the machine was immediately disengaged from its stays. It mounted with a slow and solemn motion. According to the formula given, the terminal velocity of ascension must have been only about 400 feet each minute, or at the rate of somewhat less than five miles in the hour. "The car, ascending amidst profound silence and admiration," to borrow the warm and exaggerated language of the reporter, "allowed, in its soft and measured ascent, the bystanders to follow with their eyes and their hearts two interesting men, who like demigods soared to the abode of the immortals, to receive the reward of intellectual progress, and carry the imperishable name of Montgolfier. After the globe had reached the height of 2000 feet, it was no longer possible to distinguish the aërial navigators; but the coloured pennants which they waved in the air testified their safety and their tranquil feelings. All fears were now dissipated; enthusiasm succeeded to astonishment; and every demonstration was given of joy and applause." The balloon, describing a tortuous course, and rising or sinking according to the fancy of its conductors, was, after a flight of an hour and three quarters, made to alight on the meadow of Nesle, about twenty-five miles from Paris. For the space of an hour, the buoyancy of the machine had been sensibly augmented by the sun's rays striking against the surface of the bag, and heating up the contained gas to the temperature of 55 degrees by Fahrenheit's scale.

New balloon of Charles and the Roberts.

Their ascent.

After this prosperous descent, the globe, though become rather flaccid and loose by its expenditure, yet still retained a great buoyant force when relieved from the weight of the travellers. The sun had just set, and the night was beginning to close; but M. Charles formed the resolution of making alone another aërial excursion. His courage was rewarded by the spectacle of one of the most novel and enchanting appearances in nature. He shot upwards with such celerity as to reach the height of near two miles in ten minutes. The sun rose again to him in full orb; and, from his lofty station in the heavens, he contemplated the fading luminary, and watched its parting beams, till it once more sunk below the remote horizon. The vapours rising from the ground collected into clouds, and covered the earth from his sight. The moon began to shine, and her pale rays scattered gleams of various hues over the fantastic and changing forms of those accumulated masses. This scene had all the impressive solemnity of the true sublime. No wonder that the first mortal eye that ever contemplated such awful grandeur could not refrain from shedding tears of joy and admiration. The region in which M. Charles hovered was now excessively cold; and as he opened the valve occasionally during his ascent, to prevent the violent distension of the balloon, the hydrogen gas, not having time to acquire the temperature of the exterior air, rushed out like misty vapour, with a whistling noise. But prudence forbade the voyager to remain long at such an elevation, while darkness was gathering below. He therefore descended slowly to the earth, and, after the lapse of 35 minutes, alighted near the wood of Tour du Lay, having, in that short interval, travelled about nine miles.

Ascent of Charles alone.

This balloon, with its passengers and ballast, weighed at first 680 pounds; but, notwithstanding the care taken in filling it, the hydrogen gas must have been mixed with a large proportion of common air, since it was only $5\frac{1}{4}$ times lighter than this fluid. The barometer, which stood at 29·24 English inches at the surface of the ground, subsided to 20·05 at the greatest elevation to which M. Charles had reached. This gives by calculation an altitude of 9770 feet. The thermometer, which was at 41° by Fahrenheit's scale at the first ascent, fell to 21° at the highest flight; giving a difference of one degree for every $488\frac{1}{2}$ feet of ascent.

The next voyage through the air was performed in the largest balloon ever yet constructed. The elder Montgolfier had been persuaded to open a subscription at Lyons for the sum of L.180 sterling, to construct an aëronautic machine capable of upholding a great weight, and of carrying a horse or other quadruped. It had an elongated shape, 109 feet wide and 134 feet high, and was formed of two folds of linen, having three layers of paper laid between them, and quilted over with ribands. It showed at first enormous buoyant power. A truss of straw, moistened with spirit of wine, was found, when set on fire, to yield humid smoke sufficient to inflate the balloon, and the burning of five pounds weight of alder faggots kept it in full action. Though loaded with a ballast of eighteen tons, it yet lifted up six persons from the ground. Unfortunately, it was very much damaged one night, in consequence of being exposed to rain, frost, and snow. However, on the 19th of January 1784, the balloon was charged in seventeen minutes, by the combustion of 550 pounds of alder. Joseph Montgolfier, accompanied by the ardent Pilatre de Rozier, and four other persons of note, with the proper ballast, took their seats in a wicker gallery, and were launched into the atmosphere. They

Ascent of Montgolfier at Lyons.

manœuvred over the city of Lyons, and near the course of the Rhine, for the space of forty minutes; but a large rent having been observed in the upper part of the balloon, they were compelled to descend abruptly, though without any further accident.

The difficulties and dangers of aërial navigation being at length surmounted, the ascents of balloons were now multiplied in all quarters. It will therefore be sufficient henceforth to notice very succinctly some of the more distinguished attempts of that kind.

Andreani.

The Chevalier Paul Andreani of Milan had a spherical balloon, of 70 feet in diameter, formed after Montgolfier's plan, at his own charge, in which, accompanied by two companions, he ascended from that capital on the 25th of February 1784. The machine rose to the height of 1300 feet; but after having described, in twenty minutes, a very circuitous track, it settled upon a large tree, from which however the voyagers, by applying fresh fuel, extricated themselves, and alighted on clear ground, without receiving any hurt.

Blanchard.

On the 2d of March Blanchard, who had been for some years before occupied with the chimerical project of flying in the air, and who fancied that the same principles and contrivances might be applied to direct the motion of balloons, mounted alone, and with great intrepidity, at Paris, in a silk balloon 40 feet in diameter, constructed by subscription, and filled with hydrogen gas. He darted rapidly to the height of above a mile, and after being driven about by cross winds for an hour and three quarters, he descended in the plain of Billancourt.

On the 28th of June in the same year, an ascent was made at Lyons before the King of Sweden, who then travelled under the name of Count Haga, with a fire-balloon, having somewhat of a pear shape, and 75 feet in height.

Fleurant and Thiblé.

Two passengers, M. Fleurant and a young lady, Madame Thiblé, the first female that ever adventured on such a daring voyage, entered the car, and ascended with great velocity. In four minutes the noise of the multitude was no longer audible, and in two more the eye could not distinguish them. It was inferred, from a trigonometrical calculation, that they had reached the altitude of 13,500 feet. Their flag, with its staff of 14 pounds weight, being thrown down, took seven minutes to fall to the ground. The thermometer had dropt to 43° on Fahrenheit's scale; and to the sensation of cold which they felt was joined that of a ringing in the ears. Different currents were found to occupy distinct strata of the atmosphere; and in passing from one stratum to another, the balloon was affected by a sensible undulation. The travellers continued to feed their fire with the loppings of vines, till this provision being nearly spent, they safely alighted in a corn-field, having traversed about six miles in three quarters of an hour.

Rozier and Proust.

About a fortnight afterwards, the same prince was gratified by a more splendid ascent, commanded for his entertainment by the French monarch. A large fire-balloon, carrying the naturalists Rozier and Proust, was launched from the outer court of Versailles. It soared to the height of 12,520 feet, and might appear to float in a vast congregation of extended and towering white clouds. The thermometer stood at 21° of Fahrenheit, and the flakes of snow fell copiously on the voyagers, while it only rained below. Descending again from that chaotic abyss, they were charmed with the lively aspect of a rich and populous district. They alighted at the entrance of the forest of Chantilly, about thirty-six miles from Versailles, after a flight of an hour and five minutes.

We omit the relation of a prosperous ascent performed at Rhodés on the 6th of August, by the Abbé Carnus and his companion, with a fire-balloon, of a globular shape, and 57 feet in diameter.—The longest aërial journey yet made was accomplished at Paris, on the 19th of September. The duke de Chartres, afterwards Orleans, and the noted Egalité, employed Robert to construct for him a silk balloon, which should be filled with hydrogen gas. It had 56 feet in height and 36 feet diameter, being composed of a cylinder terminated by two hemispheres; a construction which was rightly supposed to give much additional solidity to the machine. A small bag, on Meusnier's plan, had been introduced within it, and the boat was, besides, furnished with a helm and four oars. This balloon, bearing the duke himself, the two artists, and another companion, and having 500 pounds of ballast, was allowed to rise very slowly, with a buoyancy of only 27 pounds. At the height of 1400 feet, the voyagers perceived, not without uneasiness, thick dark clouds gathering along the horizon, and threatening the approach of a thunder-storm. They heard the distant claps, and experienced something like the agitation of a whirlwind, although they had not felt the slightest concussion in the air from the discharge of cannon. The thermometer suddenly dropped from 77° Fahrenheit to 61°; and the influence of this cold caused the balloon to descend within 200 feet of the tops of the trees near Beauvais. To extricate themselves, they now threw out more than forty pounds of ballast, and rose to an elevation of 6000 feet, where it was found that the confined gas had so obstinately retained its heat, as to be no less than 42° warmer than the external air. The duke became alarmed, and betrayed such impatience to return again to the earth, that he is said to have pierced the lower part of the silk bag in holes with his sword. After narrowly escaping the dangers from wind and thunder, the balloon at last descended in safety near Bethune, having performed a course of 135 miles in the space of five hours.

Duke of Orleans.

Guyton-Morveau.

On the 25th of April in the same year, the celebrated chemist Guyton-Morveau, with the Abbé Bertrand, ascended from Dijon in a balloon, nearly of a globular shape, 29 feet in diameter, composed of the finest varnished tiffany, and filled with hydrogen gas. They did not start till five o'clock in the evening, the barometer being at 29·3 inches, and the thermometer at 57° on Fahrenheit's scale; and, after surmounting some accidents, they rose to an altitude of 10,465 feet, or very nearly two English miles, where the barometer had sunk to 19·8 inches, and the thermometer to 25°. They felt no inconvenience, however, except from the pinching of their ears with cold. They saw an ocean of clouds below them, and in this situation they witnessed, as the day declined, the beautiful phenomenon of a parhelion, or mock sun. The real luminary was only ten degrees above the horizon, when, all at once, another sun appeared to plant itself within six degrees of the former. It consisted of numerous prismatic rings, delicately tinted, on a ground of dazzling whiteness. At half-past six o'clock, after a voyage of an hour and a half, they safely alighted near Magny, about fifteen miles distant from Dijon.

His second ascent.

With the same balloon, M. Guyton-Morveau made a second ascent on the 12th of June, accompanied by the President De Virly. It was launched at seven o'clock in the morning, the barometer being then at 29·5 inches, the thermometer at 66°, and Saussure's hygrometer at $81\frac{1}{2}$°. It swelled very fast, however, owing to the effect of the sun's increasing heat; and the upper valve being at intervals opened, to give vent to excess of the gas, this escaped with a noise like the rushing of water. As the voyagers did not mount to any very great elevation, they enjoyed an agreeable temperature, and could easily, by observing

Aëronautics.

the situation of the different villages scattered below them, trace out their tortuous route on the surface of the map. By nine o'clock they had reached the height of 6030 feet, the barometer now standing at 24·7 inches, the thermometer at 70°, and the hygrometer at $65\frac{1}{2}$. Three quarters of an hour afterwards they descended at the village of Etevaux, only twelve miles from Dijon, having described at least double this distance in the air. The heat had increased so much since the morning, that, notwithstanding the loss of elastic fluid, the balloon seemed yet nearly inflated on touching the ground.

Remarkable voyage of Testu.

An aërial voyage, most remarkable for its duration and its adventures, was performed on the 18th of June 1786, from Paris, by M. Testu, with a balloon 29 feet in diameter, constructed by himself, of glazed tiffany, furnished with auxiliary wings, and filled, as usual, with hydrogen gas. It had been much injured by wind and rain during the night before its ascension; but having undergone a slight repair, it was finally launched, with its conductor, at four o'clock in the afternoon. The barometer then stood at 29·68 inches, and the thermometer as high as 84°, though the day was cloudy and threatened rain. The balloon had at first been filled only five-sixths, but it gradually swelled as it became drier and warmer, and acquired its utmost distension at the height of 2800 feet. But, to avoid the waste of gas or the rupture of the silk, the navigator endeavoured to descend by the re-action of his wings. Though this force had little efficacy, yet at half-past five o'clock he softly alighted on a corn-field in the plain of Montmorency. Without leaving the car, he began to collect a few stones for ballast; when he was surrounded by the proprietor of the field and a troop of peasants, who insisted on being indemnified for the damage occasioned by his idle and curious visitors. Anxious now to disengage himself, he persuaded them that, his wings being broken, he was wholly at their mercy. They seized the stay of the balloon, which floated at some height, and dragged their prisoner through the air in a sort of triumph towards the village. But M. Testu, finding that the loss of his wings, his cloak, and some other articles, had considerably lightened the machine, suddenly cut the cord, and took an abrupt leave of the clamorous and mortified peasants. He rose to the region of the clouds, where he observed small frozen particles floating in the atmosphere. He heard thunder rolling beneath his feet, and, as the coolness of the evening advanced, the buoyant force diminished, and, at three quarters after six o'clock, he approached the ground near the abbey of Royaumont. There he threw out some ballast, and in the space of twelve minutes rose to a height of 2400 feet, where the thermometer was only 66 degrees. He now heard the blast of a horn, and descried huntsmen below in full chace. Curious to witness the sport, he pulled the valve, and descended, at eight o'clock, between Etouen and Varville, when, rejecting his oars, he set himself to gather some ballast. While he was thus occupied, the hunters galloped up to him. He mounted a third time, and passed through a dense body of clouds, in which thunder followed lightning in quick succession.

> With fresh alacrity and force renew'd,
> Springs upward, like a pyramid of fire,
> Into the wild expanse, and through the shock
> Of fighting elements, on all sides round
> Environ'd wins his way.

The thermometer fell to 21°, but afterwards regained its former point of 66°, when the balloon had reached the altitude of 3000 feet. In this region the voyager sailed till half-past nine o'clock, at which time he observed from his "watch-tower in the sky" the final setting of the sun. He was now quickly involved in darkness, and enveloped in the thickest mass of thunder-clouds. The lightnings flashed on all sides, and the loud claps were incessant. The thermometer, seen by the help of a phosphoric light which he struck, pointed at 21°, and snow and sleet fell copiously around him. In this most tremendous situation the intrepid adventurer remained the space of three hours, the time during which the storm lasted. The balloon was affected by a sort of undulating motion upwards and downwards, owing, he thought, to the electrical action of the clouds. The lightning appeared excessively vivid, but the thunder was sharp and loud, preceded by a sort of crackling noise. A calm at last succeeding, he had the pleasure to see the stars, and embraced this opportunity to take some necessary refreshment. At half-past two o'clock the day broke in; but his ballast being nearly gone, and the balloon again dry and much elevated, he resolved to descend to the earth, and ascertain to what point he had been carried. At a quarter before four o'clock, having already seen the sun rise, he safely alighted near the village of Campremi, about 63 miles from Paris.

Balloons in England.

At this period, ascents with balloons had been multiplied, not only through France, but all over Europe. They were very seldom, however, directed to any other object than amusement, and had soon degenerated into mere exhibitions for gain. The first balloon seen in England was constructed by an ingenious Italian, the Count Zambeccari. It consisted of oiled silk, in a globular shape, about ten feet in diameter, and weighed only eleven pounds. It was entirely gilt, which not only gave it a beautiful appearance, but rendered it less permeable to the gas. On the 25th of November 1783 it was filled about three-fourths, and launched at one o'clock from the artillery ground, and in the presence of a vast concourse of spectators. At half-past three in the afternoon it was taken up at Petworth, in Sussex, about the distance of 48 miles. It was not till the following year, on the 21st of September, that a countryman of his, named Lunardi, first mounted in a balloon at London. He afterwards repeated the experiment in different parts of England, and during the following year in Scotland. This active person took an expeditious but careless method of filling his balloon with gas. He had two large casks, sunk into the ground for their better security, in which he deposited 2000 pounds of the borings of cannon, divided by layers of straw, to present a larger surface. An equal weight of sulphuric acid, or common oil of vitriol, diluted with six times as much water, was poured upon the iron, and the hydrogen gas now formed, without being cooled or washed, was immediately introduced into the balloon. To Lunardi succeeded Blanchard, who possessed just as little science, but had greater pretensions, and some share of dexterity and skill. This adventurer is said to have performed not fewer than thirty-six voyages through the air, and to have acquired a large sum of money by those bold and attractive exhibitions. His most remarkable journey was across the British Channel, in company with Dr Jeffries, an American physician. On the 7th of January 1785, in a clear frosty day, the balloon was launched from the cliff of Dover, and, after a perilous course of two hours and three quarters, it alighted in safety on the edge of the forest of Guicnnes, not far beyond Calais. By the magistrates of this town were the two aërial travellers treated with the utmost kindness and hospitality; and their wondrous arrival was welcomed as a happy omen, alas! how fallacious, of the lasting harmony to subsist between rival nations, now cemented by the conclusion of the famous Commercial Treaty.

The original smoke balloon of Montgolfier appears to

Aëronautics.

have gradually fallen into disrepute, and the more elegant and expensive, but far more powerful construction, which employs varnished silk to contain hydrogen gas, came to be generally preferred. With due precaution and management, the sailing through the atmosphere is perhaps scarcely more dangerous now than the navigating of the ocean. Of some hundred ascents made at different times with balloons, not above two or three cases are recorded to have had a fatal termination. The first was rendered memorable by the shocking death of the accomplished and interesting Rozier, who perished a martyr to his ardent zeal for the promotion of science. Being anxious to return the visit which Blanchard and Jeffries had paid to the French coast, by crossing the channel again and descending in England, he transported his balloon, which was of a globular shape, and forty feet in diameter, to Boulogne; and after various delays, occasioned chiefly by adverse winds, he mounted on the 15th June 1785, with his companion M. Romain. From some vague idea of being better able to regulate the ascent of the balloon, he had most incautiously suspended below it a small smoke one of ten feet diameter; a combination to which may be imputed the disastrous issue. Scarcely a quarter of an hour had elapsed, when the whole apparatus, at the height of above three thousand feet, was observed to be on fire; and its scattered fragments, with the unfortunate voyagers, were precipitated to the ground. They fell near the sea-shore, about four miles from Boulogne, and were instantly killed by the tremendous crash, their bodies being found most dreadfully mangled. The next fatal accident with balloons happened in Italy, several years later, when a Venetian nobleman and his lady, after having performed successfully various ascents, fell from a vast height, and perished on the spot. A few years ago, the younger William Sadler, one of our most skilful aëronauts, who had successfully crossed the Irish channel from Dublin to Anglesey, was killed by collision with a tall chimney, in a descent at Liverpool.

Shocking fate of Rozier and Romain.

The Parachute.

To guard, in some degree, against the risks arising from the occurrence of such accidents, the *Parachute* was afterwards introduced; being intended to enable the voyager, in case of alarm, to desert his balloon in mid-air, and drop, without sustaining injury, to the ground. The French language, though not very copious, has yet supplied this convenient term, signifying *a guard for falling*, as it has likewise furnished the words of analogous composition, *parapluie, paravent*, and *parasol*, to denote *an umbrella, a door-screen*, and *a shade for the sun*. The *parachute* very much resembles the ordinary umbrella, but has a far greater extent. The umbrella itself, requiring such strength to bear it up against a moderate wind, might naturally have suggested the application of the same principle to break the force of a fall. Nothing was required but to present a surface having dimensions sufficient to experience from the air a resistance equal to the weight of descent, in moving through the fluid with a velocity not exceeding that of the shock which a person can sustain without any danger. Accordingly, in the East, where the umbrella, or rather the parasol, has been from the remotest ages in familiar use, this implement appears to be occasionally employed by vaulters, for enabling them to jump safely from great heights. Father Loubere, in his curious account of Siam, relates that a person, famous in that remote country for his dexterity, was accustomed to divert exceedingly the king and the royal court by the prodigious leaps which he took, having two umbrellas with long slender handles fastened to his girdle. He generally alighted on the ground, but was sometimes carried by the wind against trees or houses, and not unfrequently into the river. Not many years since, the umbrella was, at least on one occasion, employed in Europe with similar views, but directed to a very different purpose. In the early part of the campaign of 1793, the French general Bournonville, having been sent by the National Convention, with four more commissioners, to treat with the Prince of Saxe-Cobourg, was, contrary to the faith or courtesy heretofore preserved in the fiercest wars that have raged among civilized nations, detained a prisoner with his companions, and sent to the fortress of Olmutz, where he suffered a rigorous confinement. In this cruel situation he made a desperate attempt to regain his liberty. Having provided himself with an umbrella, he jumped from a window at the height of forty feet; but being a very large heavy man, this screen proved insufficient to check his precipitate descent. He struck against the opposite wall, fell into the ditch, and broke his leg, and was carried in this condition back again to his dungeon.

First used.

Blanchard was the first who constructed parachutes, and annexed them to balloons, for the object of effecting his escape in case of accident. During the excursion which he undertook from Lisle, about the end of August 1785, when this adventurous aëronaut traversed, without halting, a distance not less than 300 miles, he let down a dog from a vast height in the basket of a *parachute*, and the poor animal, falling gently through the air, reached the ground unhurt. Since that period the practice and management of the *parachute* have been carried much farther by other aërial travellers, and particularly by M. Garnerin, who has dared repeatedly to descend from the region of the clouds with that very slender machine.

Garnerin's descent.

This ingenious and spirited Frenchman visited London during the short peace of 1802, and made two fine ascents with his balloon, in the second of which he threw himself from an amazing elevation with a parachute. This consisted of thirty-two gores of white canvass formed into a hemispherical case of twenty-three feet diameter, at the top of which was a truck or round piece of wood ten inches broad, and having a hole in its centre, admitting short pieces of tape to fasten it to the several gores of the canvass. About four feet and a half below the top, a wooden hoop of eight feet in diameter was attached by a string from each seam; so that when the balloon rose, the parachute hung like a curtain from this hoop. Below it was suspended a cylindrical basket covered with canvass, about four feet high, and two and a quarter wide. In this basket the aëronaut, dressed in a close jacket and a pair of trousers, placed himself, and rose majestically from an inclosure near North Audley Street at six o'clock in the evening of the 2d of September. After hovering seven or eight minutes in the upper region of the atmosphere, he meditated a descent in his parachute. Well might he be supposed to linger there in dread suspense, and to

> ..................................... look a while
> Pondering his voyage; for no narrow frith
> He had to cross...............
> He views the breadth, and, without longer pause,
> Downright into the world's first region throws
> His flight precipitant, and winds with ease,
> Through the pure marble air, his oblique way.

He cut the cord by which his parachute was attached to the net of the balloon; it instantly expanded, and for some seconds it descended with an accelerating velocity, till it became tossed extremely, and took such wide oscillations that the basket or car was at times thrown almost into a horizontal position. Borne along likewise by the influence of the wind, the parachute passed over Mary-le-bone and Somers-town, and almost grazed the houses of St Pancras. At last it fortunately struck the ground in a neighbouring field; but so violent was the shock as to throw poor Garnerin on his face, by which accident he received some cuts, and bled considerably. He seemed to be much agitated, and trembled exceedingly at the moment he was released from the car. One of the stays of the parachute had chanced to give way; which untoward circumstance deranged the apparatus, disturbed its proper balance, and threatened the adventurer, during the whole of his descent, with immediate destruction. The feeling of such extreme peril was too much for human nature to bear.

Theory of the parachute.

From the principles before explained, we may easily determine the descent of a parachute. When, with its attached load, it is abandoned in the air, it must, from the continued action of gravity, proceed at first with an accelerated motion, till its increasing velocity comes to oppose a resistance equal to the force of attraction, or to the combined weight of the whole apparatus. After this counterpoise has taken place, there existing no longer any cause of acceleration, the parachute should descend uniformly with its acquired rapidity. This perfect equilibrium will not, however, be attained at once. The accumulation of swiftness produced by the unceasing operation of gravity, is not immediately restrained by the corresponding increased resistance of the atmosphere. The motion of a parachute must hence, for some short time, be subject to a sort of interior oscillation, alternately accelerating and retarding. It first shoots beyond the terminal velocity, and then, suffering greater resistance, it relaxes, and contracts within the just limits. This unequal and undulating progress which a parachute exhibits subsequently to the commencement of its fall, is calculated to excite disproportionate alarms of insecurity and danger.

Rate of its descent.

The terminal velocity of a parachute, or the uniform velocity to which its motion tends, would, according to theory, be equal, if its surface were flat, to the velocity that a heavy body must acquire in falling through the altitude of a column of air incumbent on that surface, and having, under the usual circumstances, the same weight as the whole apparatus. But we have already seen, that a cylinder of air, one foot in diameter and height, weighs only, in ordinary cases, the seventeenth part of a pound avoirdupois. Wherefore, if the square of the diameter of a parachute be divided by 17, the quotient will give the number of pounds equivalent to the weight of an atmospheric column of one foot; and the weight of the apparatus being again divided by this quotient, the result will express the entire altitude of an equiponderant column. Of this altitude, the square root multiplied by 8 will denote the final velocity, or that with which the parachute must strike the ground. Suppose, for example, that the diameter of the parachute were 25 feet: then $25 \times 25 = 625$; and this, divided by 17, gives $36\frac{13}{17}$. Consequently, if the parachute with its load weighed only $36\frac{13}{17}$ pounds, the shock received at the surface of the earth would be precisely the same as that which is felt in dropping from an elevation of one foot. Had the weight of the apparatus, therefore, been four times greater, or $147\frac{1}{17}$ pounds, the shock sustained would be the same as that from a fall of four feet; which is near the limit, perhaps, of what a person can bear without suffering injury from the violence of concussion. The velocity of descent, on this latter supposition, would be $8\sqrt{4}$, or sixteen feet each second.

Correct formula.

But the actual resistance of the air is rather greater than what theory would give; and it is besides augmented by the concavity of the opposing surface, which occasions an accumulation of the fluid. Let $a$ denote the diameter of a parachute, and $f$ the total weight of the apparatus abandoned to its gravity in the atmosphere; if we take Dr Hutton's valuable experiments for the basis of the calculation, the terminal velocity of descent may be expressed in round numbers, by $\frac{26}{a}\sqrt{f}$, in feet each second, and consequently the length of fall which would occasion the same shock, is $\left(\frac{13}{4a}\right)^2 . f$, or very nearly $\frac{10\frac{1}{2}}{a^2} . f$. Thus, if the parachute had thirty feet in diameter, and weighed, together with its appended load, 225 pounds; then $\frac{26}{30}\sqrt{225} = \frac{26}{30} \times 15 = \frac{13}{15} \times 15 = 13$ feet, or the velocity with which it would strike the ground; and $\left(\frac{13}{120}\right)^2 225 = 2\frac{3}{8}$ feet, being the height from which a person dropping freely would receive the same shock.

Celerity in the higher regions.

Since the resistance which air opposes to the passage of a body is diminished by rarefaction, it is evident, that the parachute disengaged from a balloon, in the more elevated regions of the atmosphere, will at first acquire a greater velocity than it can afterwards maintain as it approaches the ground. Resuming the notation employed before, the ratio of the density of the air at the surface, and at any given height, being expressed by $n : m$; then the velocity of counterpoise at that elevation would be $\frac{26}{a}\sqrt{\frac{m}{n} . f}$, or it would be equal to what is accumulated in falling freely a height of $\frac{10\frac{1}{2}}{a^2} . \frac{m}{n} . f$ feet. It is the final velocity, however, that must be chiefly considered in parachutes, being what determines the shock sustained in alighting. The violence of the rushing through the air will seldom be attended with any serious inconvenience. If we suppose the mean velocity with which a parachute descends to be twelve feet each second, this will correspond to the rate of a mile in $7\frac{1}{2}$ minutes; not more than that of a very gentle trot. We are not told from what height Garnerin dropped; but if he took four minutes in his descent, it was probably about half a mile.

The practice of aëronautics has not realized those expectations of benefit to mankind which sanguine projectors were at first disposed to entertain. It was soon found, that a balloon, launched into the atmosphere, is abandoned, without guidance or command, to the mercy of the winds. To undertake to direct or impel the floating machine by any exertion of human strength, was evidently a chimerical attempt. All the influence which the aëronaut really possesses consists in a very limited power of raising or depressing it, according to circumstances. He cannot hope to shape his course, unless by skilfully adapting his elevation to catch the prevailing currents.

Balloons used in war.

Almost the only purpose to which balloons have hitherto been applied with success, had for its object that of military *reconnoissance*. In the early part of the French revolutionary war, when ingenuity and science were so eagerly called into active service, a balloon, prepared under the direction of the *Aërostatic Institute* in the Polytechnic School, and intrusted to the command of two or three experienced officers, was distributed to each of the republican armies. The decisive victory which General Jourdan gained, in June 1794, over the Austrian forces in the plains of Fleurus, has been ascribed principally to the accurate information of the enemy's movements before and during the battle, communicated by telegraphical signals from a balloon which was sent up to a moderate height in the air. The aëronauts, at the head of whom was the cele-

Aëronautics.

brated Guyton-Morveau, mounted twice in the course of that day, and continued, about four hours each time, hovering in the rear of the army at an altitude of 1300 feet. In the second ascent, the enterprise being discovered by the enemy, a battery was opened against them; but they soon gained an elevation above the reach of the cannon. Another balloon, constructed by the same skilful artist, M. Conté, was attached to the army sent on the memorable expedition to Egypt. What service it rendered the daring invader in the wide plains and sandy deserts of Africa, we are not informed; but, after the capitulation of Cairo, it was brought back, with the remains of the army, to France, and employed in the sequel, as we shall find, more innocently in philosophical research. These balloons, being calculated for duration, were of a more solid and perfect construction than usual. Originally they were filled with hydrogen gas, obtained from the decomposition of water on a large scale. For this purpose, six iron cylinders had been fixed by masonry in a simple kind of furnace, each of their ends projecting, and covered with an iron lid. Two sets of metal tubes were also inserted, the one for conveying hot water, and the other for carrying off the gas which was formed. The cylinders being charged with iron-turnings, and brought to a red heat, the humidity was instantly converted into steam, and decomposed, the oxygen uniting with the iron, while the hydrogen gas was discharged, and made to deposit any carbonic gas that might adhere to it, by passing through a reservoir filled with caustic lye before it entered the balloon. By this method there was procured, at a very moderate expense, and in the space of about four hours, a quantity of hydrogen gas sufficient to inflate a balloon of thirty feet in diameter.

Method of filling them.

The ascents with balloons should appear to furnish the readiest means of ascertaining important facts in meteorology and atmospheric electricity, departments of science which are still unfortunately in their infancy. Some aëronauts have asserted that the magnetic needle ceased to traverse at very great elevations in the atmosphere; a statement which received some countenance from the observations made by Saussure on the lofty summit of the Col du Geant, where that celebrated naturalist thought he had found the magnetic virtue to be diminished one fifth part. It has been pretended by others, that the air of the higher regions is not of the same composition as at the surface of the earth, and is, independently altogether of its rarity, less fitted for the purpose of respiration. To determine these, and other relative points, was, therefore, an object interesting to the progress of physical science. A few years since, two young and ardent French philosophers, MM. Biot and Gay-Lussac, proposed to undertake an aërial ascent, in order to examine the magnetic force at great elevations, and to explore the constitution of the higher atmosphere and its electrical properties. For such a philosophical enterprise they were eminently qualified, having been educated together at the Polytechnic School, and both of them deeply versed in mathematics; the former indulging in a wide range of study, and the latter concentrating his efforts more on chemistry and its application to the arts. Their offer to government was seconded by Berthollet and Laplace, and the celebrated chemist Chaptal, then minister of the interior, gave it his patronage and warm support. The balloon which had once visited Egypt was delivered to the custody of Biot and Gay-Lussac; and the same artist who constructed it was, at the public expense, ordered to refit and prepare it under their direction. Besides the usual provision of barometers, thermometers, hygrometers, and electrometers, they had two compasses, and a dipping-needle, with another fine needle, carefully magnetized, and suspended by a very delicate silk thread, for ascertaining by its vibrations the force of magnetic attraction. To examine the electricity of the different strata of the atmosphere, they carried several metallic wires, from sixty to three hundred feet in length, and a small electrophorus feebly charged. For galvanic experiments they had procured a few discs of zinc and copper, with some frogs; to which they added insects and birds. It was also intended to bring down a portion of air from the higher regions, to be subjected to a chemical analysis; and for this purpose a flask, carefully exhausted, and fitted with a stop-cock, had been prepared.

Scientific ascent of Biot and Gay-Lussac.

The balloon was placed in the garden of the *Conservatoire des Arts*, or Repository of Models, formerly the Convent of St Martin; and no pains were spared by Conté in providing whatever might contribute to the greater safety and convenience of the voyagers. Every thing being now ready for their ascent, these adventurous philosophers, in the presence of a few friends, embarked in the car at ten o'clock in the morning of the 23d of August 1804. The barometer was then at 30·13 inches, the thermometer at 61·7° on Fahrenheit's scale, and Saussure's hygrometer pointed at 80·8°, or very near the limit of absolute humidity. They rose with a slow and imposing motion. Their feelings were at first absorbed in the novelty and magnificence of the spectacle which opened before them; and their ears were saluted with the buzz of distant gratulations, sent up from the admiring spectators. In a few minutes they entered the region of the clouds, which seemed like a thin fog, and gave them a slight sensation of humidity. The balloon had become quite inflated, and they were obliged to let part of the gas escape, by opening the upper valve; at the same time, they threw out some ballast, to gain a greater elevation. They now shot through the range of clouds, and reached an altitude of about 6500 English feet. These clouds, viewed from above, had the ordinary whitish appearance; they all occupied the same height, only their upper surface seemed marked with gentle swells and undulations, exactly resembling the aspect of a wide plain covered with snow.

Their experimental operations.

MM. Biot and Gay-Lussac now began their experimental operations. The magnetic needle was attracted, as usual, by iron; but they found it impossible at this time to determine with accuracy its rate of oscillation, owing to a slow rotatory motion with which the balloon was affected. In the meanwhile, therefore, they made other observations. A Voltaic pile, consisting of twenty pairs of plates, exhibited all its ordinary effects,—gave the pungent taste, excited the nervous commotion, and occasioned the decomposition of water. By rejecting some more ballast, they had attained the altitude of 8940 feet, but afterwards settled to that of 8600 feet. At this great elevation, the animals which they carried with them appeared to suffer from the rarity of the air. They let off a violet bee, which flew away very swiftly, making a humming noise. The thermometer had fallen to 56·4° by Fahrenheit, yet they felt no cold, and were, on the contrary, scorched by the sun's rays, and obliged to lay aside their gloves. Both of them had their pulses much accelerated: that of Biot, which generally beat seventy-nine times in a minute, was raised to one hundred and eleven; while the pulse of his friend Gay-Lussac, a man of a less robust frame, was heightened from sixty to eighty beats in the minute. Notwithstanding their quickened pulsation, however, they experienced no sort of uneasiness, nor any difficulty in breathing.

Magnetical observations.

What perplexed them the most was the difficulty of observing the oscillations of a delicately suspended magnetic needle. But they soon remarked, on looking attentively down upon the surface of the conglomerated clouds, that the balloon slowly revolved, first in one direction, and then returned the contrary way. Between these opposite motions there intervened short pauses of rest, which it was necessary for them to seize. Watching, therefore, the moments of quiescence, they set the needle to vibrate, but were unable to count more than five, or very rarely ten oscillations. A number of trials, made between the altitudes of 9500 and 13,000 feet, gave 7″ for the mean length of an oscillation, while at the surface of the earth it required $7\frac{1}{20}$″ to perform each oscillation. A difference so very minute as the hundred and fortieth part could be imputed only to the imperfection of the experiment; and it was hence fairly concluded, that the force of magnetic attraction had in no degree diminished at the greatest elevation which they could reach. The direction of this force, too, seemed, from concurring circumstances, to have continued the same; though they could not depend on observations made in their vacillating car with so delicate an instrument as the dipping needle.

**Birds liberated at vast heights.**

At the altitude of 11,000 feet they liberated a green linnet, which flew away directly; but, soon feeling itself abandoned in the midst of an unknown ocean, it returned and settled on the stays of the balloon. Then mustering fresh courage, it took a second flight, and dashed downwards to the earth, describing a tortuous yet almost perpendicular track. A pigeon which they let off under similar circumstances afforded a more curious spectacle. Placed on the edge of the car, it rested a while, measuring as it were the breadth of that unexplored sea which it designed to traverse: now launching into the abyss, it fluttered irregularly, and seemed at first to try its wings in the thin element; till, after a few strokes, it gained more confidence, and, whirling in large circles or spirals, like the birds of prey, it precipitated itself towards the mass of extended clouds, where it was lost from sight.

It was difficult, in those lofty and rather humid regions, to make electrical observations; and the attention of the scientific navigators was besides occupied chiefly by their magnetical experiments. However, they let down from the car an insulated metallic wire of about 250 feet in length, and ascertained, by means of the electrophorus, that the upper end indicated resinous or negative electricity. This experiment was several times repeated; and it seemed to corroborate fully the previous observations of Saussure and Volta relative to the increase of electricity met with in ascending the atmosphere.

**Diminution of temperature.**

The diminution of temperature in the higher regions was found to be less than what is generally experienced at the same altitude on mountains. Thus, at the elevation of 12,800 feet, the thermometer was at 51° by Fahrenheit, while it stood as low as $63\frac{1}{2}$° at the observatory; being only a decrement of one degree for each 1000 feet of ascent. This fact corresponds with the observations made by former aëronauts, and must have been produced, we conceive, by the operation of two distinct causes. First, the rays from the sun, not being enfeebled by passing through the denser portion of the atmosphere, would act with greater energy on the balloon and its car, and consequently affect the thermometer placed in their vicinity. Next, the warm current of air, which during the day rises constantly from the heated surface of the ground, must augment the temperature of any body which is exposed to its influence. During the night, on the contrary, the upper strata of the atmosphere would be found colder, we presume, than the general standard, owing to the copious descent of chill portions of air from the highest regions.

**Hygrometric observations.**

The hygrometer, or rather hygroscope, of Saussure, advanced regularly towards dryness, in proportion to the altitude which they attained. At the elevation of 13,000 feet it had changed from 80·8° to 30°. But still the conclusion, that the air of the higher strata is drier than that of the lower, we are inclined to consider as fallacious. In fact, the indications of the hygroscope depend on the relative attraction for humidity possessed by the substance employed, and the medium in which it is immersed. But air has its disposition to retain moisture always augmented by rarefaction, and consequently such alteration alone must materially affect the hygroscope. The only accurate instrument for ascertaining the condition of air with respect to dryness is founded on a property of evaporation. But we shall afterwards have occasion to discuss this subject at due length.

**Their descent.**

The ballast now being almost quite expended, it was resolved to descend. The aëronauts therefore pulled the upper valve, and allowed part of the hydrogen gas to escape. They dropped gradually, and when they came to the height of 4000 feet, they met the stratum of clouds, extending horizontally, but with a surface heaved into gentle swells. When they reached the ground, no people were near them to stop the balloon, which dragged the car to some distance along the fields. From this awkward and even dangerous situation they could not extricate themselves without discharging the whole of their gas, and therefore giving up the plan of sending M. Gay-Lussac alone to explore the highest regions. It has been reported that his companion M. Biot, though a man of activity and not deficient in personal courage, was so much overpowered by the alarms of their descent, as to lose for the time the entire possession of himself. The place where they alighted, at half-past one o'clock, after three hours and a half spent in the midst of the atmosphere, was near the village of Meriville, in the department of the Loiret, and about fifty miles from Paris.

It was the desire of several philosophers at Paris, that M. Gay-Lussac should mount a second time, and repeat the different observations at the greatest elevation he could attain. Experience had instructed him to reduce his apparatus, and to adapt it better to the actual circumstances. As he could only count the vibrations of the magnetic needle during the very short intervals which occurred between the contrary rotations of the balloon, he preferred one of not more than six inches in length, which therefore oscillated quicker. The dipping needle was magnetized and adjusted by the ingenious M. Coulomb. To protect the thermometer from the direct action of the sun, it was inclosed within two concentric cylinders of pasteboard covered with gilt paper. The hygrometers, constructed on Richer's mode, with four hairs, were sheltered nearly in the same way. The two glass flasks intended to bring down air from the highest regions of the atmosphere had been exhausted till the mercurial gage stood at the 25th part of an inch, and their stop-cocks were so perfectly fitted, that, after the lapse of eight days, they still preserved the vacuum. These articles, with two barometers, were the principal instruments which M. Gay-Lussac took with him. The skill and intelligence of the artist had been exerted in further precautions for the safety of the balloon.

**Gay-Lussac ascends again alone.**

At forty minutes after nine o'clock on the morning of the 15th of September, the scientific voyager ascended, as before, from the garden of the Repository of Models. The barometer then stood at 30·66 English inches, the thermometer at 82° by Fahrenheit, and the hygrometer at $57\frac{1}{2}$°. The sky was unclouded, but misty. Scarcely had the observer reached the height of 3000 feet, when he observed spread below him, over the whole extent of the atmosphere, a thin vapour, which rendered the distant objects very indistinct. Having gained an altitude of 9950 feet, he set his needle to vibrate, and found it to perform twenty oscillations in 83″, though it had taken 84·33″ to make the same number at the surface of the earth. At the height of 12,680 feet he discovered the variation of the compass to be precisely the same as below; but with all the pains he could take, he was unable to determine with sufficient certainty the dip of the needle. M. Gay-Lussac continued to prosecute his other experiments with the same diligence, and with greater success. At the altitude of 14,480 feet he found that a key, held in the magnetic direction, repelled with its lower end, and attracted with its upper end, the north pole of the needle of a small compass. This observation was repeated, and with equal success, at the vast height of 20,150 feet; a clear proof that the magnetism of the earth exerts its influence at remote distances. He made not fewer than fifteen trials at different altitudes, with the oscillations of his finely suspended needle. It was generally allowed to vibrate twenty or thirty times. The mean result gives 4·22″ for each oscillation, while it was 4·216″ at the surface of the earth; an apparent difference so extremely small, as to be fairly neglected.

His observations in magnetism.

Successive decrements of temperature.

During the whole of his gradual ascent, he noticed, at short intervals, the state of the barometer, the thermometer, and the hygrometer. Of these observations, amounting in all to twenty-one, he has given a tabular view. We regret, however, that he has neglected to mark the times at which they were made, since the results appear to have been very considerably modified by the progress of the day. It would likewise have been desirable to have compared them with a register noted every half hour at the Observatory. From the surface of the earth to the height of 12,125 feet, the temperature of the atmosphere decreased regularly from 82° to 47·3° by Fahrenheit's scale. But afterwards it increased again, and reached to 53·6°, at the altitude of 14,000 feet; evidently owing to the influence of the warm currents of air which, as the day advanced, rose continually from the heated ground. From that point the temperature diminished, with only slight deviations from a perfect regularity. At the height of 18,636 feet the thermometer subsided to 32·9°, on the verge of congelation; but it sunk to 14·9° at the enormous altitude of 22,912 feet above Paris, or 23,040 feet above the level of the sea, the utmost limit of the balloon's ascent.

Comparison of these observations.

From these observations no conclusive inference, we think, can be drawn respecting the mean gradation of cold which is maintained in the higher regions of the atmosphere; for, as we have already remarked, the several strata are during the day kept considerably above their permanent temperature by the hot currents raised from the surface through the action of the sun's rays. If we adopt the formula given by Professor Leslie at the end of his Elements of Geometry, which was the result of some accurate and combined researches, the diminution of temperature corresponding to the first part of the ascent, or 12,125 feet, ought to be forty degrees of Fahrenheit. It was actually 34·7°, and would no doubt have approached to 40°, if the progressive heating of the surface, during the interval of time, were taken into the account. In the next portion of the voyage, from the altitude of 14,000 to that of 18,636 feet, or the breadth of 4636 feet, the decrement of temperature according to the formula should only have been 16¼°, instead of 20·7°, which was really marked; a proof that the diurnal heat from below had not yet produced its full effect at such a great height. In the last portion of the balloon's ascent, from 18,636 feet to 22,912. a range of 4276 feet, the decrease of heat ought to be 15½°, and it was actually 18°; owing most probably to the same cause, or the feebler influence which warm currents of air from the surface exert at those vast elevations. Taking the entire range of the ascent, or 22,912 feet, the diminution of temperature according to the same formula would be for the gradation of temperature in ascending the atmosphere 85·4°. The decrease actually observed would be 67·1°, which might be raised to 80°, if we admit the very probable supposition, that the surface of the earth had become heated from 82° to 94·9° during the interval between ten o'clock in the morning and near three in the afternoon, when the balloon floated at its greatest elevation.

Aëronautics.

After making the fair allowances, therefore, on account of the operation of deranging causes, the results obtained by M. Gay-Lussac, for the gradation of temperature in the atmosphere, appear, on the whole, to agree very nearly with those derived from the formula which theory, guided by delicate experiments, had before assigned. This gradation is evidently not uniform, as some philosophers have assumed; but proceeds with augmented rapidity in the more elevated regions. The same conclusion results from a careful inspection of the facts which have been stated by other observers.

Indications of the hygrometer.

The hygrometers, during the ascent of the balloon, held a progress not quite so regular, but tending obviously towards dryness. At the height of 9950 feet they had changed from 57·5° to 62°; from which point they continued afterwards to decline, till they came to mark 27·5°, at the altitude of 15,190 feet. From this inferior limit the hygrometers advanced again, yet with some fluctuations, to 35·1°, which they indicated at the height of 18,460 feet. Above this altitude the variation was slight, though rather inclining to humidity. There can exist no doubt, however, that, allowing for the influence of the prevailing cold, the higher strata of the atmosphere must be generally drier than the lower, or capable of retaining, at the same temperature, a larger share of moisture.

Prospect of the highest atmosphere.

At the altitude of 21,460 feet M. Gay-Lussac opened one of his exhausted flasks; and, at that of 21,790 feet, the other. The air rushed into them through the narrow aperture, with a whistling noise. He still rose a little higher, but, at eleven minutes past three o'clock, he had attained the utmost limit of his ascent, and was then 22,912 feet above Paris, or 23,040 feet, being more than four miles and a quarter, above the level of the sea. The air was now more than twice as thin as ordinary, the barometer having sunk to 12·95 inches. From that stupendous altitude, sixteen hundred feet above the summit of the Andes, more elevated than the loftiest pinnacle of our globe, and far above the heights to which any mortal had ever soared, the aërial navigator might have indulged the feelings of triumphant enthusiasm. But the philosopher, in perfect security, was more intent on calmly pursuing his observations. During his former ascent, he saw the fleecy clouds spread out below him, while the canopy of heaven seemed of the deepest azure, more intense than Prussian blue. This time, however, he perceived no clouds gathered near the surface, but remarked a range of them stretching, at a very considerable height, over his head; the atmosphere, too, wanted transparency, and had a dull, misty appearance. The different aspect of the sky was probably owing to the direction of the wind, which blew from the north-north-west in his first voyage, but in his second from the south-east.

Feelings of Gay-Lussac.

While occupied with experiments at this enormous elevation, he began, though warmly clad, to suffer from excessive cold, and his hands, by continual exposure, grew benumbed. He felt likewise a difficulty in breathing, and his pulse and respiration were much quickened. His throat became so parched from inhaling the dry attenuated air, that he could hardly swallow a morsel of bread; but he experienced no other direct inconvenience from his situation. He had indeed been affected, through the whole of the day, with a slight headache, brought on by the preceding fatigues and want of sleep; but though it continued without abatement, it was not increased by his ascent.

His descent.

The balloon was now completely distended, and not more than 33 pounds of ballast remained: it began to drop, and M. Gay-Lussac, therefore, only sought to regulate its descent. It subsided very gently, at the rate of about a mile in eight minutes; and after the lapse of thirty-four minutes, or at three quarters after three o'clock, the anchor touched the ground, and instantly secured the car. The voyager alighted with great ease near the hamlet of St Gourgon, about sixteen miles north-west from Rouen. The inhabitants flocked around him, offering him assistance, and eager to gratify their curiosity.

His analysis of the air brought down.

As soon as he reached Paris, he hastened to the laboratory of the Polytechnic School, with his flasks, containing air of the higher regions, and proceeded to analyze it in the presence of Thenard and Gresset. Opened under water, the liquid rushed into them, and apparently half filled their capacity. The transported air was found, by a very delicate analysis, to contain exactly the same proportions as that collected near the surface of the earth, every 1000 parts holding 215 of oxygen. From concurring observations, therefore, we may conclude that the atmosphere is essentially the same in all situations.

Remarks on these last ascents.

The ascents performed by MM. Biot and Gay-Lussac are memorable, for being the first ever undertaken solely for objects of science. It is impossible not to admire the intrepid coolness with which they conducted those experiments, operating, while they floated in the highest regions of the atmosphere, with the same composure and precision as if they had been quietly seated in their cabinets at Paris. Their observations on the force of terrestrial magnetism show most satisfactorily its deep source and wide extension. The identity of the constitution of the atmosphere to a vast altitude was likewise ascertained. The facts noted by Gay-Lussac, relative to the state of the thermometer at different heights, appear generally to confirm the law which theory assigns for the gradation of temperature in the atmosphere: but many interesting points were left untouched by this philosopher. We are sorry that he had not carried with him the *cyanometer*, which enabled Saussure to determine the colour of the sky on the summits of the Swiss mountains. Still more we regret that he was not provided with an hygrometer and a photometer, of Leslie's construction. These delicate instruments could not have failed, in his hands, to furnish important data for discovering the relative dryness and transparency of the different strata of air. It would have been extremely interesting, at such a tremendous height, to have measured with accuracy the feeble light reflected from the azure canopy of heaven, and the intense force of the sun's direct rays, and hence to have determined what portion of them is absorbed in their passage through the lower and denser atmosphere.

Since that time numerous ascents have been performed in different countries, generally by adventurers guided by no philosophical views, nor leading to any valuable results. It would therefore be superfluous to recount such repeated attempts.

Various projects with balloons.

Balloons have at different times been thought capable of useful application. It has been even proposed to employ their power of ascension as a mechanical force. This might be rendered sufficient, it was believed, to raise water from mines, or to transport obelisks, and place them on great elevations. We can easily imagine situations where a balloon could be used with advantage; such as to raise, without any scaffolding, a cross or a vane to the top of a high spire. But the power would then be purchased at a very disproportionate expense. It would require $4\frac{1}{2}$ pounds of iron, or 6 of zinc, with equal quantities of sulphuric acid, to yield hydrogen gas sufficient to raise up the weight of one pound.

The proposal of employing balloons in the defence and attack of fortified places appears truly chimerical. They have rendered important service, however, in reconnoitring the face of a country, and communicating military signals; and it is rather surprising that a system, which promised such obvious benefits, has not been carried much farther.

Their application proposed for the improvement of meteorology.

But to a skilful and judicious application of balloons, we may yet look for a most essential improvement of the infant science of meteorology. Confined to the surface of this globe, we have no direct intimation of what passes in the lofty regions of the atmosphere. All the changes of weather, which appear so capricious and perplexing, proceed, no doubt, from the combination of a very few simple causes. Were the philosopher to penetrate beyond the seat of the clouds, examine the circumstances of their formation, and mark the prevailing currents, he would probably remove in part the veil that conceals those mighty operations. It would be quite practicable, we conceive, to reach an elevation of seven miles, where the air would be four times more attenuated than ordinary. A silk balloon, of forty feet diameter, if properly constructed, might be sufficient for that enormous ascent, since its weight would only be 80 pounds, while its buoyant force, though not more than a quarter filled with hydrogen gas, would amount to $533\frac{1}{3}$, leaving $453\frac{1}{3}$ pounds for the passenger and the ballast. The balloon could be safely charged, indeed, to the third part of its capacity, on account of the contraction which the gas would afterwards suffer from the intense cold of the upper regions; and this gives it an additional buoyancy of $177\frac{8}{9}$ pounds. The voyager would not, we presume, suffer any serious inconvenience from breathing the very thin air. The animal frame adapts itself with wonderful facility to external circumstances. Perhaps the quickened pulse and short respiration, which some travellers have experienced on the summits of lofty mountains, should be attributed chiefly to the suddenness of their transition, and the severity of the cold. The people of Quito live comfortably 9560 feet above the level of the sea; and the shepherds of the hamlet of Antisana, the highest inhabited spot in the known world, who breathe, at an elevation of 13,500 feet, air that has only three-fifths of the usual density, are nowise deficient in health or vigour. But the intenseness of the cold is probably what the resolute observer would have most to dread, at the height of seven miles. This decrease of temperature, perhaps equal to 148 degrees, might extend below the point at which mercury freezes. Yet several circumstances tend to mitigate such extreme cold, and proper clothing might enable an experimenter for a short time to resist its effects.

Much could be done, however, without risk or material expense. Balloons from fifteen to thirty feet in diameter, and carrying register thermometers and barometers, might be capable of ascending alone to altitudes between eight and twelve miles. Dispatched from the centres of the great continents, they would not only determine the extreme gradation of cold, but indicate by their flight the direction of the regular and periodic winds which doubtless obtain in the highest regions of the atmosphere. But we will not enlarge. In some happier times, such experiments may be performed with the zealous concurrence of different governments;—when nations shall at last become satisfied with cultivating the arts of peace; instead of wasting their energies in sanguinary, destructive, and fruitless wars.

In Plate II. there is a view of the principal balloons. The figure in the centre represents the shape of the gores for forming the cloth into a globular shape. AE, the length of the gore, is equal to the half of the circumference of the globe; BC, the breadth, is the same proportional part of the circumference as the number of gores which it requires to form the sphere. The figures between CB and A denote the breadths of the half-gore, at equal distances from the centre; the breadth BD at the centre being taken equal to 1, and the others in decimals. In this manner it is easy to construct an exact pattern of the gores, all which, being united, will form a true sphere.

---

AEROPHYLACEA, a term used by naturalists for caverns or reservoirs of air, supposed to exist in the bowels of the earth.

AEROPHYTES, a designation sometimes applied to parasite plants.

AERSCHOT, a once fortified city of Belgium, on the river Demer, 7 miles from Louvain, and 20 from Antwerp, containing 4053 inhabitants.

ÆRTSEN, PETER, a Dutch historical painter of great merit, both for drawing and colouring. His master-pieces are an altar-piece at Delft, representing the Nativity and the Wise Men's Offering, and one at Amsterdam of the Death of the Virgin. He died in 1575, aged 56.

ÆRUGINOUS, an epithet given to such things as resemble or partake of the nature of the rust of copper.

ÆRUGO, a Latin term which properly signifies the rust of copper, whether natural or artificial. The former is found about copper mines, and the latter, called *verdigris*, is made by corroding copper plates with acids.

ÆRUSCATORES, in *Antiquity*, a kind of strolling beggars, not unlike gypsies, who drew money from the credulous by fortune-telling, &c. It was also a denomination given to griping exactors, or collectors of the revenue. The Galli, or priests of Cybele, were called *æruscatores magnæ matris;* and μητραγυρται, from their begging in the streets; to which end they had little bells to draw people's attention, similar to some orders of mendicants abroad.

ÆS, commonly translated *brass:* but the æs of the Romans was a *bronze*, or alloy of copper and tin; and the cutting instruments of the ancient Greeks and Egyptians were also of bronze. The Romans borrowed their arms, as well as their money, from the Etruscans. Analysis of the bronzes of these nations shew that they contain from 8 to 12 per cent. of tin, which gave them hardness and the capability of receiving a good edge.

ÆS CIRCUMFORANEUM, money borrowed from the usurers around the Roman Forum. (*Cic. ad. Attic.* ii.)

ÆS EQUESTRE, ÆS HORDEARIUM, ÆS MILITARE, ancient terms for the pay of Roman soldiers, previous to the introduction of the regular *stipendium*, and furnished, it would appear, not from the public treasury, but by certain private persons as decreed by the state. The first, which amounted to 10,000 asses, was the purchase-money of the horse of an Eques; the second, amounting to 2000 asses, was the pay of an Eques, and was furnished by maidens, widows, and orphans, if possessed of a certain amount of property, in consideration that they enjoyed protection, and were not included in the census; and it seems probable that they were also charged with the payment of the *Æs Equestre:* the third, which Niebuhr reckons at 1000 asses a-year (the year then containing but 10 months), was the pay of a foot-soldier, and probably was provided by the *tribuni ærarii*, who would appear to have been private persons who received that title as collectors of the *tributum* for paying the army. —See Smith's *Dict. of Greek and Roman Antiquities*, 2d. edition.

ÆS UXORIUM, in *Antiquity*, a sum paid by bachelors, as a penalty for living single to old age. This tax for not marrying seems to have been first imposed in the year of Rome 350, under the censorship of M. Furius Camillus and M. Posthumus. At the census, or review of the people, each person was asked, *Et tu ex animi sententia uxorem habes liberorum quærendorum causa?* He who had no wife was hereupon fined after a certain rate, called *æs uxorium.*

*Per Æs et libram* was a formula in the Roman law, whereby purchases and sales were ratified. Originally the phrase seems to have been only used in speaking of things sold by weight, or by the scales; but it afterwards was used on other occasions. Hence even in adoptions, as there was a kind of imaginary purchase, the formula thereof expressed, that the person adopted was bought *per æs et libram.*

ÆSCHINES, an Athenian, a Socratic philosopher, the son of Charinus, a sausage-maker. He was continually with Socrates; which occasioned this philosopher to say, that the sausage-maker's son was the only person who knew how to pay a due regard to him. It is said that poverty obliged him to go to Sicily to Dionysius the tyrant; and that he met with great contempt from Plato, but was extremely well received by Aristippus, to whom he showed some of his dialogues, and received from him a handsome reward. He would not venture to profess philosophy at Athens, Plato and Aristippus being in such high esteem; but he opened a school, in which he taught philosophy to maintain himself. He afterwards wrote orations for the forum. Phrynicus, in Photius, ranks him amongst the best orators, and mentions his orations as the standard of the pure Attic style. Hermogenes has also spoken very highly of him. He wrote, besides, several Dialogues: 1. Concerning virtue, whether it can be taught. 2. Eryxias, or Erasistratus; concerning riches, whether they are good. 3. Axiochus; concerning death, whether it is to be feared,—but those extant on the several subjects, are not genuine remains. M. le Clerc has given a Latin translation of them, with notes and several dissertations, entitled *Silvæ Philologicæ.*

ÆSCHINES, a celebrated Grecian orator, was born in Attica 389 years before the Christian era. According to his own account, he was of distinguished birth; according to that of Demosthenes, he was the son of a courtesan, and a humble performer in a company of comedians. But whatever was the true history of his birth and early life, his talents, which were considerable, procured him great applause, and enabled him to be a formidable rival to Demosthenes himself. The two orators, inspired probably with mutual jealousy and animosity, became at last the strenuous leaders of opposing parties. Æschines was accused by Demosthenes of having received money as a bribe, when he was employed on an embassy to Philip of Macedon. He indirectly retaliated the charge by bringing an accusation against Ctesiphon, the friend of Demosthenes, for having moved a decree, contrary to the laws, to confer on Demosthenes a golden crown, as a mark of public approbation. A numerous as-

Æschylus. sembly of judges and citizens met to hear and decide the question. Each orator employed all his powers of eloquence; but Demosthenes, with superior talents, and with justice on his side, was victorious; and Æschines was sent into exile. The resentment of Demosthenes was now softened into generous kindness; for when Æschines was going into banishment, he requested him to accept of a sum of money; which made him exclaim, "How do I regret leaving a country where I have found an enemy so generous, that I must despair of ever meeting with a friend who shall be like him!"

Æschines opened a school of eloquence at Rhodes, which was the place of his exile; and he commenced his lectures by reading to his audience the two orations which had been the cause of his banishment. His own oration received great praise, but that of Demosthenes was heard with boundless applause. In so trying a moment, when vanity must be supposed to have been deeply wounded, with a noble generosity of sentiment, he said, "What would you have thought if you had heard him thunder out the words himself!"—Æschines afterwards removed to Samos, where he died in the 75th year of his age. Three only of his orations are extant. His eloquence is not without energy, but it is diffuse and ornamented, and more calculated to please than to move the passions.

ÆSCHYLUS, the father of the Greek tragic drama, was born in the year 525 B.C., in the Attic demos of Eleusis. The period of his youth and manhood coincides, therefore, with that great uprising of the national spirit of the Greeks, caused by the successive attempts of Darius, king of Persia, and his son Xerxes, to enslave their European neighbours on the north and west shores of the Ægean; and it was no doubt as much for the advantage of his poetical faculty as for the development of his manhood, that he took an active part in those famous military achievements by which the march of the insolent Asiatic hosts was repelled. The father of Attic tragedy helped, in the year 490, to drive the captains of Darius into the marshes of Marathon, and, ten years later, encompassed with ruin the multitudinous armament of Xerxes, within the narrow strait of Salamis. The glories of this naval achievement, the bard who had helped to win it with his sword afterwards lived to celebrate with the lyre, and left to the world the play of *The Persians*, as a great national record of combined poetry and patriotism almost unique in history. Of his subsequent career at Athens, only a few scanty notices remain, and those chiefly connected with the representation of his plays. We know that he composed 70 plays, and that he gained the prize for dramatic excellence 13 times; further, that the Athenians esteemed his works so highly as to allow some of them to be represented after his death,—a privilege, in their dramatic practice, altogether anomalous. We know, also, that in the course of his life he paid one or two visits to Sicily, to which country he was attracted, no doubt, by the same literary influence in the person of its ruler Hiero, that drew thither Bacchylides, Simonides, and other notable men of that rich epoch. There can, at the same time, be little doubt that one cause of his visits to that island may have been a want of sympathy as to political matters between him and the Athenian public; for while the Athenians, from the time of Cleisthenes (A.C. 510), had been advancing by rapid and decided steps to the full expansion of the democratic principle, it is evident, from some passages in his plays, especially from the whole tone and tendency of the *Eumenides*, that the political leanings of the poet of the *Prometheus* were towards aristocracy, and that, in the days of Pericles, he foresaw, with a sorrowful fear, the ripeness of those democratic evils which within so short a period led Xenophon to seek a new fatherland in Sparta, and opened to the Macedonian a plain path to the sovereignty of Greece. But whatever may have been his motives for retiring from the scene of so many literary triumphs (and the gossipers of ancient times have of course transmitted to us their pleasant inventions on this point), it is certain that, in the year A.C. 456, two years after the representation of his great trilogy, *The Orestiad*, he died at Gela, in Sicily, in the 69th year of his age; and the people of Gela, rejoicing in his bones, as Ravenna does in those of the banished Dante, inscribed the following memorial on his tomb:—

> "Here Æschylus lies, from his Athenian home
> Remote, 'neath Gela's wheat-producing loam;
> How brave in battle was Euphorion's son,
> The long-haired Mede can tell who fell at Marathon."

And thus he lives among posterity, celebrated more as a patriot than as a poet; as if to witness to all times, that the great world of books, with all its power, is but a small thing unless it be the reflection of a greater world of action.

Of the seventy plays which an old biographer reports him to have composed, only seven remain, with a few fragments of little significance, save to the keen eye of the professed philologist. These fragments, however, are sufficient to justify the high esteem in which he was held by the Athenian public, and by that greatest of all the great wits of a witty age and a witty people, Aristophanes. In the grand trilogy which exhibits, in three consecutive tragedies, the story of the murder of Agamemnon, and its moral sequences, we have a perfect specimen of what the Greek tragedy was to the Greeks, as at once a complex artistic machinery for the exhibition of national legend, and a grave pulpit for the preaching of important moral truths; nor could a more worthy founder than Æschylus of such a "Sacred Opera" be imagined. His imagination dwells habitually in the loftiest region of the stern old religious mythology of primeval Greece; his moral tone is pure—his character earnest and manly—and his strictly dramatic power (notwithstanding the very imperfect form of the drama in his day), as exhibited more especially in the *Agamemnon*, in the *Eumenides*, and in some parts of the *Prometheus*, is such as none of his famous successors, least of all Euripides, could surpass. Of his other plays, the *Seven against Thebes* is a drama, as Aristophanes expressed it, "full of war," and breathes in every line the spirit of the age and of the people that saved Europe from the grasp of Oriental despotism; *The Persians*, though weak in some parts, contains some fine choral poetry, and a description of the battle of Salamis, that will belong to the poetry of the world so long as the world lasts; while *The Suppliants* presents much in a tasteful translation, that makes us lament the loss of the missing pieces of the trilogy to which it belonged, no less than the blundering of the thoughtless copyists of the middle ages, by whose pen it has been so egregiously defaced. For in ancient times the flowing rhetorical Euripides was found a more useful model for the schools of eloquence, than the lofty, stern, and sometimes harsh, and occasionally it may be obscure, Æschylus: therefore, the text of the latter has been comparatively neglected, and much work was left for the tasteful philologist, before many parts of his noblest choruses could be rendered legible. Of the editions of Æschylus, the most notable in the earlier times of modern scholarship is that of Stanley; in more recent times, that of Schütz, who undertook the work of restoration with much learning and great boldness. The impulse given by this scholar was moderated by Wellauer, who, in his edition, along with some happy emendations, principally endeavoured to vindicate the authority of the manuscript readings from the large license of conjectural critics; and now from the remains of the great Hermann, has been published a text that should present the just medium between the timidity of Wellauer, and the rashness of mere conjectural criticism. Of English poetical translations there are only two; the old one by Potter, and a recent one by Blackie. There is also a translation in literal prose by Buckley. (J. S. B.)

ÆSCULAPIUS, in the *Heathen Mythology*, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron, who taught him physic, by which means Æsculapius cured the most desperate diseases. But Jupiter, enraged at his restoring to life Hippolytus, who had been torn in pieces by his own horses, killed him with a thunderbolt. According to Cicero, there were three deities of this name; the first, the son of Apollo, worshipped in Arcadia, who invented the probe and bandages for wounds; the second, the brother of Mercury killed by lightning; and the third, the son of Arsippus and Arsinoe, who first taught the art of tooth-drawing and purging. At Epidaurus, Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent: he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phliasians represented him as beardless. The cock, the raven, and the goat, were sacred to this deity. His chief temples were at Pergamus, Smyrna, Tricca, a city in Thessaly, and the isle of Coos; in all which votive tablets were hung up, showing the diseases cured by his assistance. But his most famous shrine was at Epidaurus, where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSOP, the fabulist, was born about the year 620 B.C., but the place of his birth is uncertain, that honour being claimed alike by Samos, Sardis, Mesembria in Thrace, and Cotiœum in Phrygia. He was brought, while young, to Athens as a slave, and having served several masters, was eventually enfranchised by Iadmon the Samian. He thereupon visited Crœsus king of Lydia, at whose court he is represented by Plutarch as reproving Solon for his discourteous manner towards the king. During the usurpation of Pisistratus, he is said to have visited Athens, and composed the fable of *Jupiter and the Frogs* for the instruction of the citizens (Phædrus, i. 2). As the ambassador of Crœsus at Delphi, he was charged with the distribution of the large sum of four minæ to each of the citizens; but, in consequence of some dispute, he returned the money to Crœsus. The Delphians, incensed at his conduct, accused him of sacrilege, and threw him headlong from a precipice, about 564 B.C. A pestilence which ensued being attributed to this crime, the people declared their willingness to make compensation for his death; which in default of a nearer connection was claimed and received by Iadmon, the grandson of his old master. (*Plut. de sera Num. Vind.*, p. 556. *Herodot.* ii. 134.) None of Æsop's works are extant. The popular stories regarding him are derived from a life prefixed to a book of fables purporting to be his, collected by Maximus Planudes, a monk of the fourteenth century, in which he is represented as a monster of ugliness and deformity, a notion utterly without foundation, and doubtless intended to heighten his wit by the contrast. That this life, however, was in existence a century before Planudes's time, appears by a manuscript of it found at Florence, and published in 1809. In Plutarch's *Convivium*, where Æsop is a guest, though there are many jests on his original servile condition, there are none on his appearance; and it would seem that the ancients were not usually restrained by delicacy in this point, since the personal defects of Socrates, and his resemblance to old Silenus, afford ample matter for merriment and raillery in the *Symposium* of Plato. We are told, besides, that the Athenians erected, in honour of Æsop, a noble statue by the famous sculptor Lysippus, a circumstance which alone were sufficient to confute the absurd fiction of his deformity: but more to the point is the statement of Pliny (xxxvi. 12.), that he was the *Contubernalis* of Rhodope, his fellow-slave, whose extraordinary beauty passed into a proverb:

Ἅπανθ' ὅμοια, καὶ Ῥοδῶπις ἡ καλή.

The obscurity in which the history of Æsop is involved, has induced some to deny his existence altogether; and Giambattista Vico, in his *Scienza Nuova*, chooses rather to consider him as an abstraction,—an excess of scepticism which is quite unreasonable. Whether Æsop left any written fables, has been more justly disputed, and Bentley inclines to the negative. Thus Aristophanes (*In Vespis*, v. 1259) represents the old man as learning his fables in conversation, and not from a book; and Socrates essayed to versify such as he remembered (Plat., *Phæd.* p. 61). Others again are of opinion, that a collection had been made of them before the time of Socrates. (*Mus. Crit.* i. 408.) It is, however, certain that fables bearing Æsop's name were popular at Athens during the most brilliant period of its literary history; though the discrepancies of authors in quoting the same fables seem in favour of Bentley's hypothesis. (Compare Aristot. *De Part. Anim.* iii. 2.; and Lucian. *Nigr.* 32.) The original fables were in prose, and were turned into verse by several writers; the first, after the example of Socrates, being Demetrius Phalereus. Next appeared an edition in elegiac verse, often cited by Suidas, but the author's name is unknown; then Babrius, an excellent Greek poet, turned them into choliambics; but of ten books, a few fables only are preserved entire. Of the Latin writers of Æsopean fables, Phædrus is the most celebrated.

> " Æsopus auctor quam materiam reperit,
> Hanc ego polivi versibus senariis."
> PHÆD.

The fables now extant in prose under Æsop's name are entirely spurious, as proved by Bentley in his *Dissertation on the Fables of Æsop*, and have been assigned an oriental origin. The identification of Æsop with the Arabian philosopher and fabulist Lokman (who is made by some traditions the contemporary of the psalmist David), has frequently been attempted; and the Persian accounts of Lokman, which among other things describe him as an ugly black slave, appear to have been blended by the author of the *Life* published by Planudes, with the classical stories respecting Æsop. The similarity of the fables ascribed to each renders it probable that they were derived from the same Indo-Persian source, or from the Chinese, who appear to have possessed such fables in very remote antiquity. A complete collection of the Æsopean Fables, 231 in number, was published at Breslau, by J. G. Schneider, in 1810.

ÆSOP, a Greek historian, whose life of Alexander the Great is preserved in a Latin translation by Julius Valerius. It is a work of no credit, abounding in errors.

ÆSOP, *Clodius*, a celebrated actor, who flourished about the 670th year of Rome. He and Roscius were contemporaries, and the best performers who ever appeared upon the Roman stage; the former excelling in tragedy, the latter in comedy. Cicero put himself under their direction, to perfect his action. Æsop lived in a most expensive manner, and at one entertainment is said to have had a dish which cost above L.800. This dish, we are told, was filled with singing and speaking birds, some of which cost near L.50. The delight which Æsop took in this sort of birds proceeded, as M. Bayle observes, from the expense. He did not make a dish of them because they could speak, (according to the refinement of Pliny upon this circumstance,) this motive being only accidental, but because of their extraordinary price.

Æsthetics || Æsymnium.

If there had been any birds that could not speak, and yet more scarce and dear than these, he would have procured such for his table. When he was upon the stage, he entered into his part to such a degree as sometimes to be seized with a perfect ecstasy. Plutarch mentions it as reported of him, that whilst he was representing Atreus deliberating how he should revenge himself on Thyestes, he was so transported beyond himself in the heat of action, that with his truncheon he smote one of the servants crossing the stage, and laid him dead on the spot. Æsop's son was no less luxurious than his father, for he dissolved pearls for his guests to swallow. Some speak of this as a common practice of his; but others mention his falling into this excess only on a particular day, when he was treating his friends. Horace[1] speaks only of one pearl of great value, which he dissolved in vinegar and drank.

[1] *Sat.* iii. lib. ii. 239.

ÆSTHETICS, a term derived from ʼαισθητικος, "belonging to sensation," employed by the followers of the German metaphysicians to designate philosophical investigations into the theory of *The Beautiful*, or *Philosophy of the Fine Arts*, which they are disposed to regard as a distinct science. It was first used in this sense by Wolf, about the middle of last century; and Winckelmann, in his work on painting and sculpture, maintains that *beauty* is a special property of bodies. Similar views are maintained by Baumgarten and Schelling, who apply their general principles to poetry, painting, sculpture, architecture, and music. Æsthetical speculations do not appear to have contributed any thing to the improvement of the fine arts, or to our real knowledge of mental phenomena.

ÆSTIMATIO CAPITIS, a term met with in old law-books for a fine anciently ordained to be paid for offences committed against persons of quality, according to their several degrees.

ÆSTIVAL, in a general sense, denotes something connected with, or belonging to summer. Hence æstival sign, æstival solstice, &c.

ÆSTUARY, in *Geography*, denotes an arm of the sea, which runs a good way within land. Such is the Bristol channel, and many of the firths of Scotland.

ÆSTUARY, in ancient baths, a secret passage from the hypocaustum into the chambers.

ÆSTUARY, among *Physicians*, a vapour bath, or any other instrument for conveying heat to the body.

ÆSTUI, a people that dwelt on the sea-coast in the N.E. of Germany, whose manners are minutely described by Tacitus. In appearance and manners, says that author, they resemble the Suevi; their language, that of Britain. They worshipped the mother of the gods, in whose honour they wore images of the boar, as amulets in war; fighting chiefly with clubs, as they had little iron. They engaged in husbandry, and gathered amber for the Roman market. This substance they called *glessum*. Their name is still preserved in the modern Esthen, the German name of the Esthonians. See Latham's *Germania of Tacitus*, p. 166. *Ukert*, vol. iii., pt. i., p. 420.

ÆSYMNETES, ʼΑισυμνητης, among the Greeks, was, like the Roman dictator, a person invested by the people with absolute power for a limited period in great emergencies of the State. Such was Pittacus at Mytilene, or Dracon and Solon at Athens.—Arist. *Polit.* iii. iv.

ÆSYMNIUM, in *Antiquity*, a monument erected to the memory of the heroes by Æsymnus the Megarean. On consulting the oracle in what manner the Megareans might be most happily governed, he was answered, *By holding consultation with the more numerous.* Taking this to signify the dead, he built the said monument, and a senate-house that embraced it within its compass, imagining that thus the dead would assist at their consultations.—*Pausanias.*

Aeth || Æther.

AETH. See ATH.

ÆTHALIA, or ILUA, in *Ancient Geography*, now *Elba*, an island on the coast of Etruria, in compass a hundred miles, abounding in iron. It was so called from αιθαλη, *smoke*, which issued from the shops of Vulcan.

ÆTHELING, or ÆDELING, the Anglo-Saxon title given to the children of kings and nobles. It is compounded of *æthel*, æðel, *illustrious*, and *ling*, lınȝ, which, when affixed to persons, indicates *diminution* or *adolescence*.

ÆTHELSTAN. See ATHELSTAN.

ÆTHER is usually understood of a thin, subtile matter or medium, much finer and rarer than air, which, commencing from the limits of our atmosphere, possesses the whole heavenly space. The word is Greek, αιθηρ, supposed to be formed from the verb αιθειν, *to burn, to flame;* some of the ancients, particularly Anaxagoras, supposing it to be of the nature of fire.

The philosophers cannot conceive that the largest part of the creation should be perfectly void; and therefore they fill it with a species of matter under the denomination of *æther*. But they vary extremely as to the nature and character of this æther. Some conceive it as a body *sui generis*, appointed only to fill up the vacuities between the heavenly bodies, and therefore confined to the regions above our atmosphere. Others suppose it of so subtile and penetrating a nature as to pervade the air and other bodies, and to possess the pores and intervals thereof. Others deny the existence of any such specific matter, and think the air itself, by that immense tenuity and expansion it is found capable of, may diffuse itself through the interstellar spaces, and be the only matter found therein.

In effect, æther being no object of our sense, but the mere work of imagination, brought only upon the stage for the sake of hypothesis, or to solve some phenomenon real or imaginary, authors take the liberty of modifying it as they please. Some suppose it of an elementary nature, like other bodies, and only distinguished by its tenuity, and the other affections consequent thereon; which is the philosophical æther. Others will have it of another species, and not elementary, but rather a sort of fifth element, of a purer, more refined, and spiritous nature, than the substances about our earth, and void of the common affections thereof, as gravity, &c. The heavenly spaces being the supposed region or residence of a more exalted class of beings, the medium must be more exalted in proportion. Such is the ancient and popular idea of æther, or æthereal matter.

The term *æther* being thus embarrassed with a variety of ideas, and arbitrarily applied to so many different things, the later and severer philosophers choose to set it aside, and in lieu thereof substitute other more determinate ones. Thus, the Cartesians use the term *materia subtilis*, which is their æther: and Sir Isaac Newton, sometimes a *subtile spirit*, as in the close of his *Principia;* and sometimes a *subtile* or *æthereal medium*, as in his *Optics*.

Heat, Sir Isaac Newton observes, is communicated through a vacuum almost as readily as through air; but such communication cannot be without some interjacent body, to act as a medium. And such body may be subtile enough to penetrate the pores of glass, and may permeate those of all other bodies, and consequently be diffused through all the parts of space.

The existence of such an æthereal medium being settled, that author proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elastic and active; in virtue of which properties he shows, that a great part of the phenomena of nature may be produced by it. To the weight, *e. g.* of this medium, he attributes gravitation, or the weight of all other bodies; and to its elasticity, the elastic force of the air and of nervous fibres, and the

Æther || Ætites.

emission, refraction, reflection, and other phenomena of light; as also sensation, muscular motion, &c. In fine, this same matter seems the *primum mobile*, the first source or spring of physical action in the modern system.

The Cartesian æther is supposed not only to prevade, but adequately to fill, all the vacuities of bodies; and thus to make an absolute plenum in the universe.

But Sir Isaac Newton shows that the celestial spaces are void of all sensible resistance; and hence it follows, that the matter contained therein must be immensely rare, in regard the resistance of bodies is chiefly as their density; so that if the heavens were thus adequately filled with a medium or matter, how subtile soever, they would resist the motion of the planets and comets much more than quicksilver or gold. But it has been supposed that what Newton has said of æther is to be considered only as a conjecture, and especially as no new proofs of its existence have been adduced since his time.

Æther, a term applied to several particular fluids. See Chemistry.

ÆTHEREAL, (*æthereus*) something that belongs to, or partakes of, the nature of Æther. Thus we say, *the æthereal space, æthereal regions*, &c. Some of the ancients divided the universe, with respect to the matter contained therein, into elementary and æthereal. Under the æthereal world was included all that space above the uppermost element, viz. fire. This they supposed to be perfectly homogeneous, incorruptible, unchangeable, &c. The Chaldees placed an æthereal world between the empyreum and the region of the fixed stars. Besides which, they sometimes also speak of a second æthereal world, meaning by it the starry orb; and a third æthereal world, by which is meant the planetary region.

ÆTHIOPIA. See Ethiopia.

AETIANS, in *Church History*, a branch of Arians, who maintained that the Son and Holy Ghost are in all things dissimilar to the Father. See Aetius.

ÆTIOLOGY is that part of pathology which is employed in exploring the causes of diseases.

AETION, a celebrated painter, who left an excellent picture of Roxana and Alexander, which he exhibited at the Olympic games. It represented a magnificent chamber, where Roxana is sitting on a bed of a most splendid appearance, which is rendered still more brilliant by her beauty. She looks downwards in a kind of confusion, being struck with the presence of Alexander standing before her. A number of little Cupids flutter about, some holding up the curtain, as if to show Roxana to the prince, whilst others are busied in undressing the lady; some pull Alexander by the cloak, who appears like a young bashful bridegroom, and present him to his mistress. He lays his crown at her feet, being accompanied by Hephæstion who holds a torch in his hand, and leans upon a youth, who represents Hymen. Several other little Cupids are represented playing with his arms: some carry his lance, stooping under so heavy a weight; others bear along his buckler, upon which one of them is seated, whom the rest carry in triumph; another lies in ambush in his armour, waiting to frighten the rest as they pass by. This picture gained Aetion so much reputation, that the president of the games gave him his daughter in marriage.—*Lucian.*

ÆTITES, or Eagle-stone, in *Natural History*, a flinty or crustated stone, hollow inside, and containing a *nucleus*, which, on shaking, rattles within. It was formerly in repute for several extraordinary magical as well as medical powers; such as preventing abortion, discovering thieves, and other ridiculous properties. The word is formed from αετος, eagle, the popular tradition being, that it is found in the eagle's nest, whither it is supposed to be carried while the female sits, to prevent her eggs from becoming rotten. It is found in various places. Near Trevoux, in France, one can scarcely dig a few feet without finding considerable strata or beds of the coarser or ferruginous kind. They are originally soft, and of the colour of yellow ochre. But the finest and most valued of all the eagle-stones are accidental states of one or other of our common pebbles.

Aetius || Ætna.

AETIUS, one of the most zealous defenders of Arianism, was born at Antioch in Cœle-Syria, and flourished about the year 336. Being left fatherless, and in poverty, he became a slave, and was afterwards a goldsmith, and also practised physic. After being servant to a grammarian, of whom he learned grammar and logic, he was ordained deacon at Antioch, and at length bishop, by Eudoxius, patriarch of Constantinople. Aetius was banished into Pisidia on account of his religious opinions; but was recalled from exile on the accession of Julian, and was much esteemed by that emperor. He died, it is supposed, at Constantinople, about the year 366. St Epiphanius has noticed 70 of his propositions against the Trinity. His followers were called Aetians.

Aetius, a famous physician, born at Amida in Mesopotamia, and the author of a work entitled *Tetrabiblos*, which is a collection from the writings of those physicians who went before him. He lived, according to Dr Freind, in the end of the fifth or the beginning of the sixth century.

Aetius, governor of Gallia Narbonensis in the reign of Valentinian III., forced the Franks who were passing into Gaul to repass the Rhine. He defeated the Goths, and routed Attila, king of the Huns, who invaded Gaul with an army of 700,000 men. But the emperor, jealous of the merit of this great man, killed him in 454, with his own hand, under the pretence that he had permitted the invasion of the Huns, after Attila's defeat.

ÆTNA, (in the Itineraries *Æthana*, supposed from αιθω, *to burn;* according to Bochart, from *athuna*, a furnace, or *ætuna*, darkness), now *Monte Gibello;* a volcano or burning mountain of Sicily, situated in Long. 15. E. Lat. 38. N.

This mountain, famous from the remotest antiquity, both for its bulk and terrible eruptions, stands in the eastern part of the island, in a very extensive plain, called *Val di Demona*, from the notion of its being inhabited by devils, who torment the spirits of the damned in the bowels of this volcano.

Magnitude and height of the mountain.

The base of Ætna is well defined by the sea, and by the rivers Giaretta and Alcantara; and is about eighty-seven miles in circumference, with its greatest diameter extending from east to west. The following measurements, taken by Captain Smyth, we have adopted as the most accurate hitherto published:

| | |
|---|---|
| The Summit | 10874 feet. |
| Foot of the Cone | 9760 |
| The English House | 9592 |
| Philosopher's Tower | 9467 |
| Bishop's Snow Stoves | 7410 |
| Highest part of the Woody Region | 6279 |
| The Goats' Cavern | 5362 |
| Angelo the Herdsman's Cottage | 4205 |
| Nicolosi Convent | 2449 |
| Lingua-Grossa | 1725 |
| Caltabiano Station | 371 |
| Catania Station | 47 |

General appearance.

The products and general appearance of this volcano have been described by many travellers. The journey from Catania to its summit has been described by M. D'Orville, Mr Brydone, Sir William Hamilton, M. Houel, the abbé Spallanzani, Smyth, &c. They all agree that

Ætna.

this single mountain affords an epitome of the different climates throughout the whole world. Towards the foot it is extremely hot; farther up, more temperate; and grows gradually more and more cold the higher we ascend. At the very top it is perpetually covered with snow: from thence the whole island is supplied with that article, so necessary in a hot climate, and without which, the natives say, Sicily could not be inhabited. So great is the demand for this commodity, that the bishop's revenues, which are considerable, arise from the sale of Mount Ætna's snow; and he is said to draw L.1000 a year from one small portion lying on the north side of the mountain. Great quantities of snow and ice are likewise exported to Malta and Italy, making a considerable branch of commerce. The snow of Ætna, says Captain Smyth, is not only consumed in vast quantities all over the island, but forms an extensive article of commerce with Malta and Italy, to which places it is sent in such profusion as to be sold from a penny to threepence the pound, a rate which renders it accessible to the lower orders.

Crater described.

In the middle of the snowy region stands the great *crater*, or mouth of Ætna. Sir William Hamilton describes the crater as a little mountain, about a quarter of a mile perpendicular, and very steep, situated in the middle of a gently inclining plain, of about nine miles in circumference. It is entirely formed of stones and ashes; and, as he was informed by several people of Catania, had been thrown up about 25 or 30 years before the time (1769) he visited Mount Ætna. Before this mountain was thrown up, there was only a prodigiously large chasm or gulf in the middle of the above-mentioned plain; and it has been remarked, that about once in 100 years the top of Ætna falls in; which undoubtedly must be the case at certain periods, otherwise the mountain would continually increase in height. As this little mountain, though emitting smoke from every pore, appeared solid and firm, Sir William Hamilton and his companions went up to the very top. In the middle is a hollow, about two miles and a half in circumference, according to Sir William Hamilton; three miles and a half, according to Mr Brydone; and three or four, according to M. D'Orville. The inside is crusted over with salts and sulphur of different colours. It goes shelving down from the top, like an inverted cone; the depth, in Sir William Hamilton's opinion, nearly corresponding to the height of the little mountain. From many places of this space issue volumes of sulphurous smoke, which being much heavier than the circumambient air, instead of ascending in it, roll down the side of the mountain, till, coming to a more dense atmosphere, it shoots off horizontally, and forms a large track in the air, according to the direction of the wind; which, happily for our travellers, carried it exactly to the side opposite to that on which they stood. In the middle of this funnel is the tremendous and unfathomable gulf, so much celebrated in all ages, both as the terror of this life and the place of punishment in the next. From this gulf continually issue terrible and confused noises, which in eruptions are increased to such a degree as to be heard at a prodigious distance. Its diameter is probably very different at different times; for Sir William Hamilton observed, by the wind clearing away the smoke from time to time, that the inverted hollow cone was contracted almost to a point; while M. D'Orville and Mr Brydone found the opening very large. Both Mr Brydone and Sir William Hamilton found the crater too hot to descend into it; but M. D'Orville was bolder; and accordingly, he and his fellow-traveller, fastened to ropes which two or three men held at a distance for fear of accidents, descended as near as possible to the brink of the gulf; but the small flames and smoke which issued from it on every side, and a greenish sulphur, and pumice stones, quite black, which covered the margin, would not permit them to come so near as to have a full view. They only saw distinctly, in the middle, a mass of matter which rose in the shape of a cone, to the height of above 60 feet, and which towards the base, as far as their sight could reach, might be 600 or 800 feet. While they were observing this substance, some motion was perceived on the north side, opposite to that whereon they stood; and immediately the mountain began to send forth smoke and ashes. This eruption was preceded by a sensible increase of its internal roarings; which, however, did not continue, but, after a moment's dilatation, as if to give it vent, the volcano resumed its former tranquillity; but as it was by no means proper to make a long stay in such a place, our travellers immediately returned to their attendants.

View from the summit.

The top of Ætna being above the common region of vapours, the heavens appear with exceeding great splendour. Mr Brydone and his company observed, as they ascended in the night, that the number of stars seemed to be indefinitely increased, and the light of each of them appeared brighter than usual; the whiteness of the milky way was like a pure flame which shot across the heavens; and with the naked eye they could observe clusters of stars that were invisible from below. Had Jupiter been visible, he is of opinion that some of his satellites might have been discovered with the naked eye, or at least with a very small pocket-glass. He likewise took notice of several of those meteors called *falling stars*, which appeared as much elevated as when viewed from the plain; a proof, according to Mr Brydone, that "these bodies move in regions much beyond the bounds that some philosophers have assigned to our atmosphere."

To have a full and clear prospect from the summit of Mount Ætna, it is necessary to be there before sunrise, as the vapours raised by the sun in the daytime will obscure every object. Accordingly, our travellers took care to arrive there early enough; and all agree, that the beauty of the prospect from thence cannot be described. Here Mr Brydone and Sir William Hamilton had a view of Calabria in Italy, with the sea beyond it; the Lipari islands, and Stromboli, a volcano at about 70 miles distance, appeared just under their feet: the whole island of Sicily, with its rivers, towns, harbours, &c. appeared distinct, as if seen on a map. Massa, a Sicilian author, affirms, that the African coast, as well as that of Naples, with many of its islands, has been discovered from the top of Ætna. The visible horizon here is no less than 800 or 900 miles in diameter. The pyramidal shadow of the mountain reaches across the whole island, and far into the sea on the other side, forming a visible track in the air, which, as the sun rises above the horizon, is shortened, and at last confined to the neighbourhood of Ætna. The most beautiful part of the scene, however, in Mr Brydone's opinion, is the mountain itself, the island of Sicily, and the numerous islands lying round it. These last seem to be close to the skirts of Ætna, the distances appearing reduced to nothing.

M. Houel gives the following description of the view he enjoyed from the summit of the mountain. Here, being sheltered from the wind, and the day advancing, they began to enjoy the glorious prospect, which every moment became more extensive. At the rising of the sun, the horizon was serene, without a single cloud. "The coast of Calabria," says our author, "was as yet undistinguishable from the adjoining sea; but in a short time a fiery radiance began to appear from behind the Italian hills which bounded the eastern part of the prospect.

Ætna.

The fleecy clouds, which generally appear early in the morning, were tinged with purple; the atmosphere became strongly illuminated, and, reflecting the rays of the rising sun, appeared filled with a bright effulgence of flame. The immense elevation of the summit of Ætna made it catch the first rays of the sun's light, whose vast splendour, while it dazzled the eyes, diffused a most cherishing and enlivening heat, reviving the spirits, and diffusing a pleasant sensation throughout the soul. But though the heavens were thus enlightened, the sea still retained its dark azure, and the fields and forests did not yet reflect the rays of the sun. The gradual rising of this luminary, however, soon diffused his light over the hills which lie below the peak of Ætna. This last stood like an island in the midst of the ocean, with luminous points every moment multiplying around, and spreading over a wider extent with the greatest rapidity. It was as if the universe had been observed suddenly springing from the night of non-existence. The tall forests, the lofty hills, and extensive plains of Ætna, now presented themselves to view. Its base, the vast tracts of level ground which lie adjacent, the cities of Sicily, its parched shores, with the dashing waves and vast expanse of the ocean, gradually presented themselves; while some fleeting vapours, which moved swiftly before the wind, sometimes veiled part of this vast and magnificent prospect." In a short time every thing was displayed so distinctly that they could plainly recognise all those places with which they were before acquainted. On the south were seen the hills of Camerata and Trapani; on the north, the mounts Pelegrino and Thermini, with the celebrated Enna once crowned with the temples of Ceres and Proserpine. Among these mountains were seen a great many rivers running down, and appearing like as many lines of glittering silver winding through a variety of rich and fertile fields, washing the walls of 28 cities, while their banks were otherwise filled with villages, hamlets, &c. rising among the ruins of the most illustrious republics of antiquity. On the south and north were observed the rivers which bound by their course the vast base of Mount Ætna, and afford a delightful prospect to the eye; while at a much greater distance were seen the isles of Lipari, Alicudi, Felicocide, Parinacia, and Stromboli.

Regions.

This mountain is divided into three parts or zones, which are distinguished by the names of the *Regione Culta*, the fertile or cultivated region; the *Regione Sylvosa*, the woody or temperate region; and the *Regione Deserta*, the frigid or desert zone or region. All these are plainly distinguished from the summit.

Regione Deserta.

The desert region is a dreary waste of black lava, scoria, and ashes, in the centre of which, in a desolate plain, rises the cone, to the height of eleven hundred feet. Immediately under the cone is an edifice, erected at the expense of the British officers who during the late war were stationed in Sicily, containing rooms and stabling; a great convenience to those travellers who resort to it in the proper season, but during the greater part of the year a single snow storm is sufficient to overwhelm it. Not far from this house are the vestiges of a brick building, called the *Philosopher's Tower*, from the supposition of its having been the dwelling of Empedocles. M. Houel, however, says, "it seems not to be very ancient, neither the materials of which it consists, nor the mode of architecture, bearing any resemblance to those of the Greeks or Romans."

Regione Sylvosa.

Immediately below the desert region is the woody region, which is an extensive forest of about six or seven miles in length, encircling the mountain, and affording pasturage to the numerous flocks and herds that are fed there. The woods are irregularly distributed, according to the ravages of the lava, and the senseless destruction of them by the natives. The neighbourhood of Maletto is richly clothed with fine oaks, pines, and poplars; above Nicolosi and Milo are produced stunted oaks, with fir, beech, cork, hawthorn, and bramble; and in the districts of Mascali and Piraino there are groves of cork, and luxuriant chesnut trees. The vicinity of Bronte abounds with pines of great magnitude; but the Carpinetto boasts that father of the forest, the venerable *Castagno di cento cavalli*, or chesnut of the hundred horses, supposed to be one of the oldest known trees, and, as far as is known, the largest tree in Europe. Some travellers describe it as a single tree; others, and with more plausibility, as produced by the inosculation of several young chesnut trees. It appears to consist of five large and two smaller trees. The largest trunk Captain Smyth found to measure 38 feet in circumference, and the circuit of the whole five, measured just above the ground, is 163 feet. It still bears rich foliage, and much small fruit, though the heart of the trunk is decayed, and a public road leads through them. Besides this, there is abundance of other trees in the neighbourhood, very remarkable for their size. One is mentioned as being upwards of 70 feet in circumference. Many parts of this region are remarkably picturesque, and even romantic; and its cool temperature is extremely grateful when contrasted with the heat of the lower region.

"These majestic forests of Ætna," says Houel, "afford a singular spectacle, and bear no resemblance to those of other countries. Their verdure is more lively, and the trees of which they consist are of a greater height. These advantages they owe to the soil whereon they grow; for the soil produced by volcanoes is particularly favourable to vegetation, and every species of plants grows here with great luxuriance. In several places, where we can view their interior parts, the most enchanting prospects are displayed. The hawthorn trees are of an immense size. Our author saw several of them of a regular form, and which he was almost tempted to take for large orange trees cut artificially into the figures they represented. The beeches appear like as many ramified pillars, and the tufted branches of the oak like close bushes impenetrable to the rays of the sun. The appearance of the woods in general is exceedingly picturesque, both by reason of the great number and variety of the trees, and the inequality of the ground, which makes them rise like the seats in an amphitheatre, one row above another; disposing them also in groups and glades, so that their appearance changes to the eye at every step; and this variety is augmented by accidental circumstances, as the situation of young trees among others venerable for their antiquity; the effects of storms, which have often overturned large trees, while stems shooting up from their roots, like the Lernæan hydra, show a number of heads newly sprung to make up that which was cut off."

Several extensive caverns occur in this region, among which, one is well known by the name of the *Goats' Cavern* or *Grotto*, because it is frequented by those animals, which take refuge there in bad weather. Formerly travellers on their ascent rested here, but since the erection of the more convenient shelter higher up the mountain, called the English House, it has been abandoned.

Regione Culta.

The fertile district or region comprises the delightful country round the skirts of the mountain, and is very unequal in its dimensions, being in many parts from six to nine miles broad, and above Catania nearly eleven; while on the northern side, where the woods encroach, it is little more than half a mile broad. The whole is more or less covered with towns, villages, and monasteries, and

Ætna.

is well peopled, notwithstanding the danger of such a situation. The soil is made up of decomposed lava and tuffa. It is easily worked and very productive, yielding the finest corn, oil, wine, fruit, and aromatic shrubs, in Sicily. The inhabitants, however, of many of these districts, as Smyth remarks, from the numerous minute particles of volcanic dust that fly about, severely injuring and disfiguring their eyes, and soiling their persons, their furniture, and their houses, have a squalid, slovenly, and dejected appearance. These circumstances, with the want of water, and the numerous and arid patches of lava amidst the surrounding vegetation, leave such a paradise little to be envied. In addition to these inconveniences, the constant danger of losing both landed and movable property by an eruption must be borne in mind; a disaster compared with which, earthquakes, hurricanes, plagues, and other visitations are light, as these may be counteracted in a few years, while the other destroys for ages. The terrible eruption of 1699 burst forth in this region.

In this region the river *Acis*, so much celebrated by the poets, in the fable of Acis and Galatea, takes its rise. It bursts out of the earth at once in a large stream, runs with great rapidity, and about a mile from the source throws itself into the sea.

Season for ascending the mountain.

The most desirable season, according to Smyth, for ascending the mountain, is during the full moons that occur between the middle of June and the first autumnal rains. The latter appear in the form of snow on the summit; and the peasants below attentively observe whether the east or west side is covered earliest, because in the former case they expect a wet season, and in the latter a dry one. After the equinox the weather again becomes settled, and the journey is practicable and easy until the middle of October. The ascent from Catania, through Nicolosi, to the English house, is effected on mules with the greatest ease, or even in a *Lettiga;* but from thence to the top of the cone the journey is very fatiguing. The obstacles are numerous: the surface, towards the summit, is frequently so hot as to make even resting inconvenient, and the materials, being only scoria, puzzolana, and triturated ashes, occasion the foot to sink and recede more or less at every step.

Geognostical structure.

This mighty mountain, which rises suddenly from the surrounding low country, is mostly composed of porphyritic lavas, which in every instance possess such characters as show that in all probability they have been ejected above the surface of the *waters*, and not under pressure. It rises out of a basaltic *crater of elevation*, hence its lower part is of a basaltic nature. The products of the eruptions of this mountain, in point of magnitude, form a striking contrast with those of Vesuvius; for even the greatest bodies of lava erupted from the Neapolitan mountain almost sink into insignificance when compared with those of Ætna, some of the streams or coulées of Ætna being four or five miles in breadth, 15 in length, and from 50 to 100 feet in thickness.

The elevation of Ætna, too, is so great that the lava frequently finds less resistance in piercing the flanks of the mountain than in rising to its summit; and has in this manner formed a number of minor cones, many of which possess their respective craters, and have given rise to considerable streams of lava. The most striking and original feature in the physiognomy of Ætna, says Dr Daubeny, is the zone of subordinate volcanic hills with which it is encompassed, and which look like a court of subaltern princes waiting upon their sovereign. Of these, some are covered with vegetation, others are bare and arid, their relative antiquity being probably denoted by the progress vegetation has made upon their surface; and the great difference which exists in this respect seems to indicate, that the mountain, to which they owe their origin, must have been in a state of activity, if not at a period antecedent to the commencement of the present order of things, at least at a distance of time exceedingly remote. It must be remarked, however, continues Daubeny, that the time which it takes to bring a volcanic mountain or stream of lava into cultivation is very variable;[1] and that the progress is generally more rapid in a cone composed of finely comminuted cinders, than in a stream of lava, which consists of a hard glossy substance, that yields but slowly to the causes of decomposition. There is nothing in the nature of lava, chemically considered, prejudicial to vegetation; but mechanically, the hard surface is inimical, as it gives no support to the tender shoots, and from its vesicularity often carries off all the moisture that falls on its surface. From these causes, the surface of a stream of lava must always require a long time to bring it into cultivation. This being the case, we naturally feel desirous of verifying an observation reported by Brydone, on the authority of the canon Recupero, which might render us doubtful as to the correctness of our received chronologies. This writer, says Dr Daubeny, after giving an instance of a lava, the date of which goes back to the time of the second Punic war, proceeds to state, that at Aci Reale we see seven such beds superimposed one on the other, each of which has its surface thoroughly decomposed and converted into rich vegetable mould. Now, if a single bed of lava has continued for more than 2000 years without experiencing any alteration, what a lapse of time must it have required to reduce seven successive beds of the same material into a state of such decomposition.

" Although I have no reason," says Dr Daubeny, " to doubt that Brydone received from Recupero the observa-

---

[1] " This will appear from the following statement of the condition of a few of the lavas of Vesuvius, which I examined with reference to this question in 1823:

Lava of 1551.—Fossa di Gaetano. Much decomposed; heaths grow upon it, and vines begin to be planted.

1737.—But little decomposed; moss alone grows on it.

1760.—Near the hill of the Camalduli. Still unfit for vegetation; surface, however, whitened and crumbly, owing to decomposition, which has proceeded farther than in that of 1737.

1771.—Colour grey; moss grows upon it, but no heath.

1785.—Fossa di Sventurato. Lava still quite hard and rough.

1794.—Fossa di Cucazzello. Surface much decomposed; moss grows upon it, and a few heaths, but no trees or shrubs. It is to be observed, that even the latter are met with on the surface of the crater from which this lava flowed, and which was formed by heaps of scoriæ ejected at the same time; a proof of what I have asserted in the text with respect to the more rapid decomposition of loose ashes than of a bed of lava.

1805.—Fossa del Noce. Colour very white; no moss appears to grow upon it; but, being covered with the loose scoriæ of later eruptions, it has trees growing upon it in a few parts.

1810.—Colour grey; surface rough, though somewhat decomposed; moss grows upon it, but no heaths or trees are seen, except in one part where it is covered with cinders.

1822.—Colour black; surface very rough and irregular; no moss as yet to be seen.

It will be seen that many of these lavas are in a more forward state than that of Ischia, which flowed in 1302, more than 200 years before." (Daubeny's *Volcanoes*, p. 204.)

Ætna.

tion on which he grounds his inferences, I think it most probable that the conclusion itself was his own, though he perhaps thought it would sound more *piquant* if put into the mouth of the *Canon*, whose scientific knowledge he seems willing to exalt at the expense of his orthodoxy. In reality, however, this good priest appears to have enjoyed in both respects a reputation which he very little deserved. The reports of Dolomieu and other really scientific travellers make him out to have been a man of but slender philosophical attainments, but as one who at least was free from all imputation of scepticism. It is curious, nevertheless, that another foreigner has stated, as an instance of the intolerant spirit prevailing in the country in which he lived, that the poor Abbé was thrown into prison for his religious opinions, although the truth appears to have been, that the reports circulated in his favour by Brydone, Borch, and others, induced the Neapolitan government to grant him a pension on the score of his scientific deserts. Indeed, the only annoyance, it is said, he ever experienced in consequence of his imagined discovery, was the being informed that certain foreigners, to whom he communicated his observation, not content with wresting it to a purpose of which he had never dreamt, had given him credit for the inferences which they had chosen to deduce from it themselves.

"The fact, nevertheless, reported by Brydone, obtained a currency proportionate to the popularity which his work enjoyed; and the heterodox conclusion excited at the time no slight degree of consternation among divines. It was generally combated, by remarking the great variableness as to the period which a bed of lava will take to undergo decomposition; and even Spallanzani, though he visited Sicily, seems to have contented himself with pointing out instances in which newer beds of lava have taken the start of older ones in their progress towards cultivation.

"I was therefore not a little surprised, when, on visiting the celebrated spot of the Abbé's observation, I found that the beds of vegetable mould, which proved, according to Brydone, the degree to which the decomposition of the lava had extended, were in reality nothing more nor less than beds of a ferruginous tuffa, formed probably at the very period of the flowing of the lava, and originating perhaps from a shower of ashes that immediately succeeded its eruption. It is true that the cliff, which exhibits a section of these lava beds with interposed tuffa, shows also the greater facility with which the latter has yielded to the action of the elements, as the bare and mural precipices presented by the lava are in contrast with the gentler slope of the beds of tuffa, which afford a soil sufficient for the hardy cactus, and in some places even for the vine. Still there is not the slightest evidence that the decomposition exists internally, or that it had taken place in any one instance before the superincumbent bed of lava was deposited.

"Even had the tuffa in question been in reality *vegetable mould*, the validity of Mr Brydone's conclusion might very easily be disputed, for I think it cannot be shown that any one of the beds, of which the cliff of Aci Reale exposes a section, are of postdiluvial origin. So abrupt and lofty a face of rock would hardly have been cut by processes now in operation, but may be attributed with more probability to the cause which last reduced our continents to their existing form.

"If we examine, too, the characters of these beds, we shall find them sufficiently distinguished by their greater compactness and stony aspect from modern lavas; whilst the general correspondence in mineralogical characters that exists between them all, affords a strong presumption of their having been produced about the same period.

"But it is useless to multiply proofs of the fallacy of Mr Brydone's statement; and the only circumstance that needs surprise us is, that thirty years should have elapsed without any traveller having visited the spot with the view of ascertaining the correctness of the observation.

"Should the high antiquity I have assigned to this volcano be questioned, I may remark, that there are valleys on the slope of the mountain which appeared to me too considerable to be the result of torrents, and that among the diluvial matter at its foot, I have found rolled masses of cellular as well as compact lava; the presence of the former seeming to prove that the volcano was in activity at some period intermediate between the general retreat of the ocean and the event which formed the valleys, and reduced the fragments of rock detached to the rounded condition in which we observe them." (Daubeny's *Volcanoes*, p. 206.)

We shall close this article with an enumeration of all the different eruptions from Mount Ætna which are found upon record.

List of eruptions.

1. The first is that of which Diodorus Siculus speaks, but without fixing the period at which it happened. That eruption, says he, obliged the Sicani, who then inhabited Sicily, to forsake the eastern and retire to the southern part of the island. A long time after that, the Sicilians, a people of Italy, migrated into Sicily, and took up their abode in that part of the island which had been left desert by the Sicani.

2. The second eruption known to have issued from this volcano is the first of the three mentioned by Thucydides; of none of which he fixes the date, mentioning only in general, that from the arrival of the first Greek colonies that settled in Sicily (which was in the 11th Olympiad, and corresponds to the 734th year before the Christian era), to the 88th Olympiad, or the year 425 before Christ, Ætna at three different times discharged torrents of fire. This second eruption happened, according to Eusebius, in the days of Phalaris, in the 565th year before the Christian era. The assertion of Eusebius is confirmed by a letter from that tyrant to the citizens of Catania, and by the answer of the Catanians (if, after Bentley's Dissertations against their authenticity, any credit be due to the Epistles of Phalaris). But Diodorus gives both these pieces.

3. The third, which is the second of the three mentioned by Thucydides, happened in the 65th Olympiad, in the 477th year before the Christian era, when Xantippus was archon at Athens. It was in this year that the Athenians gained their boasted victory over Xerxes's general Mardonius near Platæa. Both the eruption of the volcano and the victory of the Athenians are commemorated in an ancient inscription on a marble table, which still remains. An ancient medal exhibits a representation of an astonishing deed to which that eruption gave occasion. Two heroic youths boldly ventured into the midst of the flames to save their parents: their names, which well deserve to be transmitted to future ages, were Amphinomus and Anapius. The citizens of Catania rewarded so noble a deed with a temple and divine honours. Seneca, Silius Italicus, Valerius Maximus, and other ancient authors, mention the heroism of the youths with just applause.

4. The fourth eruption, the third and last of those mentioned by Thucydides, broke out in the 88th Olympiad, in the 425th year before the Christian era. It laid waste the territory of Catania.

5. The fifth is mentioned by Julius Obsequens and Orosius, who date it in the consulship of Sergius Fulvius Flaccus and Quintus Calpurnius Piso, nearly 133 years before the Christian era. It was considerable; but no peculiar facts are related concerning it.

Ætna.

6. In the consulship of Lucius Æmilius Lepidus and Lucius Aurelius Orestes, in the 125th year before the Christian era, Sicily suffered by a violent earthquake. Such a deluge of fire streamed from Ætna as to render the adjoining sea, into which it poured, absolutely hot. Orosius says, that a prodigious quantity of fishes were destroyed by it. Julius Obsequens relates, that the inhabitants of the Isles of Lipari ate such a number of those fishes as to suffer, in consequence of it, by a distemper which proved very generally mortal.

7. Four years after the last mentioned, the city of Catania was desolated by another eruption, not less violent. Orosius relates, that the roofs of the houses were broken down by the burning ashes which fell upon them. It was so dreadfully ravaged, that the Romans found it necessary to grant the inhabitants an exemption from all taxes for the space of ten years, to enable them to repair it.

8. A short time before the death of Cæsar, in the 43d year before Jesus Christ, there was an eruption from Mount Ætna. Livy mentions it. Rhegium suffered during this eruption. It was afterwards considered as an omen of the death of Cæsar.

9. Suetonius, in the life of Caligula, mentions an eruption from Mount Ætna which happened in the 40th year after the Christian era. The emperor fled on the very night on which it happened, from Messina, where he at that time happened to be.

10. Carrera relates, that in the year 253 there was an eruption from Mount Ætna.

11. He speaks of another in the year 420, which is also mentioned by Photius.

12. In the reign of Charlemagne, in the year 812, there was an eruption from Ætna. Charlemagne, who witnessed it, was much alarmed.

13. In the year 1169, on the 4th February, about daybreak, there was an earthquake in Sicily, which was felt as far as Reggio, on the opposite side of the strait. Catania was reduced by it to ruins; and in that city more than 15,000 souls perished. The bishop, with 44 monks of the order of St Benedict, was buried under the ruins of the roof of the church of St Agatha. Many castles in the territories of Catania and Syracuse were overturned; new rivers burst forth, and ancient rivers disappeared. The ridge of the mountain was observed to sink in on the side next Taormino. The spring of Arethusa, so famous for the purity and sweetness of its waters, then became muddy and brackish. The fountain of Ajo, which rises from the village of Saraceni, ceased to flow for two hours, at the end of which the water gushed out more copiously than before. Its waters assumed a blood colour, and retained it for about an hour. At Messina, the sea, without any considerable agitation, retired a good way beyond its ordinary limits; but soon after returning, it rose beyond them, advanced to the walls of the city, and entered the streets through the gates. A number of people who had fled to the shore for safety were swallowed up by the waves. Ludovico Aurelio relates, that the vines, corn, and trees of all sorts were burnt up, and the fields covered over with such a quantity of stones as rendered them unfit for cultivation. At this time a great part of Syria was wasted by an earthquake.

14. Twelve years after this, in the year 1181, a dreadful eruption issued from Ætna, on the east side. Streams of fire ran down the declivity of the mountain, and encircled the church of St Stephen, but without burning it.

Nicholas Speciale, who relates, though he did not see, this event, was witness to another conflagration on Ætna 48 years after this, in the year 1329, on the 23d of June, of which he has given a description.

15. On that day, says he, about the hour of vespers, Ætna was strongly convulsed, and uttered dreadful noises: not only the inhabitants of the mountain, but all Sicily, were struck with consternation and alarm. On a sudden, a terrible blaze of fire issued from the southern summit, and spread over the rocks of Mazzara, which are always covered with snow Together with the fire, there appeared a great deal of smoke. After sunset, the flames, and the stones that issued out with them, were seen to touch the clouds. The fire making way for itself with the most furious impetuosity, burnt up or reduced to ruins all those structures which the piety of former times had consecrated to the Deity. The earth yawning, swallowed up a great many springs and rivulets. Many of the rocks on the shore of Mascali were shaken and dashed into the sea. A succession of these calamities continued till the 15th of July, when the bowels of Ætna were again heard to rebellow. The conflagration of Mazzara still went on unextinguished. The earth opened near the church of St John, called *Il Paparinecca;* on the south side fire issued from the gap with great violence. To add to the horrors of the day, the sun was obscured from morning to evening with clouds of smoke and ashes, as entirely as in an eclipse. Nicholas Speciale went towards the new opened crater, to observe the fire and the burning stones which were issuing from the volcano. The earth rebellowed and tottered under his feet; and he saw red-hot stones issue four times successively in a very short space from the crater with a thundering noise, the like of which, he says, he had never before heard.

In a few days after this, all the adjacent fields were burnt up by a shower of fire and sulphurous ashes; and both birds and quadrupeds, being thus left destitute of food, died in great numbers. A great quantity of fishes likewise died in the rivers and the contiguous parts of the sea. "I cannot think," says he, "that either Babylon or Sodom was destroyed with such awful severity."—The north winds, which blew at the time, carried the ashes as far as Malta. Many persons of both sexes died of terror.

16. Scarcely had four years elapsed after this terrible event, when Ætna made a new explosion, and discharged volleys of stones, causing the neighbouring fields to tremble. This happened in the year 1333.

17. Forty-eight years after this, on the 25th of August 1381, an eruption from Ætna spread its ravages over the confines of the territory of Catania, and burnt up the olive yards in the neighbourhood of that city.

18. In the year 1444, 63 years after the last eruption, a torrent of lava issued from Ætna, and ran towards Catania. The mountain shook; and the shocks were so violent, that several huge masses of rock were broken from its summit, and hurled into the abyss with a tremendous noise.

19. After this Ætna was scarcely at rest for 18 months or two years. On Sunday the 25th of September 1446, about an hour after sunset, an eruption issued from the place called *La Pietra di Mazzara.* This eruption was soon over.

20. In the following year, 1447, on the 21st of September, there was another, with a good deal of fire; but this eruption was likewise of short duration.

21. Ætna now ceased to emit fire, and that for a considerable time. The neighbouring inhabitants not only ascended to the summit of the mountain, but even, if we may credit accounts, went down into the fiery gulf, and believed the volcanic matter to be now exhausted. But on the 25th of April 1536, near a century from the slight eruption in 1447, a strong wind arose from the west, and a thick cloud, reddish in the middle, appeared over the

summit of the mountain. At the very same instant a large body of fire issued from the abyss, and fell, with the noise and rapidity of a torrent, along the eastern side of the mountain, breaking down the rocks, and destroying the flocks and every other animal that was exposed to its fury. From the same crater, on the summit of the mountain, there issued at the same time a stream of fire more terrible than the other, and held its course towards the west. It ran over Bronte, Adrans, and Castelli. It consisted entirely of sulphur and bitumen. On the same day the church of St Leon, which stood in a wood, was first demolished by the shocks of the earthquake, and its ruins after that were consumed by the fire. Many chasms were opened in the sides of the mountain; and from these issued fire and burning stones, which darted up into the air with a noise like that produced by a smart discharge of artillery. Francis Negro de Piazza, a celebrated physician, who lived at Lentini, wishing to have a nearer view of the eruptions, and to make some observations which he thought might be of consequence, was carried off and burnt to ashes by a volley of the burning stones. This conflagration of Ætna lasted some weeks.

22. In less than a year, on the 17th of April 1537, the river Simeto swelled so amazingly as to overflow the adjacent plains, and carry off the country people, and their cattle and other animals. At the same time, the country around Paterno, the neighbouring castles, and more than 500 houses, were destroyed by the ravages of the river; and most of the wood was torn up by the roots by violent blasts of wind. These ravages of the elements were followed by Ætna, which on the 11th of the following month was rent in several places, disclosing fiery gulfs, and pouring out a deluge of fire in more terrible torrents than those of the preceding year. They directed their course towards the monastery of St Nicholas d'Arena; destroyed the gardens and vineyards; and proceeding onwards towards Nicolosi, burnt Montpellieri and Fallica, and destroyed the vineyards and most of the inhabitants. When the conflagration ceased, the summit of the mountain sunk inward with such a noise, that all the people in the island believed the last day arrived, and prepared for their end by extreme unction. These dreadful disturbances continued throughout the whole year, more especially in the months of July and August, during which all Sicily was in mourning. The smoke, the noise, and the shocks of the earthquake, affected the whole island; and if Filotes may be believed, who relates this event, many of the Sicilians were struck deaf by the noise. Many structures were demolished; and among others the castle of Corleone, though more than 25 leagues distant from the volcano.

23. During the succeeding 30 years there was no disturbance of this nature. At the end of that space, Sicily was alarmed by a new eruption from the mountain. Ætna discharged new streams of fire, and covered the adjacent country with volcanic ashes, which entirely ruined the hopes of the husbandman.

24. In the year 1579 Ætna renewed its ravages; but no particular account of the damage which it did upon this occasion has been transmitted to us.

25. Twenty-five years had elapsed, when Ætna, in the month of June 1603, flamed with new fury. Peter Carrera affirms that it continued to emit flames for the space of 33 years, till 1636, without interruption, but not always with the same violence. In 1607 the streams of lava which flowed from it destroyed the woods and vineyards on the west side of the mountain. In 1609 they turned their course towards Aderno, and destroyed a part of the forest Del Pino, and a part of the wood called *La Sciambrita*, with many vineyards in the district Costerna. These torrents of lava continued to flow for three months. In the year 1614 a new effort of the subterraneous fire opened another crater, from which fire was discharged on Randazzo, in the district called *Il Piro*. The fire continued to flame for 10 or 12 years longer.

26. The same Peter Carrera relates, that a dreadful conflagration happened in the year 1664, of which he himself was witness. It happened on the 13th of December, and lasted without interruption, but with different degrees of violence, till the end of May 1678. But in 1669 the inhabitants of Nicolosi were obliged to forsake their houses, which tumbled down soon after they left them. The crater on the summit of Ætna had not at this time a threatening aspect, and every thing there continued quiet till the 25th of March: but on the 8th of that month, an hour before night, the air was observed to become dark over the village La Pedara and all that neighbourhood; and the inhabitants of that country thought that an almost total eclipse was taking place. Soon after sunset, frequent shocks of earthquakes began to be felt: these were at first weak, but continued till day-break to become more and more terrible. Nicolosi was more affected than any other tract of country on that side of Ætna. About noon every house was thrown to the ground; and the inhabitants fled in consternation, invoking the protection of heaven. On the 10th of March a chasm several miles in length, and five or six feet wide, opened in the side of the mountain; from which, about two hours before day, there arose a bright light, and a very strong sulphurous exhalation was diffused through the atmosphere.

About 11 in the forenoon of the same day, after dreadful shocks of earthquake, a crater was opened in the hill called *Des Noisettes*, from which there issued huge volumes of smoke, not accompanied with fire, ashes, or stones, but with loud and frequent claps of thunder, displaying all the different phenomena with which thunder is at different times attended. And what was very remarkable, the chasm was formed on the south side, between the top and the bottom of the mountain. On the same day another chasm was formed two miles lower, from which issued a great deal of smoke, accompanied with a dreadful noise and earthquake. Towards the evening of the same day, four other chasms were opened towards the south, in the same direction, accompanied during their formation with the same phenomena, and extending all the way to the hill called *La Pusara*.

About twelve paces beyond that, another of the same kind was formed. On the succeeding night, a black smoke, involving a quantity of stones, issued from this last chasm: it discharged at the same time flakes of a dark-coloured spongy matter, which became hard after they fell. There issued from the same gulf a stream of lava, which held its course into a lake called *La Hardia*, six miles from Montpellieri, and on its way thither destroyed many dwelling-houses and other buildings in the neighbouring villages.

On the next day, March 12th, this stream of fire directed its course towards the tract of country called *Malpasso*, which is inhabited by 800 people: in the space of 20 hours it was entirely depopulated and laid waste. The lava then took a new direction, in which it destroyed some other villages.

The mount of Montpellieri was next destroyed, with all the inhabitants upon it.

On the 23d of the same month, the stream of fire was in some places two miles broad. It now attacked the large village of Mazzalucia; and on the same day a vast gulf was formed, from which were discharged sand or ashes, which produced a hill with two summits, two miles

Ætna. in circumference, and 150 paces high. It was observed to consist of yellow, white, black, grey, red, and green stones.

The new mount of Nicolosi continued to emit ashes for the space of three months; and the quantity discharged was so great as to cover all the adjoining tract of country for the space of 15 miles. Some of these ashes were conveyed by the winds as far as Messina and Calabria; and a north wind arising, covered all the southern country about Agosta, Lentini, and even beyond that, in the same manner.

While at that height on Nicolosi so many extraordinary appearances were passing, the highest crater on the summit of Ætna still preserved its usual tranquillity.

On the 25th of March, about one in the morning, the whole mountain, even to the most elevated peak, was agitated by a most violent earthquake. The highest crater of Ætna, which was one of the loftiest parts of the mountain, then sunk into the volcanic focus; and in the place which it had occupied, there now appeared nothing but a wide gulf more than a mile in extent, from which there issued enormous masses of smoke, ashes, and stones. At that period, according to the historian of this event, the famous block of lava on Mount Frumento was discharged from the volcanic focus.

In a short time after, the torrent of fire, which still continued to flow, directed its course towards Catania with redoubled noise, and accompanied with a much greater quantity of ashes and burning stones than before. For several months many most alarming shocks of earthquakes were felt, and the city was threatened with destruction by the torrent of fire. In vain they attempted to turn or divert its course: the lava rose over the walls, and entered by an angle near the Benedictine convent on the 11th of June following. This awful event is related by Francis Monaco, Charles Mancius, Vincent Auria, and Thomas Thedeschi.

A description of the lava issuing from Mount Ætna in 1669 was sent to the court of England by Lord Winchelsea, who at that time happened to be at Catania on his way home from an embassy to Constantinople. Sir W. Hamilton gives the following extract from it. "When it was night, I went upon two towers in divers places; and I could plainly see, at ten miles distance, as we judged, the fire begin to run from the mountain in a direct line, the flame to ascend as high and as big as one of the greatest steeples in your Majesty's kingdoms, and to throw up great stones into the air. I could discern the river of fire to descend the mountain, of a terrible fiery or red colour, and stones of a paler red to swim thereon, and to be some as big as an ordinary table. We could see this fire to move in several other places, and all the country covered with fire, ascending with great flames in many places, smoking like a violent furnace of iron melted, making a noise with the great pieces that fell, especially those that fell into the sea. A cavalier of Malta, who lives there, and attended me, told me, that the river was as liquid, where it issues out of the mountain, as water, and comes out like a torrent with great violence, and is five or six fathom deep, and as broad, and that no stones sink therein."

The account given in the Philosophical Transactions is to the same purpose. We are there told, that the lava is "nothing else than divers kinds of metals and minerals, rendered liquid by the fierceness of the fire in the bowels of the earth, boiling up and gushing forth as the water doth at the head of some great river; and having run in a full body for a stone's cast or more, began to crust or curdle, becoming, when cold, those hard porous stones which the people call *sciarri*. These, though cold in comparison of what first issues from the mountain, yet retained so much heat as to resemble huge cakes of sea-coal strongly ignited, and came tumbling over one another, bearing down or burning whatever was in their way. In this manner the lava proceeded slowly on till it came to the sea, when a most extraordinary conflict ensued betwixt the two adverse elements. The noise was vastly more dreadful than the loudest thunder, being heard through the whole country to an immense distance; the water seemed to retire and diminish before the lava, while clouds of vapour darkened the sun. The whole fish on the coast were destroyed, the colour of the sea itself was changed, and the transparency of its waters lost for many months."

While this lava was issuing in such prodigious quantity, the merchants, whose account is recorded in the Philosophical Transactions, attempted to go up to the mouth itself, but durst not come nearer than a furlong, lest they should have been overwhelmed by a vast pillar of ashes, which to their apprehension exceeded twice the bigness of St Paul's steeple in London, and went up into the air to a far greater height. At the mouth itself was a continual noise, like the beating of great waves of the sea against rocks, or like distant thunder, which was sometimes so violent as to be heard 60, or even 100 miles off; to which distance also part of the ashes was carried. Some time after, having gone up, they found the mouth from whence this terrible deluge issued to be only a hole about 10 feet diameter. This is also confirmed by Mr Brydone; and is probably the same through which Sir William Hamilton descended into the subterranean caverns already mentioned.

27. Some years after this conflagration, a new burning gulf opened, in the month of December 1682, on the summit of the mountain, and spread its lava over the hill of Mazzara.

28. On the 24th of May 1686, about ten in the evening, a new eruption burst out from the summit of the mountain, on the side contiguous to the hill Del Bue. Such a quantity of inflamed matter was thrown out as consumed woods, vineyards, and crops of grain, for four leagues round. It stopped its course in a large valley near the castle of Mascali. Several people from the neighbourhood had ascended a hill between the wood of Catania and the confines of Cirrita, to observe the progress of the lava; but the hill on a sudden sunk inwards, and they were buried alive.

29. Ætna was now long quiet; for no less a space of time indeed than one half of the present age. In the year 1755 its eruptions were renewed. During these eruptions, there issued from the mountain a great torrent of boiling-hot salt water.

Eruption of water in 1755.

This water took its course down the west side of the mountain; and the channel which it cut for itself is still visible. The eruption of water from burning mountains is still much less frequent than that of lava or half-vitrified solid matters, ashes, &c. though that of water, and even mixed with the shells of marine animals (though we are not told whether it was salt or not), has sometimes been observed in other volcanoes, particularly Vesuvius. The eruption we now speak of happened in the month of February 1755. It was preceded by an exceedingly thick black smoke issuing from the crater, intermixed with flashes of fire. This smoke gradually became thicker, and the bursts of flame more frequent. Earthquakes and subterraneous thunder convulsed the mountain, and struck the inhabitants of the adjacent parts with the utmost terror. On Sunday the 2d of March, the mountain was seen to emit a huge column of smoke, exceedingly dense and black, with a dreadful noise in the bowels of the earth, accompanied also with violent flashes of lightning. From

Ætna.

time to time there were loud cracks, like the explosions of cannon; the mountain appeared to shake from its foundations; the air on that side next Mascali became very dark, and loud peals of thunder were heard. These seemed to issue from two caverns, considerably below the summit, on the side of the mountain, and were accompanied with violent blasts of wind like a tempest.

These terrible phenomena continued and increased. Ætna seemed ready to swallow up at once all those materials which it had been for so many years disgorging, or rather about to sink at once into the bowels of the earth, from whence it appeared to have been elevated. The prospect was far beyond any idea that can be given by description of this tremendous scene. The inhabitants were alarmed beyond measure; the sight of the flames driven by the winds against the sides of the mountain, the shocks of the earthquake, and the fall of rocks, struck the imagination with a horror not to be conceived. During this dreadful commotion, an immense torrent of water was emitted from the highest crater of the mountain. The whole summit of Ætna was at that time covered with a thick coating of snow. Through this the boiling water directed its course eastward, and in its passage met with frightful precipices. Over these it dashed with the utmost violence, adding its tremendous roaring to the complicated horrors of this awful scene. The snow, melting instantaneously as the boiling torrent advanced, increased its destructive power by augmenting its quantity; while the mischievous effects of the heat were scarcely diminished, by reason of the immense quantity of boiling liquid which continued to pour from the summit of the mountain.

This boiling torrent having dashed its awful cataracts from one chain of rocks to another, at length reached the cultivated plains, which it overflowed for a number of miles. Here it divided itself into several branches, forming as many deep and rapid rivers, which, after several other subdivisions, discharged themselves into the sea.

Though the mountain continued to discharge water in this manner only for half an hour, the ravages of it were very terrible. Not only those of common inundations, such as tearing up trees, hurrying along rocks and large stones, took place here, but the still more dreadful effects of boiling water were felt. Every cultivated spot was laid waste, and every thing touched by it was destroyed. Even those who were placed beyond the reach of the torrent, beheld with inexpressible horror the destruction occasioned by it; and though the alarming noises which had so long issued from the mountain now ceased in a great measure, the shocks of earthquakes, and the violent smoke which continued to issue from the mountain, showed that the danger was not over. Two new openings were now observed, and two torrents of lava began to make their way through the snow.

On the 7th of March a dreadful noise was again heard in the bowels of the mountain, and a new column of very thick and black smoke began to issue from it. A horrid explosion of small stones succeeded, some of which were carried as far as the hills of Mascali, and great quantities of black sand to Messina, and even quite over the strait to Reggio in Calabria. On the shifting of the wind to the northward this sand reached as far as the plains of Agosta. Two days after, the mountain opened again, and a new torrent of lava was discharged; which, however, advanced very slowly towards the plain, moving only at the rate of a mile in a day. It continued to flow in this manner for six days, when every thing appeared so quiet that the canon Recupero set out to view the changes which had taken place.

That gentleman's design was to trace the course of the dreadful torrent of water above mentioned. This he was very easily enabled to do by the ravages it had made; and, by following the channel it had cut all the way from the sea to the summit of the volcano, he found that this immense quantity of water had issued from the very bowels of the mountain. After issuing from the crater, and increasing its stream by passing through and melting the snow which lay immediately below the summit, it destroyed in an instant a fine and extensive forest of fir-trees. All of these were torn up by the violence of the current, though many were no less than from 24 to 30 inches in diameter. He observed that the great stream had in its descent divided itself into four branches; and these had again subdivided themselves into several smaller ones, easily distinguishable by the quantity of sand they had deposited. Afterwards re-uniting their streams, they formed many islands, and rivers 900 feet in breadth, and of a depth which could not easily be determined. Proceeding farther down, and still forcing its way among the beds of old lava, the channel of the waters was widened to 1500 feet, until it was again contracted in the valleys as before. Every object which stood in the way of this tremendous torrent was moved from its place. Enormous rocks were not only hurried down, but several of them moved to more elevated situations than those they formerly occupied. Whole hills of lava had been removed and broken to pieces, and their fragments scattered along the course of the river; and the valleys were filled up by vast quantities of sand which the waters had deposited. Our author observed, that even at the time he visited the mountain, about ten years after the eruption, the whole side of it still bore the marks of this deluge.

Ætna.

Course of the current traced by Recupero.

30. In the year 1763 there was an eruption, which continued three months, but with intervals. Ætna was at first heard to rebellow. Flames and clouds of smoke were seen to issue out, sometimes silver-coloured, and at other times, when the rays of the sun fell upon them, of a purple radiance. At length they were carried off by the winds, and rained, as they were driven before them, a shower of fire all the way to Catania and beyond it. An eruption soon burst out: the principal torrent divided into two branches, one of which ran towards the east, and fell into a deep and extensive valley.

The flames which issued from this new crater afforded a noble spectacle. A pyramid of fire was seen to rise to a prodigious height in the air, like a beautiful artificial firework, with a constant and formidable battery, which shook the earth under those who were spectators of the scene. Torrents of melted matter, running down the sides of the mountain, diffused a light bright as day through the darkness of night.

At sunrising the burning lava was observed to have run round some oaks that were still standing unburnt. Their leaves were all withered. Some birds had fallen from their branches, and been burnt to death. Some people cast wood upon the lava, and it was immediately burnt. This lava continued hot, and exhaled smoke, for two years. For five years after this, no snow appeared on the summit of Ætna.

31. In the year 1764 a new crater was opened at a great distance from Mount Ætna.

32. In the year 1766 another was opened at the grotto of Paterno: fire, smoke, and an inconsiderable torrent of lava, issued out of it.

33. On the 27th of January 1780 a new opening was formed two miles under the last-mentioned crater. On the 28th of February and the 14th of March the earthquake was renewed on the north side, and accompanied with terrible noises.

Ætna.

Between the 6th of April and the 7th of May the convulsions were renewed, accompanied with noise as before. A quantity of pumice stones and fine sand was discharged from it.

On the 18th of May the shocks were renewed. On the 23d a new crater was formed on the side of Mount Frumento on the summit of Ætna, and from it a torrent of lava discharged, which spread through the valley of Laudunza. It was 200 paces in breadth. Two other chinks were opened in the mountain near Paterno, and very near one another. The lava issuing from them proceeded, in the space of seven days, six miles; on the 25th it had run nine miles.

A new crater was likewise opened on the 25th, from which a quantity of red-hot stones continued to issue for half an hour, and fell at a very great distance. There proceeded likewise from it a stream of lava, which in the same space of time ran over a tract of country two miles in extent.

Several parts of those streams of lava were observed to be cold on the surface, and formed into solid masses, but melted again by a new stream of burning lava, which, however, did not melt the old lava.

Account of the eruption in 1787.

34. In 1787 there was a great eruption. From the 1st to the 10th of July there were signs of its approach. On the 11th, after a little calm, there was a subterraneous noise, like the sound of a drum in a close place, and it was followed by a copious burst of black smoke. It was then calm till the 15th, when the same prognostics recurred. On the 17th the subterraneous noise was heard again: the smoke was more abundant, slight shocks of an earthquake followed, and the lava flowed from behind one of the two little mountains which form the double head of Ætna. On the 18th, while the spectators were in anxious expectation of a more severe eruption, all was quiet, and continued so for more than 12 hours. Soon after they perceived some new shocks, accompanied with much noise; and the mountain threw out a thick smoke, which, as the wind was westerly, soon darkened the eastern horizon. Two hours afterwards a shower of fine black brilliant sand descended: on the east side it was a storm of stones, and at the foot of the mountain a deluge of flashes of fire, of scoria and lava.

These appearances continued the whole day. At the setting of the sun the scene changed: a number of conical flames rose from the volcano; one on the north, another on the south, were very conspicuous, and rose and fell alternately. At three in the morning, the mountain appeared cleft, and the summit seemed a burning mass. The cones of light which arose from the crater were of an immense extent, particularly the two just mentioned. The two heads seemed to be cut away; and at their separation was a cone of flame, seemingly composed of many lesser cones. The flame seemed of the height of the mountain placed on the mountain, so that it was probably two miles high, on a base of a mile and a half in diameter. This cone was still covered with a very thick smoke, in which there appeared very brilliant flashes of lightning, a phenomenon which Ætna had not before afforded. At times, sounds like those from the explosion of a large cannon were heard, seemingly at a less distance than the mountain. From the cone, as from a fountain, a jet of many flaming volcanic matters was thrown, which were carried to the distance of six or seven miles. From the base of the cone a thick smoke arose at the time when the rivers of lava broke out, which for a moment obscured some parts of the flame. This beautiful appearance continued three quarters of an hour. It began the next night with more force, but continued only half an hour. In the intervals, however, Ætna continued to throw out flames, smoke, ignited stones, and showers of sand. From the 20th to the 22d, the appearances gradually ceased. The stream of lava was carried towards Bronte and the plain of Lago.

After the eruption, the top of the mountain on the western side was found covered with hardened lava, scoria, and stones. The travellers were annoyed by smoke, by showers of sand, mephitic vapours, and excessive heat. They saw that the lava which came from the western point divided into two branches, one of which was directed towards Libeccio, the other, as we have already said, towards the plain of Lago. The lava on the western head of the mountain had, from its various shapes, been evidently in a state of fusion; from one of the spiracula, the odour was strongly that of liver of sulphur. The thermometer, in descending, was at 40 degrees of Fahrenheit's scale; while near the lava, in the plain of Lago, it was 140 degrees. The lava extended two miles; its width was from $13\frac{3}{4}$ to 21 feet, and its depth $13\frac{3}{4}$ feet.

35. Eruptions in 1792. Eruptions of greater and less magnitude from May until the close of the year.

36. A small eruption in June 1798.

37. Smaller eruption in June 1799.

38. Eruption of lava and flood of water in February 1800.

39. Eruption in 1802.

40. Eruption 27th March 1809.

41. Eruption 28th October 1811.

42. Eruption 29th May 1819.

43. Eruption in November 1832.

44. Eruption in August 1852.

The eruption of August 1852 is the most violent which has occurred for a very long period. After some days of premonitory symptoms, such as the drying up of springs in the vicinity, *bramidas* or subterranean thunderings, three shocks of an earthquake, and a vast column of white smoke from the mountain that rose and spread out like a gigantic pine tree; on the night between the 20th and 21st of August, two new mouths opened on the east flank of Ætna, in the *Val de Leone*, and began to eject clouds of an ash-grey dust, that completely covered the adjacent country to a great extent, and was carried by the winds far to sea. Soon after a vast torrent of molten lava began to issue from those mouths, which were speedily converted into one by the force of the imprisoned lava; and vast masses of rock and scoriæ were projected to a great height into the air. The lava divided into two principal streams; the first flowing in the direction of Zaffarana, the second towards Giarra. This river of liquid fire was two miles wide at its greatest breadth, though where it issued from the mountain it was only about 60 feet wide; its thickness increasing from seven feet on the 21st., to 15 feet on the 22d, and to 170 feet on the 30th of August. Its progression was more than usually rapid where widest, being about 600 feet per hour; but when it descended the steeps of the mountain it was precipitated like a torrent, in cascades of fire. After the first week the violence of the eruption seemed to abate, until the 4th of September when it burst out with fresh fury, and the lava took the road to Milo. Eruptions, too, of dust and huge stones continued through October, but diminished in November; when the convulsion appeared to be subsiding. The country devastated was one of extraordinary fertility, and produced the finest wines of the island. But the labour of many years has been destroyed, and the peasantry about Zaffarana and in the commune of Giarra are utterly ruined, and the destruction of property of every kind has been immense. Persons whom curiosity led to behold the terrors of an eruption more nearly, describe the scene around the apertures from which the torrent issued as sublimely terrible.

"After scrambling with difficulty," says one observer, "to the summit of a hill composed of irregular blocks of lava, we beheld on our right, at the distance of a quarter of a mile, and towering far above us, an enormous hill of red hot rock and half molten lava, from which at our level issued liquid lava, which descended in a stream of about 60 feet wide into a chasm far below us, that presented the appearance of a lake of fire. Opposite to our station was a dark, frowning cliff, which sent forth clouds of lurid red smoke and steam, round which forked lightnings terrifically played. At intervals, vast masses of rocks, some the size of a small house, and intensely hot, were hurled high into the air, accompanied by *bramidas* and peals of thunder, amid clouds of steam and showers of volcanic dust. Another stream of lava glowed in a deep chasm on our left, and this aperture also projected stones with fearful violence. The thunder and lightning overhead, and the danger from those missiles rendering our station alarming, we soon retired farther from this terrific scene; which was rendered still more impressive by a storm of wind that obliged us to cling for security to adjacent rocks, or to throw ourselves to the ground." (R. J.)

ÆTNA, the name of an ancient town, built by Hiero, on the southern declivity of the mountain. Its more ancient name was Inessum, which was changed to Ætna when the Catanians took possession of it. In the the time of Cicero it was still a place of some importance. It is now Centorbi.

ÆTOLIA, a country of ancient Greece, bounded on the north by Epirus and Thessaly; on the east by the province of the Locri Ozolæ; on the south by the Gulf of Corinth; and separated on the west from Acarnania by the river Achelous. The part which lay westward of the river Evenus was called old Ætolia, and that lying to the east, new or acquired Ætolia.

The Ætolians were a restless and turbulent people, seldom at peace among themselves, and ever at war with their neighbours; utter strangers to all sense of friendship or principles of honour; ready to betray their friends upon the least prospect of reaping any advantage from their treachery: in short, they were looked upon by the other states of Greece no otherwise than as outlaws and public robbers. On the other hand, they were bold and enterprising in war; inured to labour and hardships; undaunted in the greatest dangers; jealous defenders of their liberties, for which they were on all occasions willing to venture their lives, and sacrifice all that was most dear to them. They distinguished themselves above all the other nations of Greece in opposing the ambitious designs of the Macedonian princes, who, after having reduced most of the other states, were forced to grant them a peace upon very honourable terms. The constitution of the Ætolian republic was copied from that of the Achæans, and with a view to form, as it were, a counter-alliance; for the Ætolians bore an irreconcilable hatred to the Achæans, and had conceived no small jealousy at the growing power of that state. The Cleomenic war, and that of the allies, called the *social war*, were kindled by the Ætolians in the heart of Peloponnesus, with no other view than to humble their antagonists the Achæans. In the latter they held out, with the assistance only of the Eleans and Lacedemonians, for the space of three years, against the united forces of Achaia and Macedon; but were obliged at last to purchase a peace, by yielding up to Philip all Acarnania. As they parted with this province much against their will, they watched all opportunities of wresting it again out of the Macedonian's hand; for which reason they entered into an alliance with Rome against him, and proved of great service to the Romans in their war with him; but growing insolent on account of their services, they made war upon the Romans themselves. By that warlike nation they were overcome, and granted a peace on the following severe terms:—

1. The majesty of the Roman people shall be revered in all Ætolia. 2. Ætolia shall not suffer the armies of such as are at war with Rome to pass through her territories, and the enemies of Rome shall be likewise the enemies of Ætolia. 3. She shall, in the space of 100 days, put into the hands of the magistrates of Corcyra all the prisoners and deserters she has, whether of the Romans or their allies, except such as have been taken twice, or during her alliance with Rome. 4. The Ætolians shall pay down in ready money, to the Roman general in Ætolia, 200 Euboic talents, of the same value as the Athenian talents, and engage to pay 50 talents more within the six years following. 5. They shall put into the hands of the consul 40 such hostages as he shall choose, none of whom shall be under 12, or above 40 years of age: the prætor, the general of the horse, and such as have been already hostages at Rome, are excepted out of this number. 6. Ætolia shall renounce all pretensions to the cities and territories which the Romans have conquered, though these cities and territories had formerly belonged to the Ætolians. 7. The city of Oenis and its district shall be subject to the Acarnanians.

After the conquest of Macedon by Æmilius Paullus, they were reduced to a much worse condition; for not only those among them who had openly declared for Perseus, but such as were only suspected to have favoured him in their hearts, were sent to Rome, in order to clear themselves before the senate. There they were detained, and never afterwards suffered to return into their native country. Five hundred and fifty of the chief men of the nation were barbarously assassinated by the partisans of Rome, for no other crime than that of being suspected to wish well to Perseus. The Ætolians appeared before Æmilius Paullus in mourning habits, and made loud complaints of such inhuman treatment, but could obtain no redress; nay, ten commissioners, who had been sent by the senate to settle the affairs of Greece, enacted a decree, declaring that those who were killed had suffered justly, since it appeared to them that they had favoured the Macedonian party. From this time those only were raised to the chief honours and employments in the Ætolian republic who were known to prefer the interest of Rome to that of their country; and as these alone were countenanced at Rome, all the magistrates of Ætolia were the creatures and mere tools of the Roman senate. In this state of servile subjection they continued till the destruction of Corinth and the dissolution of the Achæan league, when Ætolia, with the other free states of Greece, was reduced to a Roman province, commonly called the *province of Achaia.* Nevertheless, each state and city was governed by its own laws, under the superintendency of the prætor whom Rome sent annually into Achaia. The whole nation paid a certain tribute, and the rich were forbidden to possess lands anywhere but in their own country.

In this state, with little alteration, Ætolia continued under the emperors till the reign of Constantine the Great, who, in his new partition of the provinces of the empire, divided the western parts of Greece from the rest, calling them *New Epirus*, and subjecting the whole country to the *præfectus prætorii* for Illyricum. Under the successors of Constantine Greece was parcelled out into several principalities, especially after the taking of Constantinople by the western princes. At that time Theodorus Angelus, a noble Grecian of the imperial family, seized on Ætolia and Epirus. The former he left to Michael his son, who maintained it against Michael Palæologus, the first emperor of the Greeks, after the expulsion of the Latins. Charles, the last prince of this family, dying in 1430 without lawful issue, bequeathed Ætolia to his brother's son, named also *Charles;* and Acarnania to his natural sons Memnon, Turnus, and Hercules. But great disputes arising about this division, Amurath II., after the reduction of Thessalonica, laid hold of so favourable an opportunity, and drove them all out in 1432. The Mahometans were afterwards dispossessed of this country by the famous prince of Epirus, George Castriot, commonly called *Scanderbeg*, who with a small army opposed the whole power of the Ottoman empire, and defeated these barbarians in 22 pitched battles. That hero at his death left great part of Ætolia to the Venetians; but they not being able to make head against such a mighty power, the whole country was soon reduced by Mahommed II. It is now included in the kingdom of Hellas.

AFER, Domitius, a famous orator, born at Nismes, flourished under Tiberius, and the three succeeding emperors. Quintilian makes frequent mention of him, and commends his pleadings. But he disgraced his talents, by turning informer against some of the most distinguished personages in Rome. Quintilian, in his youth, cultivated the friendship of Domitius very assiduously. He tells us that his pleadings abounded with pleasant stories, and that there were public collections of his witty sayings, some of which he quotes. He also mentions two books of his *On Witnesses.* Domitius was once in great danger from an inscription he put upon a statue erected by him in honour of Caligula, wherein he declared that this prince was a second time consul at the age of 27. This he intended as an encomium; but Caligula taking it as a sarcasm upon his youth and his infringement of the laws, raised a process against him, and pleaded himself in person. Domitius, instead of making a defence, repeated part of the emperor's speech with the highest marks of admiration; after which he fell upon his knees, and begging pardon, declared that he dreaded more the eloquence of Caligula than his imperial power. This piece of flattery succeeded so well, that the emperor not only pardoned, but also raised him to the consulship. Afer died in the reign of Nero, A.D. 60.

AFFA, a weight used on the Gold Coast of Guinea, equal to an ounce: the half of it is called *eggeba.* Most of the blacks on the Gold Coast give these names to these weights.

AFFECTION, in a general sense, implies an attribute inseparable from its subject. Thus magnitude, figure, weight, &c. are affections of all bodies; and love, fear, hatred, &c. are affections of the mind.

Affection is a term used by various writers on *Moral Philosophy* to denote all those active principles whose direct and ultimate object is the communication either of enjoyment or of suffering to any one of our fellow-creatures. —Stewart's *Philosophy of the Active Powers*, vol. i. p. 75.

Affection, among *Physicians*, is the same as disease. Thus, hysteric *affection* is the same as hysteric disease.

AFFERERS, or Afferors, in *Law*, persons appointed in courts-leet, courts-baron, &c. to settle, upon oath, the fines to be imposed upon those who have been guilty of faults arbitrarily punishable.

AFFETTUOSO, or *Con Affetto*, in the Italian music, intimates that the part to which it is added ought to be played in a tender, moving way, and consequently rather slow than fast.

AFFIANCE, in *Law*, denotes the mutual plighting of troth between a man and woman to marry each other.

AFFIDAVIT means a solemn assurance of a matter of fact known to the person who states it, and attested as his statement by some person in authority. It is generally applied to a statement so certified by a justice of peace or other magistrate. Affidavits are sometimes necessary as certificates that certain formalities have been duly and legally performed. They are extensively used in the practice of bankruptcy, and in the administration of the revenue. Recently they were invariably taken on oath, but this practice has been much narrowed. Quakers, Moravians, and Separatists, are privileged in all cases to make a solemn declaration or affirmation. An act of 1835 (5th and 6th Will. IV. c. 62) authorised the lords of the treasury to substitute declarations for oaths in transactions connected with the different departments in the revenue and public offices. The same Act prohibited justices of peace from administering oaths in any matter in which they had not jurisdiction as judges, except when an oath was specially authorised by statute, as in the bankrupt law, and excepting criminal inquiries, parliamentary proceedings, and instances where oaths are required to give validity to documents abroad. But justices are permitted to take affidavits in any matter by declaration, and a person taking a false affidavit is liable to punishment.

AFFILIATION. See Bastard.

AFFINITY, in *Law*, as distinguished from consanguinity, is applied to the relation which each party to a marriage, the husband and the wife, bears to the kindred of the other. The marriage by making them one person is presumed to have given them the same kindred. Thus the wife's sister is the husband's sister, and the husband's brother is the wife's brother in affinity. But the relation is only with the married parties themselves, and does not bring those in affinity with them in affinity with each other: so a wife's sister has no affinity to her husband's brother. The subject is chiefly important from the matrimonial prohibitions which the canon law has applied to relations by affinity. Taking the table of degrees within which marriage is prohibited on account of consanguinity, the rule has been thus extended to affinity, and it has been maintained that wherever relationship to a man himself would be a bar to marriage, relationship to his deceased wife will be the same bar, and *vice versa* on the husband's decease. This rule has been founded on scriptural interpretations, chiefly of the eighteenth chapter of Leviticus, which have been subject to much discussion. Formerly by law in England, marriages within the degrees of affinity were not absolutely null, but they were liable to be annulled by ecclesiastical process during the lives of both parties. By an act passed in 1835 (5th and 6th Will. IV., c. 54), all marriages of this kind not disputed before the passing of the Act are declared absolutely valid, while all subsequent to it are declared null. This renders null in England a marriage with a deceased wife's sister or niece. The Act does not extend to Scotland, and it is a matter of doubt whether marriages within the degrees of affinity corresponding to the prohibited degrees of consanguinity are there null.

Affinity is also used to denote conformity or agreement. Thus we say, the *affinity* of languages, the *affinity* of words, the *affinity* of sounds, &c.

Affinity, in *Chemistry*, a term employed to express that peculiar propensity which the particles of matter have to unite and combine with each other exclusively, or in preference to any other connection.—The attractions between bodies at insensible distances, and which of course are confined to the particles of matter, have been distinguished by the name of *affinity;* while the term *attraction* has been more commonly confined to cases of sensible distance.

AFFIRMATION, in *Logic*, a positive judgment, implying the union or junction of the two terms of a proposition.

Affirmation used to be applied to the privilege enjoyed by Quakers of making an affirmation or declaration where other persons required to make oath in civil matters. The form now more commonly called declaration has been extended to criminal inquiries, and the privilege of taking it combines Moravians and Separatists. In other instances, affirmations or declarations have been substituted for oaths. See Affidavit.

Affirmation is also used for the ratifying or confirming of the sentence or decree of some inferior court. Thus we

Affirmative || Afghanistan.

say, the house of lords affirmed the decree of the chancellor, or the decree of the lords of session.

AFFIRMATIVE, in *Grammar*. Authors distinguish affirmative particles, such as *yes*. The term *affirmative* is sometimes also used substantively. Thus we say, the affirmative is the more probable side of the question: there were so many votes, or voices, for the affirmative.

AFFIX, in *Grammar*, a particle added at the close of a word, either to diversify its form or alter its signification. We meet with *affixes* in the Saxon, the German, and other northern languages, but more especially in the Hebrew, and other oriental tongues. The Hebrew *affixes* are single syllables, frequently single letters, subjoined to nouns and verbs, and contribute not a little to the brevity of that language. The oriental languages are much the same as to the *radicals*, and differ chiefly from each other as to *affixes* and *prefixes*.

AFFLATUS literally denotes a blast of wind, breath, or vapour, striking with force against another body. The word is Latin, formed from *ad*, to, and *flare*, to blow. Naturalists sometimes speak of the afflatus of serpents. Cicero uses the word figuratively, for a divine inspiration; in which sense he ascribes all great and eminent accomplishments to a divine afflatus. The Pythian priestess being placed on a tripod or perforated stool, over a holy cave, received the divine afflatus, as a late author expresses it, in her belly; and being thus inspired, fell into agitations, like a phrenetic; during which she pronounced, in hollow groans and broken sentences, the will of the Deity. This afflatus is supposed by some to have been a subterraneous fume or exhalation, wherewith the priestess was literally inspired. Accordingly, it had the effects of a real physical disease, the paroxysm of which was so vehement that, as Plutarch observes, it sometimes proved mortal. Van Dale supposes the pretended enthusiasm of the Pythia to have arisen from the fumes of aromatics.

Afforesting || Afghanistan.

AFFORESTING, AFFORESTATIO, the turning of ground into forest. The Conqueror and his successors continued afforesting the lands of the subject for many reigns, till the grievance became so notorious, that the people of all degrees and denominations were brought to sue for relief; which was at length obtained, and commissions were granted to survey and perambulate the forest, and separate all the new-afforested lands, and reconvert them to the uses of their proprietors, under the name and quality of *purlieu* or *pouralle land*.

AFFRAY, or AFFRAYMENT, in *Law*, formerly signified the crime of affrighting other persons, by appearing in unusual armour, brandishing a weapon, &c.; but at present *affray* denotes a skirmish or fight between two or more.

AFFRONTEE, in *Heraldry*, an appellation given to animals facing one another on an escutcheon; a kind of bearing which is otherwise called *confrontée*, and stands opposed to *adossée*.

AFFUSION, the act of pouring some fluid substance on another body. Dr Grew gives several experiments of the luctation arising from the affusion of divers menstruums on all sorts of bodies. Divines and church historians speak of baptism by affusion, which amounts to much the same with what we now call *sprinkling*.

# AFGHANISTAN,

An extensive and powerful kingdom of Asia, which formed at one time a considerable portion of the Mogul empire. On the decline of that power, it rose to the rank of an independent state; and from its population and extent, and still more from the character of the people, who are brave, hardy, and enterprising, as well as from its commanding position in the heart of Asia, it soon acquired political importance, and has since acted a principal part in all the revolutions which have occurred either in Hindostan or in Persia.

It is only of late years that Europeans have obtained any authentic account of this interesting country. In 1783, Mr Foster, in the course of an overland journey from India, in which he was exposed to the greatest danger from the predatory habits and religious prejudices of the people, succeeded in penetrating into those mountainous regions. He visited the cities of Cabul and Candahar, respecting which his information is equally curious and instructive. A more complete and satisfactory account of Afghanistan is derived from the work of Mr Elphinstone, by whom it was visited in 1808. It was supposed that about this time the French were meditating an invasion of British India; and Afghanistan being in a manner one of the outworks of Hindostan through which an invading army must make its approaches on the north, it was judged necessary to apprize the sovereign of his danger, in order to secure his co-operation against the common enemy. With this view, a mission was sent to him by the British government, at the head of which was Mr Elphinstone, who, with the other members of the embassy, determined, with a laudable and enlightened zeal, to profit by so favourable an opportunity for collecting information. More recent travellers have contributed largely to the stock of materials previously existing, and by the aid of their interesting works, satisfactory and ample details may now be furnished respecting the geography and productions of the country, the manners of the people, and their condition, character, and habits.

Boundaries.

The boundaries of Afghanistan have fluctuated with the vicissitudes of war from the middle of the tenth century, when the Turkish slave, Alptegin, first founded the dynasty of Ghuzni, to the date of the recent invasion of the country by the British. At the latter period the kingdom consisted of four subdivisions, Cabul, the Huzareh country, Candahar, and Herat. Taken in this extent, Afghanistan is bounded on the north by Bokhara, Kunduz, and Kaferistan; on the east by the British province of Peshawur and the Soliman range of mountains; on the south by Beloochistan, and on the west by Persia. Its greatest length from north to south is about 600 miles; its breadth measures about the same distance. The Afghans have no general name for their country but that of Afghanistan, which, Mr Elphinstone thinks, was probably first employed in Persia. It is frequently used in books, and is not unknown to the inhabitants. It is sometimes known under the appellation of the kingdom of Cabul.

Aspect of the country, mountains, and rivers.

Afghanistan to the west of the Soliman Mountains, which form its eastern barrier, may be described generally as a table-land, lying higher than most of the neighbouring countries. The Hindoo Khosh Mountains, its north-eastern bulwark, overlook the low country of Balk, the ancient Bactria, formerly a province of Persia. On the east it is equally elevated above the lower plains of the Indus. On the south it overlooks Seweestan; and on the south-west a deep valley runs between it and Beloochistan. It slopes gradually to the west, and loses the appearance of elevation as it approaches the Paropamisan Mountains. The mountainous chain of Hindoo Khosh is a continuation of the great Himalaya ridge, which it rivals in grandeur and elevation. From the elevated plains of Afghanistan these mountains are seen on the north in four distinct ranges. The first and lowest had

Afghanistan.

no snow in February, when it was observed by Mr Elphinstone from the plain of Peshawur; but the tops of the second still had their winter covering, and the third had snow half-way down. The fourth and highest range is covered with snow at all seasons. It is of great elevation, some of its peaks rising, according to measurement, to the height of 20,493 feet, and is conspicuous from Bactria, from the borders of India, and from places in Tartary at the amazing distance of 250 miles. "The stupendous heights of these mountains," says Elphinstone, "the magnificence and variety of their lofty summits, the various nations by whom they are seen, and who seem to be brought together by this common object, and the awful and undisturbed solitude which reigns amid their eternal snows, fill the mind with an admiration and astonishment which no language can express." The inferior ranges of the Hindoo Khosh Mountains decrease in height according to their distance from the principal chain. The title of table-land, which has been applied to Afghanistan, if it be understood to imply anything more than that it is raised above the level of the surrounding regions, will convey a very inaccurate idea of the nature of the country, which, so far from being a plain, is of the most diversified surface, being intersected everywhere with chains of mountains, which diverge in various directions from the main ridge of Hindoo Khosh. We will not enter into any detailed description of this complicated mass of mountains, which, however accurate, would fail to present any very clear view of the topography of the country. It may be generally stated, that the ridges branch off southward, not exactly at right angles from the main ridge, but in irregular lines, to the distance of 60 or 70 miles, when they decline to a lower level; and that those ridges are separated by intervening valleys, each of which is watered by a river flowing down the southern declivity of the Hindoo Khosh Mountains into the Cabul, which, after an easterly course along the base of the mountains of about 350 miles, joins the great Indus. These valleys or glens all open from the south into the great valley of Cabul; and the country is described as being fertile, and of a pleasing appearance. On the lower hills by which the valleys are closed in, the snow generally lies for four months in the year; there are few trees on the tops, but their sides are covered with forests of pine, oak, and wild olive. Lower down, the country improves, and is interspersed with many little valleys, watered by clear and beautiful streams, and enjoying a delicious climate, under which European fruits and flowers grow wild in the utmost variety and perfection; and even the rocks add to the beauty of the scenery, from the rich verdure of mosses with which they are covered. The narrow and alluvial plain at the bottom, through which the river runs, is in general highly productive. The valleys yield two harvests, and produce most sorts of grain; and on the plains are numerous mulberry trees and planes, besides other fruit-trees improved by culture.

An immense curve or angle projects southward from the mountain barrier to the north eastern frontier of the country, when the snowy mountain abruptly descends into the low and hot plain of Jellalabad. The range then resumes its westerly course, when lower hills assume their former appearance and character, and form the Cohistan or high lands of Cabul, a country watered by the river of this name and its tributary streams, and described as fruitful and of a delightful aspect. Thirty miles south of Jellalabad the aspect of the country is varied by the range of the Soliman Mountains, which, commencing with Suffaid Coh, or the White Mountain, so called from the snow with which it is covered at all seasons, extend south-south-west almost parallel to the course of the Indus. These mountains decline towards the west by lower ridges, which run nearly in the same direction as the main ridge; while other ridges branch off eastward toward the Indus. The height of these mountains is greatly inferior to that of the Hindoo Khosh; but it is still great, as they are covered with snow to the end of spring, which, in the latitude of 31 degrees, gives a considerable altitude. Beyond the Soliman ridges on the west, the country consists for the most part of high and bleak downs, interspersed with moderate hills; in some places desert and ill cultivated, bare and open, better fitted for pasturage than for the plough, and inhabited by migratory tribes of shepherds. There are exceptions, however, to this general description. In the country which is watered by the Helmund and its tributary streams are found many fertile and delightful spots, which afford pleasant retreats to the shepherds, and pasturage to their flocks. The country round Candahar is fertile and highly cultivated; but to the south and especially as it recedes west from the Helmund, it is a complete desert.

Afghanistan has few large rivers for a country of such extent, and so interspersed with mountains; and of these there is not one which is not fordable throughout its course for the greater part of the year. They partake generally of the character of mountain torrents, swelling rapidly, and running off; or they are sometimes all drained away for the irrigation of the fields. All the rivers of this country which take their rise in the Hindoo Khosh Mountains are feeders of the Cabul, which drains the waters falling on the southern declivity of that range, and conveys them to the Indus. The most important tributary of the Cabul is the Kooner. Lower down the country is traversed in an easterly direction by the Koorum, a tributary of the Indus; and the only river south of this which runs into the Indus is the Gomul, which, however, unless when swollen by the rains, never reaches its destination, being generally consumed in the irrigation of the country. The greatest of the rivers which run through the rest of Afghanistan is the Helmund. This river is the drain of that extensive slope which lies between the Soliman and the Paropamisan Mountains. It has its rise in the latter, and running a south-west course of 550 miles, terminates in the Lake Hamoon. The Urghundaub rises 130 miles north-east of Candahar, and after passing within a few miles of that city, joins the Helmund. It is never more than 150 yards broad. The Kashrood, after a course of 150 miles, falls into the Lake Hamoon; as does also the Farrahrood, after a course of about 60 miles. The Turnuk is a tributary of the Urghundaub, which it joins about 25 miles south-west of Candahar. It is a rapid torrent and receives the Doree and other smaller rivers. Nothwithstanding these additions, its stream rather decreases, being consumed in the irrigation of the country, or in the parched and barren sands through which it passes. The Lora, which rises in the south of Afghanistan, has a western course of 80 miles, when it disappears in the sands of the desert.

Climate.

The climate of Afghanistan is extremely various, owing to the height and inequality of its surface. According to its latitude, which is between the 28th and 37th degrees, it should have a decidedly hot temperature; but the general law of climate is here modified by the elevation of the ground, and great diversities of heat and cold are accordingly experienced within a very limited space. The mountainous nature of the country also occasions peculiarities in its climate, and distinguishes it in some degree from that of the adjacent regions. In almost all the countries of Asia within the same latitude as Afghanistan, one important circumstance in their climate is the season and quantity of the periodical rains. Throughout the greater part of India the rainy season is ushered in by the south-west monsoon, which drives the rolling clouds from the ocean on the land, where they descend in rains. The monsoon is earlier in the south of India, and in the vicinity of the ocean, than in the north, and

Afghanistan.

the rains are heavier. In many cases the opposition of mountains in the interior either arrests entirely the progress of the clouds, or it varies their direction; and hence large tracts of country are exempted from, or only partially experience, the influence of the monsoons. Before they make their way from the Indian Ocean to Afghanistan, these periodical tempests are greatly moderated, having to traverse the whole extent of Bengal in their progress to the Himalaya Mountains, when they are forced by this impassable barrier out of their original course towards the north-west by the range of Hindoo Khosh; and it is from that quarter that such parts of Afghanistan as are exposed to the monsoon receive the periodical rains. But the clouds are exhausted as they pass on westward to this country, the rains gradually become less heavy, and are at last merely sufficient to water the mountains, without much affecting the plains below. In some of the valleys to the south, the monsoon appears only in some clouds and showers: it is still less felt in the valley of the Cabul river, the passing clouds being opposed by the southern projection of the Hindoo Khosh Mountains and the Soliman range. Besides the partial influence of the south-west monsoons to which the north-eastern provinces of Afghanistan are exposed, it has the winter and the spring rains, which are of great consequence to agriculture in all those countries between the Indus and the Hellespont which are not subjected to the full effect of the south-west monsoon.

The temperature of Afghanistan varies of course with the difference of level, and also from local causes. It is affected by the direction of the prevailing winds, some blowing over snowy mountains, others being heated in summer and rendered cold in winter by their passage over deserts and arid tracts of great extent. The heat of summer is refreshed in some places by the breezes from moister countries, and others are so environed with hills as to be sheltered from all winds. Thus, throughout this extensive country, great diversity of temperature takes place often within very short distances. In the Hindoo Khosh Mountains perpetual winter reigns, and among the lower ranges snow frequently lies for four months in the year. In the plain of Peshawur, which is within view of these snowy summits, the thermometer in summer rises as high as in the hottest parts of India. It is mentioned by Mr Elphinstone, that in a tent artificially cooled, the thermometer stood for several days of summer at 112° and 113° in the shade. But the heat is not so uniform, nor does it last so long, as that of an Indian summer. At intervals in June and July cold north-west winds set in, which refresh the air, and render it pleasant. The last half of September is so cold as to be counted among the winter months, and the cold continues to increase till February. But the winter is not severe; and though there is frost in the night, it is always dispelled during the day by the influence of the sun. The temperature of the different valleys depending in this manner on their respective levels, they frequently exhibit the most remarkable contrasts of heat and cold. The plain of Jellalabad during summer is intolerably hot, while to the south, and immediately above it, the mountain of Suffaid Coh lifts its snowy summit to the clouds. To the north the nearest hills are cold; and in the distance the Hindoo Khosh Mountains are seen skirting the horizon with a bright outline of perpetual snow, while the table-land of Cabul, immediately to the west, enjoys the coolness and verdure of a temperate summer. Among the Soliman Mountains, the higher countries are exposed to severe cold; but there are some of the lower valleys on the western plains where the heat predominates, and they are accordingly deserted in the summer by the wandering shepherds, for the cool retreat and grassy valleys of the mountains. At Candahar the heat of summer is excessive, and is occasionally aggravated by the simoom winds. In proceeding north-east, however, from Candahar, along the course of the Helmund and its tributary streams, we reach elevated ground, where the cold is excessive, and where winter is experienced in all its severity. If we ascend the course of the Turnuk, and thence proceed onward to Ghuzni, we find the snow lying deep for some time after the equinox, and so thick a covering of ice on the rivers as to afford a passage for camels. At Cabul the winter is more steady and severe than in England, while the summer heat is greater. The great difference between the seasons, and the quickness with which they change, are marked by the changes which take place in the dress of the inhabitants. In winter they wear woollen garments, and in some places clothes of felt, and over these a large great-coat of well-tanned sheep-skin with the long shaggy wool inside. With the vernal equinox the snow disappears, the country is covered with young grass, the buds burst forth, and are soon followed by a profusion of flowers; and the inhabitants change their winter dress for a thin one of chintz or cotton, and frequently sleep at night under trees in the open air. The prevailing winds throughout Afghanistan are from the west, and they are generally cold; while the easterly wind is hot, and brings clouds. On the whole, the climate of this extensive country seems little subject to rains, clouds, or fogs; and judging from the size and strength of the inhabitants, it must be considered salubrious. Some fatal diseases are, however, common; such as fevers and agues, which prevail in autumn and in spring; and the small-pox still carries off many persons, though the practice of inoculation has long been introduced.

Animals.

Afghanistan abounds in wild animals, which find ample range in the extensive forests and large tracts of unfrequented deserts which it contains. The lion, however, though so common in Persia, and though it has been lately found in such numbers in Guzerat, and in the Hurriana, north-west of Delhi, is rare. In the hilly country around Cabul there is a small animal which bears the name without any of the qualities of the lion. Tigers and leopards are to be found in most of the woody tracts of the country. Wolves, hyenas, jackals, foxes, hares, porcupines, and hedgehogs, are to be seen everywhere. The wolves are formidable during the winter in the cold parts, where they assemble in troops, destroying cattle, and frequently attacking men. The hyenas sometimes attack a bullock singly, and, as well as the wolves, they make great havock among the sheep. Bears of two kinds, the one the black bear of India, and the other of a dirty white, are quite common in all the woody mountains; but they rarely leave their haunts, except when they are tempted by the sugar-cane. There are also ichneumons, ferrets, and wild dogs. Monkeys are common in the north-eastern parts. The wild boars of Persia and India are seldom seen; and the wild ass is confined to the south-western districts, on the lower Helmund, and to the sandy country round Candahar. The mountains abound with many kinds of deer, including the elk; but the antelope is rare, and confined to the plains. A species of deer is seen, which is remarkable for the size of its horns, and the strong but not disagreeable smell of its body. The chiefs are in possession of a few elephants; but neither that animal nor the rhinoceros is to be found wild in any part of the country.

Among the domestic animals is the horse, a considerable number of which are bred in the Afghan dominions; and those bred near Herat are very fine, uniting the figure of the Arab horse with superior size. In general, however, the breed of Afghan horses is not good. There is a very strong and useful breed of ponies. On the other hand, the mules and asses are the most wretched that can be conceived. The camel is the animal most employed in carrying burdens.

Afghanistan.

The dromedary, the tall long-legged animal common in India, is found all over the plains. The Bactrian camel, with two distinct humps, which is lower than the other by one-third, but stout, and covered with shaggy black hair, is much more rare, and is brought from the country beyond the Jaxartes. Buffaloes are to be found in many parts; and oxen are universally employed in the plough, and sometimes camels. They are not reared in the country, but are imported from the Rajpoot States, where they are the best in India. The sheep forms the principal stock of the pastoral tribes: it is remarkable for a tail about a foot in breadth, and consisting almost entirely of fat; in other respects it resembles the English sheep. The goat abounds in all the mountains, and is not scarce in the plains. Some of the breeds have remarkably long and curiously twisted horns. The pastoral tribes in the country, who are extremely fond of hunting, breed great numbers of excellent greyhounds, and even pointers, resembling those in England both in shape and quality. There is a breed of long-haired cats in great esteem, and of which great numbers are exported.

Of the birds, there are three sorts of eagles, and many kinds of hawks; namely, the gentle falcon, a large grey short-winged bird; the gos-hawk; the shauheen, which soars over the falconer's head, and strikes the quarry as it rises; and the chirk, which is trained to strike the antelope, and, by fastening on its head, to retard its flight till the greyhounds come up. The other birds are, herons, cranes, storks, wild ducks, geese, swans, partridges, quails, and a bird known in Europe under the name of the Greek partridge. There is another smaller bird resembling it, which is found nowhere except in Afghanistan. Pigeons, doves, crows, and sparrows, are common in all countries. Cuckoos, which are rare, and magpies, which are unknown in India, abound in the colder climate of those northern mountains; while peacocks, so commonly found wild in India, are here seen only in their domesticated state. Parrots make their appearance in the eastern provinces near the Indus.

The country is not infested with venomous reptiles. The snakes are mostly harmless. There are no crocodiles, but there are turtles, as well as tortoises. In Khorassan, great flights of locusts have sometimes occasioned famine by their devastations, though this rarely occurs. Musquitoes are less troublesome than in India, except in the southern district of Seestan, where they bite as severely as in Bengal.

In most parts of Afghanistan there are two harvests, one in spring and the other in autumn. The former is the more important. The produce of the first, which is sown in autumn and reaped in spring, is wheat, barley, peas, beans, and other grains; that of the second, sown in the end of spring and reaped in autumn, is rice, Indian corn, and various kinds of pulse. Cotton is confined to the hot climates, and sugar is cultivated in some of the rich plains. Tobacco is produced in most parts. There is another distinct harvest, which is counted of great importance, of musk-melons, water-melons, the scented melon, and various sorts of cucumbers, pumpkins, and gourds, which are grown in the open fields. All common garden-stuffs are abundant, such as carrots, turnips, beetroot, lettuce, onions, garlic, spinach, greens of all kinds, cabbages, cauliflowers, and many of the Indian vegetables. The castor oil plant is found everywhere. Madder abounds over all the western provinces, and the assafœtida plant in the hills. In the west, lucerne and a sort of trefoil are among the most important products of husbandry. Of the fruits and trees which abound in tropical countries, none are to be found; but almost all the European trees and fruits are indigenous in the congenial climate of those elevated regions. They are frequently found growing wild in different parts of the country, and are still more common in gardens and orchards. The most common trees in the mountains are pines, oaks, cedars, a sort of gigantic cypress, the walnut and the wild olive tree, the birch, the holly, and the hazel. In Hindoo Khosh the pistachio tree grows wild; and on the plains are the mulberry, the tamarisk, and the willow; also the plane and the poplar. English flowers, such as roses, jessamines, poppies, narcissuses, and hyacinths, are found in the gardens, and often in a wild state.

Vegetable products.

Minerals.

Of the minerals produced in the country little is known. Gold is said to be washed down the streams that flow from the Hindoo Khosh Mountains. Small quantities of silver are found in Kaferistan; also lead, copper, iron, and antimony, in different parts; sulphur and rock-salt in the salt range of mountains, and saltpetre everywhere in the soil.

Government.

The political institutions of the Afghans present the rude and disjointed materials of a free constitution. The form of the government is patriarchal. The nation is supposed to derive its origin from four tribes, which are divided and subdivided into inferior clans, until the last subdivision does not include more than a few families. The chief of a tribe is called Khan. The head of one of the inferior divisions owes his choice to the people. Each inferior division of the tribe has its respective head; and in cases of emergency these all meet together and form a general assembly, called a Jeerga, which, with the khan presiding over it, deliberates and decides in all matters of public importance. The heads of the inferior branches of the tribe hold similar assemblies, which decide on minor matters, and are guided by the same rules as the greater convention. When wars arise among the different tribes, it is the business of the assemblies to provide the means of carrying them on, to concert the plan of operations, or to settle the terms of peace. They have the power, along with the khan, to call out all the fighting men of the tribe, or they may levy taxes for any purpose of public utility. There is scarcely a petty community throughout the nation which does not make its own arrangements for the support of moollahs, an order of Mahometan priests, and for the maintenance and reception of strangers into the tribe, whom it is always reckoned a duty to treat with peculiar attention.

The Afghan nation consists in this manner of numerous rude democracies, which were subjected for many years to one paramount sovereign, who exercised a general superintendence over the whole kingdom, and could levy troops or money from each tribe for the common defence. But the authority of the sovereign was not equally respected by all the tribes. In the plains around the towns, throughout a considerable portion of the country, and in all the foreign provinces, he ruled with full power, and collected a revenue and maintained an army without the aid of the khans or the popular assemblies. He employed for this purpose officers of his own appointment, namely, a haukim, to collect the revenue and command the militia; a sirdar, who commanded the regular troops, and whose duty it was to enforce submission to the haukim, and to the cauzy, who presided over the administration of justice. The heads of tribes, and under them the heads of the divisions of tribes, acted in the revenue and police departments, under the haukim and the sirdar. Where the royal authority was strong, the khans had comparatively little influence; but, on the other hand, where weak, it was frequently resisted by the powerful influence of the khans, who form the aristocracy of the land, as their authority was also resisted by the inferior assemblies; and it sometimes happened that those assemblies differed with each other about the limits of their own powers; and hence the democratic tribes are often involved in dissension by this complicated collision of rival authorities. In the concerns of some of the tribes the king never interfered; he merely levied supplies of money for the public service, which, notwithstanding the presence of one of the royal sirdars, were

Afghanistan. frequently withheld or granted, according to the discretion of the khan: and in like manner the khan and the cauzy contended with more or less success, according to the state of the king's authority, for the exercise of the judicial power. Under Nadir Shah, and the earliest of the Douranee emperors, the kingdom of Afghanistan comprehended Cashmere, together with the whole extent of territory stretching westward of the Indus, and its tributaries, to the mountains; but during the distraction of the country, the Punjaub and Scinde, together with the other districts of this tract, aspired to independence, and the limits of Afghanistan, for several years past, have been contracted within the boundary of the Soliman range of mountains.

The government of the Afghans, though it contains in this manner the elements of freedom, fails entirely in the great end of securing to the community the blessings of good order and peace. The people are bold and independent, and spurn the restraints of law. Among such a variety of independent communities, imperfectly controlled by superior authority, wars arise, which are waged with great fierceness, and in which the tumultuary militia of the tribes frequently come to blows, and waste each other's territories. Private revenge, also, though prohibited by the laws, is sanctioned by manners; it is accordingly practised by all classes, and is accounted the unalienable right of every freeman. Hence family feuds arise, which are not only carried on with bitterness at the time, but being transmitted from generation to generation, produce a long-continued course of violence and bloodshed. Afghanistan, with its bold and turbulent aristocracy, and the rude independence of its people, presents a lively picture of the state of society in Europe under the feudal system, when every potent baron could defy the authority of the crown, and when, owing to the private feuds of the nobles, the whole country was frequently one general scene of rude commotion. But the liberty of the Afghans, notwithstanding all its disadvantages, is preferable to a state of despotism. The rude and stormy independence which they enjoy is calculated to give to the national character a manly and heroic cast, to inspire the Afghan with proud and elevated sentiments, and to raise him, in point of courage and intelligence, far above the wretched slaves of Asiatic despotism. The Afghan himself, far from desiring to exchange his disorderly independence for the peace of tyranny, glories in the freedom of his institutions; and it is well observed by Elphinstone, that a European visiting the country, however he might lament that the inhabitants were "trained by their unhappy situation to fraud and malice, to rapine, deceit, and revenge, could yet scarce fail to admire their martial and lofty spirit, their hospitality, and their bold and simple manners, equally removed from the suppleness of the citizen, and the awkward rusticity of the clown; and he would probably before long discover, among so many qualities that excited his disgust, the rudiments of many virtues."

The judicial institutions of the Afghans are rude and imperfect. There are no regular tribunals of justice, nor any organized systems of police. The popular assemblies of the tribes, composed of khans, mulliks, or elders, assisted by moollahs, and even by grave and experienced persons of inferior rank, discharge the functions of judges in criminal cases. Petty offences are settled by the elders of the village in which they occur; and in loosely governed tribes, every village or subdivision acts for itself. When the members are assembled, they hear the accuser's story; and after examining witnesses and other evidence, they proceed to give judgment. The right of private revenge, which is congenial to the habits of a barbarous nation, is but feebly restrained by the judicial tribunals. Among several tribes the adjustment of disputes is attempted by mediation and persuasion, to which the chief and the elders lend their influence. But if, notwithstanding this mediation, the aggressor refuses compensation, and the injured party to forgive, the latter is no longer restrained from pursuing his revenge. Among some tribes the obstinate party is compelled to yield obedience to the award of the court. The general law of the country is that of Mahomet; but there is the code of Pooshtoon-Wallee, or the peculiar usages of the Afghans, which has all the force of law. In towns justice is administered by the cauzy, who decides both in civil and in criminal cases, aided by the mooftees. There is an officer named Ameeni Mehkemeh, who takes charge of all deposits; and the Darogha of the Adawlut superintends the whole proceedings. There are also three officers who superintend the police of the towns. But in the judicial as well as the police departments the greatest abuses are said to prevail, and justice is frequently sold to the highest bidder.

Manners of the people. The Afghans are strict Mahometans, and the moollahs or priests have great influence over them. They are looked upon with extraordinary reverence. They frequently gratify their private enmities by raising a charge of heresy against obnoxious individuals, and exposing them to persecution. In the remote districts of the country an insult to any of those personages would of itself be sufficient to raise a tumult. Being intrusted with the education of youth, the practice of the law, and the administration of justice, and in possession of all the learning and science which are to be found in the country, they take the lead in popular assemblies, or in judicial proceedings, and are frequently of use in moderating the violence of an ignorant people. In some circumstances they are enabled, by their superior knowledge and habits of business, to exercise an almost unlimited influence over individuals, and even over bodies of men; to check and control the governors and other civil officers; and sometimes even to overawe and control the power of the khan himself. These priests are generally taught to read the Persian classics and the Arabic grammar, which they study diligently. They afterwards repair to Bokhara, or Peshawur, or some other seat of Mahometan learning, where they are initiated in logic, law, theology, and the system of physics known in the East, as well as in history, poetry, and medicine, which last is a favourite study. The moollahs are not so intolerant as Mahometans generally are; and the people, when they are not instigated by them, are still less disposed to religious persecution. The Hindoos in Afghanistan are allowed the free exercise of their religion, though they are prohibited from all religious processions or public exposure of their idols. But among so rude a people dissenters from the popular creed can have little security for their freedom; and among the Afghans, accordingly, there are not wanting some cruel examples of religious tyranny. Yet the Hindoos, though they are held to be impure, and though no strict man would consent to eat meat of their dressing, are employed in public situations of trust and emolument, and appear to enjoy as much security as the other inhabitants. All the Afghans are sent in their infancy to a moollah for education, by whom they are frequently taught nothing more than some prayers and passages of the Koran, and the ceremonies of their religion. A great portion of them remain consequently in a state of ignorance, and cannot read their own language. The rich maintain moollahs in their own houses, to teach their children, some of whom are taught to read the Persian classics and the Arabic. The Afghans have no literature of their own beyond a few patriotic songs or tales of love, of which passion they speak in the most romantic strain. The Mahometan religion exercises, as usual, its injurious influence on the character and condition of the women, who, especially among the higher classes, are shrouded in concealment. Polygamy is allowed, and any woman may be divorced at

Afghanistan.

the caprice of her husband. Among the lower classes the women are more freely exposed, and do all the drudgery of the house, being forced to bring in water, and, among the ruder tribes, to do the work of the men out of doors. Slavery is allowed, as in all Mahometan countries. The greater part of the slaves are born at home; but supplies are received of Abyssinians, and negroes from Arabia; and of Persians from the inhabitants of Beloochistan, who seize them in their forays. Kaufirs are purchased from their own nation, or carried off by some of their own border tribes. These last are generally women, who are in great request on account of their beauty.

The low state of knowledge among the Afghans is evinced by some of their favourite studies and amusements. They are greatly addicted to alchemy and to magic; they have implicit faith in ghosts, in dreams, in the arts of divination, the power of talismans, and in the possibility of controlling genii and demons. Grown up men play at marbles. Prisoners base, quoits, and a game like hunt the slipper, are also common; as are wrestling and other trials of strength and skill. Fighting quails, cocks, dogs, rams, and even camels, are much admired. Some of their sports are, however, more manly. The chase is the favourite amusement of all classes, for which the abundance of game in the country affords ample scope. Horse-racing is common. An amusement of the better classes is to tilt with their lances, or to shoot at a mark with carbines or matchlocks on horseback; or with guns or bows and arrows on foot. They also practise a complicated sort of dance, which gives them great delight.

The Afghan women are described as large compared with those of India, and very fair and handsome. The men are all of a robust make, and are generally lean, though bony and muscular; and with high noses, high cheek-bones, and long faces. Their hair is always coarse and strong, and they wear long and thick beards, which are generally black or brown, but rarely red. There is an expression of manliness and deliberation in their countenance, joined to an air of simplicity, not allied to weakness. The eastern Afghans have the natural features most strongly marked. Those of the western tribes are less distinct, and exhibit a greater variety of countenance, some of their features being the reverse of sharp, though their high cheek-bones never leave them. The western Afghans are larger and stouter than those of the east, some being of surprising strength and stature; but in general the Afghans are not so tall as the English. The eastern Afghans, owing to the heat of their climate, have generally dark complexions, approaching to that of the natives of Hindostan; while those of the west are olive, with a healthy colour and appearance. But among them, as among the eastern Afghans, are to be found men of swarthy complexions like the natives of India; and others, again, as fair as Europeans. In the east, however, it is more common for the complexion to have a swarthy tinge than in the west. But the two races, the eastern and the western, are distinguished by still more striking peculiarities in their manners than in their complexion. Having derived their civilisation from the Persians and Indians, they each retain the usages of the respective nations with whom they have been connected. The Persian dress, language, and manners, distinguish the western tribes; and from the supremacy which two of these, particularly that of Dooraunee, have at times maintained over the whole, they decidedly prevail in the nation, and are even recognised where the Indian customs are more in repute. The manners of the Afghans are frank and open; sometimes rustic, but seldom fierce or insolent, except among the eastern tribe of the Eusofzyes, who have naturally an arrogant carriage. In the towns they are more polished than in the country, and are accustomed to pay respect to their superiors. In all cases they show a great reverence for old age. They are altogether a superior people to the Hindostanees, being free from their puerility, and from the apathy which they display in all matters not bearing on their own interest; nor are they delighted with the baubles which form the most acceptable presents in India. The bulk of the people are rather remarkable for prudence, observation, and, though not very enlightened or enlarged in their views, for a rational spirit of inquiry. Though they have not the same regard to truth as the Europeans, they do not indulge in the practice of gratuitous falsehood, to which the natives of Hindostan and Persia are universally addicted. From the nature of their country, which admits of no travelling except on horseback, they are inured to cold and heat, and to the exertion of making long journeys, of climbing mountains, and of swimming across rapid torrents. Old men who seem hardly able to sit on horseback, will ride at a good pace up and down the steepest and roughest passes, or along the edge of precipices, where it is even dangerous to walk. They are hospitable to strangers under certain circumstances; but they are notorious freebooters, especially the mountain tribes, and plunder travellers without scruple.

The inhabitants of the towns differ in their origin and character from the cultivators and peasantry. The greater part of them in the western country consists of a race called Taujiks, originally descended from the Arabs and Persians; and in the east, of Hindikies, who are of Indian origin. No Afghan ever keeps a shop, or exercises any handicraft trade. Those employments are chiefly left to the classes mentioned above, and to the Persians, some of whom have acquired great wealth. The banking business is chiefly prosecuted by the Hindoos. They lend money at an enormous interest by negotiating bills of exchange; and they occasionally accommodate government with loans, for which they receive bills on the revenues of the provinces. Many of them are rich, and they conceal their wealth. Mr Elphinstone relates, that one of them, who gave him cash for bills on India, would only make his payments in the dead of night, when he dug up the money, and paid it with the utmost secrecy. There is a very strict police in the towns, which being exercised by the Mahometan priests, often affords pretexts for extortion. The food of the common people is leavened bread, rice, flesh, vegetables, sometimes cheese, and always dried curds, of which all classes are fond. Provisions are cheap, and there is a prodigious abundance of fruit.

Trade.

In an inland country such as Afghanistan, mountainous, destitute of navigable rivers or of proper roads, commerce is carried on entirely by beasts of burden. There are no wheeled carriages, and camels are the animals chiefly employed. The merchants travel at the rate of about 8 or 10 miles a day in large caravans, the roads often lying through close and craggy defiles, and narrow stony valleys, among bare mountains, or along the beds of torrents, or over waste plains, where there is neither water nor provisions. The principal trade is with India, Persia, and Chinese and Independent Tartary. The caravans which set out for Tartary consist of horses or ponies, which are alone able to traverse the mountainous roads that lie in one part over the snowy ridges of Hindoo Khosh. Cabul is the great mart of Independent Tartary, Candahar and Herat that of Persia. The trade carried on by sea comes to Kurrachee, and thence to Shikarpoor and Candahar. The exports to Hindostan, which form by far the most considerable trade carried on by the Afghans, consist of horses and ponies, which chiefly come from Balkh on the northern side of the Hindoo Khosh Mountains, and fruits. The imports are coarse cotton cloths, which are worn by all the common people of the country; muslins, silken cloth, brocade, indigo in great quantities, ivory, chalk, bamboos, wax, tin, sandal wood, sugar, musk, coral, drugs, and spices of all kinds. To Independent Tartary the exports are chiefly white cloth, shawls, Indian turbans, chintz, and indigo previously imported from India. The imports are horses, gold, and silver; the latter consisting of the gold coin of Bokhara, Dutch ducats, Venetian sequins, and ingots of silver from China; cochineal, cloth, British hardware, looking glasses, Russian leather from Bokhara, to which place they come from Russia; also a fine cloth made of camels' wool. The exports to Persia are shawls and shawl goods, indigo, carpets of Herat, chintz, Indian brocades, muslins, and other cotton cloths. The imports are raw silk, silken stuffs, a coloured cotton manufacture, and silken manufactures, which are used in large quantities by all ranks; embroidered satin, velvet, and Persian brocade, which are confined to the rich. Indian chintz, manufactured at Masulipatam on the Coromandel coast, comes by sea to Busheer in the Persian Gulf, and is thence brought by land to Afghanistan, where it is much used. The exports to Chinese Tartary are the same as to Bokhara. The imports are woollens, Chinese silk and satin, tea in small boxes of thin lead, china, porcelain, raw silk, cochineal, crystal, gold dust, and ingots of gold and silver with the Chinese stamp.

Agriculture.

There are five classes of cultivators in Afghanistan: 1. the proprietors, who cultivate their own lands; 2. tenants, who pay a rent in money, or in part of the produce; 3. buzgurs, who, like the metayers, are supplied with seed, cattle, the implements of husbandry, and furnish only their labour; 4. hired labourers; and, 5. villains, who are the property of the landlord. From the influence of various causes, landed property is more equally divided than in most countries. The Mahometan law, which divides the father's property equally among his children, soon breaks down the largest landed estates; and rendering the portions too small for the support of their proprietors, they are consequently sold to those who have acquired wealth in public employments, or by agriculture or commerce. Hence small proprietors, who cultivate their own lands either with the aid of their families or labourers, are numerous. The number of tenants is not great; and many of these sublet it to others, who let it to metayers. The common term of a lease is one or two years; the longest is for five. The rent varies from one-tenth to two-thirds of the produce, the latter being the rent of the fertile lands around Cabul. The value of land is from nine to twelve years' rent. Labourers in husbandry are paid by the season.

The Afghan nation is divided into a variety of clans, which we cannot even enumerate; nor does it appear to be necessary, since a mere list of names, even if it were given, would throw no light whatever on the peculiar character and manners of the different tribes. One important distinction, however, divides the community into two great classes; namely, the pastoral tribes, who live in tents, and who migrate with the seasons in quest of subsistence for their flocks and herds; and those again who follow agriculture, and have fixed habitations. The country of Afghanistan which is near the hills consists of flat and low-lying plains, or of strongly-marked ranges of mountains. Western Afghanistan has an entirely opposite character, consisting of extensive and open plains, inhabited chiefly by pastoral tribes. These wandering hordes select the grassy valleys among the mountains for their summer habitation; but the approach of winter warns them to go in quest of more genial regions; and they accordingly migrate, some to the lower valleys at the foot of the Paropamisan Mountains, some to the low countries in the south, and others of the more purely pastoral tribes, wandering from the mountain valleys of Khorassan, along the course of the Gomul, and across the Soliman hills, fix their winter habitations in the plains of Damaun, along the western shores of the Indus. The Dooraunees form one of the greatest pastoral tribes. It consists of many subordinate tribes, all of whom are more or less addicted to the wandering life; though a considerable proportion combine agriculture with pasturage, and have fixed residences. The pastoral part of the Dooraunee people are mostly to be found in the eastern hilly tracts near the frontiers of Persia, between Herat and Seestan, and in the waste plains of the south. To the south-east of Candahar the inhabitants are shepherds; in other parts of the country the husbandmen and shepherds are intermixed. North of Candahar, the migrating tribes seek the plains in winter and the hills in summer. Those to the south retire from the summer heat to the northern hills. The numerous tribes still farther south beyond the Helmund also quit the plains, which are thus left with scarcely a single inhabitant before the middle of spring. There are some tribes, such as the Naussers, who are purely pastoral in their habits, who live in tents, and have no fixed dwelling-place, and who regularly wander with the change of the season from their winter to their summer habitations. As they approach the populous parts of the country, they have to make their way through hostile tribes, who beset them in the mountain passes, and either attack the main body or cut off the stragglers. Hence they are compelled to adopt the strictest precautions. Scouts are planted on all sides, the flanks and rear are protected by armed bands, and the main body advances with all the caution and exact discipline of a regular army. These shepherds are all plunderers; and no single travellers, if they be rich, are safe in any part of the country. They are fierce and warlike in their actions, and enterprising in their habits; yet are they capable of strong attachments, and are keenly alive to the force of social and domestic ties. In distant countries they dwell with the fondest enthusiasm on the valleys of their native land, on the varieties of its scenery, on the beauties and delights of spring, and on all the pleasing vicissitudes of their wandering life; and it is seldom that they quit their own happy abodes for foreign adventures. Their camps usually consist of from ten to fifty tents. One hundred is an unusually large number. The tent is formed of coarse black camlet, and affords excellent shelter from the weather, the threads of the blanket swelling as soon as they become wet; so that its texture, naturally close, is rendered quite impervious to rain. The tents of the common people are from 20 to 25 feet long, 10 or 12 feet broad, and 8 or 9 feet high. The tents of the khans are of a superior description, being large enough to contain a numerous assembly, and so high as easily to admit a camel.

Population.

Mr Elphinstone estimates the population at 14,000,000, to which he supposes that the different natives who inhabit the country contribute in the following proportions: Afghans, 4,300,000; Beloochees, 1,000,000; Tartars of all descriptions, 1,200,000; Persians, including Taujiks, 1,500,000; Indians, Cashmeres, &c. 5,700,000; miscellaneous, 300,000.

It must be borne in mind, however, that this estimate applies to a period antecedent to the dismemberment of the kingdom of Cabul, and when Cashmere and Scinde, with Lahore, Moultan, and other populous provinces, acknowledged the supremacy of its ruler. Looking to the boundaries by which Afghanistan is now circumscribed, and to the character of the country, which is for the most part rugged and ill cultivated, we shall in all probability be nearer the truth, by reducing the estimate of its population to five millions of inhabitants.

The Afghans, like most barbarous nations, derive their origin from high antiquity. They claim their descent from Afghan, the son of Irmia or Birkia, son of Saul, king of

Israel; but this is a vain tradition, unsupported by the slightest historical evidence. The first account we have of them is in the 9th century, when they were established in the north-eastern mountains of Afghanistan.

In 997 Afghanistan was conquered by a Tartar officer, Sebuctaghi, who, marrying the daughter of Alptegin, the founder of the dynasty of Ghuzni, had been acknowledged as his successor. His son Mahmood greatly enlarged the limits of his empire, which extended over the present kingdom of Cabul, India, Balkh, Badukshan, and a great part of Khorassan. His dynasty lasted till the year 1159, from which period the house of Ghor reigned in Afghanistan till the death of Shahabudin in 1206. The country was afterwards subdued by Ghengis Khan and Tamerlane; and during their government, and that of their descendants, the native Afghans appear to have maintained their independence in the mountains. Baber, the descendant of Tamerlane, began his career by the conquest of Cabul in 1504, and extending his conquests to India, established the Mogul empire of Delhi, from the ruins of which all the existing states in India are now composed. After the death of Baber, the plains of Afghanistan were divided between the empires of Hindostan and Persia, while the mountains as before afforded an asylum to those who rejected a foreign yoke.

In 1720 the Afghan tribes threw off their allegiance to Persia, and advancing into the country, took Ispahan. But in 1728 they were driven back by the celebrated usurper Nadir Shah, who pursuing his success, in the year 1737 subdued the whole of Afghanistan. He established his power over all the countries to the west of the Indus, which continued subject to Persia till his assassination in 1747. On this event an Afghan officer of the Dooraunee tribe, Ahmed Shah, who had risen to high command in Nadir's army, took possession of Candahar, and having united all the Afghans under his authority, founded the kingdom of Afghanistan. He was a wise and politic prince, who united courage and activity with great military talents. He invaded Hindostan at different times; and in the memorable battle of Paniput, fought in 1761, on the 7th January, he gave a decisive blow to the Mahratta power. He died in 1773, and was succeeded by his son Timour Shah, whose indolence was as noted as his father's activity. He died in 1792, after a despotic reign, leaving his dominions to his two sons, Homayon and Zemaun Shah. War soon broke out between the two brothers; and the elder being defeated, the whole kingdom acknowledged the authority of Zemaun Shah. In 1796 this prince invaded Hindostan with a large army, and advanced to Lahore; but he was obliged to retreat in consequence of an insurrection in his own country. In 1800 Zemaun Shah was dethroned and deprived of his sight by his brother Mahmood. He was in 1803 expelled by his brother Shuja, but Mahmood reappearing in arms against his competitor, the result was disastrous to Shuja, who ultimately found a retreat in British territory. Meantime Runjeet Singh, the Sikh chief of Lahore, profiting by the confusion, conquered Peshawur, the modern capital of Afghanistan. In 1818 Shah Shuja, impatient of retirement, attempted to regain his former dignity, but failed. A later revolution deprived Mahmood of his throne, when the country, with the exception of Herat, passed to the brothers of Mahmood's minister; the most able of them being Dost Mahomed Khan. Herat continued in the possession of Camran the son of the expelled Mahmood.

About the year 1837 the attention of the British Government in India having been attracted by the conduct of certain supposed agents of Russia in the counties to the west of the Indus, it was considered desirable to establish an alliance with the rulers of Afghanistan, and overtures were accordingly made to Dost Mahomed Khan, the chief of Cabul. These having failed, the British Government sought to establish a friendly power in Afghanistan by aiding the exiled Prince Shah Shuja in another attempt to regain his throne. At that time Dost Mahomed held Cabul with a considerable tract of adjoining territory, yielding a revenue of L.260,000 a-year. His army was composed of 14,000 men, of whom 6000 were cavalry, and his artillery consisted of 40 field pieces. The brothers of Dost Mahomed held Candahar, with the surrounding country, affording a revenue of L.80,000 a-year, while their military force was estimated at 3000 cavalry, 1000 infantry, and 50 guns. The British force assembled to support the claims of Shah Shuja, amounted to 28,350 men, aided by a contingent force of 6000 Sikhs furnished by Runjeet Singh, the ruler of the Punjaub, and by a levy of 4800 troops raised in the name of the Shah's eldest son. These formed the invading force designated "The army of the Indus." The British force was furnished partly from Bengal, and partly from Bombay. Both divisions advanced to the town of Dadar and thence pursued their march by the same route through the Bolan and Kojuck passes to Candahar, under the chief command of Sir John Keane. The city of Candahar was occupied without opposition, and there, on the 8th May 1839, Shah Shuja was solemnly enthroned. After a brief interval, the march was resumed towards Cabul. On the 21st, the army arrived before Ghuzni, a fortress believed by the Afghans to be impregnable. Two days later the gates of the fort were blown in with gunpowder and the place taken by storm. Pursuing its march, the army reached Cabul, and on the 7th August Shah Shuja made his public entry into his capital. The war was now considered at an end, and the "Army of the Indus," leaving behind them a detachment of 8000 men, prepared to return home.

During the two succeeding years, Shah Shuja and his allies remained in possession of Cabul and Candahar. Dost Mahomed had surrendered himself prisoner, and efforts were made to reduce the remaining refractory chiefs. These attempts, however, proved unsuccessful, and indications were not wanting of the difficulty of maintaining Shah Shuja on his throne. At length, on the 2d November 1841, a fearful outbreak occurred in Cabul, in which Sir Alexander Burnes and several other British officers were massacred. The position of the British now became critical. In a conference held between Sir William Macnaughten and Akbar Khan, son of Dost Mahomed, the British representative and several officers were treacherously murdered. Shortly after, the British entered into a convention to evacuate Afghanistan, and in January 1842, the remnant of the army began to move. In addition to the hardships and privations incident to a winter march in so elevated a region, this miserable band, destitute and spiritless, were exposed to the continual attacks of a pursuing enemy, into whose hands several of the fugitives fell. The remainder pushed on for Jellalabad; but out of 4500 soldiers who quitted Cabul, with a host of camp followers, one European (Dr Bryden of the Medical Service) alone succeeded in reaching that place, and he arrived but to report the capture or destruction of all his companions. The Cabul tragedy gave rise to a further disaster; Ghuzni was surrendered to the enemy by the British garrison. But General Nott retained possession of Candahar, and Colonel Sale maintained his position in Jellalabad, against all the efforts of Akbar Khan to dislodge him. Shah Shuja died by the hands of assassins.

To avenge these disasters, and rescue the prisoners who had fallen into the hands of the enemy, preparations on a large scale were made in India. An army of 12,000 men assembled in the Punjaub under General Pollock, who succeeded in forcing his way through the Khyber Pass and joined the force of Colonel Sale at Jellalabad. General

Afghanistan.

Pollock then advanced to Cabul, where he was met by General Nott from Candahar. Ghuzni had been retaken and dismantled by the last named commander, and on the 16th September 1842, General Pollock, amid the shouts of the soldiery, and the roar of artillery, planted the British colours on the towers of Cabul. All idea of retaining a footing in Afghanistan was abandoned. The rescue of the prisoners from the hands of Akbar Khan had been effected; the fort of Cabul, with several of the principal buildings, demolished; and the British finally evacuated the country in December 1842. Dost Mahomed was set at liberty, and returned to Afghanistan. Since that period various changes have taken place in that turbulent country, with the details of which we are but little acquainted. (E. T.)

AFIUM, or APPIOM, KARA HISSAR (or *Black Castle of Opium*), a city of Asiatic Turkey, in Anatolia, and the capital of Sanjiack. It stands on a declivity, and is defended by a citadel crowning a high and almost inaccessible rock. The population is estimated at 60,000. Opium in large quantities is produced in its vicinity, and forms the staple article of its commerce; besides which it has manufactories of black felts, carpets, arms, saddlery, &c. Lat. 38. 45. N. Long. 30. 56. E.

AFORT, a hamlet in the department of Seine, France, about five miles from Paris. It is celebrated for its Veterinary College, and also for its botanical garden, which is one of the finest in Europe.

AFRAGOLA, a large manufacturing town in the kingdom of Naples, and in the province of Napoli. It has three parish churches, and contains 12,640 inhabitants, who produce, among other goods, 6000 dozen of hats annually.

AFRANIUS, LUCIUS, a Latin poet, who lived about a century before Christ. He wrote comedies in imitation of Menander; and is commended by Cicero and Quintilian for his acute genius and fluent style. Only some fragments of his works are now extant.

# AFRICA.

Ancient geography of Africa. Egypt.

THE knowledge of this great continent which ancient writers have transmitted to posterity, is of very limited extent, owing principally to its physical construction. The great desert, which in a broad belt stretches quite across the continent, forbade every attempt to pass it until the introduction of the camel by the Arabs. The want of any known great river, except the Nile, that might conduct into the interior, contributed to confine the Greek and Roman colonists to the habitable belt along the northern coast. The Phœnicians are known to have formed establishments on the northern coast of Africa at a very early period of history, probably not less than 3000 years ago; and the conquest of Egypt by Cambyses dates as far back as the year B.C. 525. We may consider, therefore, the coasts of Egypt, of the Red Sea, and of the Mediterranean, to have been settled and well known to the ancient Asiatics, who were constantly passing the narrow isthmus which divided their country from Africa, and led them immediately from parched deserts into a fertile valley, watered by a magnificent river. But whether they were much or little acquainted with the western coast, which bounds the Atlantic, and the eastern coast washed by the Indian Ocean, is a question that has exercised the research and ingenuity of the ablest scholars and geographers, and has not yet been satisfactorily answered.

Western coast.

This question being one of curiosity rather than utility, we shall only state the case, and the results of the several inquiries, without entering into the merits of the arguments advanced by the different parties. We are told by Herodotus, that Necho, king of Egypt, sent out an expedition under the command of certain Phœnician seamen, for the purpose of circumnavigating Africa; and that, on their return, they asserted that they had accomplished this undertaking. Few of the ancient writers give credit to the story; but, among the moderns, the Abbé Paris and Montesquieu have contended that this voyage was actually performed. Isaac Vossius and D'Anville have strong doubts; and Dr Vincent and M. Gosselin maintain that such an expedition, at such a period, exceeds all the means and resources of navigation, then in its infancy. Last of all comes Major Rennell, who in his elucidation of the geography of Herodotus, has done more than all the rest in clearing away the doubts of history; and *he* argues the possibility of such a voyage, from the construction of their ships, with flat bottoms and low masts, enabling them to keep close to the land, and to discover and enter into all the creeks and harbours which any part of the coast might present. At all events, one thing is evident: if such an expedition ever circumnavigated the African continent, the fruits of it have nearly, if not entirely, perished.

About half a century after this supposed expedition, the account of another voyage, down the western coast, is contained in the *Periplus* of Hanno, which has also called forth many learned and elaborate discussions among modern geographers, some of whom would carry Hanno to the Bight of Benin, others only to Sherbro Sound or the river Nun in Lat. 28. N.

Eastern coast.

The extent to which ancient discovery proceeded along the eastern coast of Africa, has divided the opinion of the learned nearly as much as its progress on the western coast. Delisle, Huet, and Bochart, made the discovery of the coast to extend as far south as Mozambique and Madagascar. D'Anville could trace such discovery no farther than to Cape Delgado; and M. Gosselin contends that the ancients never proceeded down the coast beyond Brava. But Dr Vincent, who has entered more profoundly into the subject than any of his predecessors, and brought a great fund of learning to bear on the question, in his *Periplus of the Erythrean Sea*, has with great plausibility extended these boundaries to Mozambique and to the island of Madagascar.

Egypt, under the Ptolemies, the great patrons of science and promoters of discovery, possessing the advantage of the only great river which falls from the African continent into the Mediterranean, made no progress beyond its ancient boundaries; and though the Romans, who subsequently possessed Egypt, penetrated beyond the limits of their own dependencies, they extended their discoveries no further than Fezzan in one direction, and, at a later period, beyond Nubia as far as Abyssinia, and the regions of the Upper Nile.

The Carthaginians.

We know nothing of the progress made by the Carthaginians in the discovery of Interior Africa; but although it has been asserted that their merchants had reached the banks of the interior river, which we call the Kawara or Niger, they have left nothing on record that will warrant such a supposition. The story told by Herodotus, of some Nasamonians crossing the desert, and arriving at a large river, can only be applicable to some western arm of the Nile.

The Arabs.

The people from whom we derive the first information concerning the interior of Northern Africa are the Arabs, who, by means of the camel, were able to penetrate across the great desert to the very centre of the continent, and along the two coasts as far as the Senegal and the Gambia on the west, and to Sofala on the east. On this latter coast, they not only explored to an extent far beyond any supposed limits of ancient discovery, but planted colonies at Sofala, Mombas, Melinda, and at various other places.

The Portuguese. The fifteenth century produced a new era in maritime discovery. The voyages of the Portuguese were the first to give any thing like an accurate outline of the two coasts, and to complete the circumnavigation of Africa. The discovery of America and the West India islands gave rise to that horrid traffic in African negroes which has since been carried on without intermission; and this traffic has been the means of acquiring a more extended and accurate knowledge of that part of the coast which lies between the rivers Senegal and the Cameroons, as well as of the manners and character of the people who inhabit this extended line of coast.

The English and French. With the English and French settlements in Africa began a systematic survey of the coast, and portions of the interior.

Coast surveys. Admiral Sir Francis Beaufort thus sums up the surveys of the coasts of Africa, as far as they were made up to 1848. From the Strait of Gibraltar, the western coast of Africa has been sufficiently surveyed and published as far as Cape Formosa, in the Bight of Benin; but as there is much legitimate traffic in the eastern part of that great Bight, as well as farther to the southward, both it and many of the ports and anchorages on this side of the Cape of Good Hope require a more careful and connected examination. The charts of the whole of the Cape Colony are exceedingly defective, as the numerous wrecks there amply testify, and from thence to the Portuguese settlements of Delagoa we know scarcely anything. From Delagoa to the Red Sea, and the whole contour of Madagascar, are sufficiently represented on our charts for the general purposes of navigation, though many further researches along the former coast might still be profitably made. The Red Sea has been well surveyed by the East India Company. The northern shore of Africa, with the exception of Egypt, has been surveyed by the English and French.

African Association. The uncertainty and confusion that prevailed in the geography of the interior of Africa induced a few learned and scientific individuals to form themselves into an association for promoting the exploration of Inner Africa. This society was formed in London in 1788, and under its auspices important additions were made to the geography of Africa by Houghton, Mungo Park, Hornemann, and Burckhardt. Repeated failures, however, at length discouraged the association from engaging other missionaries, and it subsequently merged in the Royal Geographical Society in 1831.

African discoveries in the 19th century. During the last sixty years more has been done to make us acquainted with the geography of Africa, than during the whole of the 1700 previous years, since Ptolemy, taken together. With Mungo Park, strictly speaking, commences the era of unceasing endeavours to explore the interior.

Mungo Park. Mungo Park proceeded in 1795 from the river Gambia on the west coast, to the Joliba (commonly called Niger), traced this river as far as the town of Silla, explored the intervening countries, determined the southern confines of the Sahara, and returned in 1797. In 1805 this adventurous traveller embarked on a second journey in the same regions, for the purpose of descending down the river Joliba to its mouth. This journey added little to the discoveries already made, and cost the traveller his life. He is ascertained to have passed Timbuktu and to have reached Boussa, where he was killed by the natives.

Hornemann. Hornemann, in 1799, penetrated from Cairo to Murzuk, and transmitted from that place valuable information respecting the countries to the south, especially Bornu. He then proceeded in that direction, but it is supposed that he soon afterwards perished, as no accounts of his further progress have ever reached Europe. In 1816 an expedition was sent out by the English government under the command of Captain Tuckey, to the river Congo, which was at that time believed to be the lower course of the Joliba. This was a disastrous undertaking, and the geographical additions were but slight, the river having been ascended a distance of only 280 miles.

Tuckey.

Lyon and Ritchie. In 1819, Lyon and Ritchie penetrated from Tripoli to Murzuk, and a little distance beyond that place.

Denham, Clapperton, and Oudney. In 1822, Denham, Clapperton, and Oudney, set forth from Tripoli in the same direction, crossed the Great Desert, and reached, on the 4th February 1823, the great Lake Tsad. The surrounding countries were explored as far as Sakatu in the west, and Mandara in the south. This journey was altogether one of the most successful and important into the interior. Oudney died in Bornu, but Clapperton undertook a second journey from the coast of Guinea, crossed the Kawara and arrived at Sakatu, at which place he also died. His servant Richard Lander returned to England after having explored a part of the adjoining regions.

Laing. Major Laing succeeded in reaching Timbuktu from Tripoli, but was murdered on his return, in the desert.

Caillié. In 1827 and 1828, Caillié set out from the Rio Nunez on the western coast, reached Timbuktu and returned from that place through the Great Desert to Marocco.

Landers. The termination of the Joliba, Kawara or Niger, remained in obscurity till 1830, when it was ascertained by Lander and his brother, who succeeded in tracing the river from Yaouri down to its mouth. They embarked on a second expedition, which sailed in 1832, for the purpose of ascending the Kawara as far as Timbuktu. But only Rabba was reached, and the general results of the expedition were most disastrous.

Niger expedition. The great Niger expedition, similar to the foregoing, consisted of three steam-vessels, and was despatched by the government in 1841, under Captain Trotter. It proved a failure, and resulted in a melancholy loss of life.

Duncan. In the region between the Kawara and the coast, Mr Duncan, one of the survivors of the Niger expedition, has made some additions to our geographical knowledge by his journey to Adafoodia, in 1845–46. This enterprising traveller has since met with an untimely death, in a second attempt in the same region for the purpose of reaching Timbuktu.

East-African travellers. The preceding journeys were confined chiefly to the northern and western portions of the continent. A much greater number of travellers explored the regions drained by the Nile, the salubrity of which, particularly of Abyssinia, is so infinitely greater than that of Western Africa, that among the many explorers of the former a very small proportion have died as compared with the immense loss of life in Western Africa. Among the most distinguished of the East-African travellers are Bruce, Brown (who reached Darfur), Burckhardt, Cailliaud, Rüppell, Russegger, Beke, and the Egyptian expeditions up the Nile.

South-African Travellers. Though the Dutch settlement in South Africa was founded as early as 1650, not much information of the interior of that portion of the continent was gained till the end of the 18th century, when a series of journeys was commenced by Sparrmann, and followed up by Vaillant, Barrow, Trotter, Somerville, Lichtenstein, Burchell, Campbell, Thomson, Smith, Alexander, and Harris.

Recent expeditions, some of which are still in progress. Within the last five or six years a number of important discoveries have been made in various parts of Inner Africa, and the present time bids fair to outstrip all previous periods in lifting the veil that has hitherto enveloped Central Africa in impenetrable mystery.

Krapf and Rebmann. The Church Missionary Society established a mission at Mombas, in about 4 deg. south lat., on the east coast of Africa, consisting of the zealous missionaries Krapf and Rebmann. These gentlemen have, ever since 1847, explored the interior from that direction with untiring perseverance. At several hundred miles from the coast they have discovered high mountains covered with perpetual snow, which is the more interesting from their position being so near the equator. The existence of snow on the mountains of Kilimanjaro and Kenia has been disputed, but with little reason. These two remarkable peaks, to judge from the description of the missionaries, seem isolated cones rising out of regions comparatively little elevated and surrounded by plains in the same way as Mount Ararat, Mount Hermon, or the Sierra Nevada de Santa Martha in the equatorial regions of South America.

Livingston, Oswell, Murray, Vardon.

In South Africa also, missionaries have been the pioneers of geographical discovery. Kolobeng (in Lat. 24. 40. S. Long. 25. 55. E.) is, of all the missionary stations in that continent, the furthest inland. It lies on the southern borders of the Kalahari Desert, the Sahara of South Africa, which had frustrated many attempts at proceeding northward, to reach a large lake reported a long time previously to exist in that direction. On the 1st of June 1849, Mr Livingston, the missionary, accompanied by Messrs Oswell and Murray, set out from Kolobeng. After having travelled 300 miles through the desert of Kalahari, they came to a fine river, the Zouga, which issues from the lake. They followed it upwards about 300 miles, when they reached the eastern extremity of that lake, the chief name of which is Ngami, at an elevation of 2825 feet above the sea. Some English traders, who lately reached the lake, succeeded in walking round it, and ascertained it to be about sixty miles in length and about fourteen in breadth.

In 1851, Livingston and Oswell again started for the north, but more in an easterly direction, when they reached the latitude of 17. 25. S., and discovered the Chobé and Sesheké, deep and constantly flowing rivers, supposed to be the feeders of the Zambezi. The Zouga was ascertained to be absorbed in sands and salt-pans. The country through which the former rivers flow is level and very fertile.

Captain Vardon explored the region north-east of Kolobeng, tracing the Limpopo river to a considerable distance.

Gassiot.

In 1851, Gassiot made an interesting journey from Port Natal north-west, through the mountains, keeping along their western slope, and ultimately reaching the Limpopo.

Galton.

During the same year, Mr Galton explored a part of South Africa, from Walfisch Bay, on the west coast, extending from that point as far as 17. 58. S. Lat. in the north, and to 21. E. Long. in the east, and inhabited by the Damara and Ovampo. No very interesting features were discovered, but the whole region was accurately determined; and in this respect this journey is one of the most important yet accomplished between the equator and the tropic of Capricorn.

Plant.

In 1852, a journey was made by Mr Plant, of Natal, from that place to Delagoa Bay, in which he discovered that St Lucia Bay leads into an extensive inlet, hitherto unknown. The preceding journeys are all that have recently been performed south of the equator. In addition to them, may be mentioned a journey across the whole of the continent, from the coast of Zanzibar to Benguela, performed by a caravan of native traders, of which an account has recently been given by the Portuguese. In this journey they crossed Nyassa, the great lake of South Africa.

Richardson, Barth, Overweg, Vogel.

To the north of the equator, the mission to Lake Tsad, originated by Mr James Richardson, promises to exceed in importance all previous expeditions to Central Africa. That gentleman left England in 1849, for the purpose of concluding commercial treaties with the chiefs of Northern Africa, as far as Lake Tsad, by which the legitimate trade with those countries might be extended, and the system of slavery abolished. Upon the proposal of Mr Petermann, Drs Barth and Overweg accompanied Mr Richardson, for the purpose of making scientific observations. The three gentlemen started from Tripoli on the 23d of March 1850, after having minutely surveyed the mountainous region to the south of that place. During the first year the travellers successfully crossed the whole of the Sahara, in a very circuitous westerly direction, and thus explored a great portion of Northern Africa, which had never before been visited by any European. Their route from Ghat to Kano, in particular, leading them through the powerful kingdom of Aïr or Asben, was highly interesting. In the second year the travellers explored a large portion of Sudan in different directions, for which purpose they separated on their arrival at the northern frontiers of that country, each pursuing a different route, their plan being ultimately to meet at Kuka, the capital of Bornu. Barth and Overweg reached that place in safety, but Richardson died on the way, within six days journey of it, in March 1851. The other travellers, nothing daunted, continued their explorations, Barth penetrating 350 miles to the south, as far as Yola, the capital of the kingdom of Adamaua; and Overweg navigating Lake Tsad in a boat, which, with great labour, had been conveyed in pieces, on the backs of camels, from Tripoli across the burning sands of the Sahara. In September 1851, the travellers set out together on a journey to Borgu, a mountainous country lying to the north-east of Lake Tsad, about midway between it and Egypt. They travelled under the protection of a large army of the Sheikh of Bornu, which, however, was attacked at no great distance beyond Lake Tsad, and put to flight so suddenly, that Barth and Overweg saved their lives and instruments only by a quick retreat. Having returned to Kuka, they set out southward with another and a very considerable *ghazzia*, consisting of about 10,000 horse, and the same number of foot soldiers, with innumerable trains of camels and other beasts of burden. On this occasion they explored the country a considerable distance beyond Mandara, the farthest point of Denham's journey, and found it to be one of great fertility. With the beginning of the third year of their explorations, Dr Barth made a journey to Maseña, the capital of the kingdom of Baghermi, to the south-east of Lake Tsad; while Dr Overweg travelled in a south-westerly direction, and reached to within 150 miles of Yacoba, the great town of the Fellatahs. This, alas, was his last journey. On his return to Kuka he was seized with fever, and after a short illness and extreme sufferings, he died, the second victim in that expedition, in September 1852. Dr Barth was about to start for Timbuktu. A reinforcement, consisting of Dr Vogel and two sappers and miners, was despatched to his assistance on the 20th of February last.

Origin of the name of Africa.

The origin and meaning of the name of this great continent has been a fertile subject for conjecture among philologists and antiquaries. By the Greeks it was called Libya, Λιβυη, and by the Romans Africa. Varro believed he had found the etymology of the former in *Libs*, the Greek name of the south wind; and Servius, the scholiast on Virgil, proposed to derive the other from the Latin word *aprica* (sunny), or the Greek word *a-phriké* (without cold). It is more probable that the name Libya was derived by the Greeks from the name of the people whom they found in possession of the country to the westward of Egypt, and who are believed to have been those that are called in the Hebrew Scriptures *Lehabim* or *Lubim*. With respect to the word *Africa*, Suidas tells us, that it was the proper name of that great city which the Romans called *Carthago*, and the Greeks *Karchedon*. It is certain, at least, that it was applied originally to the country in the immediate neighbourhood of Carthage, that part of the continent first known to the Romans, and that it was subsequently extended with

Africa. their increasing knowledge, till it came at last to include the whole continent. Of the meaning of the name, the language of Carthage itself supplies a simple and natural explanation; the word *Afrygah*, signifying a separate establishment, or in other words a colony, as Carthage was of Tyre. So that the Phœnicians of old, at home, may have spoken of their Afrygah, just as we speak of our colonies. Be that as it may, the Arabs of the present day still give the name of Afrygah or Afrikiyah to the territory of Tunis. It may also be remarked, that the name seems not to have been used by the Romans till after the time of the first Punic war, when they became first acquainted with what they afterwards called *Africa Propria*.

Position and extent. Africa lies between the latitudes of 38° north and 35° south, and is of all the continents the most truly tropical. It is, strictly speaking, an enormous peninsula attached to Asia by the isthmus of Suez. The most northern point is the Cape, situated a little to the west of Cabo Blanco, and opposite Sicily, which lies in Lat. 37. 20. 40. N. Long. 9. 41. E. Its southernmost point is Cabo d'Agulhas, in 34. 49. 15. S.; the distance between these two points being 4330 geographical, or about 5000 English miles. The westernmost point is Cabo Verde, in Long. 17. 33. W., its easternmost Cape Jerdaffun, in Long. 51. 21. E. Lat. 10. 25. N., the distance between the two points being about the same as its length. The western coasts are washed by the Atlantic, the northern by the Mediterranean, and the eastern by the Indian Ocean.

Form. The form has been likened to a triangle, or to an oval, but such a comparison is scarcely warranted, it being of an irregular shape, the northern half rounding off, the southern one contracting and terminating in a point.

Superficial extent. The superficial extent of Africa has never been accurately determined, but may be taken at 8,550,000 geographical square miles, exclusive of the islands. It is larger than either Europe or Australia, but smaller than Asia and the New World.

Coast line and indentations. The coast line of Africa is very regular and unbroken, presenting few bays and peninsulas. The chief indentation is formed by the Gulf of Guinea, with its two secondary divisions, the Bight of Benin and the Bight of Biafra. On the northern coast, the Gulf of Sidra and the Gulf of Kabes must be mentioned, and on the eastern coast the Gulf of Arabia.

Physical configuration. The physical configuration may be considered under two heads, the great plain of Northern Africa, and the great table-lands, with their mountain ranges and groups, of Central and Southern Africa. The great plain comprises the Sahara, the Lake Tsad region, and the valley of the Lower Nile. The Sahara is by no means a plain throughout, but for the greater part it rises into table-lands, interspersed with mountain groups of 6000 feet elevation, and probably more, and the term plain can only be applied to it in a general way, to distinguish it from the more elevated region to the south.

The Sahara has often been pictured as a monotonous and immense expanse of sand; but nothing could be more erroneous, as the greatest variety exists in the physical configuration of its surface, as well as in its geological features. Our knowledge is as yet too scanty to enable us to trace its features in every part. On the north, this great desert is fringed with extensive table-lands, which in some places rise abruptly from the Mediterranean, as the table-land of Barca, elevated 1500 feet, and gradually descending towards the Delta of the Nile. This elevated ground is succeeded to the south by a depressed region, which extends from the Great Syrtis or Gulf of Sidra, in a general direction as far as middle Egypt, and comprises the oases of Augila and Siwah. So greatly depressed is this region, that the level of the oasis of Siwah is 100 feet, and in one place (Bahrein) even 167 feet below the level of the sea. This depressed region is again followed by a table-land of considerable extent and width, extending from the Gulf of Kabes in a southerly direction, along the Tripoline shores, and probably traversing, in the same direction, the Lybian Desert, and reaching as far as the Nile, near the first cataract. Its north-western part, as far as Sokna, consists of the Hamadah, a stony, dreary, and extensive table-land, of from 1500 to 2000 feet high, "which seems to be like a broad belt intercepting the progress of commerce, civilisation, and conquest, from the shores of the Mediterranean to Central Africa." Our knowledge of this table-land is only of a recent date, derived as it is, from the expedition under Richardson, Barth, and Overweg, and the journey of Dickson to Ghadamis. Near Sokna, this plateau breaks up and forms what are called the Jebel-es-Soudy, or Black Mountains, a most picturesque group of cliffs; and again, on the route from Murzuk to Egypt, it also breaks into huge cliffs, and bears the name of El-Harouj. The edge of this table-land towards the Tripoline shores is formed by what is generally called the Gharian Mountains; but, strictly speaking, this name applies only to a small portion of that range, situated due south of Tripoli, the western part being called the Yofran or Jebel, the eastern the Tarhonah. This range is not, as is generally supposed, connected with the Atlas Mountains, but is separated from them by a depressed belt, which even sinks below the level of the sea. This depressed region forms the north-western boundary of the Sahara, and extends from the Gulf of Kabes along the southern slope of the Atlas system to the Wady Draa, bordering on the States of Marocco, Algeria, and Tunis. The extensive oasis of Tuat occupies the central portion of that region. From Wady Draa, this great plain extends along the western shore as far as the river Senegal, and probably continues as such to the east towards Timbuktu, and thence to Lake Tsad. To the south of the Hamadah, the kingdom of Fezzan and the oasis of Ghadamis are flat and depressed; and between Fezzan and Lake Tsad, a tract of country intervenes which may also be considered rather a desert plain than a table-land. Thus it appears, that the western half of the Sahara is surrounded by a broad belt of plains and depressions, the central parts being formed by extensive table-lands and mountainous regions, comprising the kingdom of Aïr or Asben, lately explored by Messrs Richardson, Barth, and Overweg. The route of Dr Barth in his journey to Agadez, the capital of that kingdom, was girded by mountain ranges and groups rising to 3000 and 4000 feet, and Mount Dogem, the culminating point in that region, is even between 4000 and 5000 feet high.

The eastern portion of the Sahara appears for the greater part to be a considerably elevated table-land, comprising the mountainous country of Borgu. The summit of Ercherdat-Erner is said to be the highest in the whole region, but the testimony of European eye-witnesses is altogether wanting in treating of its geographical features.

The narrow valley of the Nile forms the eastern boundary of the Great Desert.

To the south of the region just described, Africa may be considered as one connected mass of elevated land, rising more or less above the level of the sea, and comprising the most extensive table-lands, as well as high mountain groups and chains. Some geographers have attempted to trace a system of terraces, which, they maintained, this elevated mass presented on all sides. Such is certainly the case in its southern extremity, where three well-defined terraces are well known to exist, but the same feature cannot be traced throughout; on the contrary, the plateau either gradually slopes down into a plain along the sea-shore, or it rises abruptly almost from out the sea, and presents a deep edge of from 7000 to 8000 feet elevation, as the northern part

Africa.

of the Abyssinian table-land at Massowah. The edge of the table-land, however, is generally from 100 to 300 miles distant from the sea-shore. Little is known at present beyond some parts of this outer fringe, and a few routes across the interior. Commencing at the Cape of Good Hope, and traversing the three aforementioned terraces, an almost uninterrupted table-land has recently been ascertained to extend to the north for at least 1000 geographical miles. The southern portion is formed by the basin of the Orange river, followed by the desert of Kalihari, which is again succeeded by the basin of the River Sesheké and Lake Ngami, with many other rivers, traversing a region which presents a dead level, its elevation at Lake Ngami being 2825 feet. That region probably is in connection with the basin of Zambezi. Farther north the ground ascends to the line of water-parting with the basins of the Congo river and Lake Nyassa; a region very little known, and succeeded by a complete *terra incognita*, extending to the north of the equator. In this region are supposed to be the celebrated "Mountains of the Moon," which have played so exciting a part in the history of African geography, and have given rise to so many curious hypotheses. Since the time of Ptolemæus of Alexandria, geographers have continued to shift these mountains from one latitude to another, from 10° to the north of the equator to 12° to the south of it, but all seem to have agreed in one point, namely, in giving them a direction from west to east. Rennell, one of the ablest geographers of recent times, argued that a very high central chain must cross Africa from east to west in about 10° N. Lat., beginning at Cape Jerdaffun, and ending at Sierra Leone; and in some of the most recent maps this direction is still to be seen. When, therefore, the Egyptian expeditions up the Bahr-el-Abyad, not only advanced as far as the fourth parallel of north latitude, but actually sailed over the alleged site of the Mountains of the Moon, without seeing any elevations whatever which could claim the title of mountains, that favourite hypothesis fell completely to the ground. Dr Beke was the first who, from his own personal researches, combined with extensive studies of the geography of Eastern Africa, propounded the opinion that the Mountains of the Moon have a direction from north to south, and run parallel to the eastern coast, and that they form in fact the southern continuation of the Abyssinian table-land. This direction also agrees much better with what is known of the basin of the Nile. It is a remarkable feature that the most elevated peaks rise on the outer edge of this great table-land, and even between it and the coast as isolated cones. This seems to be the case with the Kenia and Kilimanjaro, which are the only snowy mountains of Africa at present known, and must have for that reason an altitude of at least 20,000 feet. Abba Yared rises out of the northern edge of the Abyssinian table-land to the height of 15,000 feet. Mendif, south of Lake Tsad, another isolated mountain, is probably as high as 10,000 feet; and Alantika, a conspicuous mountain to the south of Yola (in 8. 30. N. Lat. 13. 45. E. Long.), also an isolated peak, was estimated by Barth to be 10,000 feet high; the highest of the Cameroons is 13,760 feet, and the highest known mountain of southern Africa, the Spits Kop, or Compass Berg, attains 10,250 feet.

The system of the Atlas mountains is quite distinct from either of the two divisions described above; it occupies the north-western region of Africa, consists of several ranges, and its highest summits are said to reach an altitude of about 15,000 feet.

Geological features.

Of all the rock formations, those of sandstone and limestone are the most frequent and the most widely distributed in Africa; natron, a rare deposit in other countries, is comparatively abundant; salt is very widely distributed, though in some districts wholly wanting. Metals, although met with in different quarters, seem nowhere abundant; of all the different metals, gold being the most generally distributed. Precious stones, so frequent in other tropical regions, are here of rare occurrence. The African continent is nearly exempt from volcanic action.

Minerals.

Rivers and Lakes.

Africa is emphatically the land of deserts, which are productive of a scarcity of rivers. Many of the smaller rivers and lakes, and not a few of the large ones, present only dry water-courses during certain periods of the year. Even Lake Tsad is said at times to become nearly dry; this large expanse of water has no outlet, and the immense supply of water received during the rainy season is lost again by evaporation. With the rains, floods are prevalent all over the country, even in the desert, as the recent observations made by the expedition under Richardson testify. That traveller relates that when on the borders of the kingdom of "Aïr, in about latitude 19° north, on the 30th September 1850, there was a cry in the encampment, 'The wady is coming.' Going out to look, I saw a broad white sheet of foam advancing from the south between the trees of the valley. In ten minutes after a river of water came pouring along, and spread all around us, converting the place of our encampment into an isle of the valley. The current in its deepest part was very powerful, capable of carrying away sheep and cattle, and of uprooting trees. This is one of the most interesting phenomena I have witnessed during my present tour in Africa. The scene, indeed, was perfectly African. Rain had been observed falling in the south; black clouds and darkness covered that zone of the heavens; and an hour afterwards came pouring down this river of water into the dry parched-up valley. This instance of Wady Tintaghoda explains the Scriptural phrase, "rivers of waters," for here indeed was a river of water, appearing in an instant, and almost without notice." The importance of the floods and inundations of the Nile scarcely requires to be referred to.

Africa is chiefly drained into the Atlantic Ocean, and its branch the Mediterranean Sea, the river system of the Indian Ocean being comparatively inconsiderable.

Nile.

The Nile is the oldest of historical rivers, and afforded the only means of subsistence to the earliest civilised people on earth. Thus renowned from immemorial ages as the gift of the Nile, Egypt issues from the womb of primordial time, with a civilisation already perfected at the very earliest epoch of her history, hieroglyphed on the monuments of the third and fourth dynasties, prior to the 35th century before the Christian era. But the origin of the river itself remains an enigma to this day; and when we moderns, in the quiet of our cabinets, calmly span the chronological interval of above 5000 years, our vain-glorious boastings of the patronage vouchsafed by Europe towards African exploration and discovery, encounter signal reproof from the mute fact that "*caput Nili quærere*" is a task as arduous now-a-days, as fifty-three centuries ago it was to the primeval builders of the Pyramids.

A strange mystery has enshrouded the sources of this river, one of the mightiest of the globe. Its three principal tributaries from the east have, each in succession, claimed the distinction of being the main stream, but that stream remains still to be discovered. The Atbara, called by the Abyssinians Takkazie, the last of the tributaries of the Nile before it disembogues into the sea, was looked upon, in early Christian ages, as the head of the Nile; it rises in the Abyssinian provinces of Lasta and Samen, amid mountains attaining the height of 15,000 feet. From the same lofty regions issues the Abaï, termed formerly the Astapus, which becomes the Bahr-el-Azrek, or "Blue River," at Khartum. The Abyssinians still look upon the Abaï as the Gihon of the Genesis; as did the Portuguese Jesuits in the sixteenth and seventeenth centuries. One hundred and fifty

Africa. years before Bruce, its source in the peninsula of Godjam was visited and far more accurately described by Pedro Paez.

Above the junction of the Astapus with the Bahr-el-Abyad, or "White River," the ancients seem to have known nothing of the course of the Nile, previously to the time of Ptolemy the geographer, except that it came from the west: in this vaguely referring to the Keïlak. Our present knowledge of the upper course of the Bahr-el-Abyad is derived from the three expeditions sent up between 1835 and 1841 by the late Mohammed Ali; from which we learn that on the eastern bank the main stream is joined, in about 9. 20. N. Lat., by the Sobat, otherwise Telfi, or Bahr-el-Habesh, which takes its rise in the same Abyssinian high lands whence issues the Takkazie and the Abaï. Of the head streams of the Sobat, the principal is the Baka, known higher up its course by the names Uma and Godjeb. This last, in the country of the Gallas, is joined by the Gibbe, or Zebee of Father Antonio Fernandez (1613), the Gibbe itself being formed by the union of three rivers all bearing the same name. One of the three, the Gibbe of Enarea, has been singled out by D'Abbadie as the true source of the Nile, but this theory is contradicted by facts. A little beyond the confluence of the Sobat, the main stream of the Nile divides itself into two great arms, the eastern one of which has been ascended to about 4° north of the equator. At the point where the expedition turned back, the river was found still upwards of 1000 feet broad, from which it may be inferred that the sources are several hundred miles beyond; indeed Lakono, the king of Bari,—a country comprising the farthest region reached by the expedition,—stated that the river came from a distance 30 days farther south, a direction which was also corroborated by the direction of the valley. Hence the sources of this river, which is there called the Tubirih, may be looked for either under the equator or south of it, and the prevailing opinion at present is that it forms the true head of the Nile. It is, however, not unlikely that the great western arm of the Nile, the Keïlak, is the principal branch of the Nile, but the present state of our knowledge of that river does not justify any thing but a mere speculation respecting this point. That the basin of the Keïlak extends westward to the basins of Lake Tsad, Kawara, and the Congo, is, however, now pretty well established by the researches of Dr Barth.

The length of the Bahr-el-Azrek, or Blue River, is 2830 English miles, that of the Bahr-el-Abyad, or White River, is :—

| | | |
|---|---|---|
| From the mouth to Khartum | 1780 | English miles. |
| From Khartum to the farthest point reached by the Egyptian expeditions . . | 1300 | „ |
| Thence to the source, probably | 300 | „ |
| | 3380 | |

which is second only to that of the Mississippi-Missouri. The area drained by the Nile is at least 2,000,000 English square miles.

There are no other rivers, of any consideration, along the northern shores of Africa. Proceeding to the western coasts, we first find the Wady Draa, augmented by the Wady Sagis and el Hamra, which runs into the sea opposite the Canary Islands, and is spoken of as a considerable river.

Senegal. The River Senegal has a length of upwards of 1100 miles, and has its sources in the same elevated tract of land as those of the Kawara.

The Gambia and Rio Grande, south of the River Senegal, are also considerable rivers.

Kawara and Tchadda. The Kawara, commonly but erroneously called Niger, is next to the Nile the largest of African rivers. Its sources are like those of the Nile still unknown. It appears to be the Amner, which is said to rise in a high group of mountains east of Liberia. As far as Timbuktu the river is called Joliba, and its course is pretty well known, but from that place to Yaouri it is as yet unexplored. Thence down to its mouth it was first traced by Lander. It is there called Kawara in general, although it has several names in the different languages of the tribes which inhabit its shores. Of the tributaries of the Kawara our knowledge is very scanty. The Tchadda is the most important of these, and rivals the Kawara, if it do not actually surpass it in magnitude; it extends far into the heart of Inner Africa, and was recently explored by Dr Barth in its upper course, where it flows through the kingdom of Adamaua: even there it is half a mile broad, and ten feet deep, and is called Benue. It is highly probable that this splendid river will eventually form the natural and most important line from the west for the spread of commerce and civilisation into the very centre of Africa. The kingdom of Adamaua, situate in the valley of the upper Tchadda, with its pastoral and agricultural population, is spoken of by Dr Barth as the most beautiful country in Central Africa, and as such may probably become the key to the interior of that continent.

The length of the Kawara is about 3000 miles, and the area drained by it may amount to 1,500,000 square miles.

In contradiction to the facts observed by Denham and Clapperton, an hypothesis was started some time ago, that Lake Tsad was drained into the Kawara by means of the Yeou and Tchadda, but their observations have recently been confirmed by Barth and Overweg, who have refuted this hypothesis.

South of the equator, the west coast receives many large rivers which are as yet little explored. Such are, the Zaire Zaire. or Congo, known only for a short distance beyond its mouth; Coanza. the Coanza, which is better known; the Nourse river or Nourse. Cunene, almost unknown. The Swakop has recently been Swakop. explored by Mr Galton.

Orange R. The Orange river is about 1000 miles in length. Its head streams are the Ki Gariep or Vaal river, and the Nu Gariep, which latter again consists of the Caledon and Cradock rivers. The Orange river drains an area of about 350,000 English square miles.

Limpopo. Rounding the southern extremity of Africa, and proceeding up its eastern coast, the Limpopo is the first river requiring notice. Its head streams and its middle course are pretty well known, but whether it disembogues into the sea at Delagoa Bay or at Inhambane, is a matter of doubt. The most trustworthy testimony is that it reaches the sea at the latter place.

Zambezi. The Zambezi is the largest river of the eastern coasts. Its upper course is also shrouded in mystery. It is most probable that the Rivers Sesheké and Chobé, recently discovered by Messrs Livingston and Oswell, form the head streams of the Zambezi; their magnitude is opposed to the hypothesis entertained by some that they are lost in the sands.

Lakes. Tsad. Africa possesses several considerable lakes, among which Lake Tsad is probably the largest and most interesting. It was discovered by Denham and Clapperton, who traced its borders, except on the eastern side; but was first navigated by Overweg, who recently fell a victim in the cause of African exploration. This was done in a boat which had been conveyed from Malta across the Sahara to Lake Tsad, as already mentioned. It was successfully launched on the 18th June 1850; and Dr Overweg embarked in it at Bree, to the east of Kuka. At a distance of twelve miles from the former place he reached the first of the islands, of which there are about one hundred of large size scattered over the lake. They are wooded, and inhabited by the Bidduma, a pagan tribe who have remained independent of the Mahommedan na-

Africa.

tions living around the lake. They have herds of cattle and goats; the shores are infested by numerous crocodiles and hippopotami. The dimensions of the lake were found by Dr Overweg to be considerably smaller than those given by Major Denham; it being from west to east only 60 miles in extent, whereas in Denham's map it is more than double that size. This apparent discrepancy, however, may find its explanation in the remarkable nature of the lake,—it being an immense body of water which is greatly augmented in the rainy season, but in the season of drought evaporates so much that it seems at times to dry up entirely. This was said to have taken place six years previously to the date of Overweg's visit. The average depth of the lake is from ten to fifteen feet, and its waters are *fresh* and clear. Dr Overweg was received with great kindness by the Biddumas on his landing at several of the islands, and during his visits to many of their villages. Lake Tsad has no connection with the Kawara or the Nile, but forms an inland receptacle receiving the waters of some of the most distant regions of Inner Africa. The chief feeder is the Shary or Asu, coming from the south, with its tributary the Loggeme or Serbenel; on the western side it receives the Yeou; on the north-eastern side a river rising in the mountainous district of Borgu.

Fittri.

Lake Fittri, east of Lake Tsad, forms a distinct hydrographical system between it and the Nile, with which it has no connection. It has never been explored by Europeans.

Tsana.

Lake Tsana or Dembea is the chief lake within the basin of the Nile, as far as known. It is situate on the table-land of Abyssinia, at an elevation of 6110 feet, has a length of about 60 miles, and possesses many islands. The Abai flows through it. Other lakes on the Abyssinian table-land are Zuwai, Haik, and Ashangi.

In Inner Africa a number of considerable lakes are reported to exist, but only two are known south of the equator with any degree of certainty. They have various names, but are best known under those of Nyassa and Ngami.

Nyassa.

Nyassa, the great lake or sea in 10° south latitude, is as yet only approximately laid down in the maps, according to native information, and whether it be the feeder of a large river, or merely a recipient lake, is unknown. It is represented as stretching in a general direction of south-east to north-west. Nyassa or Nyassi is the name given to it by the Yao, nations living on its eastern shores, but it is also called Ziwa by the Sawahili, and is farther identified with the Nhanja, and the Murusura, as also with the Maravi and Zambeze of early geographers,—Zembere, Zembre, Zambre being considered corruptions of the latter. Zambeze is probably only the name of the river flowing into the Indian Ocean at Quillimane, a branch of which rises near the south-east extremity of the lake, but by no means issues from it.

Another lake in that region has recently been reported by the natives to Dr Krapf, as being situate west of Mombas, beyond Kilimanjaro, and in the country of Uniamézi.

Ngami.

Lake Ngami was known to exist upwards of twenty years ago, and is alluded to by Philips, Campbell, Harris, and others, and indicated in maps under the name of Mampoor or Mampua; but it was first reached by Europeans in 1849, when Messrs Livingston, Murray, and Oswell, undertook a voyage chiefly for the purpose of its discovery. They only saw its north-eastern extremity, however, which there opened out, like the Firth of Forth, with an unbounded horizon of water towards the south-west. As to its extent, nothing positively could be ascertained from the natives, who said that it took twenty-five days to travel round it; their canoes never cross it, but some coast round and along the shores. It was said to contain hippopotami, alligators, and large fish. The height above the sea was computed by the thermometer to be 2825 feet. The river Zouga, which issues from the lake, is lost in the sands before it reaches the sea.

Lakes Tsad, Nyassa, and Ngami are extensive fresh-water formations. There are, however, numerous small salt and natron lakes in various parts of Africa.

Climate. Temperature.

The following table, compiled from Dove, gives the data for a general view of the distribution of temperature over Africa, namely, the monthly and annual mean.

| | Lat. | Jan. | Feb. | Mar. | Apr. | May | June | July | Aug. | Sep. | Oct. | Nov. | Dec. | Year |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Africa lies almost entirely in the torrid zone, and is the hottest continent of all. The greatest heat, however, is not found under the equator but to the north of it, in consequence of the northern portion being of greater extent than the southern, and of less elevation. The greatest temperature is found throughout the Sahara, particularly in its eastern portions towards the Red Sea. In Upper Egypt and Nubia eggs may be baked in the hot sands, and the saying of the Arabs is, "in Nubia the soil is like fire and the wind like a flame." The regions along the Mediterranean and Atlantic coasts are rendered more temperate by the influence of the sea. To the south of the Great Desert, where the country becomes more elevated, the temperature decreases, and it is now fully confirmed that some spots, quite near the equator, even reach the altitude of permanent snow. Regular snowfall, however, does not occur even in the most southern or northern regions. The intensity of radiation and its influence upon the temperature are very great in Northern Africa: while in the day time the soil of the Sahara rapidly absorbs the solar rays, during the night it cools so rapidly that the formation of ice has often been known to occur.

Winds.

Africa is not much under the influence of the regular winds, except the monsoons of the Indian Ocean. It will be seen in the next paragraph, that the monsoons, although they extend only to about a third portion of the East-African shores, have an extremely important bearing upon the physical economy of the whole African continent. From hurricanes Africa is nearly exempt, except its south-eastern extremity, to which at times the Mauritius hurricanes extend. Northern Africa is much

Africa.

exposed to the hot winds and storms from the Sahara, which are called in Egypt Khamsin, in the Mediterranean, Scirocco, and in the western regions Harmattan. Extreme heat and dryness are the characteristics of these winds, which raising the sand, filling the air with dust, and prodigiously favouring the powers of evaporation, are often fatal to the vegetable and animal creation in the regions visited by them.

Rain.

The supply of rain is, upon the whole, scanty in this continent. The Sahara and also the Kalihari of Southern Africa are almost rainless regions. There seems, however, no part where rain is entirely wanting, even in the middle of the desert. A very striking instance, as related by Mr Richardson, has already been referred to. At sea, between the tropic of Capricorn and the Cape of Good Hope, on both sides of the continent, the transparency of the atmosphere exceeds what is known in any other part of the world; and European astronomers, on first visiting those latitudes, contemplate with astonishment the nocturnal splendour of the heavens, in which the naked eye can perceive stars of considerably less magnitude than it can discern in the northern skies. There Jupiter and Venus shine with startling refulgence, and cause opaque bodies to cast well-defined shadows; the fixed stars Aldebaran, Castor and Pollux, the Corona Australis, and Orion, appear preternaturally brilliant. The littoral regions of Western Africa, from the Kawara to the Senegal, receive copious falls of rain with the south-east trade-winds, so much so that at Sierra Leone 313 inches of rain have been known to fall in one year. But the largest supply of rain appears to be brought to Africa by the summer-monsoon on the east coast. This monsoon, lasting from April to October, extends over the Indian Ocean in a half-circle from south-east to north-east by west. From the latitude of Mozambique to the equator it has a general direction from south-east, and there, in a corresponding manner the chief rainy season is found during April, June, and July. Under the equator the direction of the monsoon changes and becomes south-west. To these winds are to be ascribed the heavy falls of rain that drench the extensive plains and ascending grounds of the east horn of Africa. Farther inland they are broken by the great Abyssinian table-lands, so that they do not extend beyond the strait of Babelmandeb, south-east of which a great fall of rain consequently occurs; to the north-west, on the other hand, scarcely any rain falls. No rain occurs in these regions when the monsoon comes from the opposite direction, namely, from the Asiatic continent. The south-east monsoon does not stop in the coast regions, but continues in a more or less modified direction northwards as far as Lake Tsad and Kordofan, and even the latitude of 22°; in both regions its influences begin to be felt in May, or one month later than on the coast. This is a most important fact, as it evidently shows that no connected equatorial range of high mountains—such as the hypothetical Mountains of the Moon of early geographers—can exist in Central Africa, and the assumption is corroborated by the fact that in the eastern portion, where high mountains are known to exist, the same rainy wind is interrupted so much that it reaches the northern portions of Abyssinia one month later than Lake Tsad and Kordofan. The upper basin of the Nile, being probably not far from the coast, receives the undiminished supply of water with the beginning of the monsoon, and hence, after two months, the Nile begins to rise in Upper Egypt and continues to do so till September. Were the head streams of the Nile surrounded by a high mountain range in the east and south, like the Andes of South America, the monsoon would probably not have the same beneficial influence upon its development.

Plants.

Although Africa belongs almost entirely to the torrid and warm zones, its vegetable productions are essentially different in different parts. Thus, in the extreme north, groves of oranges and olives, plains covered with wheat and barley, thick woods of evergreen-oaks, cork-trees, and sea-pines, intermixed with cypresses, myrtles, arbutus, and fragrant tree-heaths form the principal features of the landscape. On this northern coast the date-palm is first found; but its fruit does not arrive at perfection, and it is chiefly valued as an ornamental object in gardens. Various kinds of grain are cultivated. Beyond this region of the coast and the Atlas chain, with the borders of the Sahara commences a new scene. It is in this region, extending to the borders of Sudan, that the date-tree forms the characteristic feature, it being peculiarly adapted to excessive dryness and high temperature, where few other plants can maintain an existence. Were it not for the fruit of the invaluable date-tree, the inhabitants of the desert would almost entirely depend on the products of other regions for their subsistence. With the southern boundary of the Sahara, the date-tree disappears, the baobab or monkey bread-tree takes its place, and, under the influence of the tropical rains, a new, rich, and highly-developed flora presents itself. These trees, together with huge cotton-trees, oil-palms, sago-palms, and others of the same majestic tribe, determine the aspect of the landscape. The laburnum expands its branches of golden flower, and replaces the senna of the northern regions, and the swamps are often covered with immense quantities of the papyrus plant. Instead of waving fields of corn, the cassava, yam, pigeon-pea, and the ground-nut, form the farinaceous plants. The papaw, the tamarind, the Senegal custard-apple, and others, replace the vine and the fig. In Southern Africa, again, the tropical forms disappear, and in the inland desert-like plains, the fleshy, leafless, contorted, singular, tribes of kapsias, of mesembryanthemums, euphorbias, crassulas, aloes, and other succulent plants, make their appearance. Endless species of heaths are there found in great beauty, and the hills and rocks are scattered over with a remarkable tribe of plants called *cycadaceæ*. Plants of the protea tribe also add to the extraordinary variety in the vegetable physiognomy of that region.

Date-palm.

Of the characteristic African plants, the date-tree is one of the most important, as it is likewise among the nearly one thousand different species of palms. It furnishes, as it were, the bread of the desert, beyond which it occurs only in Western Asia, wherever a similar dry and hot climate prevails. This tree requires a sandy soil, and springs must not be absent. The dates furnish food not only for man, but for the camel and the horse. For the latter purpose the stones are used in many parts, and are said to be more nourishing than the fruit itself. The Arabs make a great variety of dishes of which dates form the chief part. Of the sap of the tree palm-wine is prepared, and the young leaves are eaten like cabbage.

Heaths.

In Southern Africa are the extensive miniature woods of heaths, as characteristic as the groves of date-palms in the north. No less than five hundred species have already been discovered. These plants, of which some reach the height of 12 to 15 feet (*Erica urceolaris*), are covered throughout the greater part of the year with innumerable flowers of beautiful colours, the red being prevalent.

Papyrus.

The papyrus is an aquatic plant, having a stem from 3 to 6 feet high. It inhabits both stagnant waters and running streams, and is common in the countries of the Nile, particularly Egypt and Abyssinia. Its soft, smooth, flower-stem afforded the most ancient material from which paper was prepared, and for this reason it is one of the noticeable African plants. It has, however, also been used for other purposes; its flowering stems and leaves are twisted into ropes; and the roots, which are sweet, are used as food.

Animals.

Africa is distinguished from other continents by the scar-

Africa.

Quadrupeds.

city of forests: it has consequently very few of the animals which inhabit forests. Deer are almost entirely wanting; in their place we find antelopes, which occur in greater numbers than in any other country. Peculiar to Africa are the zebras and other striped mammalia of the equine and asinine tribes; the giraffe, and their constant companion the ostrich. The extraordinary swiftness of these animals, which enables them to seek for their food at great distances, is peculiarly adapted to the immense plains of the country. The scarcity of forests further corresponds with that of squirrels, the few that are found being mostly ground-squirrels. Mice are numerous, as are also hares, which prefer steppe-like countries to woodland. The immense quantity of game affords food for plenty of carnivorous animals. Upon the whole, the mammalian fauna of Africa approaches in resemblance much nearer to that of Southern Asia than that of South America. The following table affords a general view of the distribution of mammalia in the different parts of Africa,—the figures denoting the number of species found in each of the divisions, those in parentheses being the number peculiar to Africa.

| Orders. | N. Africa, incl. Barbary & the countries bordering on the Mediterranean | S. Africa. | W. Africa. | Egypt, Nubia. | Abyssinia. | Madagascar. | All Africa. |
|---|---|---|---|---|---|---|---|
| Simiæ | 1 | 5 | 30 | 7 | 6 | 18 | 63 ( 62) |
| Carnivora | 23 | 67 | 34 | 67 | 25 | 21 | 174 (151) |
| Marsupialia | — | — | — | — | — | — | — — |
| Rodentia | 15 | 46 | 20 | 36 | 18 | 3 | 104 ( 94) |
| Edentata | — | 2 | 3 | 2 | — | — | 6 ( 6) |
| Pachydermata | 1 | 9 | 4 | 3 | 5 | 1 | 18 ( 17) |
| Ruminantia | 4 | 27 | 21 | 13 | 11 | — | 65 ( 62) |
| Cetacea | 3 | 11 | 2 | 2 | — | 2 | 16 ( 7) |
| TOTAL | 47 | 167 | 114 | 130 | 65 | 45 | 446 (399) |

Simiæ.

The order *Simiæ* is well represented, more particularly within the tropics, whence they decrease northwards and southwards. In Barbary and Lower Egypt only one ape is found (*Inuus ecaudatus*), and in the southern extremity only two species. In Madagascar, the place of the true monkeys is supplied by the peculiar tribe of the makis. Many species are similar to those of Asia; thus the orang-outang of Borneo is represented in Africa by the chimpanzee. The gibbons and solemn doucs (*Hylobates* and *Semnopithecus*) are entirely wanting.

Carnivora.

Bats are numerous in Africa, but few are peculiar to it: the hedgehog is represented by the *tenrecs* of Madagascar: the shrew peculiar to this continent is the elephant-shrew of the Cape: our mole is represented by the *chryso-chlore*, with iridescent hair, and eyes not perceptible. Of the larger carnivora the bear is almost entirely wanting, and occurs only sparely in Barbary and Abyssinia. The true martens are unknown; but otters occur; and the civets are characteristic types. Of the *Canis* family the shakal (jackal) is characteristic: it differs from the Asiatic species by a paler skin, which approaches the colour of the prevailing deserts. Hyænas are true African tenants. Africa is the chief home of the lion, who there remains undisturbed as king over the animal creation, while in Asia his power is divided with the tiger; he is found all over the continent, except in the north-eastern portions, in the greater part of the Sahara, and where European civilization has taken root. The panther, the leopard, and once, are the other principal representatives of the cat-tribe.

Marsupialia.

The Marsupialia are entirely wanting.

Rodentia.

Of Rodentia the burrowing kinds prevail, both of squirrels and of mice. Hares are unknown in Western Africa, but porcupines extend from the Cape to Barbary.

Edentata.

Of Edentata the six species known to occur in Africa, are also peculiar to it. The aardwark (*Orycteropus capensis*) is essentially burrowing in its habits; and the burrows formed by these animals are the source of frequent danger to the waggons and horses of the Cape colonists.

Pachydermata.

Of wild horses the asinine group is peculiar to Asia, and the hippotigrine group to Africa. The different species are found in large herds. The zebra ranges from Southern Africa northwards to about 10° north latitude. Africa has three peculiar species of rhinoceros, one elephant; and that remarkable animal, the hippopotamus, is one of its most characteristic types, extending from the Orange River to the Nile, Lake Tsad, and the Senegal. In the genus *sus*, the wart-hogs (*Phascochœrus*) belong exclusively to Africa, and the *Hyrax* (wabber, daman, dassie, of the colonists) is also its peculiar inhabitant.

Ruminantia.

Antelopes occur in all parts, and in great varieties and numbers. Dense herds sometimes extend over the far-stretching plains as far as the eye can reach, and, when in the dry season they are forced to approach the colonies, and pay visits to the farmers, they become as destructive as locusts. The most valuable of the African animals is the camel or dromedary, which is believed to have been introduced by the Arabs. It ranges over the Sahara and all Northern Africa, as far as Lake Tsad, and is everywhere domesticated. Lastly, the giraffe, one of the most celebrated and characteristic of African quadrupeds, ranges from the Cape Colony as far as the Sahara and Nubia.

Birds.

The ornithology of Africa presents a close analogy in many of its species to those of Europe and South Asia. Thus, on its northern coasts, there is scarcely a single species to be found which does not also occur in the other countries bordering on the Mediterranean. The ornithology of the region of the Nile and the northern coasts is identified with that of Arabia, Persia, and Spain. The deserts are inhabited by species adapted to its solitudes; while Southern Africa presents different species.

The ostrich, the hugest of birds, which has been described as the feathered camel, or the giraffe among birds, is found in almost every part of Africa. But its chief home is the desert and the open plains; mountainous districts it avoids unless pressed by hunger. The beautiful white feathers, so highly prized by the ladies of Europe, are found in the tail only of the male bird. The chase is not without its difficulties, and it requires the greatest care to get within musket-shot of the bird, owing to its constant vigilance and the great distance to which it can see. The fleetest horse,

Africa.

too, will not overtake it, unless stratagem be adopted to tire it out. If followed up too eagerly, the chase of the ostrich is not destitute of danger; for the huntsman has sometimes had his thigh-bone broken by a single stroke from the leg of a wounded bird.

The large messenger or secretary-bird, which preys upon serpents and other reptiles, is one of the most remarkable African birds. It is common near the Cape, and is not seldom domesticated. Of gallinaceous fowls, adapted to the poultry-yard, Africa possesses but a single genus, the guinea-hens, which, however, are found in no other part of the world. These birds, of which there are three or four distinct species, go in large flocks of 400 or 500, and are most frequently found among underwood in the vicinity of ponds and rivers. There are, besides, many species of partridges and quails in different parts of Africa. Water fowl of various species are also abundant on the lakes and rivers, as are likewise various species of owls, falcons, and vultures, the latter of which are highly useful in consuming the offal and carrion, which might otherwise taint the air and produce disease.

Among the smaller birds of Africa are many species remarkable for the gaudiness and brilliancy of their plumage, or the singularity of their manners and economy. Of the former kind may be mentioned the sunbirds, the lamprotornis, the bee-eaters, the rollers, the plantain-eaters, the parrots, the halcyons, and numerous smaller birds that swarm in the forests. Of the latter kind, it will be sufficient to mention the honey-cuckoo (*Cuculus indicator*).

Reptiles.

Though Africa is not exempt from the scourge of venomous or dangerous reptiles, still it has comparatively fewer than other tropical countries, owing to the dryness of the climate. Many of its rivers disappear in the hot season, and forests are scarce, and seldom extensive and large. The reptiles harboured by the desert regions consist chiefly of harmless lizards and serpents of a small size, though often venomous. The frog and tortoise tribes are represented in but few species and numbers.

The most important among the reptiles is the crocodile, which inhabits nearly all the large rivers and lakes within the tropics, and is still abundant in the Nile below the first cataract.

The chameleon is common in Africa. Among the venomous species of snakes are the purple naja, the cerastes or horned viper, the ringed naja, and the darting viper.

Fishes.

The edible fish are found almost everywhere in great variety and quantity. The fresh waters of Egypt produce the gigantic bishir, the coffres, and numerous species of the pimelodes. The greater number of the fish of the Red Sea resemble the saxatiles of the warm seas of Asia. On the west coasts are found the fish belonging to equatorial latitudes, while the shores of the Mediterranean produce those of France and Spain. The seas of the southern extremity possess the species common to the latitudes of the antarctic, south of the three great capes. The fish of the east coast are the same as those of the Indian Sea.

Insects.

Of the insect tribes, Africa also contains many thousand different kinds. The locust has been, from time immemorial, the proverbial scourge of the whole continent; scorpions, scarcely less to be dreaded than the noxious serpents, are everywhere abundant; and the zebub, or fly, one of the instruments employed by the Almighty to punish the Egyptians of old, is still the plague of the low and cultivated districts. In the interior of Africa, a venomous fly has recently been discovered, which is fatal to nearly all domestic animals. It is called tsetse (*Glossina morsitans*), and its size is almost that of the common blue fly which settles on meat; but the wings are larger. On the existence of this insect greatly depended the success of recent explorers in that quarter, as, where it occurred, their cattle infallibly fell victims to its bite. There are large tribes which cannot keep either cattle or sheep, because the tsetse abounds in their country. Its bite is not, however, dangerous to man; wild animals, likewise, are undisturbed by it. The termites or white ants are likewise a scourge to the country where they occur in great numbers. This destructive creature devours everything in the shape of wood, leather, cloth, &c. that falls in its way; and they march together in such swarms, that the devastation they commit is almost incredible.

Africa.

Zoophytes.

Of the class of zoophytes, the brilliant polypi of every variety, and madrepores, abound on the coasts of Africa. The shores of the Mediterranean produce the finest coral, and those of the Red Sea bristle with extensive reefs of the same mollusca.

Man.

From the shores of the Mediterranean to about the latitude of 20° north, the population of Africa consists largely of tribes not originally native to the soil, but of Arabs and Turks, planted by conquest, with a considerable number of Jews, the children of dispersion; and the recently introduced French. The Berbers of the Atlas region, the Tuaricks and Tibbus of the Sahara, and the Copts of Egypt, may be viewed as the descendants of the primitive stock, while those to whom the general name of Moors is applied, are perhaps of mixed descent, native and foreign. From the latitude stated, to the Cape colony, tribes commonly classed together under the title of the Ethiopic or negro family are found, though many depart very widely from the peculiar physiognomy of the negro, which is most apparent in the natives of the Guinea coast. In the Cape Colony, and on its borders, the Hottentots form a distinct variety in the population of Africa, most closely resembling the Mongolian races of Asia.

The Copts, or as they are correctly pronounced either Ckoobt or Ckibt, are considered to be the descendants of the ancient Egyptians. They do not now compose more than one-sixteenth part of the population of Egypt, their number not exceeding 150,000, about 10,000 of whom reside at Cairo. Conversions to the Mahometan faith, and intermarriages with the Moslems, have occasioned this decrease in their numbers; to which may be added the persecutions which they endured from their Arabic invaders and subsequent rulers. They were forced to adopt distinctions of dress, and they still wear a turban of a black or blue, or a grayish or light brown colour, in contradistinction to the red or white turban. In some parts of Upper Egypt, there are villages exclusively inhabited by the Copts. Their complexion is somewhat darker than that of the Arabs, their foreheads flat, and their hair of a soft and woolly character; their noses short, but not flat; mouths wide, and lips thick; the eyes large, and bent upwards in an angle like those of the Mongols; their cheek-bones high, and their beards thin. They are not an unmixed race, their ancestors in the earlier ages of Christianity having intermarried with Greeks, Nubians, and Abyssinians. With the exception of a small proportion, the Copts are Christians of the sect called Jacobites, Eutychians, Monophysites, and Monothelites, whose creed was condemned by the council of Chalcedon, A.D. 451. They are extremely bigoted, and bear a bitter hatred to all other Christians; they are of a sullen temper, extremely avaricious, great dissemblers, ignorant, and faithless. They frequently indulge in excessive drinking; but in their meals, their mode of eating, and the manner in which they pass their hours of leisure, which is chiefly in smoking their pipes and drinking coffee, they resemble the other inhabitants of the country. Most of the Copts in Cairo are employed as secretaries and accountants, or tradesmen; they are chiefly engaged in the government offices; and as mer-

Africa.

chants, goldsmiths, silversmiths, jewellers, architects, builders, and carpenters, they are generally considered more skilful than the Moslems. The Coptic language is now understood by few persons, and the Arabic being employed in its stead, it may be considered as a dead language.

Nubians.

The countries above Egypt are inhabited by two tribes of people resembling each other in physical characters, but of distinct language and origin. One is, perhaps, the aboriginal or native, the other a foreign tribe. Dr Prichard terms them Eastern Nubians, or Nubians of the Red Sea, and Nubians of the Nile, or Berberines. All these tribes are people of a red-brown complexion, their colour in some instances approaching to black, but still different from the ebony hue of the Eastern negroes. Their hair is often frizzled and thick, and is described to be even woolly; yet it is not precisely similar to the hair of the negroes of Guinea. The Eastern Nubians are tribes of roving people who inhabit the country between the Nile and the Red Sea; the northern division of this race are the Ababdeh, who reach northward in the eastern desert as far as Kosseir, and towards the parallel of Deir border on the Bishari. The Bishari reach thence towards the confines of Abyssinia. The latter are extremely savage and inhospitable; they are said to drink the warm blood of living animals: they are for the most part nomadic, and live on flesh and milk. They are described as a handsome people, with beautiful features, fine expressive eyes, of slender and elegant forms; their complexion is said to be a dark brown, or a dark chocolate colour. The Barâbra or Berberines are a people well known in Egypt, whither they resort as labourers from the higher country of the Nile. They inhabit the valley of that name from the southern limit of Egypt to Sennaar. They are a people distinct from the Arabs and all the surrounding nations. They live on the banks of the Nile; and wherever there is any soil, they plant date-trees, set up wheels for irrigation, and sow durra and some leguminous plants. At Cairo, whither many of this race resort, they are esteemed for their honesty. They profess Islam. The Barâbra are divided into three sections by their dialects, which are those of the Nuba, the Kenous, and the Dongolawi. According to Dr Prichard, it is probable that the Berberines may be an offset from the original stock which first peopled Egypt and Nubia.

Tibbus.

The country of the Nubians is limited on the west by that of the Tibbus, who are spread over the eastern portions of the Sahara, as far as Fezzan and Lake Tsad. Dr Latham considers it probable that their language belongs to the Nubian class. They inhabit the locality of the ancient Libyans or *Libyes*. Their colour is not uniform. In some it is quite black, but many have copper-coloured faces. They are slim and well made, have high cheek-bones, the nose sometimes flat like that of the negro, and sometimes aquiline. Their mouth is, in general, large, but their teeth fine. Their lips are frequently formed like those of Europeans, their eyes are expressive, and their hair, though curled, not woolly. The females are especially distinguished by a light and elegant form, and in their walk and erect manner of carrying themselves are very striking. Their feet and ankles are delicately formed, and not loaded with a mass of brass or iron, as is the practice in other countries of Northern Africa, but have merely a light anklet of polished silver or copper, sufficient to show their jetty skin to more advantage; and they also wear neat red slippers. The Tibbus are chiefly a pastoral people. They keep horses, cattle, sheep, and goats, but camels constitute their principal riches. The villages of the Tibbus are very regularly built in a square, with a space left on the north and south faces of the quadrangle for the use of the cattle. The huts are entirely of mats, which exclude the sun, yet admit both the light and the air. The interior of these habitations is singularly neat: clean wooden bowls for the preservation of milk, each with a cover of basket-work, are hung against their walls. They are greatly exposed to the predatory incursions into their country by the enemies who surround them. They carry on a considerable traffic in slaves between Sudan, Fezzan, and Tripoli.

The Berber group.

"All that is not Arabic in the kingdom of Marocco," says Dr Latham, "all that is not Arabic in the French provinces of Algeria, and all that is not Arabic in Tunis, Tripoli, and Fezzan, is Berber. The language, also, of the ancient Cyrenaica, indeed the whole country bordering the Mediterranean, between Tripoli and Egypt, is Berber. The extinct language of the Canary Isles was Berber; and, finally, the language of the Sahara is Berber. The Berber languages, in their present geographical localities, are essentially inland languages. As a general rule, the Arabic is the language for the whole of the sea-coast, from the Delta of the Nile to the Straits of Gibraltar, and from the Straits of Gibraltar to the mouth of the Senegal." The Berber nation is one of great antiquity, and, from the times of the earliest history, has been spread over the same extent of country as at present: the ancient Numidian and Mauritanian names of Sallust, and other writers, have a meaning in the Modern Berber. It has affinities with the Semitic languages. In the northern parts of Atlas, these people are called Berbers; in the southern tracts, they are the Shuluh, or Shelhas. In the hilly country belonging to Tunis, the Kabyles, in Mount Auress, the Showiah, and in the Desert the Tuarick,—all belong to the same group. The mountains of Atlas are said to be inhabited by more than twenty different tribes, carrying on perpetual warfare against each other. They are very poor, and make plundering excursions in quest of the means of supporting life. They are described as an athletic, strong-featured people, accustomed to hardships and fatigue. Their only covering is a woollen garment without sleeves, fastened round the waste by a belt.

The Shuluh, who are the mountaineers of the Northern Atlas, live in villages of houses made of stone and mud, with slate roofs, occasionally in tents, and even in caves. They are chiefly huntsmen, but cultivate the ground and rear bees. They are described as lively, intelligent, well-formed athletic men, not tall, without marked features, and with light complexions. The Kabyles, or Kabaily, of the Algerian and Tunisian territories, are the most industrious inhabitants of the Barbary States, and, besides tillage, work the mines contained in their mountains, and obtain lead, iron, and copper. They live in huts made of the branches of trees, and covered with clay, which resemble the *magalia* of the old Numidians, spread in little groups over the sides of the mountains, and preserve the grain, the legumes, and other fruits, which are the produce of their husbandry, in *mattoures*, or conical excavations in the ground. They are of middle stature; their complexion is brown, and sometimes nearly black.

The Tuarick are a people spread in various tribes through the greater portion of the Sahara. The expedition under Richardson, Barth, and Overweg, who traversed and explored a great portion of the Tuarick territories, has greatly added to our knowledge of these people. The following are the names and localities of the principal tribes:—

1. Tanelkum, located in Fezzan.
2. Azghers, { Ouraghen, family of Shafou, / Emanghasatan, „ of Hateetah, / Amana, „ of Jabour, } located at Ghat.
3. Aheethanaran, the tribe of Janet.
4. Hagar (Ahagar), pure Hagars and Maghatah. They occupy the tract between Ghat, Tuat, and Timbuktu.
5. Sagamaram, located on the route from Aisou to Tuat.

Africa.

6. Kailouees, including the Kailouees proper, the Kaltadak, and the Kalfadaï.

7. Kilgris, including the Kilgris proper, the Iteesan, and the Ashraf. These and the tribes under the preceding head inhabit the kingdom of Ahir.

8. Oulimad, tribes surrounding Timbuktu in great numbers. This, probably identical with the Sorghou, is the largest and most powerful tribe, while the Tanelkums are the smallest and weakest.

The various tribes are very different in their characters, but they are all fine men, tall, straight, and handsome. They exact a tribute from all the caravans traversing their country, which chiefly furnishes them with the means of subsistence. They are most abstemious, their food consisting principally of coarse brown bread, dates, olives, and water. Even on the heated desert, where the thermometer generally is from 90° to 120°, they are clothed from head to foot, and cover the face up to the eyes with a black or coloured handkerchief.

Moors. The Moors who inhabit large portions of the empire of Marocco, and are spread all along the Mediterranean coast, are a mixed race, grafted upon the ancient Mauritanian stock; whence their name. After the conquest of Africa by the Arabs, they became mixed with Arabs; and having conquered Spain in their turn, they intermarried with the natives of that country, whence, after a possession of seven centuries, they were driven back to Mauritania. They are a handsome race, having much more resemblance to Europeans and western Asiatics, than to Arabs or Berbers; although their language is Arabic, that is, the Mogrebin dialect, which differs considerably from the Arabic in Arabia, and even in Egypt. They are an intellectual people, and not altogether unlettered; but they are cruel, revengeful, and blood-thirsty, exhibiting but very few traces of that nobility of mind and delicacy of feeling and taste which graced their ancestors in Spain. The history of the throne of Marocco, of the dynastic revolutions at Algiers, Tunis, and Tripoli, is written with blood; and among the pirates who infested the Mediterranean they were the worst. Their religion is the Mahometan. They are temperate in their diet, and simple in their dress, except the richer classes in the principal towns, where the ladies literally cover themselves with silk, gold, and jewels, while the men indulge to excess their love of fine horses and splendid arms. They generally lead a settled life as merchants, mechanics, or agriculturists, but there are also many wandering tribes. They exhibit considerable skill and taste in dyeing, and in the manufacture of swords, saddlery, leathern-ware, gold and silver ornaments. At the Great Exhibition in London in 1851, the Moorish department contained several articles which were greatly admired. The Moors, along the coast of Marocco, still carry on piracy by means of armed boats.

Arabs. At two different periods, separated from each other by perhaps a thousand years, Africa was invaded by Arabic tribes which took a lasting possession of the districts they conquered, and whose descendants form no inconsiderable portion of the population of North and Central Africa, while their language has superseded all others as that of civilisation and religion. Of the first invasion, more has been said under the head *Abyssinians*. The second was that effected by the first successors of Mahomet, who conquered Egypt, and subsequently the whole north of Africa as far as the shores of the Atlantic, in the course of the first century of the Hegira, or the seventh of the Christian era. As regards language, Egypt is now an entirely Arabic country, although in many other respects the Fellahs are totally different from the peasants in Arabia. But there are also several tribes of true Arabic descent scattered about from the highlands of Abyssinia down over Nubia and Egypt, and westward over the central provinces of Kordofan, Darfur, Waday, and Bornu. Others wander in the Libyan deserts and the Great Sahara, as well as in the states of Tripoli, Tunis, and Algiers, leading a similar life with the Kabyles, but constituting a totally distinct race. Others, again, dwell in the empire of Marocco, among whom those along the shores of the Atlantic are notorious for their predatory habits and ferocious character. In many places Arabic adventurers have succeeded in subduing native tribes of every nationality, over which they rule as sovereign lords; and on the coast of Zanzibar resides an Arabic royal dynasty. Many of the smaller islands to the north of Madagascar are inhabited by Arabs, and traces of them have been discovered in Madagascar itself. The African Arabs are not all alike in features and colour of skin, the differences being attributable to some of them having intermarried with natives, while others preserved the purity of their blood.

Jews. The early settlements of the Jews in Egypt are facts universally known. Under the Ptolemies, large numbers of them settled at Alexandria and in Cyrenaica, and after the destruction of Jerusalem they rapidly spread over the whole of the Roman possessions in Africa; many also took refuge in Abyssinia. King Philip II. having driven them out of Spain, many thousands of families took refuge on the opposite coast of Africa. They are now numerous in all the larger towns in the north, where they carry on the occupation of merchants, brokers, &c., the trade with Europe being mostly in their hands. They live in a state of great degradation, except in Algiers, where the French restored them to freedom and independence. They have acquired much wealth, and, although compelled to hide their riches from the cupidity of their rulers, they lose no opportunity of showing them whenever they can do so without risk of being plundered, fear and vanity being characteristic features of their character. The Jewesses in Marocco and Algiers are of remarkable beauty.

Turks. Ever since the conquest of Egypt by Sultan Selim, and the establishment of Turkish pashalics in Tripoli, Tunis, and Algiers, Turks have settled in the north of Africa; and as they were the rulers of the country, whose numbers were always on the increase, on account of the incessant arrivals of Turkish soldiers and officials, the Turkish became, and still is, the language of the different governments. Properly speaking, however, they are not settled, but only encamped in Africa, and hardly deserve a place among the African nations.

Abyssinians. Not all the inhabitants of the country called Abyssinia are Abyssinians in ethnology; nor are the real Abyssinians all of the same origin, being a mixed race, to the formation of which several distinct nations have contributed. The primitive stock is of Ethiopian origin, but, as their language clearly shows, was at an early period mixed with a tribe of the Himyarites from the opposite coast of Arabia, who, in their turn, were ethnologically much more closely connected with the Hebrews than with the Joctanides, or the Arabs properly speaking. In the age of the Egyptian Ptolemies, and after the destruction of Jerusalem, Jews settled in Abyssinia in such numbers, that not only their religion spread among the inhabitants, but the Hebrew language became mixed with the Abyssinian as it then was. Hence the surprising analogy between the principal Abyssinian languages, viz., the Gheez in Tigré, and the Amharic in Amhara, with the Hebrew. The uninterrupted intercourse with Arabia, and the immigration of several Arabic tribes, also contributed towards the apparently Semitic aspect of the present Abyssinian language. A large portion of Abyssinia having been occupied by Galla and other tribes, we shall here only dwell on the original Abyssinians. They inhabit a large tract extending from the upper course of the Blue River, north as far as the Red Sea, and some isolated districts in the south

Africa.

and south-east. To the west of them are the Agau Abyssinians, a different tribe, whose idiom, however, is the common language of the lower classes in Tigré and Amhara also. Abyssinia was once a large and powerful kingdom, but the Galla having conquered the whole south of it, it gradually declined until the king or emperor became a mere shadow, in whose name several vassal princes exercise an unlimited power each in his own territory. Owing to their jealousy and mutual fears, war seldom ceases among the inhabitants. The Christian religion was introduced into Abyssinia in the first centuries after Christ; but whatever its condition might have been in former times, it now presents a degraded mixture of Christian dogmas and rites, Jewish observances, and heathenish superstition. Yet of Judaism, which was once so powerful, but feeble traces are extant, while the Mahometan religion is visibly on the increase. European missionaries have been and still are very active among them, but their efforts have been crowned only with partial success. The Abyssinians, the Gallas being excluded from that denomination, are a fine strong race, of a copper hue more or less dark, and altogether different from the Negroes, with whom, however, they have frequently been confounded because they were called a black people. Their noses are nearly straight, their eyes beautifully clear, yet languishing, and their hair is black and crisp, but not woolly. They are on the whole a barbarous people, addicted to the grossest sensual pleasures; and their priests, among whom marriage is customary, are little better than the common herd of the people. They live in huts, a large assemblage of which forms a so-called town, and although they possess some solid constructions of stone, such as churches and bridges, it appears that they were built by the Portuguese, the ruins at Axum and other places belonging to a much earlier period, when the country undoubtedly enjoyed a higher civilisation than at present. Owing to influence exercised upon them during the last thirty years by European missionaries and travellers, their conduct towards strangers is less rude than it used to be at the time of Bruce. It is a remarkable fact that, notwithstanding the low state of their religion, the Christians in Abyssinia are not allowed to keep slaves, although they may purchase them for the purpose of selling them again.

The Ethiopic race.

This extensive race comprehends by far the greater number of African nations, extending over the whole of Middle and South Africa, except its southernmost projection towards the Cape of Good Hope. A line drawn from the mouth of the Senegal in the west to Cape Jerdaffun in the east, forms its northern limits almost with geometrical accuracy, few Ethiopic tribes being found to the north of it. All the members of this race, however, are not Negroes. The latter are only one of its numerous offshoots, but between the receding forehead, the projecting cheek-bones, the thick lips of the Negro of Guinea, and the more straight configuration of the head of a Galla in Abyssinia, there are still many striking analogies; and modern philology having traced still greater analogies, denoting a common origin, among the only apparently disconnected languages of so many thousands of tribes, whose colour presents all the hues between the deepest black and the yellow brown, it is no longer doubtful that the Negro, the Galla, the Somali and the Kaffre, all belong to the same ethnological stock. Owing to our most imperfect knowledge of the central parts inhabited by that race, a classification of all its numerous members must always remain imperfect, a circumstance which cannot fail to give interest to the following scientific classification of the Negro tribes according to their various languages.[1]

I. *North-west Atlantic Languages.* 1st Group.—Fulup, Filham. 2d.—Bola, Sarar, Pepel. 3d.—Biafada, Padsade. 4th.—Baga, Timne, Bulom, Mampua, Kisi.

II. *North-west High Sudan or Mandengo Languages.* 1st.—Mande or Mandengo dialects. 2d.—Bambara. 3d. Kono. 4th.—Vei. 5th.—Soso. 6th.—Tene. 7th.—Gbandi. 8th.—Landoro. 9th.—Mande. 10th.—Gbese. 11th.—Toma. 12th.—Mano. 13th.—Gio.

III. *Upper Guinea Languages.* A. *Liberian or Kru* (Kroo). 1st.—Dewoi or De. 2d.—Basa. 3.—Kra or Kru. 4th.—Krebo. 5th.—Gbe.

B. *Dahomean or Slave Coast.* 1st.—Adampe. 2d.—Anfue. 3d.—Hwida. 4th.—Dahome. 5th.—Mahi.

C. *Aku-Igalu.* 1st Group.—Aku proper, Ota, Egba, Idsesa, Yoruba, Yagba, Ki or Eki, Dsumu, Oworo, Dsebu, Ife, Ondo or Doko, Dsekiri. 2d.—Igala dialects.

IV. *North-east High Sudan Languages.* 1st Group.—Mose or Gurmaka or Bembe, Dselana, Guren, Gurma. 2d.—Legba, Kaure, Kiamba or Dsamba or Tem. 3d.—Koama, Bagbalan. 4th.—Kasem, Yula.

V. *Niger-Delta Languages.* 1st Group or Ibo dialects.—Isoama, Isiele, Abadsa, Aro, Mbofia. 2d.—Sobo, Egbele, Bini, Ihewe or Isewe, Oloma. 3d.—Okuloma, Udso.

VI. *Niger-Chadda or Nupe Languages.* Nupe, Kupa, Esitako, Musu, Goali, Basa, Ebe, Opanda, Egbira Hima.

VII. *Central African Languages.* 1st Group of Languages.—Buduma, Bornu dialects. 2d.—Pika, Karekare. 3d.—Bode dialects.

*South African Languages*—distinguished by an initial inflection.

VIII. *Atam Languages.* 1st Group.—Ekamtulufu, Udom, Mbofon, Eafen. 2d.—Basa, Kamuku.

IX. *Moko Languages.* 1st.—Isuwu, Diwala, Orungu, Bayon, Kum or Bakum, Bagba, Balu, Mom or Bamom, Ngoala, Momenya or Bamenya, Papiah, Param. 2d.—Ngotan, Melon, Nhalemoe, Seke.

X. *Kongo-Ngola Languages* (in Kongo, Angola, and further inland). 1st Group. Kabenda, Mimboma, Ntere or Nteke or Betera, Mutsaya, Musentandu or Besentandu, Mbamba, Kanyika. 2d.—Babuma, Bumbete, Kasands, Nyombe, Sunde. 3d.—Ngola (Angola), Pangela (Benguela), Lubalo, Ruunda or Luonda or Muola, Songo, Kisama.

XI. *South-east Languages.* Muntu or Adsawa, Kiriman, Marawi, Meto, Matatan, Nyamban.

XII. *Unclassified and isolated Languages.* A. *In North-western Sudan.* Wolof or Yolof, Gadsaga, Bidsogo, Gura, all distinguished by final inflection; and Banyun, Nalu, Bulanda, Limba and Landoma, distinguished by initial inflection.

B. *In High Sudan.* Asante, Barba, Boko.

C. *In Central Africa.* Kandin, Timbuktu, Baghermi, Houssa, Pulo dialects.

D. *In the delta of the Niger.* Yala.

E. *In South Africa.* Anan, Dsuka, Dsarawa, Koro, Ham, Akurakura, Okam, Yasgua, Nki, Kambali, Alege, Penin, Bute, Murundo, Undaza, Ndob, Nkele, Konguan, Mbarike, Tiwi, Abadsa, Boritsu, Afudu, Mfut, Mbe, Nso.

These divisions, however, are merely linguistic. The principal Negro nations, as we know them, are the *Mandingoes*, who are numerous, powerful, and not uncivilised, in Senegambia, and farther inland, around the head waters of the Kawara, where they have established a great number of kingdoms and smaller sovereignties. The inland trade is chiefly in their hands. They are black, with a mixture of yellow, and their hair is completely woolly. The *Wolofs* or *Yolofs*, whose language is totally different from those of

[1] Extracted from a MS. of the Rev. Mr Koelle of the Church Missionary Society, on the Negro Languages, which the author, who has just returned from his labours at Sierra Leone, kindly allowed the writer to avail himself of for the *Encyclopædia Britannica*.

Africa. their neighbours, are the handsomest and blackest of all Negroes, although they live at a greater distance from the equator than most of the other black tribes, their principal dwelling-places being between the Senegal and the Gambia along the coast of the Atlantic. They are a mild and social people. The *Foulahs* or *Fellatahs* occupy the central parts of Sudan, situated in the crescent formed by the course of the Kawara, and also large tracts to the south-east as far as the equator west to the Senegal, and east till beyond Lake Tsad. Their colour is black, with a striking copper hue, some of them being hardly more dark than gipsies. They are one of the most remarkable nations in Africa, very industrious, live in commodious and clean habitations, and are mostly Mahometans. A distinction was formerly made between the Foulahs of Senegambia and the Fellatahs of Central Africa, but it has since been ascertained that they belong to the same stock, and speak the same language. The hair of the Foulahs is much less woolly than that of other Negroes. Of the principal nations in Guinea, among whom the true Negro type is particularly distinct, especially around the Bight of Benin, are the Feloops, near the Casamanca, very black, yet handsome; and the Ashanti, of the Amina race, who surpass all their neighbours in civilisation, and the cast of whose features differs so much from the Negro type that they are said to be more like Indians than Africans; although this is perhaps only true of the higher orders. They are still in possession of a powerful kingdom. The country behind the Slave Coast is occupied by tribes akin to the Dahomeh on the coast. In South Guinea we meet three principal races, namely, the Congo, the Abunda, and the Benguela Negroes, who are divided into a variety of smaller tribes, with whom we are much less acquainted than with the northern Negroes, although the Portuguese have occupied this coast for upwards of three centuries. The next great branch of the Ethiopic race comprehends the Galla, who occupy an immense tract in Eastern Africa from Abyssinia as far as the inland portions of the Portuguese possessions in Mozambique to the south of the equator. Our knowledge of them is chiefly confined to those Gallas who conquered Abyssinia. With regard to their physical conformation, they stand between the Negro of Guinea and the Arab and Berber. Their countenances are rounder than those of the Arabs, their noses are almost straight, and their hair, though strongly frizzled, is not so woolly as that of the Negro, nor are their lips quite so thick. Their eyes are small (in which they again differ from the Abyssinians), deeply set, but very lively. They are a strong, large, almost bulky people, whose colour varies between black and brownish, some of their women being remarkably fair, considering the race they belong to.

Galla.

Somali. An interesting tribe of them has lately been brought to the knowledge of Europeans, the Somali, a widely-scattered nation which leads a pastoral life on the uplands, and also nearer to the coast of the Indian Ocean from Cape Jerdaffun southward for a considerable distance. They seem to be of a mild and peaceful disposition, while on the contrary the other Galla are a warlike race, which has been pressing upon its neighbours during the last three hundred years, and are much feared by all those who are obliged to come near them.

Kaffres. The Kaffres, who, together with the tribes most akin to them, occupy the greater portion of South Africa, especially the eastern portions, have some analogy with Europeans in their features; but they are woolly haired, and while some are almost black, others are comparatively fair, although some of their tribes might have been mixed with the Eastern Negroes. They have been very wrongly classed with the Negroes. They are a strong, muscular, active people, addicted to plunder and warfare. The Eastern Kaffres, among whom the Amakosah and Amazulah are best known to us on account of their frequent invasions of the Cape Colony, are much more savage than the western and northern, or the Bechuana and Sichuana tribes. All Kaffres are pastoral, keeping large herds of cattle, but the last-named tribes inhabit large towns, well-built houses, cultivate the ground carefully, and exhibit every appearance of being capable of entire civilisation. The word Kaffre or Kafir, as it ought to be written, is Arabic, and was first applied by the Europeans to the inhabitants of the coast of Mozambique, because they were so called by the Mahometans, in whose eyes they were *Kafirs*, that is infidels. Africa.

Hottentots. We conclude this sketch with the Hottentot race, which is entirely different from all the other races of Africa. Where they originally came from, and how they happened to be hemmed in and confined entirely to this remote corner of the earth, is a problem not likely to be ever satisfactorily solved. The only people to whom the Hottentot has been thought to bear a resemblance, are the Chinese or Malays, or their original stock the Mongols. Like these people, they have the broad forehead, the high cheek-bones, the oblique eye, the thin beard, and the dull yellow tint of complexion, resembling the colour of a dried tobacco leaf; but there is a difference with regard to the hair, which grows in small tufts, harsh, and rather wiry, covering the scalp somewhat like the hard pellets of a shoe-brush. The women, too, have a peculiarity in their physical conformation, which, though occasionally to be met with in other nations, is not universal, as among the Hottentots. Their constitutional "bustles" sometimes grow to three times the size of those artificial stuffings, with which our fashionable ladies have disfigured themselves. Even the females of the diminutive Bosjesmen Hottentots, who frequently perish of hunger in the barren mountains, and are reduced to skeletons, have the same protuberances as the Hottentots of the plains. It is not known even whence the name of Hottentot proceeds, as it is none of their own. It has been conjectured that *hot* and *tot* frequently occurring in their singular language, in which the monosyllables are enunciated with a palatic clacking with the tongue, like that of a hen, may have given rise to the name, and that the early Dutch settlers named them *hot-en-tot*. They call themselves *qui-quæ*, pronounced with a clack. They are a lively, cheerful, good-humoured people, and by no means wanting in intellect; but they have met with nothing but harsh treatment since their first connection with Europeans. Neither Bartholomew Diaz, who first discovered, nor Vasco de Gama, who first doubled, the Cape of Good Hope, nor any of the subsequent Portuguese navigators, down to 1509, had much communication with the natives of this southern angle of Africa; but in the year above mentioned, Francisco d'Almeyda, viceroy of India, having landed on his return, at Saldanha (now Table) Bay, was killed, with about twenty of his people, in a scuffle with the natives. To avenge his death, a Portuguese captain, about three years afterwards, is said to have landed a piece of ordnance loaded with grape shot, as a pretended present to the Hottentots. Two ropes were attached to this fatal engine; the Hottentots poured down in swarms. Men, women, and children flocked round the deadly machine, as the Trojans did round the wooden horse, "*funemque manu contingere gaudent.*" The brutal Portuguese fired off the piece, and viewed with savage delight the mangled carcasses of the deluded people. The Dutch effected their ruin by gratifying their propensity for brandy and tobacco, at the expense of their herds of cattle, on which they subsisted. Under the British sway they have received protection, and shown themselves not unworthy of it. They now possess property, and enjoy it in security. One of the most beautiful villages, and the neatest and best-cultivated gardens, Africa. belong to a large community of Hottentots, under the instruction and guidance of a few Moravian missionaries.

Bushmen. These forlorn people are of Hottentot origin. Of them also several tribes have been discovered much farther north, and intelligence has lately reached Europe, that between the Portuguese possessions, in the very centre of South Africa, there is a nation of dwarfish appearance who possess large herds, and who seem to belong to the original Bushmen stock.

Malays. The island of Madagascar is inhabited by a race of Malay origin, exhibiting traces of Negro and Arabic mixture.

Population The total population of Africa is vaguely estimated, according to the most recent researches, at 100,000,000.

Occupation Strictly nomadic habits are not extensively prevalent. The great majority of the native tribes are distributed in towns or villages, occupy permanent dwellings and cling to their rude habitations with home attachment; while even the wild tenants of the desert, who roam far and wide in search of plunder, have selected oases, or watered valleys, as the sites of permanent abode. Except in the immediate neighbourhood of the Mediterranean, and of European settlements, society has remained in a barbarian state.

*Agriculture* is conducted with little art. The natural fertility of the soil in the well-watered districts supersedes the need of skill, while the production of the simplest manufactures is alone requisite, where the range of personal wants embraces few objects, and those of the humblest class.

*Wars*, cruel and incessant, waged not for the sake of territory, but for the capture of slaves, form one of the most marked and deplorable features in the social condition of the African races. This practice, though not of foreign introduction, has been largely promoted by the cupidity of the Europeans and transatlantic nations; and, unhappily, the efforts of private philanthropy, and the political arrangements of various governments, have not availed to terminate the hideous traffic in mankind, or abate the suffering entailed upon its victims.

Religion. In *Religion*, Christianity is professed in Abyssinia, and in Egypt by the Copts, but its doctrines and precepts are little understood and obeyed. Mahometanism prevails in all the northern countries; but the native mind, generally, is surrendered to superstitions of indefinite number and character. The labours of Christian missionaries have, however, done much, especially in South Africa, towards turning the benighted Africans from idols to the living God.

Political Divisions. In describing the political divisions of Africa, we shall proceed from north to south.

Northern Africa; Barbary. The country included under the general name of Barbary extends from the borders of Egypt on the east, to the Atlantic on the west, and is bounded by the Mediterranean on the north, and by the Sahara on the south. It comprises the states of Marocco, Algeria, Tunis, and Tripoli.

Marocco. Marocco, the most westerly state of Barbary, is thus named by the Europeans, but by the Arabs themselves Mogr'-eb-el-Aksa, or "the extreme west." The eastern boundary was determined in the treaty with the French of 18th March 1845, by a line which, in the south, commences east of the oasis Figueg, intersecting the desert of Angad, and reaching the Mediterranean at a point about 30 miles west of the Franch port Nemours. It comprehends an area of about 170,000 geographical square miles, and a population of 8,500,000. But for some time the power of the government of Marocco has been diminishing, and at present the greater portion of the empire may be said to be independent, particularly that to the south of the Atlas chain. See Marocco.

Algeria extends from Marocco in the west, to Tunis in the east, and closely answers in its limits to the ancient kingdom of Numidia. The eastern and southern boundaries are not very definite, falling, as they do, within the boundless plains of the desert. The area is estimated at 100,000 square miles, the population at 3,000,000. See Algiers. Africa.

Tunis is the smallest of the Barbary states. The area may be estimated at 40,000 square miles, and the population between 2,000,000 and 3,000,000. Tunis.

The configuration of the surface is similar to that of Algeria, the northern part being mountainous, the southern and eastern consisting of lowlands and plains. The highest peaks range between 4000 and 5000 feet. The southern plains comprise the land of dates (Belad-el-Jerid), and several extensive salt lakes. Tunis possesses but few rivers and streams, and springs are plentiful only in the mountainous regions.

The climate is, upon the whole, salubrious, and is not of the same excessive character as that of Algeria; regular sea-breezes exercise an ameliorating influence both in summer and winter; frost is almost unknown, and snow never falls. During summer occasional winds from the south render the atmosphere exceedingly dry and hot.

The natural productions of the country are somewhat similar to those of the other Barbary states, but dates of the finest quality are more largely produced. The horses and camels are of excellent breed, and the former are eagerly sought for the French army in Algeria. Bees are reared in great quantity, and coral fisheries are carried on, especially at Tabarka. Of minerals, lead, salt, and saltpetre, are the most noticeable.

The population consists chiefly of Moors and Arabs: the former have attained a higher degree of industry and civilisation than their brethren elsewhere; those of the latter who inhabit the central mountainous regions are nearly independent.

The government is vested in a hereditary bey, and has been conducted in peace and security for a number of years. The present ruler, Bey Mushir Pasha, abolished the slave trade in 1842, and has otherwise endeavoured to govern the country on an enlightened system.

The commerce of Tunis is considerable, but agriculture is in a backward state. The exports consist chiefly of wool, olive-oil, wax, honey, hides, dates, grain, coral, &c.

The principal town is Tunis, situated on a shallow lake on the north coast. It is the most important commercial place on the southern shores of the Mediterranean after Alexandria, and has a population of about 100,000. The site of the ancient Carthage is thirteen miles from Tunis in the direction of Cape Bon.

Tripoli, a Turkish province, extends from Tunis to Egypt, along the shores of the Mediterranean. Politically, it includes the pashalics of Fezzan and Ghadamis, countries which, in a physical point of view, are included in the Sahara. The area is estimated at 200,000 square miles, and the population at 1,500,000. Tripoli.

Tripoli is the least favoured by nature of the Barbary states, possessing a great extent of sterile surface. Mr Richardson graphically describes the physiognomy of the country between the towns of Tripoli and Murzuk in eight zones: 1, the plain along the sea-shore, with the date-palm plantations and the sandhills; 2, the Gharian mountains, with their olive and fig plantations, more favoured with rains than the other regions; 3, the limestone hills and broad valleys between the town of Kalubah and Ghareeah, gradually assuming the aridity of the Sahara as you proceed southward; 4, the Hamadah, an immense desert plateau, separating Tripoli from Fezzan; 5, the sandy valleys and limestone rocks between El-Hessi and Es-Shaty, where herbage and trees are found; 6, the sand between Shiaty and El-Wady, piled in masses or heaps, and extending in undulating plains; 7, the sandy valleys of El-Wady, covered with forests of date-palms; 8, the plateau of Murzuk, consisting of shallow valleys, ridges of low sandstone hills, and naked plains. These

Africa.

zones extend parallel with the Mediterranean shores through the greater portion of the country. Mount Tekut, almost due south of Tripoli, 2800 feet high, is supposed to be the culminating point of the regency. Rivers exist only periodically, and springs are exceedingly scarce.

The climate is somewhat more excessive than that of Tunis, especially in the interior, where extreme heat is followed by a considerable degree of cold. As far south as Sokna, snow occasionally falls. The climate of Murzuk is very unhealthy, and frequently fatal to Europeans.

The natural products are very much like those of Tunis. Oxen and horses are small, but of good quality; the mules are of excellent breed. Locusts and scorpions are among the most noxious animals. Salt and sulphur are the chief minerals.

The population is very thin. Arabs are the prominent race, besides which are Turks, Berbers, Jews, Tibbus, and Negroes. The country is governed by a pasha, subject to the Ottoman empire. The military force by which the Turks hold possession of this vast but thinly-peopled territory amounts only to 632 men.

The commerce is not inconsiderable, and the inhabitants of Tripoli trade with almost every part of the Sahara, as well as the Sudan. At Murzuk there is a large annual market, which lasts from October to January. The exports of Tripoli are gum-arabic, wool, senna, hides, and dates.

Tripoli is the capital of the regency, and the largest town; it lies on the Mediterranean, surrounded by a fertile plain; the number of inhabitants is from 15,000 to 20,000. Bengazi is the second important town on the coast, and has about 10,000 inhabitants. Murzuk, the capital of Fezzan, has a mixed population of only 2000 souls, that of the whole pashalic being 26,000. The town of Ghadamis has about 1000 inhabitants.

North-western or Nilotic countries; Egypt.

Egypt occupies the north-eastern corner of Africa, and comprises about 100,000 square miles with 2,000,000 inhabitants. It is remarkable for its ancient and sacred associations, and its wonderful monuments of human art.

Egypt is a vast desert, the cultivable and fertile portions being confined to the Delta of the Nile and its narrow valley, a region celebrated in the most ancient historic documents for its singular fertility, and still pouring an annual surplus of grain into the markets of Europe. By the annual inundation of the Nile this region is laid under water, and upon its retirement the grain crops are sown in the layer of mud left behind it. Barren ranges of hills and elevated tracts occupy the land on both sides of the Nile, which is the only river of the country. The amount of its rise is a matter of extreme solicitude to the people, for should it pass its customary bounds a few feet, cattle are drowned, houses are swept away, and immense injury ensues; a falling short of the ordinary height, on the other hand, causes dearth and famine, according to its extent. The water of the Nile is renowned for its agreeable taste and wholesome quality. In connection with the Nile is the Birket-el-Kerun, a salt lake.

The climate is very hot and dry. Rain falls but seldom along the coasts, but the dews are very copious. The hot and oppressive winds called khamsin and simooms are a frequent scourge to the country; but the climate is, upon the whole, more salubrious than that of many other tropical countries.

The natural products are not of great variety. The wild plants are but few and scanty, while those cultivated include all the more important kinds adapted to tropical countries: rice, wheat, sugar, cotton, indigo, are cultivated for export; dates, figs, pomegranates, lemons, and olives, are likewise grown. The doum-palm, which appears in Upper Egypt, is characteristic, as also the papyrus. The fauna is characterised by an immense number of waterfowl, flamingoes, pelicans, &c. The hippopotamus and crocodile, the two primeval inhabitants of the Nile, seem to be banished from the Delta, the latter being still sometimes seen in Upper Egypt. The cattle are of excellent breed. Large beasts of prey are wanting; but the ichneumon of the ancients still exists. Bees, silkworms, and corals are noticeable. Minerals are scarce, natron, salt, and sulphur being the principal.

Africa.

Since the last century the inhabitants, then amounting to four millions, have considerably diminished in number. In 1840 their total number was calculated at 2,895,500. The native Egyptians of Arab descent amounted to 2,600,000 souls, composing the great bulk of the people. Next in number, though comparatively few (150,000) are the Copts, descended from the old inhabitants of the country, the ancient Egyptians, but far from being an unmixed race. The Arabic Bedouin tribes were calculated in 1840 at 70,000, the Negroes at 20,000, the European Christians at 9500, the Jews at 7000, and the dominant Turks at only 12,000.

Egypt is formally a Turkish pashalic, but the hereditary pasha, by whom the government is conducted, and whose authority is absolute, is practically an independent prince. The government of Nubia and Kordofan is also conducted by the Pasha of Egypt.

The agriculture of Egypt has always been considerable; there being three harvests in the year. The industry is limited: one peculiar branch is the artificial hatching of eggs in ovens heated to the requisite temperature, a process which has been handed down from antiquity, and is now chiefly carried on by the Copts. Floating bee-hives are also peculiar to the Nile. The commerce is extensive and important: the exports to Europe consist chiefly of cotton, flax, indigo, gum-arabic, ostrich-feathers, ivory, senna, and gold.

Egypt is divided into three sub-pashalics; Bahari or Lower Egypt, Vostani or Middle Egypt, and Said or Upper Egypt. Cairo, on the east bank of the Nile, is the capital of Egypt, and is the largest town of Africa, containing about 300,000 inhabitants in 30,000 houses: it has 400 mosques, and upwards of 130 minarets, some of them of rich and graceful architecture, presenting at a distance an appearance singularly imposing. Alexandria, on the coast, is the emporium of the commerce with Europe, and has 60,000 inhabitants, among whom are 12,000 Europeans. Suez, on the northern extremity of the Red Sea, is a small, ill-built town, but has assumed importance as a good port since the establishment of the overland route to India.

Nubia.

Nubia extends along the Red Sea, from Egypt to Abyssinia, comprising the middle course of the Nile. The total population amounts to 1,000,000 at the least.

The natural features of this country are varied; the northern portion consisting of a burning sterile wilderness, while the southern, lying within the range of the tropical rains, and watered by the Abyssinian affluents of the Nile, exhibits vegetation in its tropical glory, forests of arborescent grasses, timber-trees, and parasitical plants largely clothing the country. This latter territory, which may be called Upper Nubia, includes the region of ancient Meroe, situated in the peninsula formed by the Nile proper, the Blue River, and the Atbara, and comprises, further south, the recently extinguished modern kingdom of Sennaar.

Nubia forms the link between the plain of Egypt and the high table-lands of Abyssinia; its general physical character is that of a slightly ascending region. The lowest parts in Upper Nubia scarcely exceed an altitude of 1500 feet; Khartum, at the confluence of the Blue and White Rivers, being 1525 feet above the level of the sea. A chain of mountains and elevated land rises abruptly along the shores of the Red Sea, gradually sloping down to the valley of the Nile; the intermediate region being intersected by smaller ranges, groups of hills, and numerous wadies filled with sand. Jebel Olba, a prominent summit of that range, is upwards of 7000

Africa.

feet high. The spurs of the Abyssinian table-land, extending within the southern confines of Nubia, reach a height of 3000 feet; Mount Akaro, in Tasokl, being 3300 feet high. Besides the Nile, the country is watered by two other large rivers, its tributaries, the Bahr-el-Azrek, or Blue River, and the Atbara or Takkazie, both being much alike in magnitude, and having their head-streams on the Abyssinian table-land.

The climate of Nubia is tropical throughout, and the heat in the deserts of its central portions is not exceeded by that of any other part of the globe. The southern half of the country is within the influence of the tropical rains, the northern partakes the character of the almost rainless Sahara; and while the latter is generally very salubrious, the former is a land of dangerous fevers, particularly in the plains subject to inundations. Such is the Kolla, a marshy and swampy region of great extent, situated along the foot of the Abyssinian Mountains, between the Blue River and the Takkazie.

The northern region is poor in natural productions, but in the south the vegetation is most luxuriant; palms form a prominent feature, and the monkey bread-tree attains its most colossal dimensions. The date-tree, dourra, cotton, and indigo, are cultivated. The date-palm does not extend beyond the south of Abou-Egli, in Lat. 18. 36.

The elephant is native to this region, and is seen in herds of several hundreds; also the rhinoceros, lion, and giraffe. The waters are inhabited by crocodiles more ferocious than those of Egypt, and by huge hippopotami. The young hippopotamus brought to the zoological gardens, Regent's Park, in 1850, was captured in Nubia, in an island of the Nile, about 1800 miles above Cairo: no living specimen had been seen in Europe since the period when they were exhibited by the third Gordian in the Colosseum at Rome. Monkeys and antelopes are found in great numbers. The camel does not extend beyond the twelfth degree of latitude to the south. Ostriches roam over the deserts; and among the reptiles, besides the crocodile, are large serpents of the python species, and tortoises. Of the numerous insects, the most remarkable is the scarabaeus of the ancient Egyptians, still found in Sennaar. Of minerals. Nubia possesses gold, silver, copper, iron, salt.

In the inhabitants two principal varieties are recognised, the pure original population, and their descendants mixed with other nations. The Berberines, amounting to upwards of 100,000, inhabit the northern part, and the Bisharis, to about 200,000, the desert regions; the latter are the genuine Nubians, finely moulded and dark complexioned, supposed by some to agree more closely with the ancient Egyptians than the Copts, usually deemed their representatives. In the south-eastern part, the true negro element appears.

Nubia, now a province under the pashalic of Egypt, consisted formerly of a number of small and independent kingdoms. The Turkish conquest lasted from 1813 to 1822: in the latter years it was invaded and mercilessly ravaged by the army of Mahomet Ali, under his second son Ismayl, whose dreadful atrocities entailed a fearful fate upon himself, having been surprised when attending a nocturnal banquet at some distance from his camp, and burned to death.

The country is favourable for agriculture, which, however, is only carried on to a limited extent, by the women. Cattle are abundant, and the camels of the Bisharin and Ababde are famous for their enduring powers. Commerce has diminished through the oppressive policy of Mahomet Ali. Salt is largely exported from the shores of the Red Sea to India, and ivory, with other products of tropical Africa, forms a principal article of trade.

Khartum, the capital of Nubia, the headquarters of the Egyptian government, and the chief seat of commerce, contains 20,000 inhabitants. It is a newly-created town, having been founded in 1821, and lies in a dry, flat, and unhealthy country.

Kordofan.

Kordofan, on the western side of Nubia, lies between the parallels of 12° and 16°, and between the meridians 29° and 32°, containing about 30,000 square miles. It is a flat country interspersed with a few hills, presenting in the dry season a desert with little appearance of vegetation, and in the rainy season a prairie, covered with luxuriant grass and other plants. The general elevation of the country is 2000 feet, and some of the hills attain a height of 3000. The altitude of El Obeid is 2150 feet. There are no permanent rivers in the country, and the natural products are similar to those of the adjoining regions of Nubia.

The population consists of Negroes. This country was, simultaneously with Nubia, made tributary to Egypt. The commerce consists of gum-arabic, ivory, and gold, and is not inconsiderable. El Obeid, the chief town, is composed of several villages of mud-built houses thatched with straw, containing about 20,000 inhabitants.

Abyssinia.

The boundaries of Abyssinia are somewhat uncertain; but, confining it to the provinces actually under the government of Christian or Mahometan princes, it may be described as extending from about 9° to 16° north Latitude, and from 35° to 41° east Longitude, and as having a superficial area of about 150,000 square miles. The population has been estimated at from 4,000,000 to 5,000,000, which is probably too high. See ABYSSINIA.

Saharan countries.

The Saharan countries extend from the Atlantic in the west, to the Nilotic countries in the east, from the Barbary States in the north, to the basins of the Rivers Senegal and Kawara, and Lake Tsad in the south. The area of this large space amounts to at least 2,000,000 square miles, or upwards of one-half of that of the whole of Europe. It is very scantily populated, but from our present defective knowledge of that region, the number of its inhabitants cannot even be estimated.

The physical configuration of the Sahara has already been indicated in the general introductory remarks of this article. Notwithstanding the proverbial heat, which is almost insupportable by day, there is often great cold at night, owing to the excessive radiation, promoted by the purity of the sky. Rain is nearly, though not entirely absent, in this desolate region. It appears that when nature has poured her bounty over the adjoining regions in the south, and has little more left to bestow, she sends a few smart showers of rain to the desert, parched by the long prevalence of the perpendicular rays of the sun. The prevailing winds blow during three months from the west, and nine months from the east. When the wind increases into a storm, it frequently raises the loose sand in such quantities that a layer of nearly equal portions of sand and air, and rising about 20 feet above the surface of the ground, divides the purer atmosphere from the solid earth. This sand, when agitated by whirlwinds, sometimes overwhelms caravans with destruction, and, even when not fatal, involves them in the greatest confusion and danger.

The natural products correspond with the physical features of the country. Vegetation and animal life exist only sparingly in the oases or valleys where springs occur, and where the soil is not utterly unfit to nourish certain plants. Amongst the few trees, the most important is the date-palm, which is peculiarly suited to the dryness of the climate. This useful tree flourishes best in the eastern part of the desert, inhabited by the Tibbus. The doum-palm is likewise a native of the same part, and seems entirely absent in the western Sahara: its northernmost limit is on the southern borders of Fezzan and Tegerry, in Lat. 24. 4. N. Acacias are found in the extreme west towards Senegambia, furnishing the so-called gum-arabic. In many parts of the desert, a thorny evergreen plant occurs, about

18 inches high. It is eagerly eaten by the camels, and is almost the only plant which supplies them with food while thus traversing the desert. The cultivation of grains to a small extent is limited to the western oases of Tuat and others, a little barley, rice, beans, and gussub, being there grown. In the kingdom of Aïr, there are some fields of maize and other grains; but upon the whole, the population depend for these products on Sudan and other regions. There are but a few specimens of wild animals in these wildernesses; lions and panthers are found only on its borders. Gazelles and antelopes are abundant, hares and foxes but scarce. Ostriches are very numerous, and vultures and ravens are also met with. In approaching Sudan, animal and vegetable life becomes more varied and abundant. Of reptiles only the smaller kinds are found, mostly harmless lizards and a few species of snakes. Of domestic animals, the most important is the camel, but horses and goats are not wanting, and in the country of the Tuaricks an excellent breed of sheep is found, while in that of the Tibbus a large and fine variety of the ass is valuable to the inhabitants. Of minerals, salt is the chief production, which occurs chiefly near Bilma.

The habitable portions of the Sahara are possessed by three different nations. In the extreme western portion are Moors and Arabs. They live in tents, which they remove from one place to another; and their residences consist of similar encampments, formed of from twenty to a hundred of such tents, where they are governed by a sheik of their own body; each encampment constituting, as it were, a particular tribe. They are a daring set of people, and not restrained by any scruple in plundering, ill-treating, and even killing persons who are not of their own faith; but to such as are, they are hospitable and benevolent. The boldest of these children of the desert are the Tuaricks, who occupy the middle of the wilderness, where it is widest. The form of their bodies, and their language, prove that they belong to the aboriginal inhabitants of Northern Africa, who are known by the name of Berbers. They are a fine race of men, tall, straight, and handsome, with an air of independence which is very imposing. They live chiefly upon the tribute they exact from all caravans traversing their country. They render themselves formidable to all their neighbours, with whom they are nearly always in a state of enmity, making predatory incursions into the neighbouring countries. The third division of Saharan people are the Tibbus, who inhabit the eastern portion, comprising one of the best parts of the desert. In some of their features they resemble the Negroes. They are an agricultural and pastoral nation, live mostly in fixed abodes, and are in this respect greatly different from their western neighbours. Their country is as yet little explored by Europeans. The Tibbus are in part Pagans, while the other inhabitants of the Sahara are Mahometans.

The commerce of the Sahara consists chiefly of gold, slaves, ivory, iron, and salt.

Western Africa.

Western Africa comprehends the west coast of Africa, from the borders of the Sahara, in about Lat. 17. north to Nourse River, in about the same latitude south, with a considerable space of inland territory, varying in its extent from the shores, and, in fact, completely undefined in its interior limits.

Senegambia.

Senegambia, the country of the Senegal and Gambia, extends from the Sahara in the north to Lat. 10. in the south, and may be considered as extending inland to the sources of the waters which flow through it to the Atlantic.

The western portion is very flat, and its contiguity to the great desert is frequently evidenced by dry hot winds, an atmosphere loaded with fine sand, and clouds of locusts. The eastern portion is occupied with hills and elevated land. Under the 10th parallel the hills approach quite close to the coast. There the Sangari Mountains attain an elevation of from 4000 to 5000 feet. The country possesses a great number of rivers, among which the Senegal, Gambia, and Rio Grande are the most important. Senegambia ranges, in point of heat, with the Sahara and Nubia. The atmosphere is most oppressive in the rainy season, which lasts from June to November, when an enormous amount of rain drenches the country. The prevailing winds in that period are southwest, whereas in the dry season they are from the east. The climate is, upon the whole, most unhealthy, and too generally proves fatal to Europeans.

The vegetation is most luxuriant and vigorous. The baobab (monkey bread-tree), the most enormous tree on the face of the globe, is eminently characteristic of Senegambia. It attains to no great height, but the circumference of the trunk is frequently 60 to 75 feet, and has been found to measure 112 feet; its fruit, the monkey-bread, is a principal article of food with the natives. Bombaceae (cotton-trees) are likewise numerous, and they are among the loftiest in the world. Acacias, which furnish the gum-arabic, are most abundant, while the shores are lined with mangrove trees. The vegetation is similar to that of Nubia, as also the animal world. Gold and iron are the chief metals.

The inhabitants consist of various Negro nations, the chief of which are the Wolof.

The gum trade is the most important traffic on the Senegal; bees-wax, ivory, bark, and hides, forming the chief exports from the Gambia.

Of European settlements are: The French possessions on the Senegal; the capital of which is St Louis, built about the year 1626, on an island at the mouth of the river. The total population of the settlement amounted, in 1846, to 17,976 coloured people, and 1170 Europeans.

The British settlement is on the Gambia, and has 4851 inhabitants. Bathurst is the chief town.

The Portuguese settlement consists of small factories south of the Gambia, at Bissao, Cacheo, and some other points.

The Guinea coast.

The West coast of Africa, from Senegambia to the Nourse River, is commonly comprised by the general denomination Guinea Coast, a term of Portuguese origin.

The coast is mostly so very low, as to be visible to navigators only within a very short distance, the trees being their only sailing marks. North of the equator, in the Bight of Benin, the coast forms an exception, being high and bold, with the Cameroon Mountains behind; as also at Sierra Leone, which has received its name (Lion Mountain) in consequence. The coast presents a dead level often for thirty to fifty miles inland. It has numerous rivers, some of which extend to the furthest recesses of Inner Africa.

The climate, notoriously fatal to European life, is rendered pestilential by the muddy creeks and inlets, the putrid swamps, and the mangrove jungles that cover the banks of the rivers. There are two seasons in the year, the rainy and the dry season. The former commences in the southern portion in March, but at Sierra Leone and other northern parts, a month later.

Vegetation is exceedingly luxuriant and varied. One of the most important trees is the *Elais guineensis*, a species of palm, from the covering of whose seed or nut is extracted the palm oil, so well known to English commerce and manufacture: several thousand tons are annually brought into the ports of Liverpool, London, and Bristol. The palm-oil tree is indigenous and abundant from the river Gambia to the Congo; but the oil is manufactured in large quantities chiefly in the country of the Gold and Slave Coasts. The former comprises nearly all the more remarkable of African animals: particularly abundant are elephants, hippopotami, monkeys, lions, leopards, crocodiles, serpents, parrots. The domestic animals are mostly of an inferior quality. The principal minerals are gold and iron. The population consists, besides a few European colonists, of a vast variety of Negro nations, similar in their physical qualities and prevailing customs, but differing considerably in their dispositions and morals.

The chief articles of commerce are palm-oil, ivory, gold, wax, various kinds of timber, spices, gums, and rice.

The divisions of Northern or Upper Guinea, are mostly founded on the productions characteristic of the different parts, and are still popularly retained.

**Sierra Leone.** The British colony of Sierra Leone extends from Rokelle River in the north, to Kater River in the south, and about twenty miles inland. The population, consisting chiefly of liberated slaves, amounted in 1847 to 41,735. Freetown, the capital, has 10,580 inhabitants, and is, after St Louis, the most considerable European town on the western coast of Africa.

**Grain coast.** The Malaghetta or Grain Coast extends from Sierra Leone to Cape Palmas. Malaghetta is a species of pepper yielded by a parasitical plant of this region. It is sometimes styled the Windy or Windward Coast, from the frequency of short but furious tornadoes, throughout the year. **Liberia.** The republic of Liberia, a settlement of the American Colonization Society, founded in 1822, for the purpose of removing free people of colour from the United States, occupies a considerable extent of the coast, and has for its capital Monrovia, a town named after the president, Mr Monro. The population amounts to from 10,000 to 15,000 native inhabitants, and 3200 liberated Negroes from America.

**Ivory coast.** The Ivory Coast extends from Cape Palmas to Cape Three Points, and obtained its name from the quantity of the article supplied by its numerous elephants.

**Gold coast.** The Gold Coast stretches from Cape Three Points to the River Volta, and has been long frequented for gold-dust and other products. The Dutch have several trading ports, of which Elmina, a town of 12,000 inhabitants, is the principal and oldest of the European stations, founded by the Portuguese in 1411. The British possess Cape Coast Castle, a spacious fortress, and James' Fort, near Accra. The Danish settlements of Christiansburg and Friedensburg were ceded to the English in 1849.

**Slave coast.** The Slave Coast extends from the River Volta to the Calabar River, and is, as its name implies, the chief scene of the most disgraceful traffic that blots the history of mankind. Eko, or Lagos, one of the chief towns of the coast, was destroyed in 1852.

The kingdoms of Ashanti, Dahomey, Yoruba and others, occupy the interior country of the Guinea coast.

The coast from the Old Calabar River to the Portuguese possessions is inhabited by various tribes. Duke's Town, on the former river, is a large town of 30,000 to 40,000 inhabitants, with considerable trade in palm-oil, ivory, and timber.

On the Gabun river, close to the equator, are a French settlement and American missionary stations. At the equator, Southern or Lower Guinea begins, where the only European settlements are those of the Portuguese.

**Loango.** Loango is reckoned from the equator to the Zaïre or Congo river. Its chief town is Boally, called Loango by the Europeans.

**Congo.** Congo extends south of the Zaïre, comprising a very fertile region, with veins of copper and iron. Banza Congo or St Salvador is the capital.

**Angola and Benguela.** Angola comprises the two districts of Angola proper and Benguela. In these regions the Portuguese settlements extend farther inland than in the two preceding districts, namely, about 200 miles. The population of the settlements is about 400,000, comprising only 1830 Europeans. The capital St Paolo de Loando, contains 1600 Europeans and 4000 native inhabitants, and has a fine harbour. St Felipe de Benguela is situated in a picturesque but very marshy and most unhealthy spot.

**South Africa.** The coast from Benguela to the Cape Colony may, in a general arrangement like this, be included either within West Africa or South Africa. The whole coast is little visited or known, being of a most barren and desolate description, and possessing few harbours. From Walfich Bay, as has been already stated, Mr Galton recently penetrated nearly 400 miles into the interior towards Lake Ngami, and explored the country inhabited by the Ovaherero or Damaras, and other tribes.

**Cape Colony.** Under South Africa the Cape Colony only is generally comprised. It takes its name from the Cape of Good Hope, and extends from thence to the Orange River in the north, and to the Tugela River in the east. A large proportion of the territory included within these limits, especially in the north, is either unoccupied, or, excepting missionary stations, entirely in the hands of the aborigines.

Apart from the shores, the country consists of high lands, forming parallel mountainous ridges, with elevated plains or terraces of varying extent between. The loftiest range, styled in different parts of its course Sneuw-bergen, Winter-bergen, Nieuveld-bergen, and Roggenveld-bergen, names originated by the Dutch, is the third and last encountered on proceeding into the interior from the south coast. The most elevated summit, Spitzkop or Compass-berg, in the district of Graafreynet, attains the height of 10,250 feet. This and the other chains are deeply cut by the transverse valleys called kloofs, which serve as passes across them, and appear as if produced by some sudden convulsion of nature, subsequently widened by the action of the atmosphere and running water.

The high plains or terraces are remarkable for their extraordinary change of aspect in the succession of the seasons. During the summer heats they are perfect deserts, answering to the term applied to them, karroos, signifying, in the Hottentot language, "dry" or "arid." But the sandy soil being pervaded with the roots and fibres of various plants, is spontaneously clothed with the richest verdure after the rains, and becomes transformed for a time into a vast garden of gorgeous flowers, yielding the most fragrant odours. Adapted thus to the support of graminivorous animals, the karroos are the resort of antelopes, zebras, quaggas, and gnus in countless herds, and of the carnivorous beasts that prey upon them, the lion, hyæna, leopard, and panther. These quadrupeds, however, with the elephant, rhinoceros, hippopotamus, giraffe, buffalo, and ostrich, have been largely banished from their old haunts by the advanced footsteps of civilised man, and are only found in the more secluded parts of the interior. The country has a singular and superb flora, but it comprises few native plants useful to man: many such have been now introduced. Heaths of varied species and great beauty abound; and geraniums are treated as common weeds. Many highly productive districts occur; corn, wines, and fruit, being the chief objects of cultivation in the neighbourhood of the Cape, while the more inland settlements are grazing farms. Some fine natural forests clothe the sides of the mountains; but in general the colony is deficient in timber-trees, as well as in navigable streams, perennial springs, and regular rain. A great deposit of rich copper ore occurs near the mouth of the Gariep; and salt is obtained for consumption and sale from salt lakes.

The climate is exceedingly fine and salubrious. There are two seasons, characterised by the prevalence of certain winds. During the summer, which lasts from September to April, the winds blow from southeast, cold and dry; during the winter, namely from May to September, northwest winds prevail. In the most elevated regions the winters are occasionally severe, and snow and ice occur.

Africa.

The population of Cape Colony amounted in 1847 to 178,300 souls. The chief native tribes within the British territory are the Kaffres, Hottentots, and Bechuanas. No manufacture is conducted at the Cape except the making of wine, of which 8000 pipes are annually exported to England. Various articles of provision are supplied to ships sailing between Europe and the East Indies.

Cape Town is the capital of the colony, and contains 22,600 inhabitants. Its commerce is considerable, and the port is frequented by 500 to 600 vessels every year.

The Orange River sovereignty, added to the British territories in 1849, extends north of the Orange River as far as the Ky Gariep or Vaal River.

Natal. Natal, or Victoria, a district on the east coast, and separated from the Cape Colony by Kaffraria, is a recently formed British settlement, containing an area of about 18,000 square miles. It is highly favoured in those respects in which the Cape is most deficient, having abundance of wood and water, with coal and various metallic ores, a fine alluvial soil, and a climate adapted to the cultivation of the products for which the home demand is large and constant—cotton, silk, and indigo. Pietermaritzburg, the capital of the settlement, lies 50 miles from the coast. Port Natal, now D'Urban, seated on a fine lake-like bay, is the only harbour.

East Africa. East Africa extends from Natal northwards to the Red Sea, comprising Sofala, Mozambique, Zanzibar, and the Somali country. But little is known of that region beyond the shores. Sofala. The Sofala coast, extending from Delagoa Bay to the Zambezi River, is flat, sandy, and marshy, gradually ascending towards the interior. It abounds with rivers, which cause yearly inundations. The soil is very fertile, and produces chiefly rice. In the interior, gold and other metals, as well as precious stones, are found. The Portuguese have settlements at Sofala, in an unhealthy spot, abounding with salt-marshes; it consists of only eighteen huts, a church, and a fort in ruins. Inhambane, near the Tropic of Capricorn, has an excellent harbour.

Mozambique. Mozambique extends from the Zambezi to Cape Delgado, and is similar, in its natural features, to the Sofala coast. The country is inhabited by the large and powerful tribe of the Macuas. The principal river is the Zambezi. The principal settlement of the Portuguese is at Quillimane, which is situated in a very unhealthy position, surrounded with mangrove trees. It has 130 free inhabitants, comprising only 12 Portuguese, and 5000 or 6000 slaves.

Zanzibar. The Zanzibar or Sawahili coast extends from Cape Delgado to the River Jub, near the Equator. The coast is generally low, and has but few bays or harbours: its northern portion is rendered dangerous by a line of coral reefs extending along it. The region possesses a great number of rivers, but none of them attain a first-rate magnitude. The principal are the Livuma, Lufigi, Ruvu, Pangani, and Dana; the two latter rising in the snowy mountains of Kilimanjaro and Kenia. The climate is similar to that of other tropical coasts of Africa, hot and unhealthy in general: in some portions, however, the elevated ground, and with it a more temperate and healthy climate, approaches the shores to within a short distance. The vegetation is luxuriant, and cocoa-nut, palms, maize, rice, and olives, are the chief articles of cultivation. The fauna comprises all the more characteristic African species.

The chief inhabitants are the Sawahili, but the coasts are under the Arab dominion of the Imaum of Muscat, by whose efforts commerce with the nations of the interior has greatly increased.

The island of Zanzibar (Unguja of the Sawahili) is the residence of the Imaum of Muscat, and the seat of extensive commerce. Mombas, on a small island close to the main shore, possesses the finest harbour on that coast, and has recently become famous as the seat of an important missionary station.

Africa.

Somali country. The Somali country comprises the eastern horn of Africa, from the equator northward to the Bay of Tadjurra, near the entrance into the Red Sea. The coast is generally bold and rocky, in some places covered with sand; and the extensive region it encloses, presents a slightly ascending plain, traversed by large valleys of great fertility, among which the Wady Nogal is prominent. Along the Arabian Gulf the coast is very abrupt, and girded with a range of mountains, the highest summit of which, Jebel Ahl, reaches an elevation of 6500 feet. This country is not so well watered as the region to the south, and some of its rivers are periodical.

The Somali country is famous for its aromatic productions and gums of various kinds; and it is supposed that the spices and incense consumed in such large quantities by the ancient people of Egypt, Greece, Syria, and Rome, were derived from this part of Africa, and not from Arabia.

The Somali, the inhabitants of this region, belong to the Galla tribe. The commerce is considerable, and is partly in the hands of the Arabs. Zeïla and Berbera, on the northern coast, are the chief trading ports: the permanent population of the former is about 750, while the latter may be said to exist only during the winter, when no less than 20,000 strangers, at an average, arrive to pitch their tents, and thus create a great market place. Hurrur is the chief place in the interior, with 17,000 inhabitants, who are Mahometans.

Central Africa. Central Africa comprises the regions which extend from the southern borders of the Sahara in the north to Cape Colony in the south, and from Senegambia in the west to the territory of the Egyptian pashalic on the east. It comprehends the central basins of Lake Tsad, Nyassa, and others, and the greater part of the basins of the Kawara, Zaïre, Nile, and Zambezi. Even the Sahara may well be included in this general denomination. So little is yet known of this vast region that the general features of some portions only can be indicated. The greater portion seems to be densely peopled with numerous tribes, and to possess inexhaustible natural resources. The portion north of the equator, under the name Sudan or Nigritia, comprises a great number of states, among which the principal are Bambarra, Timbuktu, and Houssa in the west; Bornu, Baghermi, and Waday, around Lake Tsad; Darfur in the east; and Adamaua in the south. The inhabitants are Negro races, with many Arabs, Moors, and Berbers.

Bambarra. Bambarra occupies part of the basin of the Joliba, or upper source of the Kawara. The dominant inhabitants are the Mandingoes and Foulahs, who have embraced Islamism, and are much more advanced in civilisation than the other negro tribes. The country comprises extensive and excellent pastures, with abundance of domestic animals, as horned cattle, sheep, goats, and horses of a fine breed. Among the vegetable products the most remarkable is the butter-tree, which furnishes an important article of agricultural industry and trade.

Sego, the capital, is situated on the Joliba, and contains 30,000 inhabitants. It was here that Mungo Park first caught sight of the long-sought river.

Timbuktu. Timbuktu, or Jennie, comprises the basin of the Joliba below Bambarra, and lies partly within the Great Sahara. Timbuktu, a few miles from the banks of the Joliba, and situated amid sands and deserts, is a celebrated centre of the North African caravan trade. It contains from 12,000 to 15,000 inhabitants.

Houssa. Houssa is an extensive country extending to the Sahara in the north, to the Joliba or Kawara on the west, to Bornu on the east, and to about 10. north Lat. on the south. The dominant race are the Foulahs, but the mass of the popula-

Africa.

tion are Negroes. It is a very fertile and beautiful country, but the climate is insalubrious, and in many parts fatal to Europeans. The inhabitants are engaged in pastoral, as well as in agricultural and commercial pursuits.

The capital, Sakatu, is one of the largest cities in Negroland; it is situated in a fertile but marshy plain. Kano, another large town, containing 30,000 to 40,000 inhabitants, is the great emporium of trade in Houssa: there the English merchandise coming from the north through the Sahara, meets with American goods coming from the Bight of Benin. The manufactures of Kano consist chiefly of cloth, for the dyeing of which that town is famed all over Central Africa.

Bornu.

Bornu is one of the most powerful states of Negroland; extending on the west to the 10th degree of Long., on the east to Lake Tsad and the kingdom of Baghermi, and on the south as far as Mandara and Adamaua, in about 11. north Lat. Kanem, on the northern side of Lake Tsad, has recently been conquered and brought under Bornuese sovereignty.

The general character of Bornu is that of a plain, subject to inundations, particularly near Lake Tsad. It is very fertile, and cotton and indigo attain a high degree of excellence. The original Bornuese are an agricultural people.

Kuka, the capital and residence of the Sheik of Bornu, has only 8000 inhabitants, while Angornu, south of it, has 30,000.

Baghermi.

Baghermi, another powerful kingdom, is situated east of Bornu. The boundaries, according to Dr Barth, who first visited this country and penetrated as far as Maseña, the capital, are on the west the river Loggeme, a tributary of the Shary or Asu, by which it is divided from Bornu and Adamaua; on the north its limits are in about $12\frac{1}{2}°$ north Lat., and on the east in $19\frac{1}{2}°$ east Long., both lines dividing it from Waday: the southern boundary is in about $8\frac{1}{2}°$ north Lat. Baghermi is an extensive plain or valley formed by the river Shary or Asu and its tributaries. The inhabitants are very warlike, and frequently engage in slave marauding expeditions into the neighbouring states to the south.

Maseña, the capital, lies in 11.40. north Lat., and 17.20. east Long.

Waday.

Waday, or Dar Saley, lies east of Baghermi, and reaches as far as Darfur. It comprises an extensive region, stretching as far as the basin of the Nile. Lake Fittri, situated in the western portion, forms a basin, unconnected with that of Lake Tsad, and by which the country as far as Darfur is drained. It has never been explored by Europeans. The population comprises a great variety of tribes and different languages.

Wara, the capital, is placed by Dr Barth in 14° north Lat., and 22° east Long.

Darfur.

Darfur, east of Waday, extends as far as Kordofan. The country rises towards the west into a range of hills called Jebel Marrah. It is drained into the Nile. A great portion of the country is Saharan in its character, while others are fertile and diversified. Browne, in 1793, estimated the whole population at 200,000. It has an extensive trade with Egypt.

Cobbeïh, the capital, is a merchant town, and contains about 6000 inhabitants.

Adamaua.

Fumbina or Adamaua is an extensive country south of Houssa and Bornu, under Foulah dominion. It consists of a large, fertile, and highly-cultivated valley, formed by the River Benue, which is the upper course of the Tchadda. Near Yola, the capital, the Benue receives the Faro, a large tributary coming from the south-west in the direction of the Cameroon Mountains. The waters in the rainy season, namely, from June to September, rise 40 to 50 feet. This country was first visited by Dr Barth in 1851.

Yola, the capital, lies in 8.50. north Lat., and 13.30. east Longitude.

Africa.

Islands of Africa in the Atlantic Ocean.

To Africa belong a considerable number of islands. The Madeiras, belonging to Portugal, lie off the north-west coast of Africa, at a distance of about 360 miles. Madeira, the chief island, is about 100 miles in circuit, and has long been famed for its picturesque beauty, rich fruits, and fine climate, which renders it a favourite resort of invalids. Wine is the staple produce. Funchal, the chief town, with nearly 30,000 inhabitants, is a regular station for the West India mail steam-packets from Southampton, and the Brazilian sailing-packets from Falmouth.

The Canaries, belonging to Spain, the supposed Fortunate Islands of the ancients, are situated about 300 miles south of Madeira. They are 13 in number, all of volcanic origin, Teneriffe being the largest. The latter is remarkable for its peak, which rises as a vast pyramidal mass to the height of 12,172 feet.

The Cape Verde Islands, subject to Portugal, are a numerous group about 80 miles from Cape Verde. They obtained their name from the profusion of sea-weed found by the discoverers in the neighbouring ocean, giving it the appearance of a green meadow. They are also of volcanic origin.

Fernando Po, a very mountainous island, is in the Bight of Biafra. Formerly a British settlement, it was abandoned owing to its unhealthiness, and is now only inhabited by a few negroes and mulattoes.

St Thomas, immediately under the equator, is a Portuguese settlement; as also Prince's Island, 2° north of the line.

Annobom, in 2. south Lat., belongs to the Spaniards.

Ascension, a small, arid, volcanic islet, was made a British port on the arrival of Napoleon Bonaparte at St Helena, and since retained as a station, at which ships may touch for stores. Green Hill, the summit of the island, rises to the height of 2840 feet.

St Helena is a huge dark mass of rock, rising abruptly from the ocean to the height of 2692 feet. James' Town is the only town and port, containing 5300 inhabitants.

Islands of Africa in the Indian Ocean.

Madagascar, the largest island of Africa, and one of the largest in the world, is separated from the Mozambique coast by a channel of that name, about 250 miles wide. The area exceeds that of France, comprising 225,000 square miles, and the population is estimated at 4,000,000.

It has an atmosphere so pestilential, in particular localities, that to breathe it for a short duration is generally, and very quickly fatal. But other parts are not insalubrious. The lemurs, an interesting tribe of animals, are peculiar to Madagascar and the Comoro Archipelago.

The inhabitants are diverse races of Negro, Arab, and Malay origin. The Ovahs, a people of the central provinces, are now dominant. The principal town, Tananarivu, has 8000 inhabitants.

The Comoro isles, four in number, are in the north part of the Mozambique Channel, and inhabited by Arab tribes.

Bourbon, 400 miles east of Madagascar, is a colony of France, producing for export, coffee, sugar, cocoa, spices, and timber.

Mauritius, ceded to the British by the French in 1814, is 90 miles north-east of Bourbon. The sugar-cane is chiefly cultivated. Port Louis, the capital, beautifully situated, has 26,000 inhabitants. Within the jurisdiction of the Governor of the Mauritius, are the islands of Rodriguez, the Seychelles, and the Amirante islands.

Socotra, a large island, east of Cape Jerdaffun, with an Arab population, has been known from early times; it is now a British possession. This island was long celebrated as producing the finest aloetic drug: a few years ago this was denied; but now it is found still to produce a fine kind of aloe, though much of what passed as Socotrine aloes really came from India.

AFRICANUS, John Leo. See Leo.

Africanus, Sex. Julius, of Emmaus in Palestine, a learned Christian historian of the third century, who wrote a chronicle extending from the date of the creation to A. D. 221, of which copious extracts exist in the Chronicon of Eusebius, besides many fragments in Syncellus, Cedrenus, and the Paschale Chronicon. Eusebius has also given some extracts of his letter to Aristides reconciling the apparent discrepancy of St Matthew and St Luke in the genealogy of Christ. His letter to Origen, impugning the authority of the book of Susanna, and Origen's answer, are both extant. To Africanus is also ascribed a work entitled Κεστοι, treating of medicine, agriculture, natural history, the military art, &c., of which extracts have been published, and some of the books are said to exist still in MS.

AFRIQUE, St, a French town in the department of Aveyron, in Lat. 43. 57. N. Long. 2. 51. E. with a population of 6000 persons.

AFSLAGERS, persons appointed by the burgomasters of Amsterdam to preside over the public sales made in that city. They must always have a clerk of the secretary's office with them, to take an account of the sale. They correspond to our brokers, or auctioneers.

AFT, in the sea language, the same with Abaft.

AFTER-GUARD, in the navy, the men stationed on the poop to work the aftersails, &c.

AFTERMATH, in *Husbandry*, signifies the grass which springs or grows up after mowing.

AFWESTAD, or Avestad, a market-town of Sweden, in the district of Fahlun, on the Dal-Elf. Pop. 900. It has iron and copper works, and the copper coin of the country was formerly struck here.

AGA, in the Turkish language, signifies a great lord or commander. Hence the aga of the janizaries is the commander-in-chief of that corps; as the general of horse is denominated *spachiclar aga*. The aga of the janizaries is an officer of great importance. He is the only person who is allowed to appear before the grand signior without his arms across his breast in the posture of a slave. Eunuchs at Constantinople are in possession of most of the principal posts of the seraglio: the title *aga* is given to them all, whether in or out of employment. This title is also given to all rich men without employ, and especially to wealthy landholders.

We find also *agas* in other countries. The chief officers under the khan of Tartary are called by this name; and among the Algerines we read of *agas* chosen from among the *boluk bashis* (the first rank of military officers), and sent to govern in the chief towns and garrisons of that state. The *aga* of Algiers is the president of the divan or senate. For some years the *aga* was the supreme officer, and governed the state in place of the bashaw, whose power dwindled to a shadow. But the soldiery rising against the *boluk bashis* or *agas*, massacred most of them, and transferred the sovereign power to the caliph with the title of *Dey* or King.

AGADIR, or Santa Cruz, a seaport on the western coast of Marocco, in Lat. 30. 26. 35. N. Long. 9. 35. 56. W. It was, when possessed by the Portuguese, a strong fortress; but it was captured by the Moors in 1536, and since that time has decayed, and its former trade has been transferred to Mogadore.

AGALMATA, in *Antiquity*, a term originally used to signify any kind of ornaments in a temple, but afterwards applied only to the statues, which were most conspicuous.

AGAMEMNON, the son of Plisthenes and Aërope, and grandson of Atreus, or according to Homer, the son of Atreus and grandson of Pelops. He was king of Mycenæ in Argos, and married Clytemnestra daughter of Tyndarus king of Sparta. On the abduction of Helen the wife of his brother Menelaus, by Paris, Agamemnon, as the most powerful prince in Greece, was chosen captain-general of the expedition against Troy. While the fleet lay at Aulis, Agamemnon chanced in hunting to kill a stag sacred to the goddess Diana, who punished the offence by sending a pestilence among the troops, and a dead calm, which retarded the further progress of the expedition. The oracle, on being consulted, demanded the sacrifice of Agamemnon's daughter Iphigenia, as the only expiation of the crime. While the king was in the act of slaying his child, the goddess intervened, and carried her away to Tauris. Another victim was substituted, and the fleet pursued its course to Troy. Agamemnon's quarrel with Achilles and its consequences form the subject of the Iliad. After the taking of Troy, Agamemnon returned home, carrying with him Cassandra daughter of Priam, whom he had received as his prize. During his absence Clytemnestra had formed an unlawful connection with Ægisthus, who now sat on the throne of Mycenæ. Agamemnon was received into his palace by the adulterers, and assassinated by their own hands. This horrible tragedy forms the subject of the *Agamemnon* of Æschylus.

AGANIPPE, in *Antiquity*, a fountain of Bœotia, at Mount Helicon, on the borders between Phocis and Bœotia, sacred to the Muses, and running into the river Permessus. Ovid seems to make *Aganippe* and *Hippocrene* the same. Serenus more truly distinguishes them, and ascribes the blending of them to poetical license. From this fountain the Muses derived their designation of *Aganippides*.

AGAPE, in *Ecclesiastical History*, the love-feast, or feast of charity, in use among the primitive Christians, when a liberal contribution was made by the rich to feed the poor. The word is Greek, and signifies *love*. St Chrysostom gives the following account of this feast, which he derives from the apostolical practice. He says, "The first Christians had all things in common, as we read in the Acts of the Apostles; but when that equality of possessions ceased, as it did even in the apostles' time, the *agape* or love-feast was substituted in the room of it. Upon certain days, after partaking of the Lord's Supper, they met at a common feast; the rich bringing provisions, and the poor who had nothing being invited." It was always attended with receiving the holy sacrament; but there is some difference between the ancient and modern interpreters as to the circumstance of time, viz. whether this feast was held before or after the communion. St Chrysostom is of the latter opinion; the learned Dr Cave of the former. These love-feasts, during the first three centuries, were held in the church without scandal or offence; but in after times the heathens began to tax them with impurity. This gave occasion to a reformation of these *agapæ*. The kiss of charity, with which the ceremony used to end, was no longer given between different sexes; and it was expressly forbidden to have any beds or couches for the conveniency of those who should be disposed to eat more at their ease. Notwithstanding these precautions, the abuses committed in them became so notorious, that the holding of them (in churches at least) was solemnly condemned, at the Council of Carthage, in the year 307.

AGAPETÆ, in *Ecclesiastical History*, a name given to certain virgins and widows, who, in the ancient church, associated themselves with and attended on ecclesiastics, out of a motive of piety and charity.

In the primitive days there were women instituted deaconesses, who, devoting themselves to the service of the church, took up their abode with the ministers, and assisted them in their functions. In the fervour of the primitive piety, there was nothing scandalous in these societies; but they afterwards degenerated into libertinism; insomuch that St Jerome asks, with indignation, *unde agapetarum pestis* *in ecclesias introiit?* This gave occasion for councils to suppress them. St Athanasius mentions a priest, named Leontius, who, to remove all occasion of suspicion, offered to mutilate himself, to preserve his beloved companion.

AGAPETUS, deacon of the church at Constantinople, A. D. 527, was the author of a work on the *Duties of Princes*, which he presented to the emperor Justinian, who had been his pupil. This work, known as the *Charta Regia*, caused him to be ranked among the best writers of his age. It was translated into English by Thos. Paynell in 1550.

AGARD, ARTHUR, a learned English antiquary, born at Foston, in Derbyshire, in the year 1540. His fondness for English antiquities induced him to make many large collections; and his office as deputy-chamberlain of the exchequer, which he held 45 years, gave him great opportunities of acquiring skill in that study. Similarity of taste brought him into acquaintance with Sir Robert Cotton and other learned men, who associated themselves under the name of *The Society of Antiquaries*, of which society Mr Agard was a conspicuous member. He made the Domesday book his peculiar study, and composed a work purposely to explain it, under the title of *Tractatus de Usu et obscurioribus Verbis libri de Domesday*. He also compiled a book for the service of his successors in office, which he deposited with the officers of the king's receipt, as a proper index for succeeding officers. All the rest of his collections, containing at least 20 volumes, he bequeathed to Sir Robert Cotton. He died in 1615.

AGARIC MINERAL, a marly earth, resembling the vegetable of that name in colour and texture.

AGARICUS, a genus of mushroom, a cryptogamian plant. Some of the genus are excellent articles of food, as the common mushroom, *A. campestris*, *A. pratensis*, &c.; others are poisonous, as *A. necator*, *A. acris*, *A. semiglobosus*, &c.

AGASIAS, son of Dositheus, was a famous sculptor of Ephesus, whose celebrated work, known under the erroneous title of the Borghese *Gladiator*, is now in the Louvre. He probably lived not earlier than the fourth century.

AGATE, or ACHAT (among the Greeks and Latins Αχατης and *Achates*, from a river in Sicily, on the banks of which it was first found), a name applied by mineralogists to a siliceous stone of the quartz family, generally occurring in rounded nodules, or in veins in trap rocks. The number of agate balls in the rock often give it the character of amygdaloid; and when such a rock decomposes by the elements, the agates drop out, and are found in the beds of streams descending from such mountains; or they may be obtained in quarrying. Immense quantities are obtained from Oberstein and Idar, in Germany, and many are brought from India and Brazil. Very large masses of chalcedony, a variety of agate, are brought from Iceland, Feroe, and Brazil, which often have a mammillated surface, and are very uniform in colour. A large quantity of agate is found in Scotland; whence the stone is familiarly known to our lapidaries as *Scotch Pebble*. Agate chiefly consists of chalcedony, with mixtures of common quartz, and occasional patches of jasper and opal. The colour delineations are often in concentric rings of varying forms and intensity, or in straight parallel layers or bands. The colours are chiefly gray, white, yellow, or brownish-red. The composition of agate is not uniform; but it usually contains from 70 to 96 per cent. of silica, with varying proportions of alumina, coloured by oxide of iron or manganese. The principal varieties are—

1. *Chalcedony*. In this the colours are in parallel bands. Notwithstanding the compact structure of agate, it is now known to be porous, though the eye cannot detect the cavities; and this has given rise to a beautiful and important process for heightening the natural colours of the stone artificially. This has been long secretly practised at Oberstein and Idar, the seats of the great agate manufactories of Europe, and probably has been long known in India, especially for the production of the finely coloured *Carnelians* and *Mochas* of that country. The stones best suited for this purpose are such as when recently fractured most readily imbibe moisture from the tongue; and a rude guess is made of the value of the specimen, by the quickness with which the moisture disappears.

The stone is first dried without heat, and is then immersed in a mixture of a quarter of a pound of honey in a pint of water; the whole is placed in an oven heated below the boiling point, where it should remain for two or three weeks, constantly covered with the liquid. At the end of this time the stones are washed, dried, and introduced into an earthenware vessel, containing sufficient sulphuric acid to cover the stones; this vessel, covered with a lid, is next placed in the oven, for a space varying from one to twelve hours, according to the hardness of the stone. The agates are now removed from the vessel, washed, and thoroughly dried; after which they are kept in oil for twenty-four hours; the oil is removed by rubbing them with bran. The stones are now cut and polished. In the best specimens, the gray streaks are increased in intensity; some exhibit brown streaks approaching to black, while white impenetrable parts assume a brighter hue by the contrast. This is the process employed to convert the veined chalcedony or agate into *onyx*, for the purposes of the lapidary, especially in the production of *cameos* and *intaglios*, in imitation of the antique sculptured gems; of which most admirable specimens have descended to us, and are found in the cabinets of the curious, especially in the Florentine Museum. In those minute but exquisite works, the ancient Greeks especially excelled; and curious specimens of the art are still found among the tombs of Egypt, Assyria, and Etruria. Among the moderns the Romans are the most successful imitators of antiquity; and the name of Pickler was long mentioned as almost a rival of the ancient engravers of gems. In such works the figures, whether in relief or intaglio, appear of a different colour from the ground.

A beautiful clear yellow is given to agate by digestion in hydrochloric acid for two or three weeks, at a moderate heat. The stone is first dried for two days in an oven, and immersed, when hot, in the acid; the jar is lined with clay, and placed in an oven for the requisite time. When examined, the muddy-brown streaks will be found of a rich yellow. The change that takes place is probably on the oxide of iron. Chalcedony has also been coloured, so as to imitate the Turquoise; but the process is not divulged. It is perhaps effected by immersing it in a solution of copper, which is the colouring matter of Turquoise.

2. *Carnelian*, or red chalcedony, when found, is almost always brownish or muddy. Both this sort and the yellowish-brown varieties are converted into a rich red by *roasting*, so as to rival the Indian carnelian, which probably also has its colour heightened artificially. The following process is employed at Oberstein, when the pale red stone becomes of a bright full red, and the muddy yellow of a rich full *carnelian* hue. Such stones are first kept in an oven for two or three weeks to dissipate moisture; they are then dipped in sulphuric acid, and immediately exposed in a covered earthenware crucible to a red heat: the whole is allowed to cool slowly; the stones are removed when cold, and washed. The hydroxide of iron they naturally contained has lost its water, and is more highly oxidated, and thus the full colour is produced.

3. *Mocha stones*, originally brought from the East, are clear grayish chalcedonies, with clouds and dashes of rich brown of various shades. They probably owe their colour chiefly to art.

4. *Moss-agates* are such as contain arborizations, or *dendrites* of oxide of iron: these seem in some instances to be produced on real vegetable forms, as petrifactions; but some of them are imitative forms that oxide of iron and manganese are known to assume.

5. *Jasp-agate* and *Opal-agate*, are mixtures of agate with these minerals.

6. *Plasma*, a substance found in engraved stones in the ruins of Rome, also on the Schwartzwald near Baden, and on Mount Olympus, appears to be chalcedony, coloured by oxide of iron, as it occurs in *green-earth*.

7. *Chrysoprase* is now considered as a quartz, or agate, coloured by oxide of nickel.

Agates have been described with representations of men, animals, or inanimate natural objects; but we can now have no hesitation in considering them as productions of art, or ingenious deceptions. Velschius had in his custody a flesh-coloured agate, on one side of which appeared a half-moon in great perfection, represented by a milky semicircle; on the other side, the phases of *vesper*, or the evening star; whence he denominated it an *aphrodisian agate*. An agate is mentioned by Kircher,[1] on which was the representation of a heroine armed; and one in the church of St Mark in Venice has the representation of a king's head adorned with a diadem. On another, in the museum of the Prince of Gonzaga, was represented the body of a man with all his clothes, in a running attitude. A still more curious one is mentioned by De Boot,[2] wherein appears a circle struck in brown, as exactly as if done with a pair of compasses, and in the middle of the circle the exact figure of a bishop with a mitre on; but inverting the stone a little, another figure appears; and if it is turned yet farther, two others appear, the one of a man, and the other of a woman. But the most celebrated agate of this kind was that of Pyrrhus, wherein were represented the nine Muses, with their proper attributes, and Apollo in the middle playing on the harp.[3] We have also seen accounts of an oriental agate, of such size as to be fashioned into a cup, with a diameter of an ell abating two inches. In the cavity is found delineated in black specks, B. XRISTOR. S. XXX. Other agates have also been found, representing the numbers 4191, 191; whence they were called *arithmetical* agates, as those representing men or women have obtained the name of *anthropomorphous*.

[1] *Ephem. German.* dec. i. an. 1. obs. 151.

[2] *De Gem.* l. ii. c. 95.

[3] *Pliny*, l. xxxvii. c. 3.

The agate is used for making cups, rings, seals, handles for knives and forks, hilts for swords and hangers, rosary beads, and a great variety of trinkets; being cut or sawed with no great difficulty. (T. S. T.)

AGATE, among *Antiquaries*, denotes a stone of this kind engraven by art.

AGATE is also the name of an instrument used by gold-wire drawers; so called from the agate in the middle of it, which forms its principal part.

AGATHARCHUS, a Greek painter, commemorated by Vitruvius for having first applied the laws of perspective to architectural painting, which he successfully used in painting scenery for the plays of Æschylus. He flourished about 480 years B.C.

AGATHARCIDES, a celebrated geographer, who flourished about 140 years B.C., was born at Cnidos. His works are lost, except those passges quoted by Diodorus Siculus, and other authors, for his descriptions especially of the gold mines of Upper Egypt, and his philosphical explanation of the inundations of the Nile, which he ascribed to the rains on the mountains of Ethiopia.—Hudson's *Greek Geographers*.

AGATHERMUS, a Greek geographer of the third century, of whose works we only possess brief outlines.—Hudson's *Greek Geographers*.

AGATHIAS, or, as he calls himself in his epigrams, AGATHIUS, distinguished by the title of *Scholasticus*, a Greek historian in the sixth century, in the reign of Justinian. He was born at Myrina, a colony of the ancient Æolians, in Asia the Less, at the mouth of the river Phythicus. He was an advocate at Constantinople. Though he had a taste for poetry, he was yet more famous for his history, which begins with the 26th year of Justinian's reign, where Procopius ends. It was printed in Greek and Latin by Vulcanius, at Leyden, 1594, in 4to. The best edition is that of Niebuhr, Bonn, 1828.

AGATHO, the Athenian, a tragic and comic poet, was the disciple of Prodicus and Socrates, and applauded by Plato, in his Dialogues, for his virtue and beauty. His first tragedy obtained the prize; and he was crowned, in the presence of upwards of 30,000 persons, in the fourth year of the 90th Olympiad. There are no remains of his works, excepting a few quotations in Aristotle, Athenæus, and others.

AGATHOCLES, the famous tyrant of Sicily, was the son of a potter at Reggio. By his singular vigour and abilities, he raised himself through various gradations of rank, till he finally made himself tyrant of Syracuse, and then of all Sicily. He defeated the armies of the Carthaginians several times, both in Sicily and Africa. But meeting at length with a reverse, and being in arrears with his soldiers, they mutinied, forced him to fly his camp, and murdered his sons. Recovering himself, he relieved Corfu, which was besieged by Cassander; burnt the Macedonian fleet; and revenged the death of his children by putting the murderers, with their wives and families, to the sword. After ravaging the sea-coast of Italy he took the city of Hipponium. He was at length poisoned by his grandson Archagathus, in the 72d year of his age, B.C. 290, having reigned 28 years.

AGATHYRNA or AGATHYRNUM, AGATHYRSA or AGATHYRSUM, a town of Sicily, now *St Marco*, as old as the war of Troy, having been built by Agathyrnus, son of Æolus. The gentilitious name is *Agathyrnæus;* or, according to the Roman idiom, *Agathyrnensis*.

AGBARUS. See ABGARUS.

AGAVE, a botanical genus, of the natural order of *Bromeliaceæ*, including the *American aloe*. The principal species is *A. americana*, a plant now naturalised in Spain, where it forms very secure fences. It sends up a lofty spike of very rapid growth, bearing a bunch of yellow flowers. The leaves are fleshy, long, and strong, carrying a formidable spine at their extremity. The fermented juice of the stem is the *pulque* of the native Mexican tribes. The fibres of the leaf afford a very good material for cordage.

AGDE, a city of France, in the department of Herault. It is seated on the river Herault between two and three miles from its mouth, where it falls into the Gulf of Lyons, and where there is a fort built to guard its entrance. The greater part of the inhabitants are merchants or seamen. The city is extended along the river where it forms a little port wherein ships of 200 tons may enter. Pop. in 1846, 8321.

AGE, in its most common acceptation, implies the whole space of time through which anything has existed; but the term is frequently used in other senses too vague and figurative to be included under any general definition.

The age of this habitable globe has been much disputed. Cuvier, Dolomieu, Deluc, and Greenough, concur in thinking that not more than 5000 or 6000 years have elapsed since the creation of man.—Cuvier's *Theory of the Earth*.

Josephus estimates the period that elapsed from the creation of man to the deluge at 2256 years. The antediluvian or obscure age was succeeded by the fabulous or heroic age, in which the exploits of the gods and heroes of the ancients were supposed to have been performed, extending down to the first Olympiad, B.C. 776. To this succeeded the historic age, terminating with the destruction of Carthage by the Romans in B.C. 146. The period immediately following has been denominated the Roman age, which extended down to the fall of the Roman Empire in the West, A.D. 476. The middle age is defined by some writers as that period extending from the time of Constantine in the fourth century to the capture of Constantinople by the Turks, A.D. 1453; but it is more usually defined as dating from the division of the empire of Theodosius, A.D. 395, down to the time of the emperor Maximilian I., in the beginning of the sixteenth century, when the Germanic Empire was first divided into circles. It has also been termed the barbarous age, and is commonly divided into two periods; the first extending from the sixth to the ninth century, when learning was almost extinct in Europe; the second dating from the ninth century, when letters again began to flourish.

The term age has been applied metaphorically to supposed epochs in human civilisation: thus, in the mythology of the Greek and Roman poets, there were four ages, distinguished as the Golden, the Silver, the Brazen, and the Iron; the three latter being successively a farther declension from the first or pristine state of purity and bliss. In the first, mankind were supposed to have subsisted on the spontaneous productions of nature, in a state of innocence and happiness, without the necessity of laws or civil government. In the second, the earth no longer yielded its fruits untilled, and the human heart first began to be corrupted. In the third, emulation and discord arose, men grew more and more selfish, and laws became necessary to restrain human depravity. In the fourth, Astræa, the last of the celestial sojourners on earth, withdrew from the contemplation of human wickedness, and abandoned the world to violence, the scourge of wars, and desolation. The propriety of inverting the order of these four ages has been urged, on the ground that civilisation has been steadily progressive from the earliest times down to the present. However this may be, the universal tradition of a golden age, or primeval state of bliss, seems to favour the opinion that the light of revealed religion was never wholly extinguished, but may be traced exerting a remote influence on the human mind, long after the source whence it was derived was lost to the heathen world.

The term age is often used to denote any period that has been distinguished by the occurrence of remarkable events, or by the appearance of eminent persons; *e. g.* the age of the crusades, of chivalry, of the reformation; or, the age of Pericles, of Alexander, of Augustus, of Trajan, of Alfred, of Chaucer, the Elizabethan age,—the age of Shakspeare, of Newton, &c. The reign of Queen Anne has sometimes been styled the Augustan age of English literature, from its supposed resemblance to that illustrious period in the literary history of Rome.

The several ages at which, with us, individuals become legally qualified for certain ends, may be stated shortly as follows, commencing with the earliest age so cognisable. An infant under $10\frac{1}{2}$ years of age is not amenable to the laws; but above that age, the offender, without distinction of sex, is responsible, if found to be *capax doli*, or competent to distinguish between right and wrong: and although 14 is fixed by the civil law as the age of criminal responsibility, capital punishment has once been inflicted, for an artfully-concealed murder (in 1629), at the early age of 8 years. After 12, the oath of allegiance may be taken. The age of puberty in either sex is 14, when each may choose guardians; and formerly, if their discretion was proved, a male at 14, and a female at 12, could execute a valid testament of personal property, though not of lands: but by Vict. 1, c. 26, it is enacted that no person can execute any valid will under 21 years of age. The nubile age was fixed by the Roman law at 14 for males, and 12 for females, which are the respective legal ages with us, when either sex may consent to marriage, with the approval of guardians; yet it may be observed, that many minors contract marriages without such sanction. In France, by the *Code-Napoleon*, the nubile age is 18 for males, and 15 for females, under similar restriction. At 17, a person of either sex may be an executor or executrix. The sovereignty of this realm is assumed at 18; though the law, according to Blackstone, recognises no minority in the heir to the throne. The age of majority, which gives to both sexes the free disposal of themselves and their property, personal and real, is 21; at which age a man is capable of enjoying most civil privileges. In France the age of majority is the same. Among the Romans, minority did not cease until the completion of the 25th year. A seat in the British Parliament may be taken at 21: in the American House of Representatives at 25, and in the Senate at 30. In France, the requisite age for an elector was 25: for a seat in the Chamber of Deputies, 30; and in the Chamber of Peers it was 25, though no member of that Assembly could vote till 30. At Rome, during the time of the republic, 32 was probably the senatorial age; but it was fixed by Augustus at 25, and so it continued during the time of the empire. It appears that previous to the year B.C. 179, a citizen was eligible to most offices in Rome after the completion of his 27th year: but at that time it was enacted that the earliest age for the quæstorship should be 31; for the ædileship, 36; for the prætorship, 40; and for the consulate, 43,—though the law respecting this last was frequently infringed, especially by Julius Cæsar. The age for admission to the Spartan *Gerusia*, or Council of Elders, was 60. In the Church of England, a candidate for holy orders may become a deacon at 23; be ordained a priest at 24; and at 30 is eligible to a bishopric. A licentiate of the Church of Scotland must not be under 21 years of age. The same is the age for admission to the English or Scottish Bar, and for receiving the degree of Doctor of Medicine in the University of Edinburgh, and in most other colleges.

*Age of Man.*—We learn from the oldest and most authentic record of our race that the age of man has greatly diminished from his first creation. The antediluvians attained an age nearly approaching one thousand years; and during all the period from the creation of man to the deluge, his age did not diminish, seeing that the last of the antediluvians, Noah, lived 950 years, or twenty years longer than Adam. From the period of the deluge however, the age of man was suddenly shortened; none born after that event reached the age of 500 years, and even that age was lessened by a-half, and again gradually shortened during succeeding generations, till in the days of Moses it had reached that standard from which it has not since departed. "The days of our years are threescore years and ten; and if by reason of strength they be fourscore years, yet is their strength labour and sorrow."

As the most remarkable instance of longevity in modern times we may notice Petratsch Czartan, a Hungarian peasant, who was born in 1537, and died in 1722, at the patriarchal age of 185 years. See Longevity.

As applied to man the term age is often used to express the duration of a generation. The ancients in using the term in this sense intended to express a period of thirty years. Thus Nestor is said to have lived three ages when he was ninety years old. It is a remarkable instance of the correct observation of the ancients, that the statistics of the countries of Europe at present show that thirty years is the mean term of the life of a generation. In our more favourable isle this mean age or mean duration of a generation is somewhat higher, being for London about thirty-one years, and for England and Wales thirty-three years;—residence in the

Age. country being more favourable to health and longevity than residence in towns. As a general rule, when the population is rapidly increasing, as in America, the mean age or mean duration of a generation is lower than in an old country where the population is nearly stationary.

The age of man has been variously divided into four, six, and seven stages:—The latter being not only the poetical, but the most correct physiologically. These seven stages are, 1. Infancy; 2. Childhood; 3. Boy or Girlhood; 4. Adolescence; 5. Manhood or Womanhood; 6. Age; 7. Old Age or second childhood. These different periods are more or less distinctly marked. Infancy is attended with peculiar dangers, and extends to about the end of the second year of life, by which time the first dentition is completed. Childhood extends from this period to about the seventh year, the termination of this period being marked by the dropping out of the middle incisors, and the appearance of the second set of teeth. Boyhood extends from the seventh to about the fourteenth year, and during this period all the first or milk set of teeth are replaced by the permanent ones. Adolescence, youth, or puberty, generally commences somewhat earlier in the female than in the male; and extends in both from about the fourteenth to the twenty-first year of life. It commences with the evolution of the generative system; and during this period the body attains its full height. Womanhood lasts distinctly from the 21st to the 45th or 50th year, most generally to about the latter, at which period the female ceases to be capable of procreation, and her constitution undergoes a complete change. Though less attention has been paid to the duration of this stage in the male, it is an unquestionable fact that about the 49th or 50th year of life the male constitution also undergoes a change, and fully justifies the notion of the ancients as to climacteric periods of life. The period of life we have termed age, extending generally from the 49th to the 63d year of life, has been too commonly, but most erroneously, confounded with the next stage, viz. old age. During the earlier portion of this period, the body, instead of tending to decay, tends rather to obesity. The maturity and strength of intellect too, continue for the most part undiminished during all this stage. In old age, the last stage of all, the body begins to shrink, the muscles lose their tone, and not being able to sustain the weight of the body, allow the limbs to bend more or less. The hair becomes white; the teeth drop out; all the senses are blunted; the intellect is feeble; the circulation becomes weaker; and death naturally closes the scene.

*Age of Animals.*—Comparatively few observations have been made on the ages of animals. From observations founded on some of the domestic animals, it has been stated that the duration of the life of an animal is usually seven or eight times longer than the period it takes to arrive at its full growth. This rule applies pretty well to horses, oxen, sheep, dogs, the camel, and even the elephant, but is quite inapplicable to man, to many quadrupeds, birds, reptiles, or fishes. Even were the rule applicable to animals, it would not enable us from an examination of the animal to find out its age; hence other means have been devised for determining the age with a greater degree of certainty. Thus the age of the horse may be pretty accurately determined by the examination of the incisive teeth or nippers, but even these lose mark at ten years, and the age of the horse after that period cannot be accurately ascertained. (See Horse.) In horned cattle and deer, the age may, for a certain period of their life, be pretty accurately guessed at by the appearance of the horns. All deer shed their horns annually, and, in the males of many species, each successive year adds one more branch to the horns, till they attain a certain size, beyond which they do not increase. Thus the common stag during the first year of its life has a simple horn, called a pricket. This falls off during the second year of its life, and is replaced by a horn with one branch or antler. This in its turn falls off during the third year, to be replaced by a horn with two antlers; and so on till the eighth year of life, when the horns cease to acquire additional antlers, so that the future age of the animal cannot be ascertained. The horns of oxen, sheep, goats, and antelopes, being permanent, are simple, and grow in a different manner. As a general rule, for a certain number of years, a ring is added annually to the base of the horn, and by this mark their age may be pretty accurately ascertained. In sheep and goats the horn which grows the first year of life is smooth; but every year after this a ring more or less wrinkled is added to the base of the horn, and indicates their age. It is probable that the same law prevails with the antelopes. In oxen, again, the horn continues smooth for the first three years of life, but every year thereafter, a wrinkled ring is added to the base of the horns. By counting the number of these rings, therefore, and adding three for the first years when the horns are smooth, the age may be pretty accurately known.

No sure indications exist by which the ages of birds, reptiles, or fishes, may be known.

Several curious facts, however, have been collected relative to the age attained by various animals. The Indians believe that the elephant lives three centuries; and authentic instances are on record of their having been kept in captivity for 130 years, their age being unknown at the period of their being taken captive. Camels live from 40 to 50 years; horses from 25 to 30 years, if not overworked; oxen about 20 years; sheep 8 or 9 years; dogs 12 to 14 years.

The longevity of some birds appears to be very great. The swan has been known to live 100 years. Birds of prey, and especially the eagle, have survived a century; and several instances are on record of the raven having exceeded that period. Parrots have been known to live 60 and 80 years. The gallinaceous birds, as domestic poultry and pheasants, have short lives, rarely exceeding 12 or 15 years.

Of reptiles, so far as known, the tortoise seems to attain the greatest age. One was placed in the archiepiscopal garden at Lambeth in the year 1633 during the life of Archbishop Laud, and it survived till the year 1753, when it perished from accident rather than old age. The toad is know to live about 15 years. Nothing, however, is known relative to the age of the gigantic boas or other serpents.

Of fishes, the carp has been known to attain the age of 200 years. We have seen the common river trout confined in a well, one 30 years, the other upwards of 50 years, and both still living. Rzaczynski mentions a pike which lived in a pond a period of 90 years. Gesner relates that in 1497 an enormous pike was caught in a lake near Haillerun in Suabia, with a brazen ring attached to it, bearing that it was put into the lake in the year 1230; which ring is still preserved at Mannheim. This pike, therefore, appears to have reached the patriarchal age of 267 years at least.

Of the ages of the lower animals little is known. That of insects has received most attention, and it is instructive to note that, though the first period of life of many of these animals (the caterpillar or grub) extends through a period of several months, or even years, the great majority live but a few days or weeks after they attain their perfect form. The ephemera does not enjoy the pleasures of its aerial life above a few hours; the same day which brings it into perfect being seeing it die.

It may be observed, as a general law of nature applicable to all organised beings, that early maturity indicates shortness of life, and that they are usually prolific in the inverse ratio of their duration.

*Age of Plants and Trees.*—The great majority of plants which adorn the face of the earth are annual and biennial—

that is, spring from the seed, blossom, ripen their seeds, and die, in one or in two years. Most of those, however, which rise to the stature of shrubs or trees attain considerable age. Of the palm trees it is very questionable whether any attain a greater age than 200 years. As this class of plants, after attaining a certain diameter, shoots up a straight stem which never increases in diameter, and all the new wood which every leaf necessarily produces insinuates its fibres into the centre of the trunk, this trunk or stem necessarily becomes more and more condensed, so that at last life or vegetation ceases, from the fibres and vessels being too much compressed to conduct the sap to the growing top. Exogenous trees, or those which grow by the addition of an annual layer of wood superimposed or encircling those already formed, may continue growing for an indefinite length of time, and several of the trees which exist on the surface of the globe may have witnessed the Noachian deluge. Of this class is the Baobab tree of Senegal, with a girth of nearly 300 feet, reckoned by Adanson to be 5150 years old; the gigantic *Dracœna draco* at Orotava, in Teneriffe, which Humboldt classes with the Baobab as "the oldest habitants of our planet;" the deciduous cypress at Chapultepec in Mexico, supposed by the younger De Candolle to be of equal antiquity with the two former; the chestnut trees on Mount Ætna, of which one is 180 feet in circumference, another 70 feet, and another 64 feet; and the oriental plane tree, in the valley of Bujukdere, near Constantinople, which measures 150 feet in circumference. Of trees of known age are the eight olive trees which still exist in the garden on the Mount of Olives at Jerusalem, and which historical documents prove to have existed prior to the taking of that city by the Turks. These trees, consequently, exceed 800 years in age. The yew tree is proverbial for the great age it sometimes attains. The yews at Fountains Abbey in Yorkshire were considered old trees when the Abbey was erected in 1132, and are probably more than 1200 years old. The old yew formerly in Fortingal churchyard, in Perthshire, was probably double that age, and was 56½ feet in circumference. At Ankerwyke House, near Staines, is the yew tree known as a tree of note before the day of Runnymede (5th June 1215); and many other instances might be adduced. Oaks have frequently been cut down in the New Forest which presented 300 and 400 concentric rings, each of which indicated a year's growth. But many oaks exist of much larger dimensions, and consequently of much greater age, probably exceeding 1200 years. Thus, an oak was felled at Norburg, as is related by Dr Plott, of the enormous circumference of 45 feet, and the Boddington oak, in the vale of Gloucester, was 54 feet in circumference. Damory's oak in Dorsetshire was 68 feet in circumference, and, according to the common calculation, was 2000 years of age. Wallace's oak at Ellersley, near Paisley, must be at least 700 years old, but its age is trifling as compared with the forementioned giants. The cypress has been known to attain the age of 800 years. A lime tree in the Grisons, measuring 51 feet in circumference, is known to be upwards of 580 years old. It is doubtful whether the elm ever reaches the age of 300 years. One planted by Henry IV. was standing at the Luxembourg, at the commencement of the French Revolution. Bacon's elms in Gray's Inn Walks, planted in 1600, decayed prematurely in 1720; and the elms in the Long Walk at Windsor, planted in the beginning of the last century, are evidently past their prime, though still noble trees.

AGEDA, Synod of, an assembly of Jewish doctors in the year 1650, who met in the plain of this name, about thirty leagues distant from Buda, for the purpose of debating whether the Messiah had appeared. The meeting was attended by more than 300 rabbis, and many other Jews of different nations, and the question was decided in the negative. Some ecclesiastics from Rome were present, but the multitude refused to hear them.

AGELA, in *Antiquity*, an assembly of the sons of the noblest families in Crete, who lived together from their eighteenth year, and were instructed in manly exercises at the expense of the state until the time of their nuptials, which were solemnized simultaneously. The Agelæ were exclusively aristocratic. At Sparta, seven was the age for entering the Βοῦαι.

AGELADAS, an eminent statuary of Argos, and the instructor of the three great sculptors, Phidias, Myron, and Polycletus.

AGELNOTH, Egelnoth, or Æthelnoth, in Latin *Achelnotus*, archbishop of Canterbury in the reign of Canute the Great, succeeded Livingus in that see in the year 1020. This prelate, surnamed the *Good*, was son of Earl Agilmer, and at the time of his election, dean of Canterbury. After his promotion he went to Rome, and received his pall from Pope Benedict VIII. On his way thither, as he passed through Pavia, he purchased, for a hundred talents of silver and one of gold, St Augustin's arm, which was kept there as a relic, and sent it over to England as a present to Leofric, earl of Coventry. Upon his return, he is said to have raised the see of Canterbury to its former dignity. He was much in favour with King Canute, and employed his interest with that monarch to good purposes. By his advice the king sent over large sums of money for the support of the foreign churches; and William of Malmesbury observes, that this prince was prompted to acts of piety, and restrained from excesses, by the regard he had for the archbishop. Agelnoth, after he had sat 17 years in the see of Canterbury, died October 29, 1038, and was succeeded by Eadsius, King Harold's chaplain. He was the author of, 1. A panegyric on the blessed Virgin Mary; 2. A Letter to Earl Leofric concerning St Augustin; 3. Letters to several persons.

AGEMA, in *Macedonian Antiquity*, was a body of soldiers, not unlike the Roman legion.

AGEN, an arrondissement in the department of Lot and Garonne, containing 9 cantons, 72 communes, and 85,149 inhabitants. The chief town of the same name is situate on the right bank of the Garonne, about 75 miles south-east of Bordeaux. It has a sail-cloth manufactory, a college, several literary institutions, and is the seat of a bishop and a royal court of justice. Here is a fine bridge of 11 arches over the Garonne. In this neighbourhood some meteoric stones fell in July 1790. In 1846 the population was 14,091.

AGENDA, among *Philosophers* and *Divines*, signifies the duties which a man lies under an obligation to perform. Thus we meet with the *agenda* of a Christian, or the duties he ought to perform; in opposition to the *credenda*, or things he is to believe.

Agenda, among *Merchants*, a term sometimes used for a memorandum-book, in which is set down all the business to be transacted during the day, either at home or abroad.

Agenda, among *Ecclesiastical Writers* denotes the service or office of the church. We meet with *agenda matutina et vespertina*, the morning and evening prayers; *agenda diei*, the office of the day, whether feast or fast; *agenda mortuorum*, called also simply, *agenda*, the service of the dead.

Agenda is also applied to certain church-books, compiled by public authority, prescribing the order and manner to be observed by the ministers and people in the principal ceremonies and devotions of the church; in which sense *agenda* amounts to the same with what is otherwise called *ritual*, *liturgy*, *acolouthia*, *missal*, *formulary*, *directory*, *&c.*

AGENHINE, in our old writers, signifies a guest that has lodged at an inn for three nights, after which time he was accounted one of the family; and if he offended the king's peace, his host was answerable for him. It is also written Hogenhine and Hogenhyne.

AGENOIS, a country of France, in the department of the Garonne, formerly the province of Guienne. It contained about one hundred and twenty square leagues, was fertile and healthful, and, according to Cæsar, was inhabited by the Nitiobriges. It constituted part of the kingdom of Aquitania: was held by the counts of Toulouse, and successively by the English and French.

AGENT, in a general sense, denotes any active power or cause. Agents are either natural or moral. Natural agents are such inanimate powers as act upon other bodies in a certain and determinate manner: as gravity, fire, &c. Moral agents, on the contrary, are rational creatures, capable of regulating their actions by a certain rule.

Agent, in *Diplomacy*, *Commerce*, and *Jurisprudence*.—This word applies generally to any person who acts for another. It has probably been adopted from France, as its function in modern civil law was otherwise expressed in Roman jurisprudence. Ducange tells us that in the eastern empire the important officers who collected the grain in the provinces for the troops and the household, and afterwards extended their functions so as to include those of government postmasters, came to be called *agentes in rebus*, though their earlier name was *frumentarii*.

In *Diplomacy*, a class of semi-ambassadors termed agents have been employed generally between states of unequal power. The small community might send an agent to propitiate some powerful government, and secure its protection. A great power would, on the other hand, distribute its agents among the petty states which it kept in clientage, to see that no counteracting influence was at work among them. In this shape our Indian government keep agencies in the protected and other neighbouring states. In countries within the operation of the laws of diplomacy, an agent has the privilege of personal protection, and sometimes that of exemption from direct taxes, but he has not the ambassador's prerogative of communicating directly with the sovereign. See Ambassador; Diplomacy.

The law of principal and agent is one of those which have arisen in common practice regulated by jurisprudential theory. It involves nice and subtle distinctions, which are not merely theoretical, but have been found of eminent practical utility in the affairs of active life, for the service of which they have been created from time to time, by sagacious jurists. They had their origin in the subtleties of the law of mandate among the Romans, whence they spread through the different countries of Europe. It is perhaps fortunate that in England the spirit of the Justinian system thus pervades this branch, and that it is but little affected by the conventional peculiarities of the common law. This renders the law of agency almost alike throughout the whole British empire, and produces the farther result, that a branch of the British commercial code, in which it is of great importance that different nations should understand each other's system, differs only slightly from the corresponding branch of the law throughout the rest of Europe. The main features of a general view of the law of agency involve the adjustment of the rights and duties of the principal, the agent, and the public. The agent should not do what he has no authority for, yet if he be seen to have authority, those with whom he deals should not be injured by secret and unusual conditions. The employer is bound by what his agent does in his name, but the public are not entitled to take advantage of obligations which are known to be unauthorised and unusual. The agent is entitled to demand performance by the principal of the obligations undertaken by him within the bounds of his commission, but he is not entitled to pledge him with a recklessness which he would certainly avoid in the management of his own affairs. It is in the regulation of these powers and corresponding checks in such a manner that the legal principle shall apply to daily practice, that the niceties of this branch of the law consist.

Agents are of different kinds, according to their stipulated or consuetudinary powers. The main restraint in the possible powers of an agent is in the old maxim, *delegatus non potest delegare*, designed to check the complexity that might be created by inquiries into repeatedly deputed responsibility. But in practice this principle is modified. The agent cannot delegate his commission, or put another in his own place; but it is often a part of his function that he is to employ, for the accomplishment of certain objects, persons who are themselves agents. Thus, there is nothing to prevent a commercial agent from sending a portion of the goods entrusted by him to his own agent for disposal. In the general case, the authority may pass from the principal to the agent, either verbally or in writing. The English statute of frauds requires an agent to have authority in writing for the purposes of its 1st, 2d, and 3d clauses relating to leases. "And it is a general rule, that an agent who has to execute a deed, or to take or give livery or seisin, must be appointed by deed for that purpose. Moreover, as a corporation aggregate can in general act only by deed, its agent must be so appointed, though it would seem that some trifling agencies, even for corporations, may be appointed without one; and there is one case in which it was considered that a corporation might, without deed, empower an agent to do acts in the common course of its corporate business, or to make notes for a banking corporation." (Smith's *Commercial Law*, B. I. chap. v.) It is a general rule, that those obligations which can only be undertaken by solemn formalities cannot be entered on by a delegate who has not received his authority in writing. Agency is, however, often constituted, at the same time that its extent is defined, by mere appointment to some mandatory function—as where one is appointed agent for a banking establishment, factor for a merchant, broker, supercargo, traveller, or attorney. In these cases, usage defines pretty strictly the powers granted to the agent; and the employer will not readily be subjected to obligations going beyond the usual functions of the office; nor will the public dealing with the agent be bound by private instructions inconsistent with its usual character. While, however, the public, ignorant of such secret limitations, are not bound to respect them, the agent himself is liable for the consequences of transgressing them. There is another method by which agency may either be created or enlarged—*implication*. What the agent has done with his principal's consent, the public are justified in believing him authorised to continue doing. Thus, as a familiar instance, the servant who has continued to purchase goods for his master at a particular shop on credit, is presumed to retain authority and trust, and pledges his master's credit in farther purchases, though he should apply the articles to his own uses. The law is ever jealous in admitting as accessories of a general appointment to any particular agency the power to borrow money in the principal's name, to give his name to bill transactions, and to pledge him to guaranties; but all these acts may be authorised by implication, or by being the continuation of a series of transactions, to the precedents of which the principal has given his sanction. Thus an employer may, by the previous sanction of such operations, be liable for the bills or notes drawn, indorsed, and accepted by his clerk, or other mandatory; nay, may be responsible for the obligations thus incurred after the mandatory's dismissal, if the party dealing with him knew that he was countenanced in such transactions, and had no reason to suppose that he was dismissed. The unpleasant responsibilities thus created have often suggested the propriety of some system of publishing the cessation of agency, after the manner in which dissolutions of partnerships are gazetted. It is true that every principal has the means of specially warning the public not to confide in the agent he has ceased to employ, but the merely occasional use of precaution makes it invidious, and sometimes cruel.

The law of principal and agent, though of a purely consuetudinary character, has, by the sound foresight of great lawyers, been so well adjusted on the whole to the exigencies of society, that parliament has only found it necessary to interfere in one department of it. The law applicable to a mercantile agent's power to pledge, or otherwise dispose of the goods entrusted to him being in an unsatisfactory state, a statutory remedy was applied to it by an act of 1825 (6th Geo. IV. c. 94), which required amendment in 1842 (5th and 6th Vict. c. 39). It is to be regretted that these statutes, intended to regulate merchants in the transaction of their business, should have been framed with all the worst technicalities and elaborate complexities, which are never necessary, but would be less mischievous in acts for the guidance of professional or official men.

The general object of these measures is, to make transactions with an agent in possessions of goods as safe as dealing with the owner, to all who treat with him as purchasers or otherwise, in good faith, and in ignorance of his want of ownership. Thus, when an agent ships goods in his own name, the consignee is entitled to a lien on them for any advances to the agent, or liabilities on bills or notes. The presumption in such cases is ownership; and the burden of disproving it, as well as of showing that the consignee was aware of the mere agency, falls on the person questioning the validity. By the statutes, the person in possession of a bill of lading, dock warrant, warehouse-keeper's certificate, wharfinger's certificate, or other delivery warrant, is held the owner of the goods it represents, so as to render valid any transaction for their sale or other disposal to parties ignorant of the limited ownership. Besides their effect in rendering valid, in this more comprehensive manner, operations conducted under the appearance and supposition of absolute ownership, the acts have separate provisions for the security of those who deal with agents knowing them to be such. Any purchase from the agent, or payment of price to him, is declared to be effective against the principal, "provided such contract and payment be made in the usual and ordinary course of business," and that the party, when he made the purchase, or paid the price, was not specially warned, that the agent had no authority to sell or receive money for his principal. By the earlier act, the extent to which an impledgment by an agent was made effective, was only to the extent of covering the amount of his own claims against the principal. The act of Victoria, in the preamble, that advances on goods and delivery orders are part of the usual and ordinary course of business, enlarges the freedom of disposal, and provides that the agent is to be held as owner, to the effect of affording validity "to any contract or agreement by way of pledge, lien, or security, *bona fide* made by any person with such agent;" although it be known that he is merely an agent, provided it be not also known that he is acting fraudulently, and without authority. The interest of the principal is fortified by severe penal provisions against agents acting fraudulently; but it is provided that no agent is to be held fraudulent, who pledges merely for the amount due to him by his principal, or for which he has rendered himself liable by acceptances.

This necessarily very brief outline applies to the constitution of agency, which, as involving those questions where not only the two parties to the contract but the rest of the public, are concerned, is by far the most important branch of the subject. The others, which may be more briefly noticed, comprehend the mutual and reciprocal rights and obligations of the principal and agent. These can always be regulated by agreement. The obligations on the principal are, to pay the agent's remuneration, and honour the obligations lawfully undertaken for him. The responsibilities of the agent involve greater niceties. He is responsible for the possession of the proper skill and means for carrying out the functions which he undertakes. He must devote to the interests of his employer such care and attention as a man of ordinary prudence bestows on his own—a duty capable of no more certain definition, the application of it as a fixed rule being the function of a jury. In some instances the law interposes to remove him from temptation to sacrifice his employer's interests to his own: Thus, when he is employed to buy, he must not be the seller; and when employed to sell, he must not be the purchaser. He ought only to deal with persons in good credit, but he is not responsible for their absolute solvency unless he guarantee them. A mercantile agent guaranteeing the payments he treats for is said to hold a *del credere* commission. Doubtful questions often arise as to the extent to which an agent may save expense to his employer, and take credit for the amount. Thus, it used to be said that an agent cannot take credit for home customs or excise dues which he has evaded, but that he may for foreign; but, at the present day, certainly neither claim could be supported.

In Scotland, the procurators or solicitors who act in the preparation of cases in the various law-courts, and all who take out the attorney-license are called agents. See ATTORNEY.

In France, the *Agents de Change* were formerly the class generally licensed for conducting all negotiations, as they were termed, whether in commerce or the money market. Of late the term has been practically limited to those who conduct, like our stockbrokers, transactions in public stock; and it is understood that it is rather as speculators than as agents that the majority of them adopt the profession. The laws and regulations as to *courtiers*, or those whose functions were more distinctly confined to transactions in merchandise, have been mixed up with those applicable to *agents de change*. Down to the year 1572, both functions were free; but at that period, partly for financial reasons, a system of licensing was adopted at the suggestion of the Chancellor l'Hôpital. Among the other revolutionary measures of the year 1791, the professions of agent and courtier were again opened to the public. Many of the financial convulsions of the ensuing years, which were due to more serious causes, were attributed to this indiscriminate removal of restrictions, and they were re-imposed in 1801. From that period regulations have been made from time to time as to the qualifications of agents, the security to be found by them, and the like. (J. H. B.)

AGER, in *Roman Antiquity*, a certain portion of land allowed to each citizen.

AGER PICENUS, or PICENUM, in *Ancient Geography*, a territory of Italy, to the south-east of Umbria, reaching from the Apennines to the Adriatic. The people are called *Picentes* (Cicero, Livy), distinct from the Picentini on the Tuscan Sea, though called by Greek writers Πικεντινοί. This name is said to be derived from the bird *picus*, under whose conduct they removed from the Sabines, of whom they were a colony.

AGESILAUS II., king of the Lacedemonians, son of Archidamus II., was raised to the throne in opposition to the superior claim of his nephew Leotychides. Immediately on his accession, he advised the Lacedemonians to anticipate the king of Persia, who was making great preparations for war, and to attack him in his own dominions. He was himself chosen for this expedition, and gained so many advantages over the enemy, that if the league which the Athenians and the Thebans formed against the Lacedemonians had not obliged him to return home, he would have carried his victorious arms into the very heart of the Persian empire. He gave up, however, all these triumphs readily, to come to the succour of his country, which he happily relieved by his victory over the allies in Bœotia. He obtained another near Corinth; but, to his great mortification, the Thebans afterwards gained several over the Lacedemonians. These misfortunes at first raised a clamour against him. He had been sick during the first advantages which the enemy gained; but as soon as he was able to act in person, his valour and prudence prevented the Thebans from reaping the advantages of their victories; so that it was generally believed, had he been in health at the beginning, the Lacedemonians would have sustained no losses, and that without him all would have been lost. It cannot be denied, however, that his fondness for war occasioned many losses to his countrymen, and led them into enterprises which in the end contributed much to weaken their power. He died in the third year of the 103d Olympiad, being the 84th year of his age and 38th of his reign, and was succeeded by his son Archidamus. Agesilaus would never suffer any picture or sculpture to be made of him, and prohibited it also by his will. This he is supposed to have done from a consciousness of his own deformity; for he was of short stature, and lame of one foot, so that strangers used to despise him at the first sight. Agesilaus was extremely fond of his children, and would often amuse himself by joining in their diversions. One day when he was surprised riding upon a stick with them, he said to a person who had seen him in this posture, "Forbear talking of it till you are a father."

AGGER, in the *Ancient Military Art*, a work of fortification, used both for the defence and the attack of towns, camps, &c.; in which sense it is the same with what was otherwise called *vallum*, and in later times *aggestum;* and, among the moderns, *lines*, sometimes *cavaliers, terrasses*, &c. The agger was usually a bank or elevation of earth or other matter, bound and supported with timber; having sometimes turrets on the top, wherein the workmen, engineers, and soldiery were placed. It was also accompanied with a ditch, which served as its chief defence.

The height of the agger was frequently equal to that of the wall of the place. Cæsar tells us of one he made which was 30 feet high and 330 feet broad. Besides the use of aggers before towns, the generals used to fortify their camps with such works.

AGGER, in *Ancient Writers*, likewise denotes the middle part of a military road, raised into a ridge, with a gentle slope on either side, to make a drain for the water, and keep the way dry.—The term is also used for the whole road or military way. Where highways were to be made in low grounds, as between two hills, the Romans used to raise them above the adjacent land, so as to make them on a level with the hills. These banks they called *aggeres*. Bergier mentions several in Gallia Belgica, which were thus raised, ten, fifteen, or twenty feet above ground.

AGGERHUUS, one of the provinces or dioceses into which the kingdom of Norway is divided. It extends over 31,050 square miles, with a population, in December 1845, of 519,890 inhabitants. It is a very mountainous and most romantic district, abounding in woods, rivers, cascades, and lakes, with some moderately fruitful spots in the narrow valleys. The climate is raw and cold, and the frosts usually continue till May. The corn is scarcely sufficient for the consumption, though fish and potatoes are extensively used as food. The chief trade is in deals, pitch, and tar, with some iron, butter, tallow, and hides. The inhabitants all speak the peculiar language of Norway, a dialect of the Teutonic mixed with the Celtic. They are all of the Lutheran confession, and have 307 parish churches and chapels.

AGGERHUUS, a bailiwick in the see of the same name, in Norway. It is in the middle of the see, near the lake of Christiania, and comprehends 2 cities, 5 market towns, 22 parishes, and 109,432 inhabitants.

AGGLUTINANTS, in *Pharmacy*, a general name for all medicines of a glutinous or viscid nature; which, by adhering to the solids, were supposed to contribute to repair their loss.

AGGREGATION, in *Physics*, a species of union, whereby several things which have no natural dependence or connection with one another are collected together, so as in some sense to constitute one. Thus, a heap of sand, or a mass of ruins, is a body by aggregation.

AGHORI, a fraternity that infests almost every town in the upper provinces of Hindostan, especially Behar. Their religion teaches them to act in almost every thing contrary to the rules of caste, which they altogether despise; and, going to the opposite extreme, they eat all kinds of food, such even as those who do not respect caste abhor.

AGHRIM, or AUGHRIM, in Galway, a small village, about 95 miles from Dublin, and rendered memorable by a decisive battle fought there and at Kilcommodon-hill on the 12th of July 1691, between General Ginkell and Monsieur St Ruth, who commanded respectively under King William III. and James II. St Ruth was slain, with 7000 of his men: the loss of the English was only 700. The victory was the more brilliant, as the English army consisted of no more than 18,000 men, whereas the Irish were computed at 20,000 foot and 5000 horse and dragoons. They lost likewise nine pieces of brass cannon; all their ammunition, tents, and baggage; and most of their small-arms, which they threw away to expedite their flight; with 11 standards, and 32 pair of colours.

AGINCOURT, a French village in the department of the Pas de Calais, situate in N. Lat. 50. 35. E. Long. 2. 10. famous on account of the victory obtained there by Henry V. of England over the French.

On the morning of Friday the memorable 25th of October, A.D. 1415, the day of Crispin and Crispianus, the English and French armies were ranged in order of battle, each in three lines, with bodies of cavalry on each wing. The Constable d'Albert, who commanded the French army, fell into the snare that was laid for him, by drawing up his army in the narrow plain between the two woods. This deprived him, in a great measure, of the advantage he should have derived from the prodigious superiority of his numbers; obliged him to make his lines unnecessarily deep, about thirty men in file; to crowd his troops, particularly his cavalry, so close together, that they could hardly move or use their arms; and, in a word, was the chief cause of all the disasters that followed. The French, it is said, had a considerable number of cannon of different sizes in the field; but we do not hear that they did any execution, probably for want of room. The numbers of the French are differently stated, the estimates varying from 50,000 to 150,000 men. The first line was commanded by the Constable d'Albert, the Dukes of Orleans and Bourbon, and many other nobles; the Dukes of Alençon, Brabant, and Bar, &c. conducted the second line; and the Earls of Marle, Damartine, Fauconberg, &c. were at the head of the third line. The King of England employed various arts to supply

Agio.

his defect of numbers. He placed 200 of his best archers in ambush, in a low meadow, on the flank of the first line of the French. His own first line consisted wholly of archers, four in file, each of whom, besides his bow and arrows, had a battle-axe, a sword, and a stake pointed with iron at both ends, which he fixed before him in the ground, the point inclining outwards, to protect him from cavalry. This was a new invention, and had a happy effect. That he might not be encumbered, he dismissed all his prisoners on their word of honour to surrender themselves at Calais if he obtained the victory, and lodged all his baggage near the village of Maisoncelle, in his rear, under a slender guard. The main body of the English army, consisting of men-at-arms, was commanded by Henry in person; the vanguard, committed to Edward Duke of York, at his particular request, was posted as a wing to the right; and the rearguard, commanded by Lord Camois, as a wing on the left. The archers were placed between the wings, in the form of a wedge. The lines being formed, the king, in shining armour, with a crown of gold adorned with precious stones on his helmet, mounted on a fine white horse, rode along them, and addressed each corps with a cheerful countenance and animating speeches. To inflame their resentment against their enemies, he told them that the French had determined to cut off three fingers of the right hand of every prisoner; and to rouse their love of honour, he declared, that every soldier in that army who behaved well should from henceforth be deemed a gentleman, and entitled to bear coat armour.

When the two armies were drawn up in this manner, they stood a considerable time gazing at one another in solemn silence. But the king, dreading that the French would discover the danger of their situation, and decline a battle, commanded the charge to be sounded, about ten o'clock in the forenoon. At that instant the first line of the English kneeled down and kissed the ground; and then starting up, discharged a flight of arrows, which did great execution among the crowded ranks of the French. Immediately after, upon a signal being given, the archers in ambush arose, and discharged their arrows on the flank of the French line, and threw it into some disorder. The battle now became general, and raged with uncommon fury. The English archers, having expended all their arrows, threw away their bows, and rushing forward, made dreadful havock with their swords and battle-axes. The first line of the enemy was by these means defeated, its leaders being either killed or taken prisoners. The second line, commanded by the Duke d'Alençon (who had made a vow either to kill or take the King of England, or to perish in the attempt), now advanced to the charge, and was encountered by the second line of the English, conducted by the King. This conflict was more close and furious than the former. The Duke of Gloucester, wounded and unhorsed, was protected by his royal brother till he was carried off the field. The Duke d'Alençon forced his way to the king, and assaulted him with great fury; but that prince brought him to the ground, where he was instantly despatched. Discouraged by this disaster, the second line made no more resistance, and the third fled without striking a blow; yielding a complete and glorious victory to the English, after a violent struggle of three hours' duration.—Henry's *Britain*; and *Battle of Agincourt*, by Sir H. Nicolas.

AGIO, a term used in *Commerce*, to denote the difference between the real and the nominal value of money. In some states the coinage is so debased, that the real is greatly reduced below the nominal value. Sometimes this is owing to abrasion, and the wear of circulation. Where this reduction amounts, *e. g.* to 5 per cent., if 100 sovereigns were offered as payment of a debt in England, while such sovereigns were current at their nominal value, they would be received as just payment; but if they were offered as payment of the same amount of debt in a foreign state, they would be received only at their intrinsic value of L.95, the additional L.5 constituting the *Agio*. The same principle is applied to the paper currency of a country, when reduced below the bullion value which it professes to represent. According to the respective demand for gold or paper money for the purposes of commerce, it becomes necessary, in order to procure the one or other, as the case may require, to pay a premium for it, which is called the *Agio*.

Agiosymandrum || Agis.

AGIOSYMANDRUM, a wooden instrument used by the Greek and other churches, under the dominion of the Turks, to call together assemblies of the people. The *agiosymandrum* was introduced in the place of bells, which the Turks prohibited their Christian subjects the use of, lest they should make them subservient to sedition.

AGIS. Four kings of this name reigned at different periods in Sparta. The first of the name was the son of Eurysthenes, and is supposed to have reigned about 1032 B.C. The designation of *Helots*, is said to have had its rise in his time, from the unsuccessful revolt and final enthralment of the inhabitants of Helos by the Spartans.

Agis II. succeeded his father Archidamus, and reigned from 427 to 399 B.C. He was an able and successful general, and headed the Spartans at the great and decisive battle of Mantineia.

Agis II. succeeded his father Archidamus VI. B.C. 338. He took an active part in the league of the Grecian states against Alexander the Great, and at the head of their forces defeated a Macedonian army under Corragus. He was slain about 331 B.C., in a battle with Antipater, under the walls of Megalopolis.

Agis IV., son of Eudamidas II., and lineally descended from Agesilaus II., succeeded his father B.C. 244, and reigned four years. The degenerate state of the Spartan commonwealth moved him to attempt a reformation by restoring the institutions of Lycurgus, and, in the spirit of a true reformer, he set the example in his own person and household. His excellent intentions were seconded by all the younger and poorer portion of the community; but the rich and luxurious were vehemently opposed to measures which threatened to interfere so seriously with their influence and pleasures. His colleague, Leonidas, headed the opposition, and busily propagated the suspicion that Agis aspired to tyranny, by levelling the just distinctions of society, and increasing the power of the multitude. Agis was supported by the influence of his uncle Agesilaus, who, being deeply in debt, was highly favourable to the proposed changes. Lysander and Mandroclides, two of the ephori, were also strenuous promoters of the reform. When the time came for Agis to propose in the senate a general discharge of debts, and a new division of lands, the measure was lost by a minority of one. The triumph of Leonidas, however, was short. Being accused by Lysander of having violated the laws, he took refuge in the temple of Minerva, and refusing to appear in his own defence, was degraded from his dignity, and banished to Tegæa. His son-in-law, Cleombrotus, was elected in his stead. The next election of ephori proved unfavourable to the party of Agis. Lysander and Mandroclides were tried for innovation, but succeeded in persuading the two kings to eject the new magistrates out of office, which was effected in the midst of much tumult. The reformation might now have been established, but for the intrigues of Agesilaus, whose selfish schemes counteracted the good intentions of the two kings. At this time the Achaians sent to Sparta for assistance in the war with the Ætolians, which was granted. Agis received the command of the troops, and conducted the campaign with much reputation. On his return, he found that the misconduct of Agesilaus had resulted in a revolution, and the recal of Leonidas. He took refuge in the temple of Minerva, Cleombrotus in that of Neptune. Leonidas contented himself with banishing his son-in-law, but resolved on the ruin of Agis. The unfortunate king was accordingly seized and cast into prison, whence he was brought to trial and sentenced to be strangled. His mother and grandmother in vain entreated to gain him a public hearing: they were insidiously permitted to visit him in prison, where they immediately after shared his fate.

Agis, a Greek poet of Argos, who accompanied Alexander the Great to Asia, and celebrated the praises of his patron in verses of the most contemptible quality. Q. Curtius, viii. 5.

AGISTMENT, Agistage, or Agistation, in *Law*, the taking in of other people's cattle to graze at so much per week. The term is peculiarly used for the taking of cattle to feed in the king's forests, as well as for the profits arising from that practice. It is also used, in a metaphorical sense, for any tax, burden, or charge; thus, the tax levied for repairing the banks of Romney Marsh was called *agistamentum*.

*Tythe of Agistment*, or the tithe of cattle and other produce of grass lands, is a small tithe in England paid to the vicar or rector by the occupier of the land, and not by the person who may put his cattle there to graze at a certain rate per head. This tithe was abolished in Ireland by the act of Union; but for a long time previously it had been very irregularly paid. After the Reformation, while the lands were chiefly in the possession of Catholics, the clergy received thankfully whatever they could get; but subsequently to the capitulation of Limerick, when almost all the benefices fell into the hands of Protestant rectors, they gradually began to reassume their constitutional rights. Accordingly, about the year 1720, they formally demanded payment of the tithe of agistment, to which their right was as indisputable as to the tithe of tillage lands; but it was vehemently resisted by the landlords. The clergy appealed to the Court of Exchequer; but although they obtained a decision in their favour, the question was not set at rest: for soon afterwards (on the 18th March 1735), the Irish House of Commons resolved, "that any lawyer assisting in a prosecution for tithes of agistment, should be considered as an enemy to his country." The tendency of this arbitrary and unjust procedure was to deprive the incumbents of the greater part of their income, and, at a time when the cultivated land in Ireland was but a mere fraction of what it now is, to throw the whole burden of their maintenance on the cultivators of tillage lands, thus relieving the extensive landowners at the expense of the small proprietors and tenants. In this position the matter stood at the period of the Union, when Sir John Macartney, aware that the extraordinary resolution of 1735 was not law, attempted to frustrate the Union, by moving that the abolition of the tithe of agistment should be embodied in the act. The measure, however, contrary to expectation, was suffered quietly to pass, and became law by a formal act of the imperial parliament. See *Wakefield's Account of Ireland*, vol. ii. p. 485.

AGISTOR, or Agistator, an officer belonging to forests, who has the care of cattle taken in to be grazed, and levies the moneys due on that account. They are generally called *quest-takers* or *gift-takers*, and are created by letters-patent. Each royal forest has four agistors.

AGITATION, the act of shaking a body, or tossing it backwards and forwards.

Agitation, *in Politics*, is the art of keeping the object to be obtained perpetually under discussion, so as to make a deep impression on the public mind. For this purpose a large number of co-operators is not at first absolutely requisite: the desired sensation may be produced by the well-directed efforts of a few, and it is not even necessary to success that the object of pursuit be important to the great mass of the people, or practically useful. The great agitator Daniel O'Connell was able to stir up the mass of the Irish nation, and keep them for years in a state of intense excitement, in the hopeless struggle for the attainment of his panacea for all their evils—a repeal of the Union. We have an instance of the beneficial effect of this principle, when wisely directed to a legitimate object, in the judicious and constitutional agitation which paved the way to the repeal of the corn-laws.

The effect of political agitation has long been recognised, and prompted the answer of the Marquis of Anglesey when lord-lieutenant of Ireland, to a deputation that waited on him with a petition. "If you really expect success, *agitate, agitate, agitate*." How heartily this advice has been followed, in that country especially, is too well known to all.

The ordinary course pursued by agitators is to hold public meetings, pass resolutions, get up petitions, employ popular lecturers, and procure frequent discussions in the newspapers on the subject; and though at first the public at large may take very little interest in the object proposed, yet, by the loud and constant agitation kept up, it may assume an aspect of the utmost importance. Thus, not only measures of great value have often been obtained, but, on the other hand, by the same means, objects of little or very doubtful advantage have too often acquired public favour. Agitation is a two-edged weapon that requires to be cautiously and prudently used; but when so employed in a good cause, it rarely fails to make an impression on the legislature, in countries blessed with a representative government. Under a despotism agitation cannot exist, but it is an invariable feature of free governments.

AGITATOR, in *Antiquity*, a term sometimes used for a charioteer, especially those who drove in the circus at the curule games.

Agitators (a corruption of *Adjutators*), in *English History*, certain officers appointed by the army in 1647, to take care of its interests during the revolutionary struggle.

AGLAIA, the name of the youngest of the three Graces, espoused to Vulcan.—*Hesiod.*

AGLAPHON, a Greek painter, best known as the father of Polygnotus. He was of Thasos, and flourished about 500 years B.C. He had also a son of his own name.

AGLAR. See Aquileja.

AGLIE, or Aglia, a town of Piedmont, nine miles southwest of Ivrea. It has a population of 4300. Near it is a royal palace, with an extensive park, fine gardens, and a collection of antiquities from Tusculum.

AGLIONBY, John, an English divine, chaplain in ordinary to King James I., was born in Cumberland, and admitted a student at Oxford in 1583. He was a man of universal learning, and took a very considerable part in the translation of the New Testament appointed by King James I. in 1604. He died in 1609.

AGMEN, in *Antiquity*, properly denotes a Roman army in march; in which sense it stands contradistinguished from *acies*, which denoted the army in battle array; though, on some occasions, we find the two words used indifferently for each other. The Roman armies in their marches were divided into *primum agmen*, answering to our vanguard; *medium agmen*, our mainguard; and *postremum agmen*, the rearguard.

AGNANO, Lago d', a small circular lake, near Naples, about two miles in circumference, and evidently the crater of a volcano, now filled with water. On its banks are the *stufe*, or natural vapour-baths of San Germano, and on its opposite shore is the famous *Grotta del Cane*, from the floor of which carbonic acid is continually evolved, in such quantity as to kill dogs that enter it, while a man, on account of his erect posture, escapes wholly the effect of the gas. (See *Spallanzani's Travels.*) This grotto is a small artificial excavation 12 feet long by 4 or 5 wide, and 6 feet high, seemingly made for obtaining puzzolano, or earthy volcanic tufa. The story of birds not frequenting the lake is erroneous, for it abounds in teal ducks and other birds, and in frogs.

AGNATE (from the Roman *Agnatus*), in *Law*, any male relation by the father's side.

AGNEL, an ancient French gold coin, first struck under the reign of St Louis, worth about twelve sols six deniers. The agnel is also called sometimes *mouton d'or*, and *agnel d'or.* The denomination is supposed to have arisen from the figure of a lamb (*agnus*) struck on one side.

AGNES, St, a large mining village in the county of Cornwall, 263 miles from London, and eight from Truro. It is built on a small rocky harbour, only accessible to fishing boats, on the British Channel. Pop. in 1851, 6674.

Agnes, St, one of the Scilly Islands, on the coast of Cornwall. The soil is fertile, and tolerably cultivated; but there is a great deficiency of water. A lighthouse on the island, about 50 feet in height, built on one of the loftiest hills, is an important object to seamen. Its exact position, as ascertained by the great trigonometrical survey, is in Long. 6. 19. 23. W. and Lat. 49. 53. 38. N. from Greenwich. The light is composed of Argand lamps, with reflectors, moving in a circular revolution, and presenting a bright and conspicuous light in every direction once a minute. Westward of St Agnes is the Gillstone rock, on which Sir Cloudesley Shovel was lost in the Association ship of war in 1707.

AGNESI, Maria Gaetana, an Italian lady, who may be justly pronounced one of the greatest wonders and ornaments of her sex, was born at Milan, on the 16th of May 1718. At nine years of age she not only spoke the Latin language with precision, but even composed and delivered an oration in that language, intended to prove that the cultivation of letters is not incompatible with the female character. This singular piece was published at Milan the same year in which it was spoken, with the following title: *Oratio, qua ostenditur artium liberalium studia a fœmineo sexu neutiquam abhorrere, habita a Maria de Agnesiis, rhetoricæ operam dante, anno ætatis suæ nono nondum exacto, die* 18 *Augusti* 1727.

At eleven years of age she spoke Greek with all the fluency of her native tongue. When yet very young, she had also acquired some of the languages of the East; and, in a word, her acquisitions as a linguist were such as to procure for her the appellation of a *Walking Polyglot.* But her aptitude for acquiring languages, however great, was by no means the only, or the most striking feature of her intellectual character. We have seen how early she essayed the discussion of a general question affecting the mental capacities of her sex; and the vigour and acuteness displayed in this aspiring essay were, ere long, exerted with ardour and success in scientific inquiries. Having gone through the elementary branches of mathematics, she proceeded with alacrity to the study of natural philosophy; and she seems also to have carried her researches into the obscurer regions of metaphysical speculation.

About the time when she reached her fifteenth year, her father formed a select assembly of the learned of Milan; and at these meetings, which were held in his house at stated times, for several years, Agnesi maintained a succession of *Theses* on various points of speculation and philosophy. The ability which she displayed on these occasions seems to have been altogether surprising; and the effect was not the less, that her person was agreeable, and her whole deportment gentle and prepossessing. We are indebted to the learned president De Brosses for the following account of one of these conferences at which he assisted, during his travels in Italy, through the introduction of Count Belloni. "I had conceived," says he, "when I went to this *conversazione*, that it was only to talk with this young lady in the usual way, though on learned subjects; but to my surprise Belloni addressed her in a fine Latin harangue, with all the formality of an academic oration. She replied in the same language with promptness and ability; and they proceeded, still in Latin, to discuss the origin of fountains, and the causes of the ebbings and flowings observed in some of them. She spoke like an angel on this subject, and I never heard it treated so much to my satisfaction. We then discoursed with her concerning the manner in which the soul receives impressions from outward objects, and their conveyance to the general *sensorium*, the brain; and afterwards upon the propagation of light, and the prismatic colours. The conversation afterwards became general, every one speaking to her in the language of his own country, and she answering in the same." (*Lettres sur l'Italie*, tom. i. p. 243.) But Agnesi seems to have taken but little delight in the glory which she acquired as a philosophical disputant. Her temper was retired and devout, and she appears to have acted this part more to gratify her father than herself. About her twentieth year she accordingly withdrew from these assemblies, and for a long period devoted the greater part of her time to mathematical studies. The Theses which she had maintained with so much applause were published in a quarto volume, under the following title: *Propositiones Philosophicæ, quas crebris disputationibus domi habitis coram clarissimis viris explicabat extempore, et ab objectis vindicabat, Maria Gaetana de Agnesiis, Mediolanensis.* Med. 1738.

The first fruit of her mathematical studies was a Commentary on the *Conic Sections* of the Marquis de l'Hôpital; but this piece she would never consent to publish, though Mazzuchelli says that it was greatly praised by many who had perused the manuscript. In the course of a few years, however, she gave to the world a mathematical work, which must ever secure her a high rank among the most distinguished cultivators of abstract science. This work, entitled *Instituzioni Analitiche ad uso della Gioventu Italiana*, was published at Milan in 1748, in two volumes quarto. The first volume treats of the analysis of finite quantities; the second, of the analysis of infinitesimals. These two volumes contain a full and satisfactory view of this branch of mathematical science in the state at which it had then arrived; and though improvements have since that time been introduced, the treatise of Agnesi, according to a very competent authority, may still be regarded as perhaps the best introduction that is to be found to the works of Euler and the other mathematicians of the Continent. (*Edinb. Review*, vol. iii. p. 408.) An English translation of this work was long ago executed by the late Professor Colson of Cambridge; but the manuscript lay buried in obscurity for many years, and was only published in 1801, through the care and at the expense of Baron Maseres.

Besides other literary honours which followed the publication of the *Analytical Institutions*, Agnesi was, in 1750, appointed professor of mathematics and natural philosophy in the university of Bologna. The appointment of a young female, of thirty-two years of age, to such a charge, must appear to many as not a little singular; but the truth is, that female professors were by no means uncommon in Italy; and Lalande mentions several as having been eminent in the same university, one of whom was professor of anatomy. (*Voyage en Italie*, tom. ii.) Our scanty information does not enable us to state whether Agnesi ever entered upon the active duties of the mathematical chair. Though her life was long, we can add but little in regard to her after-history. She died, according to the meagre notice contained in the *Biographie Universelle*, in the year 1799. Her mistaken notions of religious duty rendered the greater part of her existence but a blank to the world. She had early expressed a wish to retire into a convent, and seems to have carried this design into effect not long after the period when her great work procured for her the honours to which we have just alluded. We afterwards hear of her only as a devoted sister of the austere order of *Blue Nuns*, repelling the approaches of those of the learned who still desired to converse with her, and thus exhibiting, like Pascal, another melancholy instance of the inconsistencies of our nature, and the darkening power of superstition over the brightest minds. But she lived long enough for the world to vindicate the intellectual capacities of her sex,—to show that the female mind is not only fitted for the lighter exercises of literature, but capable also of fathoming the depths and unravelling the intricacies of abstract science. If there are any, therefore, whose speculations may have led them to more depreciating conclusions, let them, to use the words of the eloquent writer already quoted in this article, "peruse the long series of demonstrations which the author of the *Analytical Institutions* has contrived with so much skill, and explained with such elegance and perspicuity: if they are able to do so, they will probably retract their former opinions; if unable, they will not of course see the reasons for admiring her genius that others do; but they may at least learn to think modestly of their own."—*Edinb. Review*, vol. iii. p. 410. (M. N.)

AGNOETÆ (from αγνοεω, to be *ignorant* of), in *Church History*, a sect of ancient heretics, who maintained that Christ's human nature did not become omniscient by its union with his divinity.—See Reid's edition of *Mosheim*, p. 238, note.

AGNOMEN, in *Roman Antiquity*, a kind of fourth or honorary name, given to a person on account of some extraordinary action, virtue, or accomplishment. Thus the agnomen *Africanus* was bestowed upon Publius Cornelius Scipio on account of his great achievements in Africa. The order in which the names of a Roman citizen followed each other was thus: 1. *Prænomen*, denoting the individual; 2. *Nomen gentilitium*, indicating the *gens* to which he belonged; 3. *Cognomen*, which every citizen had or might have, marked his *familia;* 4. *Agnomen*, given as a mark of distinction, usually honorary, but sometimes the reverse.

AGNONE, a city at the foot of Monte Capraro, in the province of Molise, in the kingdom of Naples, with 7000 inhabitants, chiefly employed in the manufacture of copper wares.

AGNUS DEI, in the Church of Rome, a cake of wax stamped with the figure of a lamb supporting the banner of the cross. These being consecrated by the pope with great solemnity, and distributed among the people, are supposed to have great virtues; as, to preserve those who carry them worthily, and with faith, from all manner of accidents; to expel evil spirits, &c. It was sometimes made of gold.

AGNUS *Dei* is also a popular name for that part of the mass wherein the priest, striking his breast three times, rehearses, with a loud voice, a prayer beginning with the words *Agnus Dei.* It is said to have been first introduced into the missal by Pope Sergius I.

AGOBARD, Archbishop of Lyons from 816 to 840, was one of the most enlightened and distinguished men of his age, the champion of truth, and the successful opposer of every form of superstition. Of his writings, which were rescued from destruction in a shop at Lyons in 1605, the principal are—a *Treatise against Felix D'Urgel; Treatise against the Jews; Against Trial by Combat; On the Privileges and Rights of the Priesthood; Against Sorcery;* and the celebrated treatise *Against the Worship of Images.* 2 vols. 8vo, Paris, 1666.

AGON, a small seaport town of France, in the department of La Manche, with 1561 inhabitants.

AGON, among the *Ancients*, implied any dispute or contest, whether it had regard to bodily exercises or the accomplishments of the mind; and therefore poets, musicians, painters, &c., had their agones, as well as the athletæ. Games of this kind were celebrated at most of the heathen festivals with great solemnity, either annually or at certain periods of years. Among the latter were celebrated at Athens, the *agon gymnicus*, the *agon Nemeus* instituted by the Argives in the 53d Olympiad, and the *agon Olympius* instituted by Hercules 430 years before the first Olympiad.—The Romans also, in imitation of the Greeks, instituted contests of this kind. The emperor Aurelian established one under the name of *agon solis*, the contest of the sun; Diocletian another, which he called *agon capitolinus*, which was celebrated every fourth year, after the manner of the Olympic games. Hence the years, instead of *lustra*, are sometimes numbered by *agones.*

AGON also signified one of the ministers employed in the heathen sacrifices, and whose business it was to strike the victim. The name is supposed to have been derived from hence, that standing ready to give the stroke, he asked *Agon'?* or *Agone?* Shall I strike? Ovid. *Fast.* l. 1.

AGONALIA, in *Roman Antiquity*, festivals celebrated in honour of Janus or the god Agonius, whom the Romans invoked before undertaking any affair of importance.

AGONALIS CIRCUS, now *La Piazza Navona*, a long, wide, and beautiful street in the centre of Rome, adorned with fountains, and with the obelisk of Caracalla. The reason of the name *Agonalis* is either unknown or doubtful. Ovid derives it from the *agones*, or solemn games, there celebrated, supposed to have been the *Ludi Apollinares*, or *Actiaci*, instituted by Augustus; whence the circus was called *Apollinaris;* also *Alexandrinus*, from the emperor Alexander Severus, who either inclosed or repaired it.

AGONISMA, in *Antiquity*, denotes the prize given to the victor in any combat or dispute.

AGONISTARCHA (αγων, and αρχος), in *Antiquity*, seems to have been much the same with *agonotheta;* though some suggest a difference, making it the office of the former to preside at and direct the private exercises of the athletæ, which they went through by way of practice, before they made their appearance on the public theatres.

AGONISTICI, in *Church History*, a name given by Donatus to such of his disciples as he sent to fairs, markets, and other public places, to propagate his doctrine; for which reason they were also called *Circutores, Circelliones, Catropitæ*, and at Rome *Montenses.* They were called *Agonistici*, from the Greek αγων, *combat*, being sent as it were to fight and subdue the people to their opinions.

AGONIUM, in *Roman Antiquity*, was used for the day on which the *rex sacrorum* sacrificed a victim, as well as for the place where the games were celebrated, otherwise called *agon.*—*Fest.* p. 9.

AGONOTHETA, or AGONOTHETES (αγων and τιθημι), in *Grecian Antiquity*, was the president or superintendent of the sacred games; who not only defrayed the expense attending them, but inspected the manners and discipline of the athletæ, and adjudged the prizes to the victors. But in the great public games, such as the Olympic, Pythian, &c., these presidents were the representatives of different states, or were chosen from the people in whose country the games were celebrated. They received the several titles of αἰσυμνῆται, βραβευταί, ἀγωνάρχαι, ἀγωνοδίκαι, ἀγωνοθέται, ἀθλοθέται; but Favorinus makes the distinction, that the term ἀθλοθέται was peculiar to gymnastic exercises, whereas that of ἀγωνοθέται might refer equally to musical contentions. They were also called ῥαβδοῦχοι or ῥαβδονόμοι, from the rod or sceptre emblematic of their authority.

AGONYCLITÆ (α, priv. γονυ and κλινω), in *Church History*, a sect of Christians, in the seventh century, who prayed always standing, thinking it unlawful to kneel.

AGORA (αγειρω, I congregate), in *Grecian Antiquity*, denoted both the public assembly of the people and the place in which they met. In the latter sense the term corresponds to the Roman *Forum.* The open space of the Agora was surrounded by the various buildings connected with the public administration. It was also in general the market place, and formed, as may be supposed, the centre of public resort and business of all kinds.

AGORACRITUS, a famous Greek statuary and sculptor, and the favourite pupil of Phidias, who is said by Pliny to have inscribed even some of his own works with the name of his disciple.

AGORÆUS, in *Heathen Antiquity*, an appellation given to such deities as had statues in the market-places; particularly Mercury, whose statue was to be seen in almost every public place.

AGORANOMI (αγορα and νεμω), in *Grecian Antiquity*, public functionaries, who had the regulation of weights and measures, the prices of provisions, &c.—The *agoranomi*, at Athens, were ten in number, five belonging to the city, and as many to the Piræus, one from each tribe being chosen by lot. To these a certain toll or tribute was paid by foreigners or aliens who brought any thing to sell in the market.

AGORDO, a market town in the Austrian dominions, in Italy, with 2600 inhabitants. It is in the government of Venice, and in the delegation of Belluno, on the river Cordevolo. In its vicinity are mines of copper, lead, sulphur, and vitriol, the preparation of which is the chief occupation of the people.

AGOSTINI, Lionardo, an eminent antiquary of the seventeenth century, author of a great work on Sicilian medals, and another upon ancient gems.

AGOSTINO, and Angelo, Da Siena (1296–1338), two brothers, sculptors and architects, who greatly distinguished themselves in the infancy of Italian art. Their native Siena is adorned by many of their works. See *Lanzi*, i.

Agostino, *Paolo*, of Valerano, an eminent musician, master of the chapel of St Peter's at Rome, and celebrated for his scientific compositions in every branch of his art. He died in the prime of life, A.D. 1629.

AGRA Provinces. In 1833 the British Parliament authorised the division of the territories of Bengal into two distinct presidencies; the one retaining the title of the Presidency of Bengal, and the other to be styled the Presidency of Agra. Subsequently the sanction of the legislature was obtained for the suspension of the contemplated division, and for the appointment, during the interim, of a lieutenant-governor of the districts which were intended to constitute the separate presidency of Agra. The seat of the new government has been fixed in the city of Agra, and from this circumstance the officer charged with the administration is usually styled the Lieutenant-Governor of Agra. The extensive territory subject to his jurisdiction is bounded on the north and north-east by the tract known as the Cis Sutlej territory, and by the native state of Nepaul; on the east and south-east by the kingdom of Oude and by some of the lower provinces of Bengal; on the south by the dominions of the Rajah of Nagpore and those of the Nizam, and on the west by the native states of Central India. It is 720 miles in length from north-west to south-east, and 310 in breadth in the direction of the opposite angle; and extends from Lat. 21. 17. to Lat. 31. 6., and from Long. 73. 2. to Long. 84. 40. It has an area of 101,241 square miles, and a population of upwards of twenty-five millions. The geographical divisions of this vast tract comprise, 1*st*, The thirty-one north-western provinces of India, usually denominated the "Regulation Provinces," most of them larger than English counties, and in all of which the general code of laws passed by the British government in India since 1793 is in full operation; 2*d*, The province of Kumaon, the Deyrah Doon, the Saugur and Nerbudda territories, and other large districts, wherein, though justice is administered in the spirit of the code, considerable discretion rests with the superintending functionaries to dispense with the letter of the law, when the claims of equity may appear to require such a course; 3*d*, Sundry petty native states whose defence from external aggression has devolved upon the British government, but in regard to which that government has pledged itself to abstain from all interference in the internal administration. Statistical and geographical particulars in respect to these states and the non-regulation provinces will be found detailed under their respective names in the alphabetical arrangement. The Regulation Provinces before mentioned occupy the valleys of the Jumna and the Ganges. Here the country is flat and open; little chequered by the interchange of hill and dale; and for the most part bare of trees; but to the south of the river Chumbul, and also towards the western frontier, it rises into hills, and is interspersed with jungle. Owing to the elevation of the ground, the climate for the greater part of the year is temperate, and in the winter months, especially during the night, it becomes actually cold. The general character of these districts affords great facilities for purposes of irrigation. They are intersected throughout their entire length by two great rivers, the Ganges and the Jumna, which derive their sources from the Himalayas, and the drainage of these mountains has been made extensively available by the construction of canals which traverse the land in various directions. Sugar and rice are less largely cultivated than in the lower provinces of Bengal, but cotton is a valuable article of produce, and the export of opium and indigo is annually increasing. The mineral productions are not remarkable: nor do the animals differ in any respect from those found in other parts of Hindostan. A coarse description of cotton cloth is the principal article of manufacture, but no great quantity is exported. The natives are a robust and handsome race of people, and consist of a mixture of Hindoos and Mahometans.

The experiment of a separate administration for these provinces has been eminently successful. Such a result might indeed have been reasonably anticipated. None but servants of the East India Company are eligible for the office of lieutenant-governor; and as the local authorities must obviously be the best judges of the character and qualifications of their respective functionaries, the choice of the individual to discharge its arduous duties was wisely committed to the government of India. Opportunity is thereby afforded for promoting the ablest public servant without reference to the ordinary principle of seniority. That the right of selection has been discreetly exercised may be inferred from the fact, that Agra is popularly denominated "the Model Government" of India; and a passing notice of one or two of the series of comprehensive measures which of late years have been adopted for the improvement of the condition and the elevation of the character of the people, may suffice to show that the title has not been conferred unworthily. We will first advert to the new land revenue settlement. In this part of India, the land is held in the most minute subdivision by the agricultural classes, and the entire breadth of the Regulation Provinces has recently come under government survey. Every separate holding was then measured, and an official record compiled, in which are detailed the boundaries and extent of the farm, the quality of the soil, the name both of landlord and tenant, the government revenue at which the former is assessed, and the amount of rent payable by the latter. The actual condition of the landed property of the country, together with the relations of landlord and tenant, and the rights and obligations of both parties, having been ascertained and defined, ample means are now possessed for the adjustment of all disputes affecting real property; and as the land in India is the great source of litigation, these records have rendered the administration of justice both simple and effective. The government assessment is levied with equity and moderation,—a part only being taken of the surplus constituting the rent. The remainder furnishes an income to the landholder, who has thus the means of effecting improvements, while, moreover, his property acquires a marketable value. Another great work to which it may be proper to draw attention, is the government plan of education. The system of registration which has been sketched was devised for the protection of the rights of the community. The registers are open to public inspection; but owing to the prevailing ignorance of the first elements of learning, these records proved, in the first instance, but a sealed book to the great bulk of the community. The majority of the population, it was discovered, were unacquainted with the simplest rules of arithmetic and land measurement, and unable, for the most part, to read or write. The people knew that they were in possession of valuable rights, and they felt that these rights were liable to be defeated solely because they were unable to define them. A desire for knowledge was suddenly manifested, from the conviction of its necessity to the general weal, and the lieutenant-governor was not slow in availing himself of so favourable an opening for educating the community. A scheme of instruction, admirably adapted to the exigencies of the agricultural classes, came into operation in the year 1848. Its design is to aid the efforts of the people in acquiring so much knowledge as is sufficient for the ordinary purposes of life: it contemplates the fulfilment of this object by the means of indigenous schools scattered over the surface of the country. Where a school is wanted, the villagers are assisted in building one; where the superintendence is defective, the government provides a competent instructor; where books are needed, they are supplied from the stock of vernacular literature prepared and printed by the government. The agency for carrying out the plan consists of a series of government model-schools, with two grades of school-visitors, superintended by a visitor-general. The course of education comprises reading, writing, arithmetic, and land measurement; and when practicable, geography, history, and other subjects, are superadded.

These measures, worthy of a paternal government and an enlightened age, clearly mark the difference of character between British and native rule. Under the Hindu dynasties the social fabric was upheld through the power and influence of privileged classes. The Mahometans, who succeeded, ruled for their own advantage, with little regard to the interests of their conquered subjects, and class legislation prevailed. It is only under British administration that the wants and interests of the masses have been permitted to occupy any share of the attention of the state, and to the government of Agra must be awarded the honour of having been foremost in recognising their paramount importance. (E. T.)

AGRA CITY, the seat of the government of the north-western provinces of Bengal, is situate on the south-west or right bank of the river Jumna, which is here a navigable stream. The extent of the city is about four miles in length, and three in breadth: it sweeps along the banks of the river in a semicircle, and suggests, on a distant view, an idea of grandeur; which, however, is not realised on nearer inspection. A well-constructed strand road leads from the Taj Mehal to the custom-house, a distance of two miles; but the principal thoroughfare is a fine broad street, running almost north and south, and nearly bisecting the city. In this locality, the houses, chiefly built of the red stone found in the neighbouring hills, are from three to four stories high. In other quarters of the town the streets, though cleanly, are narrow and irregular, and the houses, for the most part, of mean character. The fort of Agra is, as to appearance, one of the most imposing in India. It is surrounded by high walls and towers of red stone, which command some noble views of the city, its neighbourhood, and the windings of the Jumna. It has a ditch of great depth, and a double rampart, the inner one being of an enormous height, with bastions at regular distances. The fort was invested in 1803 by the army of Lord Lake, and surrendered after a brief resistance. The defences were subsequently improved, but it is still reported to be a place of no great strength.

Agra is famed for some beautiful edifices, the most remarkable of which is the Taj Mehal, a mausoleum erected by the Emperor Shah Jehan to commemorate the virtues of his favourite consort. The name of this distinguished personage was Arjammed Banoo, which, according to oriental usage, was changed on her elevation to that of Mumtazee Zumanee, signifying *the paragon of the age*. The Taj Mehal, of white marble, with four tall minarets of the same material rising at each of its angles, is placed on an elevated terrace, also of white and yellow marble. The interior, containing a central hall, in which are the tombs of the emperor and his queen, is remarkable for its exquisite finish, the pavement being laid with alternate squares of marble, and the walls, screens, and tombs, crowned with flowers, and inscriptions executed in beautiful mosaic of carnelian, lapis lazuli, and jasper, the whole appearing as fresh and almost as perfect as when first completed. Bishop Heber mentions that after all he had heard of this far-famed mausoleum, its beauty rather exceeded than fell short of his expectations. The Taj is surrounded by a lofty wall of red stone, with cupolas and pillars of marble.

Within the walls of the fort are the palace of Shah Jehan, and the Motee Musjid or Pearl Sanctuary, a celebrated mosque of white marble. Outside the walls is another mosque, termed the Jumna Musjid, and in the adjoining suburbs of Secundra is the mausoleum of the Emperor Akbar. An English church has been erected in Agra, which is described as a handsome building, and calculated to hold 1000 persons. The population of the city was computed in 1846 at 66,000. Lat. 27. 10. Long. 78. 5. (E. T.)

AGRAM, or ZAGRAB, a palatinate in the Austrian province of Croatia. Its extent is 768 square miles, or 491,520 English acres. Pop. in 1829, 392,190; all of the Catholic religion. It is subdivided into two circles, that of Agram and of St John; the latter of which comprehends no town. In the whole palatinate there are one city, two market towns, and 279 villages. The country is undulating, but with a range of hills towards the Warasdin frontier. It is watered by the Save and its tributary streams. The chief productions are corn, tobacco, wine, potashes, and cattle. It contains much wood and pasture land. Agram or Zagrab, the capital of Croatia, on the palatinate of the same name, is situate on a hill near the banks of the Save, in Lat. 45. 49. N. Long. 16. 1. E., 170 miles south of Vienna. It is the seat of the governor of Sclavonia and Croatia, of a bishop, and of the courts of justice. Agram contains 20,000 inhabitants, and is divided into three parts, called the upper and lower town, and the town of the bishop. It has a lyceum, library, museum, gymnasium, an ancient cathedral with forty altars, and a large library. Some silk and porcelain are manufactured, and a brisk trade is carried on in grain, potash, and tobacco.

Agrarian.

AGRARIAN LAWS (*Leges Agrariæ*), when used in the most extended signification of the term, are laws for the distribution and regulation of property in land. The history of these enactments is not only important as explanatory of the constitution of the ancient republics, but is rendered highly interesting by the conflicting opinions which have been entertained respecting their object and operation. It seems to have been a notion generally entertained in the ancient world, that every citizen of a country should be a landholder; and that the territory of a state, so far as it was not left uninclosed or reserved for public purposes, should be divided in equal portions among the citizens. Such a distribution of public land seems to have been acted upon as a recognised principle from the earliest period to which existing historical records extend. Hence we find the Almighty giving express instructions to Moses as to the manner in which the land of Canaan was to be portioned out among the Hebrews (*Num.* xxxiii. 54), and naming the persons to whom the division was to be entrusted (*Num.* xxxiv. 16–18). A division of the land was accordingly made, and the portion assigned to each man became his inalienable property, and descended in perpetuity to his heirs and successors. By the law of Jubilee, all lands were restored free from encumbrances on the recurrence of the "year of release;" so that, though a man's estate might, in the interval, have been repeatedly sold or alienated, yet, on the return of the fiftieth year, it reverted to the heirs of the original possessor (*Levit.* xxv. 10). In the republics of ancient Greece, and also in the Grecian colonies, a similar principle of division of land prevailed (*Thuc.* v. 4., *Herod.* iv. 159). Lycurgus is represented by Plutarch (*Lycur.*), as re-dividing the whole territory of Laconia into 39,000 parcels, of which 9000 were assigned, in equal lots, to as many Spartan families, and 30,000, also in equal lots, to their free subjects; and although this statement is not borne out by any of the early Greek historians, and is even inconsistent with the assertion of Aristotle (*Polit.* ii. 4), yet it is valuable as recognising the principle of the division of the public lands. (See Thirlwall's *Hist. of Greece*, chap. viii., and Grote's *Hist. of Greece*, part ii. chap. vi., with the authorities there quoted.)

It was long a prevalent and undisputed opinion that the territories of the Hebrews, and of the republics of ancient Greece were divided into equal portions, and that the object of such a distribution was to maintain a state of equality among all the members of the community. This, however, does not appear to be consistent with the distinctions of rank which we find admitted in Scripture (*Josh.* ix. 15; xxii. 14; 1 *Sam.* ix. 21, &c., &c.); and from a remark of Thucydides (i. 6), taken in connection with the statement of Aristotle (*Polit.* ii. 9), it may be legitimately inferred that property did not continue to be equally distributed at Lacedæmon. Distinctions of rank are clearly recognised in the legislation of Solon. Aristotle, in the Second Book of his Politics (chap. vi., &c.), explains the constitutions of several of the ancient republics, and endeavours to show how the population is to be accommodated to this equal division of land; but it would be foreign to our object to review his arguments. It may be sufficient to remark, that such an attempt to arrest the progress of enterprise is altogether inconsistent with the spirit of liberty which gave life and energy to the ancient republics; and that though it might have been carried into effect under the despotism of Persia, or the predominant rule of the kings of Macedonia, it was entirely at variance with the freedom of opinion which prevailed in Greece, and the stubborn resistance to control which animated the Romans after the expulsion of the kings. But, granting that such a policy had been practicable, it would have been highly inexpedient. The ignorant Hindoo might remain satisfied with the *class* which nature had transmitted to him through successive generations, because his progenitors had been prevented from emerging from their obscurity; but the citizens of Greece and Italy, being themselves constituent members of the body politic, and not ignorant of the power thereby conferred on them, could not have been kept in check by the same principle of fear. Such an attempt, moreover, to prevent the acquisition of property, would have obstructed the advancement of the arts of civilised life, would have extinguished those feelings of patriotism which led the Greeks so often to hazard their lives in defence of their country, and, by engendering discontent and exciting internal commotions, would have made them an easy prey to their enemies.

The expression Agrarian Laws, however, is more commonly applied to the enactments among the Romans for the management of the public domains (*ager publicus*); and to an account of these the remainder of our space must be devoted. It is a singular fact that, while almost every other subject connected with the Roman constitution had been successfully investigated and explained, the object and intention of the agrarian laws were entirely misunderstood by scholars for many centuries after the revival of letters. They were invariably represented as intended to prohibit Roman citizens from holding property in land above a certain fixed amount; and as authorising the division among the poorer citizens of the estates of private individuals, when these exceeded the prescribed limit; thus legalising a system of plunder which would have been subversive of all social order. No such doctrine had, indeed, been admitted in any well-regulated state, ancient or modern; nor did anything analogous to it appear in the principles or practice of the Roman constitution: yet the expressions used by the ancient authors in reference to these enactments, and the disturbances to which they invariably gave rise, seemed to justify an unfavourable interpretation; and the opinion, when once propounded, was unconditionally received by successive generations of learned men, notwithstanding the many embarrassments and contradictions to which it led.

Romulus is represented as dividing his small territory among the members of his infant community at the rate of two *jugera* (each extending to two-thirds of an English acre) a-piece, as inheritable property. The whole district, however, was not thus assigned; one portion was set apart for the service of the gods, and for the royal domains; and another was reserved as common land for pasture. The stock kept on the common land served to eke out a maintenance which two *jugera* could not otherwise have furnished to a family, and an agistment was paid to the commonwealth for the pasturage. It is probable that the same principle prevailed under the regal government, and that successive adjustments of the territory were made. Such a law existed among those of Servius Tullius. The equality of property thus established seems to have been considered as a fundamental principle of the Roman constitution; and the agrarian laws were regarded as the necessary means of wresting from the large proprietors the possessions which they had illegally acquired. Machiavelli and Montesquieu both participate in this mistake, and are far from condemning the agrarian laws, even when taken in the common meaning. The former alleges that the interest of every republic requires that the state should be rich and the citizens poor, and thus justifies the assumed spoliation; while Montesquieu receives it as an historical fact that Romulus adopted the principle of equality in his original distribution of the territory of Rome, as the future ground of her strength; and that the tribunitian contests were but attempts to restore the original constitution. Adam Smith (*Wealth of Nations*, B. iv. chap. vii. part i.) assents to the same interpretation, without, however, any expression of approval.

The correct interpretation of the agrarian laws must thus be considered as of modern date. Amidst the violence of the French Revolution, a scheme for the equal division of the national property was advocated amidst great popular favour, by some of the frantic leaders, who sought a sanction for their extravagancies in precedents drawn from the ancient republics, and particularly from the agrarian laws of the Romans. The subject was thus invested with a new interest, and engaged the attention of Professor Heyne of Göttingen, who, in 1793 (*Opus. Acad.* iv. 350–373), addressed to the members of his university a paper in which he successfully combated the opinions which, up till that time, had been entertained respecting them; and showed that their object had been entirely misunderstood. Other writers, as Heeren and Hegewisch, embraced and illustrated his views; but it was reserved for the acuteness and learning of Niebuhr fully to develop the theory which had been suggested, and to demonstrate the fact "that the agrarian laws of the Romans were in no case intended to interfere with or affect private property in land, but related exclusively to the public domain." The theory of Niebuhr was too startling to meet with universal approval. It has accordingly been assailed by Rudorff, Dureau de la Malle (*Econ. Polit. des Romaines*), Puchta, and others, who have ingeniously and plausibly supported the opinions formerly maintained; but their arguments fail to produce conviction (*Class. Mus.*, vol. ii.) The language of Livy *passim*, when referring to the agrarian laws, is inexplicable unless the interpretation of Niebuhr be adopted. "If," says Dr Arnold, "amongst Niebuhr's countless services to Roman history, any single one may claim our gratitude beyond the rest, it is his explanation of the true nature and character of the agrarian laws. Twenty-four years have not yet elapsed since he first published it, but it has already overthrown the deeply-rooted false impressions which prevailed universally on the subject; and its truth, like Newton's discoveries in natural science, is not now to be proved, but to be taken as the very corner-stone of all our researches into the internal state of the Roman people."—*Hist. of Rome*, vol. ii.

In almost all countries, the legal property of the land has been originally vested in the sovereign, whether we are to understand under that name a single chief, a particular portion of the nation, or the people at large. In the same manner, the property of all the land in a conquered country was held to be transferred to the sovereign power in the conquering state; and was assumed with more or less rigour as circumstances seemed to require. From the earliest times a portion of the Roman territory was thus regarded as the property of the state, and the profits arising from it were applied to the public service. The public domain (*ager publicus*) was at first small, but was gradually extended by the right of conquest, till it embraced a large portion of the whole peninsula. In this process of extension, the subjugated communities were frequently mulcted of a proportion of their lands, varying according to the alleged offence, or the resistance which they had offered to the arms of the conquerors. Thus the Boii were deprived of one-half of their territory; the Hernici forfeited two-thirds, and the whole of the *ager Campanus*, the richest district in Italy, was taken from the inhabitants of Capua, on the capture of their city after its revolt to Hannibal.

The lands thus acquired were disposed of in various ways. A portion of them was frequently sold by auction, to meet the immediate necessities of the state, and was thus conveyed in perpetuity to the purchasers. The disposal of the remainder depended on the nature and condition of the land, and its position in reference to the bulk of the community. If in good condition, and at no great distance from the city, it was frequently assigned, in small allotments of seven jugera (between 4 and 5 acres) to those of the poorer citizens, whose services in war gave them a claim upon the state; while in hostile districts, and on exposed frontiers, military colonies were planted, each colonist receiving a fixed quantity of land. In both of these cases the land so assigned ceased to form part of the public domain, and became the property of the recipients. In some cases the land, after having been assumed as public property, was allowed to remain in the hands of the former owners, who became the tenants of the state for a fixed period, and paid a certain rent to the Roman exchequer.

The preceding remarks refer only to arable or meadow-land, vineyards, or olive-gardens, which could be turned to immediate advantage. It is obvious, however, that in a country, the greater part of which was acquired by conquest, large districts must have been laid waste, the inhabitants with their houses destroyed, and neither cultivators nor the means of cultivation left. Arrangements of a different description were therefore necessary for lands in this position. Wide ranges of country, fit only for pasture, had to be disposed of, and were available to those alone who were able to stock them with flocks and herds, and to provide slaves to attend to and protect their property. Hence it was usual for the state to invite persons possessed of the necessary means to enter upon the occupation of such lands on advantageous terms; an invitation with which the patricians, as being the wealthy class, could alone comply. The ordinary conditions were, that after the land was again brought into cultivation, the occupants should pay as rent one-tenth of the produce of the corn-lands, and one-fifth of the vines and fruit-trees, with a moderate rate per head for sheep and cattle grazing on the public pastures. The lands were not assigned for any definite period; the occupants were merely tenants at will, liable to extrusion whenever the state found it necessary to employ the land for any other purpose. It was a fundamental principle of Roman law that prescription could not be pleaded against the state; and consequently, though the right of occupancy might not only be transmitted from heir to heir, but might also be sold, no length of time could alter the precarious nature of the tenure by which the lands were held. The state always reserved to itself the power of resuming possession when it thought fit; and though such resumption might in many cases be attended by individual hardship, it was nevertheless justified by the original contract.

Much of the obscurity connected with the Roman agrarian laws has arisen from a misapprehension of the meaning of the words *possidere*, *possessor*, and *possessio*. These terms, when used in a strictly legal sense, denote merely occupancy by a tenant, and never imply an absolute right of property. The act of occupancy was termed *usus*, and the benefit derived by the state *fructus*.

"The *ager publicus*," says Professor Ramsay, "having been acquired and occupied as explained above, numerous abuses arose in process of time, especially among the tenants belonging to the second class. These being, as we have said, in the earlier ages, exclusively patricians, who at the same time, monopolized the administration of public affairs, they were in the habit of defrauding the state, either by neglecting altogether to pay the stipulated proportion of the produce, or by paying less than was due; or, finally, by claiming, what was in reality *ager publicus*, as their own private property; it being easy, of course, in the absence of all strict superintendence, and of scientific surveys, to shift the land-marks which separated public from private property. Meanwhile the deficiencies in the public treasury were made up by heavier taxes; and the plebeians complained that they were impoverished by new imposts, while the lands belonging to the community, which they had acquired by their blood, if fairly managed, would yield a sufficient return to meet all demands upon the exchequer; or, if portioned out in allotments among themselves, afford them the means of supporting the increased burdens. These complaints, unquestionably founded in justice, were soon vehemently expressed, and were revived from time to time more or less loudly, and enforced more or less earnestly, according to the state of public feeling, and the energy of the popular champions. It is true, that the wealthier plebeians soon became tenants of the *ager publicus* as well as the patricians; but, although this circumstance materially strengthened the hands of the occupiers, it did not improve the condition of the poor, or make them less keenly alive to the injustice of the system against which they protested."—*Manual of Rom. Antiq.* p. 228.

Assuming, then, that the agrarian laws had for their sole object the distribution and management of the public lands (*ager publicus*), their effect must have been felt in two ways:—(1.) In enforcing the regular payment of rent from the occupants, preventing them from exceeding the limits assigned to them, and compelling the surrender of portions for division among the poorer citizens;—and, (2.) In insisting upon the immediate application of newly acquired territories to the establishment of colonies, or its assignment to individuals. It is obvious that the laws first referred to, as involving long-established interests, would necessarily lead to violent contests.

The first agrarian law, properly so called, was proposed and passed by Sp. Cassius Viscellinus, when Consul, B.C. 486 (*Liv.* ii. 41, *Dionys.* viii. 76), respecting the provisions of which we have no precise information. Cassius was himself a patrician, and we may, therefore, infer that the law did not encroach upon the just rights of the dominant class to which he belonged. It is not the object of this article to trace in detail the various measures which were proposed, and the agitations with which they were severally attended. Three such are recorded during the fourth century B.C. (*Liv.* iv. 36, 47, 48); but by far the most important measure of this class, and that which served as the model of nearly all subsequent agrarian laws, was that carried by C. Licinius Stolo, when tribune of the people, in B.C. 367 (*Liv.* vi. 42). The provisions of this law were: (1.) that no one should occupy more than 500 jugera (about 333 acres) of the public land; (2.) nor have more than 100 large, and 500 small cattle, grazing on the public pastures; and, (3.) that every occupant of the public lands should employ a certain proportion of free labourers in cultivating it. Niebuhr (vol. iii. p. 11, &c. *Eng. Transl.*) has endeavoured to supply the other details; but these can be received merely as ingenious, and, it may be, successful conjectures. For an able controversy as to this law, see *Class. Museum*, vol. ii.

After the excitement occasioned by the passing of the Licinian law had subsided, two centuries were allowed to pass with only a single interference (*Valer. Max.* v. 4, 5; *Polyb.* ii. 21) with the occupants of the public lands; and during that time large additions had been made to the possessions of the state by the confiscations consequent upon the second Punic war. In the meantime the wealthier families had extended their possessions greatly beyond the limits prescribed by the Licinian law; while the small proprietors had disappeared, and the poor continued to increase. In B.C. 133, Tiberius Gracchus proposed and carried a modification of the Licinian law (*Liv. Epit.*, lviii.; *Appian.*, i. 9), which his premature death prevented from being carried into effect; and a similar result attended the enactment of his brother (*Liv. Epit.*, lx.) Both were set aside or eluded after the death of Caius. During the period which preceded the subversion of the republic, various other laws were passed for the distribution of the public lands; but these it is not necessary to enumerate. It may be mentioned, in conclusion, as a significant fact, that the prominent advocates of the Agrarian laws, Cassius, Licinius, and the Gracchi, all belonged to the class which would have been injured by their operation, had they led to an undue interference with private property. (G. F.)

AGREDA, a very mountainous district of the province of Soria, in Spain, containing 11 towns, 23 villages, and 63 hamlets. Pop. 23,618.

AGREDA, the *Gracchuris* of the Romans, the chief town of the above district, built on the skirts of the Sierra Moncayo, and divided by the River Queiles into two parts, communicating by a fine stone bridge of one arch. It has six churches and four monasteries. Population 3847. Its trade suffered severely from a three days' occupation by a French army of 25,000 men, in the Peninsular war. The chief manufactures are cloth, hats, linen, pottery, and oil.

AGRIA, called by the Germans *Eger*, is a strong town in Upper Hungary, situate on a river of the same name, and has a citadel called *Erlau*. See ERLAU.

AGRICOLA, CNÆUS JULIUS, was born at Forum Julii, now Frejus, in Provence, A.D. 37, and was in Vespasian's time made lieutenant to Vettius Bolanus in Britain. Upon his return he was ranked by that emperor among the patricians, and made governor of Aquitania. This post he held for three years: he then was recalled to Rome, and chosen consul; and was appointed governor of Britain, where he greatly distinguished himself. He reformed many abuses occasioned by the avarice or negligence of former governors, put a stop to extortion, and caused justice to be impartially administered. Vespasian dying about this time, his son Titus, knowing the great merit of Agricola, continued him in the government. In the spring he marched towards the north, where he made new conquests, and ordered forts to be built for the Romans to winter in. He spent the following winter in concerting schemes to bring the Britons to conform to the Roman customs. He thought the best way of diverting them from their warlike propensities was to soften their rough manners by proposing to them new kinds of pleasure, and inspiring them with a desire of imitating the Roman manners. He encouraged the erection of magnificent temples, porticoes, baths, and other fine buildings. The British nobles at length had their sons educated in learning; and they who before had the utmost aversion to the Roman language, now began to study it with great assiduity. They wore likewise the Roman habit; and, as Tacitus observes, they were brought to consider those things as marks of politeness, which were only so many badges of slavery. Agricola, in his third campaign, advanced as far as the Tweed; and in his fourth he subdued the nations betwixt the Tweed and the firths of Forth and Clyde, into which the rivers *Bodotria* and *Glotta* discharged themselves; and here he built fortresses to shut up the nations yet unconquered. In his fifth he marched beyond the firths, where he made some new acquisitions, and fixed garrisons along the western coasts, over against Ireland. In his sixth campaign he passed the river Bodotria; ordering his fleet, the first which the Romans ever had in those parts, to row along the coasts, and take a view of the northern parts. In the following spring, the Britons raised an army of 30,000 men, under the command of Galgacus, to oppose the invaders. In the engagement that ensued the Romans gained the victory, and 10,000 of the Britons are said to have been killed. This happened in the reign of the Emperor Domitian, who, growing jealous of the glory of Agricola, recalled him, under pretence of making him governor of Syria. Agricola was in Britain fully seven years, from A.D. 78 to 85; and he died on the 23d August, A.D. 93, when he had attained the age of 55. The great historian Tacitus, who was married to the daughter of Agricola, has written his life, one of the most beautiful specimens of biography ever composed.

Agricola || Agriculture.

Agricola [properly *Landmann*], *George*, a German physician, famous for his skill in metals. He was born at Glaucha, in Misnia, March 24th, 1494. His discoveries in the mountains of Bohemia gave him so great a desire of examining accurately into every thing relating to metals, that though he had engaged in the practice of physic at Joachimstal by advice of his friends, he still prosecuted his study of fossils with great assiduity, and at length removed to Chemnitz, where he entirely devoted himself to this study. He spent in pursuit of it the pension he had from Maurice Duke of Saxony, and part of his own estate; so that he reaped more reputation than profit from his labours. His great work *De Re Metallica* contains much curious information. He died at Chemnitz on the 21st November 1555.

Agricola, *John*, a Saxon divine, born at Eisleben in 1492. He went as chaplain to Count Mansfield, when that nobleman attended the Elector of Saxony to the diet at Spires in 1529, and that of Augsburg in 1530. He was of a restless, ambitious temper, rivalled and wrote against Melancthon, and gave Count Mansfield occasion to reproach him severely. He obtained a professorship at Wittemberg, where he taught peculiar doctrines, and became founder of the sect of Antinomians; which occasioned warm disputes between him and Luther, who had before been his attached friend. But though he was never able to recover the favour either of the Elector of Saxony or of Luther, he received some consolation from the fame he acquired at Berlin, where he became preacher at court; and was chosen, in 1548, in conjunction with Julius Phlug and Michael Heldingus, to compose the famous *Interim*. He died at Berlin in 1566. His real name was *Schnitter* or *Schneider*.

Agricola, *Rodolphus*, one of the most eminent scholars of the fifteenth century. He was born near Gröningen in Friesland, in 1443, and died at Heidelberg in 1485. He was educated at Louvain; and travelling into Italy, became the pupil of Theodore Gaza in Greek, at Ferrara, for about two years; and at the same time gave instructions on the language and literature of ancient Rome. He was not only a profound scholar, but had much skill in painting and music. In his treatise *De Inventione Dialectica*, he clearly saw and tried to remedy the defects of the then prevalent scholastic philosophy. His real name was *Rolef Huysmann*.

# AGRICULTURE.

## CHAPTER I.

Historical Summary.

It would be interesting to know how the nations of antiquity tilled, and sowed, and reaped; what crops they cultivated, and by what methods they converted them into food and raiment. But it is to be regretted, that the records which have come down to us are all but silent upon these homely topics.

In Mr Hoskyn's admirable treatise,[1] we have an excellent specimen of what may yet be done to recover and construct an authentic history of the Agriculture of the ancients, from the casual allusions and accidental notices of rural affairs which lie thinly scattered through the body of general literature; and, more especially, from those mysterious records of the past, which are now being rescued from their long burial under the ruins of some of the most famous cities of antiquity. Although comparatively little has been found in such records bearing directly upon the subject; we must not despair of the learned industry, and masterly skill, of an advancing and searching criticism, gathering together these gleams of light, and making them happily converge upon the darkness which has hitherto interposed between us and a circumstantial knowledge of the methods and details of ancient husbandry.

Babylonians and Egyptians.

Every reader of the Bible is familiar with its frequent references to Egypt as a land so rich in corn, that it not only produced abundance for its own dense population, but yielded supplies for exportation to neighbouring countries. Profane history corroborates these statements. Diodorus Siculus bears explicit testimony to the skill of the farmers of ancient Egypt. He informs us that they were acquainted with the benefits of a rotation of crops, and were skilful in adapting these to the soil and to the seasons. The ordinary annual supply of corn furnished to Rome has been estimated at 20,000,000 of bushels. From the same author, we also learn, that they fed their cattle with hay during the annual inundation, and at other times tethered them in the meadows on green clover. Their flocks were shorn twice annually, (a practice common in several Asiatic countries), and their ewes yeaned twice a-year. For religious as well as economical reasons, they were great rearers of poultry, and practised artificial hatching, as at the present day. The abundance or scarcity of the harvests in Egypt depended chiefly upon the height of the annual inundation. If too low, much of the land could not be sown, and scarcity or famine ensued. On the other hand, great calamities befell the country when the river rose much above the average level. Cattle were drowned, villages destroyed, and the crops necessarily much diminished; as in such cases, many of the fields were still under water at the proper seed-time. In 1818, a calamity of this kind took place, when the river rapidly attained a height of three-and-a-half feet above the proper level.

It is from the paintings and inscriptions with which the ancient Egyptians decorated their tombs, that we get the fullest insight into the state of agriculture amongst this remarkable people. Many of these paintings, after the lapse of two or three thousand years, retain the distinctness of outline and brilliancy of colour of recent productions. The acquaintance which these give us with their occupations, attainments, and habits, is truly marvellous, and fills the reader of such works as "Wilkinson's Egypt" with perfect amazement. Every fresh detail seems to give confirmation to that ancient saying, "There is nothing new under the sun." Those which refer to rural affairs disclose a state of matters at that early date of the world's history, which may well remind us to speak modestly of our own attainments. An Egyptian villa comprised all the conveniences of a European one of the present day. Besides a mansion with numerous apartments, there were gardens, orchards, fish-ponds, and preserves for game. Attached to it was a farm-yard, with sheds for cattle and stables for carriage horses. A steward directed the tillage operations, superintended the labourers, and kept account of the produce and expenditure. The grain was stored in vaulted chambers furnished with an opening at the top, reached by steps, into which it was emptied from sacks, and with an aperture below for removing it when required. Hand-querns, similar to our own, were used for grinding corn; but they had also a larger kind worked by oxen. In one painting in which the sowing of the grain is represented, a plough drawn by a pair of oxen goes first; next comes the sower scattering the seed from a basket, he is followed by another plough, whilst a roller, drawn by two horses yoked

[1] Short Enquiry into the History of Agriculture, by Chandos Wren Hoskyn, Esq.

Historical Summary.

abreast, completes the operation. The steward stands by superintending the whole. Nothing, however, conveys to us so full an impression of the advanced state of civilisation amongst the ancient Egyptians as the value which they attached to land, and the formalities which they observed in the transfer of it. In the time of the Ptolemies, their written deeds of conveyance began with the mention of the reign in which they were executed, the name of the president of the court, and of the clerk who drew them. The name of the seller, with a description of his personal appearance, his parentage, profession, and residence, was engrossed. The nature of the land, its extent, situation, and boundaries; the name and appearance of the purchaser were also included. A clause of warrandice and an explicit acceptance by the purchaser followed, and finally the deed was attested by numerous witnesses (so many as sixteen occur to a trifling bargain), and by the president of the court.

Patriarchal age.

The Nomades of the patriarchal ages, like the Tartar, and perhaps some of the Moorish tribes of our own, whilst mainly dependent upon their flocks and herds, practised also agriculture proper. The vast tracts over which they roamed were in ordinary circumstances common to all shepherds alike. During summer they frequented the mountainous districts and retired to the valleys to winter. Vast flocks of sheep and of goats constituted the chief wealth of the Nomades, although they also possessed animals of the ox kind. When these last were possessed in abundance, it seems to be an indication that tillage was practised. We learn that Job, whose time is by the best authorities fixed as about contemporaneous with that of Abraham, besides immense possessions in flocks and herds, had 500 yoke of oxen, which he employed in ploughing, and a "very great husbandry." Isaac, too, conjoined tillage with pastoral husbandry, and that with success, for we read that he sowed in the land Gerar, and reaped an hundred fold—a return which, it would appear, in some favoured regions, occasionally rewarded the labour of the husbandman. In the Parable of the Sower, our Lord (grafting his instructions upon the habits, scenery, and productions of Palestine), mentions an increase of thirty, sixty, and an hundred fold. Such increase, although far above the average rate, was sometimes even greatly exceeded, if we take the authority of Herodotus, Strabo, and Pliny.

Israelites.

Along with the Babylonians, Egyptians, and Romans, the Israelites are classed as one of the great agricultural nations of antiquity. The sojourn of the Israelites in Egypt trained them for the more purely agricultural life that awaited them upon their return to Canaan, to take possession of it as their own. Nearly the whole population were virtually husbandmen, and personally engaged in its pursuits. Upon their entrance into Canaan, they found the country occupied by a dense population, possessed of walled cities and innumerable villages, masters of great accumulated wealth, and subsisting on the produce of their highly cultivated soil, which abounded with vineyards and oliveyards. It was so rich in grain, that the invading army, numbering 601,730 able-bodied men, with their wives and children, and a mixed multitude of camp-followers, found "old corn" in the land sufficient to maintain them from the day that they passed Jordan. The Mosaic Institute contained an Agrarian law, based upon an equal division of the soil amongst the adult males, a census of which was taken just before their entrance into Canaan. Provision was thus made for six hundred thousand yeomen, assigning (according to different calculations) from sixteen to twenty-five acres of land to each. This land, held in direct tenure from Jehovah, their sovereign, was strictly inalienable. The accumulation of debt upon it was prevented by the prohibition of interest, the release of debts every seventh year, and the reversion of the land to the proprietor, or his heirs, at each return of the year of jubilee. The owners of these small farms cultivated them with much care, and rendered them highly productive. They were favoured with a soil extremely fertile, and which their skill and diligence kept in good condition. The stones were carefully cleared from the fields, which were also watered from canals and conduits, communicating with the brooks and streams with which the country "was well watered everywhere," and enriched by the application of manures. The seventh year's fallow prevented the exhaustion of the soil, which was further enriched by the burning of the weeds and spontaneous growth of the Sabbatical year. The crops chiefly cultivated were wheat, millet, barley, beans, and lentiles; to which it is supposed, on grounds not improbable, may be added rice and cotton. The ox and the ass were used for labour. The word "oxen," which occurs in our version of the Scriptures, as well as in the Septuagint and Vulgate, denotes the species, rather than the sex. As the Hebrews did not mutilate any of their animals, bulls were in common use. The quantity of land ploughed by a yoke of oxen in one day, was called a yoke or acre. Towards the end of October, with which month the rainy season begins, seedtime commenced, and of course does so still. The seedtime, begun in October, extends, for wheat and some other white crops, through November and December; and barley continues to be sown until about the middle of February. The seed appears to have been sometimes ploughed in, and at other times to have been covered by harrowing. The cold winds which prevail in January and February, frequently injured the crops in the more exposed and higher districts. The rainy season extends from October to April, during which time, refreshing showers fall, chiefly during the night, and generally at intervals of a few days. The harvest was earlier or later as the rains towards the end of the season were more or less copious. It, however, generally commenced in April, and continued through May for the different crops in succession. In the south, and in the plains, the harvest, as might be expected, commenced some weeks earlier than in the northern and mountainous districts. The slopes of the hills were carefully terraced and irrigated wherever practicable; and on these slopes, the vine and olive were cultivated with great success. At the same time, the hill districts and neighbouring deserts afforded pasturage for numerous flocks and herds, and thus admitted of the benefits of a mixed husbandry. With such political and social arrangements, and under the peculiarly felicitous climate of Judea, the country, as a whole, and at the more prosperous periods of the commonwealth, must have exhibited such an example of high cultivation, rich and varied produce, and wide-spread plenty and contentment as the world has never yet elsewhere produced on an equally extensive scale. Not by a figure of speech but literally, every Israelite sat under the shadow of his own vine and fig-tree; whilst the country as a whole, is described (2 Kings xviii. 32) as "a land of corn and wine, a land of bread and vineyards, a land of oil-olive and of honey." An interesting illustration of the advanced state of agriculture in these ancient times is afforded by the fact, that, making allowance for climatic differences, the numerous allusions to it with which the Scriptures abound, seem natural and appropriate to the British farmer of the present day.

Ancient Greeks.

The unrivalled literature of Greece affords us little information regarding the practical details of her husbandry. The people who, by what remains to us of their poetry, philosophy, history, and fine arts, still exert such an influence in guiding our intellectual efforts, in regulating taste, and in moulding our institutions, were originally the invaders and conquerors of the territory which they have rendered so famous. Having reduced the aboriginal tribes to bondage, they imposed upon them the labour of cultivating the soil, and

Historical Summary.

hence both the occupation, and those engaged in it, were regarded contemptuously by the dominant race, who addicted themselves to what they regarded as nobler pursuits. With the exception of certain districts, such as Bœotia, the country was naturally unfavourable to agriculture. When we find, however, that valleys were freed from lakes and morasses by drainage, that rocky surfaces were sometimes covered with transported soil, and that they possessed excellent breeds of the domesticated animals, which were reared in vast numbers, we infer that agriculture was better understood, and more carefully practised, than the allusions to it in their literature would seem to warrant.

Ancient Romans.

Amongst the ancient Romans, agriculture was highly esteemed, and pursued with earnest love and devoted attention. "In all their foreign enterprises, even in earliest times," as Schlegel remarks, "they were exceedingly covetous of gain, or rather of land; for it was in land, and in the produce of the soil, that their principal and almost only wealth consisted. They were a thoroughly agricultural people, and it was only at a later period that commerce, trades, and arts, were introduced among them, and even then they occupied but a subordinate place."[1] Their passion for agriculture survived very long; and when at length their boundless conquests introduced an unheard-of luxury, and corruption of morals, the noblest minds amongst them were strongly attracted towards the ancient virtue of the purer and simpler agricultural times. Several facts in their history afford convincing proof, if it were required, of the devotion of this ancient people to agriculture, in their best and happiest times. Whilst their arts and sciences, and general literature, were borrowed from the Greeks, they created an original literature of their own, of which rural affairs formed the substance and inspiration. Schlegel and Mr Hoskyn notice also the striking fact, that whilst among the Greeks the names of their illustrious families are borrowed from the heroes and gods of their mythology, the most famous houses amongst the ancient Romans, such as the Pisones, Fabii, Lentuli, &c., have taken their names from their favourite crops and vegetables. Perhaps it is not too much to assert, that many of those qualities which fitted them for conquering the world, and perfecting their so celebrated jurisprudence, were acquired, or at all events nourished and matured, by the skill, foresight, and persevering industry, so needful for the intelligent and successful cultivation of the soil. The words which Cicero puts into the mouth of Cato give a fine picture of the ancient Roman enthusiasm in agriculture. "I come now to the pleasures of husbandry, in which I vastly delight. They are not interrupted by old age, and they seem to me to be pursuits in which a wise man's life should be spent. The earth does not rebel against authority; it never gives back but with usury what it receives. The gains of husbandry are not what exclusively commend it. I am charmed with the nature and productive virtues of the soil. Can those old men be called unhappy who delight in the cultivation of the soil? In my opinion, there can be no happier life, not only because the tillage of the earth is salutary to all, but from the pleasure it yields. The whole establishment of a good and assiduous husbandman is stored with wealth; it abounds in pigs, in kids, in lambs, in poultry, in milk, in cheese, in honey. Nothing can be more profitable, nothing more beautiful, than a well-cultivated farm."

In ancient Rome, each citizen received, at first, an allotment of about two English acres. After the expulsion of the kings this allotment was increased to about six acres. These small inheritances must of course have been cultivated by hard labour. On the increase of the Roman territory, the allotment was increased to fifty, and afterwards even to five hundred acres. Many glimpses into their methods of cultivation are found in those works of Roman authors which have survived the ravages of time. Cato speaks of irrigation, frequent tillage, and manuring, as means of fertilizing the soil. Mr Hoskyn, from whose valuable contribution to the History of Agriculture we have drawn freely in this historic summary, quotes the following interesting passage from Pliny, commenting on Virgil:[2]—"Our poet is of opinion that alternate fallows should be made, and that the land should rest entirely every second year. And this is, indeed, both true and profitable, provided a man have land enough to give the soil this repose. But how, if his extent be not sufficient? Let him, in that case, help himself thus. Let him sow next year's wheat-crop on the field where he has just gathered his beans, vetches, or lupines, or such other crop as enriches the ground. For, indeed, it is worth notice that some crops are sown for no other purpose but as food for others, a poor practice, in my estimation." In another place, he tells us, "Wheat, the later it is reaped, the better it casts; but the sooner it is reaped, the fairer the sample. The best rule is to cut it down before the grain is got hard, when the ear begins to have a reddish-brown appearance. 'Better two days too soon than as many too late,' is a good old maxim, and might pass for an oracle." The following quotation from the same author is excellent: "Cato would have this point especially to be considered, that the soil of a farm be good and fertile; also, that near it there be plenty of labourers, and that it be not far from a large town: moreover, that it have sufficient means for transporting its produce, either by water or land. Also, that *the house be well built*, and the land about it as well managed. But I observe a great error and self-deception which many men commit, who hold opinion that the negligence and ill-husbandry of the former owner is good for his successor or after-purchaser. Now, I say, there is nothing more dangerous and disadvantageous to the buyer than land so left waste and out of heart; and therefore Cato counsels well to purchase land of one who has managed it well, and not rashly and hand-over-head to despise and make light of the skill and knowledge of another. He says, too, that as well land as men, which are of great charge and expense, how gainful soever they may seem to be, yield little profit in the end, when all reckonings are made. The same Cato being asked, what was the most assured profit rising out of land? made this answer,—'To feed stock well.' Being asked again, 'What was the next?' he answered, 'To feed *with moderation*.' By which answer he would seem to conclude that the most certain and sure revenue was *a low cost of production*. To the same point is to be referred another speech of his, 'That a good husbandman ought to be a seller rather than a buyer;' also, 'that a man should stock his ground early and well, but take long time and leisure before he be a builder;' for it is the best thing in the world, according to the proverb, 'to make use, and derive profit, from other men's follies.' Still, when there is a good and convenient house on the farm, the master will be the closer occupier, and take the more pleasure in it; and truly it is a good saying, that 'the master's eye is better than his heel.'"

"It is curious (says Mr Hoskyn) to read such passages as these, and to find the very same subjects still handled, week after week, in fresh and eager controversy in the agricultural writings and periodicals of the present day, eighteen centuries after those opinions were written."

[1] The Philosophy of History, by Frederick Von Schlegel. London, 1846; p. 253.
[2] Short Enquiry into the History of Agriculture, pp. 49–51, by Chandos Wren Hoskyn, Esq.

Historical Summary.

In the later ages of the empire agriculture was neglected, and those engaged in it regarded with contempt. Many fair regions, once carefully cultivated, and highly productive, were abandoned to nature, and became a scene of desolation; the supplies of overgrown Rome being drawn from Egypt, Sicily, and other provinces, which became notable as the granaries of the empire.

Agriculture during the middle ages.

Saracens and Moors of Spain.

Under the Goths, Vandals, and other barbarian conquerors, agriculture in Europe, during the middle ages, seems to have sunk into the lowest condition of neglect and contempt. We owe its revival, like that of other arts and sciences, to the Saracens of Spain, who devoted themselves to the cultivation of that conquered territory, with hereditary love for the occupation, and with the skilful application of the experience which they had gathered in other lands in which they had established their power. By them, and their successors, the Moors, agriculture was carried in Spain to a height which perhaps has not yet been surpassed in Europe. It is said, that so early as the tenth century, the revenue of Saracenic Spain alone amounted to £6,000,000 sterling,—probably as much as that of all the rest of Europe at that time. The ruins of their noble works for the irrigation of the soil, still attest their skill and industry, and put to shame the ignorance and indolence of their successors. The same remark applies to the Spanish dominions in South America. In the ancient empire of Peru, agriculture seems to have reached a high degree of perfection. The ruins of basins and canals, frequently carried through tunnels, prove their industry and skill in irrigation. One of their aqueducts is said by Mr Prescott[1] to have been traced by its ruins for nearly 500 miles. They cultivated the sides of mountains, by means of terraces, which retained forced soil, and were skilled in the application of manure. That on which they chiefly depended was guano, and their Incas protected the penguins, by which it was deposited, by strict laws, which made it highly penal to kill one of these birds, or to set foot on the islands at breeding time. The Spaniards thus obtained possession of two good patrimonies, and have wasted them both.

The influence of the crusades upon the agriculture of this period is not to be overlooked. The dreadful oppression of the feudal system received at that time a shock most favourable to the liberties of man, and, with increasing liberty, more enlightened ideas began to be entertained, and greater attention to be paid to the cultivation of the soil.

But, during this long interval, the population of Europe was divided into two great classes, of which by far the larger one was composed of bondmen, without property, or the power of acquiring it, and small tenants, very little superior to bondmen; and the other class, consisting chiefly of the great barons and their retainers, was more frequently employed in laying waste the fields of their rivals, than in improving their own. The superstition of the times, which destined a large portion of the country to the support of the church, and which, in some measure, secured it from predatory incursions, was the principal source of what little skill and industry were then displayed in the cultivation of the soil. "If we consider the ancient state of Europe," says Mr Hume,[2] "we shall find, that the far greater part of society were everywhere bereaved of their personal liberty, and lived entirely at the will of their masters. Every one that was not noble was a slave; the peasants were not in a better condition; even the gentry themselves were subjected to a long train of subordination under the greater barons, or chief vassals of the crown, who, though seemingly placed in a high state of splendour, yet, having but a slender protection from law, were exposed to every tempest of the state, and, by the precarious condition on which they lived, paid dearly for the power of oppressing and tyrannizing over their inferiors."—"The villains were entirely occupied in the cultivation of their master's land, and paid their rents either in corn or cattle, and other produce of the farm, or in servile offices, which they performed about the baron's family, and upon farms which he retained in his own possession. In proportion as agriculture improved and money increased, it was found that these services, though extremely burdensome to the villain, were of little advantage to the master; and that the produce of a large estate could be much more conveniently disposed of by the peasants themselves, who raised it, than by the landlord or his bailiff, who were formerly accustomed to receive it. A commutation was therefore made of rents for services, and of money-rents for those in kind; and as men in a subsequent age discovered that farms were better cultivated where the farmer enjoyed security in his possession, the practice of granting leases to the peasant began to prevail, which entirely broke the bonds of servitude, already much relaxed from the former practices. The latest laws which we find in England for enforcing or regulating this species of servitude were enacted in the reign of Henry VII. And though the ancient statutes on this subject remain still unrepealed by Parliament, it appears, that before the end of Elizabeth, the distinction between villain and freeman was totally, though insensibly, abolished; and that no person remained in the state to whom the former laws could be applied."

Leases during the middle ages.

But, long before the fifteenth century, it is certain that there was a class of tenants holding on leases for lives, or for a term of years, and paying a rent in land produce, in services, or in money. Whether they gradually sprung up from the class of bondmen, according to Lord Kames,[3] or existed from the earliest period of the feudal constitution, according to other writers,[4] their number cannot be supposed to have been considerable during the middle ages. The stock which these tenants employed in cultivation commonly belonged to the proprietor, who received a proportion of the produce as rent; a system which still exists in France and in other parts of the Continent, where such tenants are called *metayers*, and some vestiges of which may yet be traced in the *steel-bow* of the law of Scotland. Leases of the thirteenth century still remain;[5] and both the laws and chartularies[6] clearly prove the existence in Scotland of a class of cultivators distinct from the *serfs* or bondmen. Yet the condition of these tenants seems to have been very different from that of the tenants of the present day; and the lease approached nearer in its form to a feu-charter than to the mutual agreement now in use. It was of the nature of a beneficiary grant by the proprietor, under certain conditions, and for a limited period: the consent of the tenant seems never to have been doubted. In the common expression, "granting a lease," we have retained an idea of the original character of the deed, even to the present time.

Crops cultivated.

The corn crops cultivated during this period seem to have been of the same species, though all of them probably much inferior in quality to what they are in the present day. Wheat, the most valuable grain, must have borne a small proportion, at least in Britain, to that of other crops; the remarkable fluctuation of price, its extreme scarcity, indicated by the extravagant rate at which it was sometimes sold, as well as the preparatory cultivation required, may convince us that its consumption was confined to the higher orders, and that its growth was by no means extensive. Historical Summary.

oats furnished the bread and drink of the great body of the people of Europe. Cultivated herbage and roots were then unknown in the agriculture of Britain. It was not till the end of the reign of Henry VIII. that any salads, carrots, or other edible roots were produced in England. The little of these vegetables that was used, was formerly imported from Holland and Flanders. Queen Catherine, when she wanted a salad, was obliged to despatch a messenger thither on purpose.[1]

The ignorance and insecurity of those ages, which necessarily confined the cultivation of corn to a comparatively small portion of country, left all the rest of it in a state of nature, to be depastured by the inferior animals, then only occasionally subjected to the care and control of man. Cultivators were crowded together in miserable hamlets; the ground contiguous was kept continually under tillage; and beyond this, wastes and woodlands of a much greater extent were appropriated to the maintenance of their flocks and herds, which pastured indiscriminately, with little attention from their owners.

The low price of butcher-meat, though it was then the food of the common people, when compared with the price of corn, has been justly noticed by several writers as a decisive proof of the small progress of civilisation and industry.

Continent of Europe.

According to the reports of a writer who has had access to the best sources of information, in addition to his own observations, the present state of the agriculture of the greater part of the Continent of Europe is not very different from what it was in Britain during the prevalence of the feudal system. "The greater part of France," he says, "a still much greater portion of Germany, and nearly the whole of Prussia, Austria, Poland, and Russia, present a wretched uniformity of system. It is called the three-course husbandry, consisting of, 1*st*, one year's clean fallow; 2*d*, winter corn, chiefly rye, with a proportion of wheat commensurate to the manure that can be applied; 3*d*, summer corn, or barley and oats. There are occasional and small deviations from this system. In some few cases potatoes, in others peas, are grown, in the fallow year; but they are only minute exceptions to the generally established system. It is not surprising that under such a system the produce should not be much more than four times the quantity of seed, at which rate it is calculated, as appears to be rightly, by Baron Alexander Humboldt."

"The fields are almost universally uninclosed, and exposed to the most injurious effects of a changeable and an intemperate climate. The ancient feudal system of tenure is still continued, modified indeed, and softened in some few parts, but not to a degree or an extent that deserves to be taken into account in the view now under consideration of the countries as a whole. The peasants, for the most part, are *adstricti glebæ;* and where, by recent laws, their condition has been changed, the practical effect has yet hardly had time to exhibit any observable improvement in their state. Labour, whether of men or of cattle, is usually exchanged for the occupancy of land; and hence the labour is performed in the most negligent and imperfect manner, that the vigilance of an overseer, who cannot be everywhere present, will allow.

"The lords of the soil, besides their demesnes, have the right of pasturage on the fields of their tenants from harvest to the next seed-time: hence none of those intervening crops which tend to enrich the soil can be cultivated without infringing on their rights.

"Among the cultivators of the land little or no accumulation of capital has been formed; from the lord to the lowest grade of the peasantry, all are alike destitute of disposable funds. The lords are only rich in land, and sufficiently at their ease, if that land be unencumbered with mortgages or annuities. The peasants, whether owners of the live stock and of the implements, or having the use of them with the land from its owners, are content to live on, from year to year, eating their own produce, growing their own wool and flax, and converting them into garments. They are quite satisfied if they can dispose of as much surplus produce as will pay the small share of money-rent which becomes due to their lord." (*Tracts relating to the Corn Trade and Corn Laws*, by William Jacob, Esq., 1828.)

Flemish Agriculture.

The agriculture of nearly the whole of the continent of Europe has made very great progress since the remarks now quoted were penned. In Flanders, the Netherlands, Italy, Switzerland, and Germany, there are certain limited districts which, in general management, rival, and in particular points excel, our own. In nothing is this more apparent than in their scrupulous economy of manure, both as regards its preparation and application. In Flanders, not only the contents of privies, but soap-suds, scullery-water, and slops of every kind containing fertilising matters, are carefully preserved in suitable receptacles, by the town's-folk and villagers, from whom they are purchased by regular manure dealers, who come statedly round with their tub-carts, to collect this sewage, and who store it in tanks, and in due time retail it to the farmers. The latter invariably have tanks of their own, in which the urine of their cattle and similar matters are collected. This liquid manure is frequently enriched by the addition of night-soil and rape-dust, and is always stored for several months before being applied to the land. In South-West Germany, Switzerland, and Holland, the same attention is paid to the preparation of liquid manure, by mingling the dung and urine of the cattle with water, fermenting it in tanks, and then in distributing it over green crops by means of barrel-carts. The following might stand for a description of Myre Mill or Tiptree, but for the want of the steam-engine, force-pump, and underground pipes: "The cows often lie on smooth bricks, which are washed clean twice a-day, for which purpose a pump is an essential appendage to a cow-house. There is generally a deep gutter along the wall behind the cows, into which the water and urine drain, the ground sloping gently towards it. The tank is either immediately under the stable, well vaulted over, or it is so near that all the liquid readily runs into it through a covered drain. The heads of the cows are towards the middle of the stable, and their tails over the gutter along the wall. The width of the building admits of two rows of cows, facing each other, with a space between them sufficiently wide to admit a small cart, to bring the food to them. This is universally the form of a cow-house in Holland. The liquid in the tank is allowed to go through the first stages of fermentation, during which the caustic portion of the urine is rendered mild, and the liquid is better fitted to be taken up by the fibres of the roots. In order that there may be a regular succession of liquid in a proper state for use, there are partitions in the tanks, and by means of small flood-gates in the drain which leads to it, the fresh accumulation may be directed to any one of the pits thus formed, while the ripe liquor may be pumped up into tubs or barrels set on wheels, to be conveyed to the land. There are means of accelerating or retarding the fermentation, according to the time when the liquor is wanted. Stirring and admitting the air assist the process, while the addition of earth, peat, or ashes, and keeping out the air, retard it. The efficacy of the liquid is much increased by adding rape-cake, and other vegetable

Historical Summary.

substances. This is usually done a short time before it is put on the land, as it would otherwise ferment too much."[1]

France.

The Agriculture of France has been influenced in no ordinary degree by the altered tenure and distribution of the soil consequent upon the great Revolution. A large portion of its territory is now minutely subdivided amongst small proprietors, and presents the appearance of one vast cultivated open field. "As far as the eye can reach over vast plains bounded by sloping hills, you see the surface varied by every description of crop; none, perhaps above an acre or two in size,—the larger portion not more than the fourth or eighth of an acre." These small proprietors are, for the most part, without capital, so that the government takes the chief part in instigating and promoting improvements. For this purpose it has instituted various establishments, which are either maintained entirely at its cost, or by grants in aid of local efforts. These consist of agricultural societies, veterinary schools, model farms, sheep-farms, and haras or studs. Of the model farms, Grignon, in the vicinity of Paris, consists of nearly 1200 English acres of land of various qualities. Here numbers of young men are instructed in the theory and practice of agriculture by highly qualified teachers, and have the opportunity of witnessing the daily operations of the farm. The sheep-farms are devoted to rearing the best breeds of sheep; the rams produced upon them being distributed over the country by annual sales. The haras or studs are maintained for improving the breed of horses. Stallions are sent out from them in great numbers, and are stationed at suitable places for the accommodation of the respective neighbourhoods. These institutions have aided considerably in promoting agricultural improvement in France.

Spain.

Spain, with its delicious climate and fertile soil, exhibits the most antiquated agriculture in Europe. For want of means of conveyance, the abundant and choice products of the interior cannot be brought to its out-ports at a cost that would remunerate the exporter. Its great proprietors are indolent, poor, and proud, and everything lags behind for want of energy and capital. Vast tracts of country, including much fertile soil formerly occupied, are now without an inhabitant, and bear the significant designation, "*Despoblado*" (unpeopled).

Germany.

The Society of German Landowners and Foresters was established in 1837 for purposes similar to those of our own National Agricultural Societies, and is supported by the principal landed proprietors of Germany. Mr Handley, who was present at its Fifth Annual Meeting held at Doberan in Mecklenburg, in September 1841, thus speaks of it:—"Although its objects are the same as ours, the arrangements and proceedings of the meeting partake more of the character of the British Association. Thus, while the exhibition of stock and implements forms a secondary consideration, the main business, viz., the discussions of points connected with the science of agriculture, are carried on in sections, under the presidency of some one celebrated for his acquirements in that particular department, with an earnestness which marks the interest with which they pursue the theories of agriculture, and investigate the results of practical experiments. The president of the meeting is named annually by the sovereign or reigning prince of the state in which it is held. The sections appointed were,—on sheep and the management of flocks,—on practical agriculture,—on horned cattle,—on the breeding of horses,—on geology,—on agricultural mechanics,—on pomology—on the management of woods. The sittings occupied eight days. The several sections met at half-past six A.M., daily, and continued in deliberation till eleven. At noon, they all assembled in the grand saloon, under the presidency of Count Sacken, when a résumé of their several proceedings was read, and animated general discussions ensued. That this Society is on a scale to work very great improvements in the agriculture of Germany, there can be no doubt. If I were to form an opinion only from what I heard, I should say it has already materially changed the cultivation of the north."[2]

Northern Europe.

In the northern countries of Europe, improvement in agriculture makes steady, and in some of them, even rapid progress. In all of them institutions analogous to those of France (already referred to), and similarly supported, are in operation, at which great numbers of the rising generation, both proprietors and peasants, are made acquainted, theoretically and practically, with the most approved methods of their own and other countries. By all our continental neighbours Great Britain is looked upon as their agricultural model. Specimens of our best implements, live stock, and crops, are constantly being introduced in these countries. Young men are frequently sent here by their governments, to acquire a knowledge of our agriculture, and numbers of their landowners are constantly to be found amongst us on the same errand. Our best agricultural treatises are also translated into the principal languages of Europe. In this respect we have, however, received payment in kind, particularly in the scientific department, the names of Liebig, Boussingault, Sprengel, and others, being now as familiar to us as those of our native authors. The recent removal by our Legislature of import duties on farm produce has given a powerful stimulus to agricultural improvement on the continent of Europe. The quality as well as numbers, of the live stock sent to us, is already observed to improve.

It would have been interesting to have directed our attention to the agriculture of those more distant parts of the world with which our all-pervading commerce now brings us into constant intercourse. China, with whose skilful and elaborate husbandry Mr Fortune has recently made us acquainted, modern Egypt, the United States of America, and our own vast colonial empire, all possess new interest to us in an agricultural point of view, seeing that they now send corn and wool to our markets, in addition to their peculiar products. Tempting as the subject is, we must, however, refrain, and now direct our attention to the history of our native agriculture.

Agriculture in England to the end of the 15th century.

Of the early agriculture of England, and of the condition of its cultivators, we may form some conception, by adverting to a few of the enactments, from the Conquest, down to the beginning of the reign of Henry VII. in 1485, when the feudal system, which had been gradually falling into decay, was almost dissolved in that country.

One of the earliest and greatest grievances was the levying of Purveyance. This originally comprehended the necessary provisions, carriages, &c. which the nearest farmers were obliged to furnish to the king's armies at the current prices, and to his houses and castles in time of war. It was called the *great purveyance*, and the officers who collected those necessaries were called purveyors. The smaller purveyance included the necessary provisions and carriages for the king's household, when living at home, or travelling through the kingdom, which the tenants on the king's demesne lands were obliged to furnish gratis; and the practice came to be adopted by the barons and great men, in every tour which they thought proper to make in the country These exactions were so grievous, and levied in so licentious a manner, that the farmers, when they heard of the court's approach, often deserted their houses, as if the country had been invaded

1 "On the Agriculture of the Netherlands;" Journal of Royal Agricultural Society of England, vol. ii., p. 57.
2 Account of the Meeting of German Landowners in 1841; Journal of the Royal Agricultural Society of England, vol. iii., pp. 218, 230.

Historical Summary.

by an enemy. "Purveyance," says Dirom,[1] "was perhaps for many centuries the chief obstruction to the agriculture and improvement of Great Britain. Many laws were made for the reformation and regulation of purveyance, but without effect; and the practice continued down to so late a period as the reign of James the First."

The home trade in corn was restrained by acts against forestallers in 1360, and at several subsequent periods. For many years after the Conquest, the greater part of the trade of England was carried on in markets and fairs; and a very considerable part of the revenue of the crown arose from the duties payable to the king, upon the goods brought to them for sale. The barons had also tolls at the fairs within their respective jurisdictions. When farmers and merchants were bringing their corn and other necessaries to be sold there, they were sometimes met on the way by persons who purchased their commodities, in order to retail them at a higher price. Thus the king and the lords of the manor lost the several duties payable to them; and the price, it was thought, was at the same time raised to the inhabitants. Such were the original forestallers, who were subjected by several statutes to severe penalties. This crime of forestalling, and the kindred ones of regrating and engrossing, were carefully defined, and the different degrees of punishment specified, in a new statute in 1552, to be afterwards noticed. An early law of 1266, for regulating the assize of bread and ale, furnishes a clear proof of the little intercourse that must have subsisted at that time between town and country. "Brewers in cities," says the statute, "may well afford to sell two gallons of beer or ale for a penny, and out of cities three or four gallons for a penny."

Several laws were made in the fourteenth and fifteenth centuries, permitting the exportation of grain when the price of wheat did not exceed six shillings and eightpence a quarter; and in 1463 importation was prohibited when the price was lower. The last statute, however, was little attended to, and foreign grain was admitted as before; while the state of the country, and the restrictions on internal commerce, scarcely permitted any advantage to be derived from the acts allowing exportation.

Husbandry of Scotland.

In Mr Chalmers's *Caledonia*, a great many valuable notices are collected regarding the husbandry of Scotland during these ages. It is evident from his elaborate researches, that the progress of cultivation in the 13th century had been greater than we should have expected from the turbulence of the times, and the comparatively rude and uncivilized state of society. Purveyance, and other obstructions to improvement, were nearly the same in Scotland as in England; the laws regarding the corn trade appear, in some instances, to have been copied from those of England; and in the northern, as in the southern part of the island, the clergy were by far the most skilful and industrious husbandmen.

Yet it is difficult to reconcile the idea of any considerable improvement, particularly in so far as regards the extensive cultivation of wheat (which Mr Chalmers infers from the authorities he quotes), with an act passed in 1426, which ordained every husbandman tilling with a plough of eight oxen to sow at least a firlot (little more than a Winchester bushel) of wheat, and half a firlot of peas, with a proportion of beans; or with the state of the districts only a few years ago, where wheat is said to have been extensively grown at that early period.

By statute 1449, the tenant was for the first time secured in possession, during the term of his lease, against a purchaser of the land; and in 1469 he was protected from having his property carried off for the landlord's debts, beyond the amount of rent actually due; an enactment which proves his miserable condition before that time.

Writers on agriculture.

Soon after the beginning of the 16th century, agriculture partook of the general improvement which followed the invention of printing, the revival of learning, and the more settled authority of government; and instead of the occasional notices of historians, we can now refer to regular treatises, written by men who engaged eagerly in this neglected and hitherto degraded occupation. We shall therefore give a short account of the principal works, as well as of the laws and general policy of Britain, in regard to agriculture, from the early part of the sixteenth century to the Revolution in 1688, when a new era commenced in the legislation of corn, and soon after in the practice of the cultivator.[2]

Fitzherbert.

The first and by far the best of our early works is the *Book of Husbandry*, printed in 1534, commonly ascribed to Fitzherbert, a judge of the common pleas in the reign of Henry VIII. This was followed, in 1539, by the *Book of Surveying and Improvements*, by the same author. In the former treatise we have a clear and minute description of the rural practices of that period, and from the latter may be learned a good deal of the economy of the feudal system in its decline. The *Book of Husbandry* has scarcely been excelled by any later production, in as far as concerns the subjects of which it treats; for at that time cultivated herbage and edible roots were still unknown in England. The author writes from his own experience of more than forty years; and, with the exception of passages denoting his belief in the superstition of the Roman writers, there is very little of this valuable work that should be omitted, and not a great deal that need be added, in so far as regards the culture of corn, in a manual of husbandry adapted even to the present time. Fitzherbert touches on almost every department of the art, and in about a hundred octavo pages has contrived to condense more practical information than will be found scattered through as many volumes of later times; and yet he is minute even to the extreme on points of real utility. There is no reason to say, with Mr Harte, that he had revived the husbandry of the Romans; he merely describes the practices of the age in which he lived; and from his commentary on the old statute *extenta manerii*, in his *Book of Surveying*, in which he does not allude to any recent improvements, it is probable that the management which he details had been long established. But it may surprise some of the agriculturists of the present day to be told, that, after the lapse of almost three centuries, Fitzherbert's practice, in some material branches, has not been improved upon; and that in several districts abuses still exist, which were as clearly pointed out by him at that early period as by any writer of the present age.

The *Book of Husbandry* begins with the plough and other instruments, which are concisely and yet minutely described; and then about a third part of it is occupied with the several operations as they succeed one another throughout the year. Among other things in this part of the work, the following deserve notice:—"Somme (ploughs) wyll tourn the sheld bredith at every landsende, and plowe all one way;" the same kind of plough that is now found so useful on hilly grounds. Of wheel-ploughs he observes, that "they be good on even grounde that lyeth

[1] *Inquiry into the Corn Laws*, &c. p. 9.

[2] The account of the Writers on Agriculture taken from Mr Cleghorn's Treatise in the former edition of the Encyclopædia Britannica.

Historical Summary.

lyghte;" and on such lands they are still most commonly employed. Cart-wheels were sometimes bound with iron, of which he greatly approves. On the much agitated question about the employment of horses or oxen in labour, the most important arguments are distinctly stated. "In somme places," he says, "a horse plough is better," and in others an oxen plough, to which, upon the whole, he gives the preference; and to this, considering the practices of that period, they were probably entitled. Beans and peas seem to have been common crops. He mentions the different kinds of wheat, barley, and oats; and after describing the method of harrowing "all maner of cornnes," we find the roller employed. "They use to role their barley grounde after a showr of rayne, to make the grounde even to mowe." Under the article "To falowe," he observes, "the greater clottes (clods) the better wheate, for the clottes kepe the wheat warme all wynter; and at March they will melte and breake and fal in manye small peces, the whiche is a newe dongynge and refreshynge of the corne." This is agreeable to the present practice, founded on the very same reasons. "In May, the shepe folde is to be set out;" but Fitzherbert does not much approve of folding, and points out its disadvantages in a very judicious manner. "In the later end of May and the begynnynge of June, is tyme to wede the corne;" and then we have an accurate description of the different weeds, and the instruments and mode of weeding. Next comes a second ploughing of the fallow; and afterwards, in the latter end of June, the mowing of the meadows begins. Of this operation, and of the forks and rakes, and the haymaking, there is a very good account. The corn harvest naturally follows: rye and wheat were usually *shorn*, and barley and oats cut with the scythe. This intelligent writer does not approve of the practice, which still prevails in some places, of cutting wheat high, and then mowing the stubbles. "In Somersetshire," he says, "they do shere theyr wheat very lowe; and the wheate strawe that they purpose to make *thacke* of, they do not threshe it, but cut off the ears, and bynd it in sheves, and call it *rede*, and therewith they thacke theyr houses." He recommends the practice of setting up corn in shocks, with two sheaves to cover eight, instead of ten sheaves, as at present; probably owing to the straw being then shorter. The corn was commonly housed; but if there be a want of room, he advises that the ricks be built on a scaffold, and not upon the ground. Corn-stacks are now beginning to be built on pillars and frames. The fallow received a third ploughing in September, and was sown about Michaelmas. "Wheat is moost commonlye sowne under the forowe, that is to say, cast it uppon the falowe, and then plowe it under;" and this branch of his subject is concluded with directions about threshing, winnowing, and other kinds of barn-work.

Fitzherbert next proceeds to live stock. "An housbande," he says, "can not well thryue by his corne without he have other cattell, nor by his cattell without corne. And bycause that shepe, in myne opynyon, is the mooste profytablest cattell that any man can haue, therefore I pourpose to speake fyrst of shepe." His remarks on this subject are so accurate, that one might imagine they came from a storemaster of the present day; and the minutiæ which he details are exactly what the writer of this article has seen practised in the hilly parts of this country. In some places at present, "they neuer seuer their lambes from their dammes;" "and the poore of the peeke (high) countreye, and such other places, where, as they vse to milke theyr ewes, they vse to wayne theyr lambes at 12 weekes olde, and to mylke their ewes fiue or syxe weekes;" but that, he observes, "is greate hurte to the ewes, and wyll cause them that they wyll not take the ramme at the tyme of the yere for pouertye, but goo barreyne." "In June is tyme to shere shepe; and ere they be shorne, they must be verye well washen, the which shall be to the owner greate profyte in the sale of his wool, and also to the clothe-maker." It appears that *hand washing* was then a common practice; and yet in the west and north of Scot nd, at this day, sheep are never washed at all. His remarks on horses, cattle, &c. are not less interesting; and there is a very good account of the diseases of each species, and some just observations on the advantage of mixing different kinds on the same pasture. Swine and bees conclude this branch of the work.

The author then points out the great advantages of inclosures; recommends "quycksettynge, dychynge, and hedgeyng;" and gives particular directions about the *settes*, and the method of training a hedge, as well as concerning the planting and management of trees. We have then a short information "for a yonge gentylman that intendeth to thryue," and "a prolouge for the wiues occupation," in some instances rather too homely for the present time. Among other things, she is to "make her husband and herself somme clothes;" and "she maye haue the lockes of the shepe eyther to make blankettes and courlettes, or bothe." This is not so much amiss; but what follows will bring our learned judge into disrepute even with our most industrious housewives. "It is a wyues occupation," he says, "to wynowe all maner of cornes, to make malte, to washe and wrynge, to make heye, shere corne, and, in time of nede, to helpe her husbande to fyll the mucke wayne or dounge carte, dryue the ploughe, to loode heye, corne, and suche other; and to go or ride to the market to sel butter, chese, mylke, egges, chekyns, capons, hennes, pygges, gese, and all maner of cornes." The rest of the book contains some useful advices about diligence and economy; and concludes, after the manner of the age, with many pious exhortations.

Such is Fitzherbert's *Book of Husbandry*, and such was the state of agriculture in England in the early part of the sixteenth century, and probably for a long time before; for he nowhere speaks of the practices which he describes or recommends as of recent introduction.

The *Book of Surveying* adds considerably to our knowledge of the rural economy of that age. "Four maner of commens" are described; several kinds of mills for corn and other purposes, and also "quernes that goo with hand;" different orders of tenants, down to the "boundmen," who "in some places contynue as yet;" "and many tymes, by colour thereof, there be many freemen taken as boundmen, and their lands and goods is taken from them." Lime and marl are mentioned as common manures; and the former was sometimes spread on the surface to destroy heath. Both draining and irrigation are noticed, though the latter but slightly. And the work concludes with an inquiry "how to make a township that is worth XX. marke a yere, worth XX. li. a year;" from which we shall give a specimen of the author's manner, as well as of the economy of the age.

"It is undoubted, that to every townshyppe that standeth in tyllage in the playne countrey, there be errable landes to plowe and sowe, and leyse to tye or tedder theyr horses and mares upon, and common pasture to kepe and pasture their catell, beestes, and shepe upon; and also they have medowe grounde to get theyr hey upon. Than to let it be known how many acres of errable lande euery man hath in tyllage, and of the same acres in euery felde to chaunge with his neyghbours, and to leye them toguyther, and to make hym one seuerall close in euery felde for his errable lands; and his leyse in euery felde to leye

Historical Summary.

them togyther in one felde, and to make one seuerall close for them all. And also another seuerall close for his portion of his common pasture, and also his porcion of his medowe in a seuerall close by itselfe, and al kept in seueral both in wynter and somer; and euery cottage shall haue his portion assigned hym accordynge to his rent, and than shall nat the ryche man ouerpresse the poore man with his cattell; and euery man may eate his oun close at his pleasure. And vndoubted, that hay and strawe that will find one beest in the house wyll finde two beestes in the close, and better they shall lyke. For those beestis in the house have short heare and thynne, and towards March they will pylle and be bare; and therefore they may nat abyde in the fylde before the heerdmen in winter tyme for colde. And those that lye in a close under a hedge haue longe heare and thyck, and they will neuer pylle nor be bare; and by this reason the husbande maye kepe twyse so many catell as he did before.

"This is the cause of this approwment. Nowe euery husbande hath sixe seuerall closes, whereof iii. be for corne, the fourthe for his leyse, the fyfte for his commen pastures, and the sixte for his haye; and in wynter time there is but one occupied with corne, and than hath the husbande other fyue to occupy tyll lente come, and that he hath his falowe felde, his ley felde, and his pasture felde al sommer. And when he hath mowen his medowe, than he hath his medowe grounde, soo that if he hath any weyke catell that wold be amended, or dyvers maner of catell, he may put them in any close he wyll, the which is a great advantage; and if all shulde lye commen, than wolde the edyche of the corne feldes and the aftermath of all the medowes be eaten in X. or XII. dayes. And the rych men that hath moche catell wold have the advantage, and the poore man can have no helpe nor relefe in wynter when he hath moste nede; and if an acre of lande be worthe sixe pens, or it be enclosed, it will be worth VIII. pens whan it is enclosed, by reason of the compostying and dongyng of the catell that shall go and lye upon it both day and nighte; and if any of his thre closes that he hath for his corne be worne or ware bare, than he may breke and plowe up his close that he hadde for his layse, or the close that he hadde for his commen pasture, or bothe, and sowe them with corne, and let the other lye for a time, and so shall he have alway reist grounde, the which will bear moche corne with lytel donge; and also he shall have a great profyte of the wod in the hedges whan it is growen; and not only these profytes and advantages beforesaid, but he shall save moche more than al these, for by reason of these closes he shall save meate, drinke, and wages of a shepeherde, the wages of the heerdman, and the wages of the swine herde, the which may fortune to be as chargeable as all his holle rent; and also his corne shall be better saved from eatinge or destroyeng with catel. For dout ye nat but heerdemen with their catell, shepcherdes with their shepe, and tieng of horses and mares, destroyeth moch corne, the which the hedges wold save. Paraduenture some men would say, that this shuld be against the common weale, bicause the shepeherdes, heerdmen, and swyneherdes, shuld than be put out of wages. To that it may be answered, though these occupations be not used, there be as many newe occupations that were not used before; as getting of quickesettes, diching, hedging, and plashing, the which the same men may use and occupye."

Tusser.

The next author who writes professedly on agriculture is Tusser, whose *Five Hundred Points of Husbandry*, published in 1562, was formerly in such high repute as to be recommended by Lord Molesworth to be taught in schools.[1] The edition of 1604 is the one we make use of here, in which the book of husbandry consists of 118 pages; and then follows the *Points of Housewifrie*, occupying 42 pages more. It is written in verse. Amidst a vast heap of rubbish, there are some useful notices concerning the state of agriculture at the time in different parts of England. Hops, which had been introduced in the early part of the sixteenth century, and on the culture of which a treatise was published in 1574 by Reynolde Scott, are mentioned as a well-known crop. Buckwheat was sown after barley. It seems to have been the practice then, in some places, to "*geld fillies*" as well as colts. Hemp and flax are mentioned as common crops. Inclosures must have been numerous in several counties; and there is a very good comparison between "champion (open fields) country, and several," which Blythe afterwards transcribed into his *Improver Improved*. Carrots, cabbages, turnips, and rape, are mentioned among the herbs and roots for the kitchen. There is nothing to be found in Tusser about serfs or bondmen, as in Fitzherbert's works. This author's division of the crop is rather curious, though probably quite inaccurate, if he means that the whole rent might be paid by a tenth of the corn.

"One part cast forth for rent due out of hand.
"One other part for seed to sow thy land.
"Another part leave parson for his tith.
"Another part for harvest, sickle and sith.
"One part for ploughwrite, cartwrite, knacker, and smith.
"One part to uphold thy teemes that draw therewith.
"Another part for servant and workman's wages laie.
"One part likewise for filbellie daie by daie.
"One part thy wife for needful things doth crave.
"Thyself and thy child the last part would have."

Googe.

The next writer is *Barnaby Googe*, whose *Whole Art of Husbandry* was printed in 1578, and again by Markham in 1614. The first edition is merely a translation of a German work; and very little is said of English husbandry in the second, though Markham made some trifling interpolations, in order, as it is alleged, to adapt the German husbandry to the English climate. It is for the most part made up of gleanings from the ancient writers of Greece and Rome, whose errors are faithfully retained, with here and there some description of the practices of the age, in which there is little of novelty or importance. Googe mentions a number of English writers who lived about the time of Fitzherbert, whose works have not been preserved.

For more than fifty years after this, or till near the middle of the seventeenth century, there are no systematic works on husbandry, though several treatises on particular departments of it. From these it is evident, that all the different operations of the farmer were performed with more care and correctness than formerly; that the fallows were better worked, the fields kept freer of weeds, and much more attention paid to manures of every kind. A few of the writers of this period deserve to be shortly noticed.

Plat.

Sir Hugh Plat, in his *Jewel House of Art and Nature*, printed in 1594 (which Weston in his catalogue erroneously gives to Gabriel Plattes), makes some useful observations on manures, but chiefly collected from other writers. His censure of the practice of leaving farm dung lying scattered about is among the most valuable.

[1] *Some Considerations for the promoting of Agriculture and employing the Poor.* Dublin, 1723.

Historical Summary.

Norden.

Sir John Norden's *Surveyor's Dialogue*, printed in 1607, and reprinted with additions in 1618, is a work of considerable merit. The first three books of it relate to the rights of the lord of the manor, and the various tenures by which landed property was then held, with the obligations which they imposed. Among others, we find the singular custom so humorously described in the Spectator, of the incontinent widow riding upon a ram. In the fifth book there are a good many judicious observations on the "different natures of grounds, how they may be employed, how they may be bettered, reformed, and amended." The famous meadows near Salisbury are mentioned; and when cattle have fed their fill, hogs, it is pretended, "are made fat with the remnant; namely, with the knots and sappe of the grasse." "Clouer grasse, or the grasse honey suckle" (white clover), is directed to be sown with other hay seeds. "Carrot rootes" were then raised in several parts of England, and sometimes by farmers. London street and stable dung was carried to a distance by water, though it appears from later writers to have been got for the trouble of removing. And leases of 21 years are recommended for persons of small capital, as better than employing it in purchasing land; an opinion that prevails very generally among our present farmers.

Bees seem to have been great favourites with these early writers; and among others, there is a treatise by Butler, a gentleman of Oxford, called the *Feminine Monarchie*, or the *History of Bees*, printed in 1609, full of all manner of quaintness and pedantry.

Weston.

We shall pass over Markham, Mascall, Gabriel Plattes, and several other authors of this period, the best part of their writings being preserved by Blythe and Hartlib, of whom we shall say a little immediately. In Sir Richard Weston's *Discourse on the Husbandry of Brabant and Flanders*, published by Hartlib in 1645, we may mark the dawn of the vast improvements which have since been effected in Britain. This gentleman was ambassador from England to the elector palatine and king of Bohemia in 1619, and had the merit of being the first who introduced the *great clover*, as it was then called, into English agriculture, about 1645, and probably turnips also. His directions for the cultivation of clover are better than was to be expected. It thrives best, he says, when you sow it on the worst and barrenest ground, such as our worst heath ground is in England. The ground is to be pared and burnt, and unslacked lime must be added to the ashes. It is next to be well ploughed and harrowed; and about ten pounds of clover seed must be sown on an acre in April or the end of March. If you intend to preserve seed, then the second crop must be let stand till it come to a full and dead ripeness; and you shall have at the least five bushels per acre. Being once sown, it will last five years; and then being ploughed, it will yield, three or four years together, rich crops of wheat, and after that a crop of oats, with which clover seed is to be sown again. It is in itself an excellent manure, Sir Richard adds; and so it should be, to enable land to bear this treatment. In less than ten years after its introduction, that is, before 1655, the culture of clover, exactly according to the present method, seems to have been well known in England, and it had also made its way to Ireland.

Blythe.

A great many works on agriculture appeared during the time of the commonwealth, of which Blythe's *Improver Improved*, and Hartlib's *Legacy*, are the most valuable. The first edition of the former was published in 1649, and of the latter in 1650; and both of them were enlarged in subsequent editions. In the first edition of the *Improver Improved*, no mention is made of clover, nor in the second of turnips; but in the third, published in 1662, clover is treated of at some length, and turnips are recommended as an excellent cattle crop, the culture of which should be extended from the kitchen garden to the field. Sir Richard Weston must have cultivated turnips before this; for Blythe says, that Sir Richard affirmed to himself he did feed his swine with them. They were first given boiled, but afterwards the swine came to eat them raw, and would run after the carts, and pull them forth as they gathered them; an expression which conveys an idea of their being cultivated in the fields.

Culture of turnips.

Blythe's book is the first systematic work in which there are some traces of the alternate husbandry so beneficially established since, by interposing clover and turnip between culmiferous crops. He is a great enemy to commons and common fields, and to retaining land in old pasture, unless it be of the best quality. His description of the different kinds of ploughs is interesting; and he justly recommends such as were drawn by two horses (some even by one horse), in preference to the weighty and clumsy machines which required four or more horses or oxen. Almost all the manures now used seem to have been then well known; and he brought lime himself from a distance of 20 miles. He speaks of an instrument which ploughed, sowed, and harrowed at the same time; and the *setting of corn* was then a subject of much discussion. "It was not many years," says Blythe, "since the famous city of London petitioned the parliament of England against two anusancies or offensive commodities, which were likely to come into great use and esteem; and that was Newcastle coal, in regard of their stench, &c., and hops, in regard they would spoyle the taste of drink, and endanger the people."

Hartlib.

Hartlib's *Legacy* is a very heterogeneous performance, containing, among some very judicious directions, a great deal of rash speculation. Several of the deficiencies which the writer complains of in English agriculture must be placed to the account of our climate, and never have been or can be supplied. Some of his recommendations are quite unsuitable to the state of the country, and display more of general knowledge and good intention, than of either the theory or practice of agriculture. Among the subjects deserving notice may be mentioned the practice of steeping and liming seed corn as a preventive of smut; changing every year the *species* of grain, and bringing seed corn from a distance; ploughing down green crops as manure; and feeding horses with broken oats and chaff. This writer seems to differ a good deal from Blythe about the advantage of interchanging tillage and pasture. "It were no losse to this island," he says, "if that we should not plough at all, if so be that we could certainly have corn at a reasonable rate, and likewise vent for all our manufactures of wool:" and one reason for this is, that pasture employeth more hands than tillage, instead of depopulating the country, as was commonly imagined. The *grout*, which he mentions "as coming over to us in Holland ships," about which he desires information, was probably the same with our present shelled barley; and mills for manufacturing it were introduced into Scotland from Holland towards the beginning of the last century.

To the third edition, published in 1655, are subjoined Dr Beatie's Annotations, with the writer of the Legacy's answers, both of them ingenious, and sometimes instructive. But this cannot be said of Gabriel Plattes's *Mercurius Lætificans*, also added to this edition, which is a most extravagant production. There are also several communications from Hartlib's different correspondents, of which the most interesting are those on the early cultivation and great value of clover. Hartlib himself does not appear much in this collection; but he seems to have been a

Historical Summary.

very useful person in editing the works of others, and as a collector of miscellaneous information on rural subjects. It is strange that neither Blythe nor Hartlib, nor any of Hartlib's correspondents, seem ever to have heard of Fitzherbert's works.

Ray and Evelyn.

Among the other writers previous to the Revolution, we shall only mention Ray the botanist and Evelyn, both men of great talents and research, whose works are still in high estimation. A new edition of Evelyn's *Silva and Terra* was published in 1777 by Dr Hunter, with large notes and elegant engravings, and reprinted in 1812.

The preceding review commences with a period of feudal anarchy and despotism, and comes down to the time when the exertions of individual interest were protected and encouraged by the firm administration of equal laws; when the prosperity of Great Britain was no longer retarded by internal commotions, nor endangered by hostile invasion.

Laws

The laws of this period, in so far as they relate to agriculture and rural economy, display a similar progress in improvement.

against laying arable land to pasture,

From the beginning of the reign of Henry VII. to the end of Elizabeth's, a number of statutes were made for the encouragement of tillage, though probably to little purpose. The great grievance of those days was the practice of laying arable land to pasture, and suffering the farm-houses to fall to ruin. "Where in some towns," says the statute 4th Henry VII. (1488), "two hundred persons were occupied and lived of their lawful labours, now there are occupied two or three herdsmen, and the residue fall into idleness:" therefore it is ordained, that houses which within three years have been let for farms, with twenty acres of land lying in tillage or husbandry, shall be upheld, under the penalty of half the profits, to be forfeited to the king or the lord of the fee. Almost half a century afterwards, the practice had become still more alarming; and in 1534 a new act was tried, apparently with as little success. "Some have 24,000 sheep, some 20,000 sheep, some 10,000, some 6000, some 4000, and some more and some less;" and yet it is alleged the price of wool had nearly doubled, "sheep being come to a few persons' hands." A penalty was therefore imposed on all who kept above 2000 sheep; and no person was to take in farm more than two tenements of husbandry. By the 39th Elizabeth (1597), arable land made pasture since the 1st Elizabeth shall be again converted into tillage, and what is arable shall not be converted into pasture.

Many laws were enacted during this period against vagabonds, as they were called; and persons who could not find employment seem to have been sometimes confounded with those who really preferred idleness and plunder. The dissolution of the feudal system, and the suppression of the monasteries, deprived a great part of the rural population of the means of support. They could not be employed in cultivating the soil, for there was no middle class of farmers possessed of capital to be vested in improvements; and what little disposable capital was in the hands of great proprietors could not, in those rude times, be so advantageously embarked in the expensive and precarious labours of growing corn, as in pasturage, which required much less skill and superintendence. Besides, there was a constant demand for wool on the Continent; while the corn-market was not only confined by laws against exportation, but fettered by restrictions on the internal trade. The laws regarding the wages of labour and the price of provisions are a further proof of the ignorance of the age in regard to the proper subject of legislation.

Historical Summary.

against forestalling,

By the statute 1552 it is declared, that any person that shall buy merchandise, victual, &c. coming to market, or make any bargain for buying the same before they shall be in the market ready to be sold, or shall make any motion for enhancing the price, or dissuade any person from coming to market, or forbear to bring any of the things to market, &c. shall be deemed a *forestaller*. Any person who buys and sells again in the same market, or within four miles thereof, shall be reputed a *regrater*. Any person buying corn growing in the fields, or any other corn, with intent to sell again, shall be reputed an unlawful *ingrosser*. It was also declared, that no person shall sell cattle within five weeks after he had bought them. Licences, indeed, were to be granted in certain cases, and particularly when the price of wheat was at or under 6s. 8d. a quarter, and other kinds of grain in that proportion.

and for regulating the corn trade.

The laws regarding the exportation and importation of corn during this period could have had little effect in encouraging agriculture, though towards the latter part of it they gradually approached that system which was finally established at and soon after the Revolution. From the time of the above-mentioned statute against forestallers, which effectually prevented exportation, as well as the freedom of the home trade, when corn was above the price therein specified, down to 1688, there are at least twelve statutes on this subject; and some of them are so nearly the same, that it is probable they were not very carefully observed. The price at which wheat was allowed to be exported was raised from 6s. 8d. a quarter, the price fixed by the 1st and 2d of Philip and Mary (1553), to 10s. in 1562; to 20s. in 1593; to 26s. 8d. in 1604; to 32s. in 1623; to 40s. in 1660; to 48s. in 1663; and at last, in 1670, exportation was virtually permitted without limitation. Certain duties, however, were payable, which in some cases seem to have amounted to a prohibition; and until 1660 importation was not restrained even in years of plenty and cheapness. In permitting exportation, the object appears to have been revenue rather than the encouragement of production.

The first statute for levying tolls at turnpikes, to make or repair roads in England, passed in 1662.

Agriculture of Scotland in the 16th and 17th centuries.

Of the state of agriculture in Scotland in the 16th and the greater part of the 17th century, very little is known; no professed treatise on the subject appeared till after the Revolution. The south-eastern counties were the earliest improved, and yet in 1660 their condition seems to have been very wretched. Ray, who made a tour along the eastern coast in that year, says, "we observed little or *no fallow grounds* in Scotland; some ley ground we saw, which they manured with sea wreck. The men seemed to be very lazy, and may be frequently observed to plough in their cloaks. It is the fashion of them to wear cloaks when they go abroad, but especially on Sundays. They have neither good bread, cheese, nor drink. They cannot make them, nor will they learn. Their butter is very indifferent, and one would wonder how they could contrive to make it so bad. They use much pottage made of coalwort, which they call *kail*, sometimes broth of decorticated barley. The ordinary country-houses are pitiful cots, built of stone and covered with turfs, having in them but one room, many of them no chimneys, the windows very small holes, and not glazed. The ground in the valleys and plains bears very good corn, but especially bears barley or bigge, and oats, but rarely wheat and rye."[1]

[1] *Select Remains of John Ray.* Lond. 1760.

Historical Summary. It is probable that no great change had taken place in Scotland from the end of the 15th century, except that tenants gradually became possessed of a little stock of their own, instead of having their farm stocked by the landlord. " The minority of James V., the reign of Mary Stuart, the infancy of her son, and the civil wars of her grandson Charles I., were all periods of lasting waste. The very laws which were made during successive reigns, for protecting the tillers of the soil from spoil, are the best proofs of the deplorable state of the husbandman."[1]

Yet in the 17th century were those laws made which paved the way for the present improved system of agriculture in Scotland. By statute 1633, landholders were enabled to have their tithes valued, and to buy them either at nine or six years' purchase, according to the nature of the property. The statute 1685, conferring on landlords a power to entail their estates, was indeed of a very different tendency in regard to its effects on agriculture. But the two acts in 1695, for the division of commons, and separation of intermixed properties, have facilitated in an eminent degree the progress of improvement.

Progress of agriculture from 1688 to 1760. From the Revolution to the accession of George III. the progress of agriculture was by no means so considerable as we should be led to imagine from the great exportation of corn. It is the opinion of well-informed writers,[2] that very little improvement had taken place, either in the cultivation of the soil or in the management of live stock, from the Restoration down to the middle of last century. Even clover and turnips, the great support of the present improved system of agriculture, were confined to a few districts, and at the latter period were scarcely cultivated at all by common farmers in the northern part of the island. Of the writers of this period, therefore, we shall notice only such as describe some improvement in the modes of culture, or some extension of the practices that were formerly little known.

In Houghton's *Collections on Husbandry and Trade*, a periodical work begun in 1681, we have the first notice of turnips being eaten by sheep. " Some in Essex have their fallow after turnips, which feed their sheep in winter, by which means the turnips are scooped, and so made capable to hold dews and rain water, which, by corrupting, imbibes the nitre of the air, and when the shell breaks it runs about and fertilizes. By feeding the sheep, the land is dunged as if it had been folded; and those turnips, though few or none be carried off for human use, are a very excellent improvement, nay, some reckon it so though they only plough the turnips in without feeding."[3] This was written in February 1694; but ten years before, Worlidge, one of his correspondents, observes, " sheep fatten very well on turnips, which prove an excellent nourishment for them in hard winters, when fodder is scarce; for they will not only eat the greens, but feed on the roots in the ground, and scoop them hollow even to the very skin. Ten acres (he adds) sown with clover, turnips, &c. will feed as many sheep as one hundred acres thereof would before have done."[4]

At this time potatoes were beginning to attract notice. " The potato," says Houghton, " is a *bacciferous* herb, with *esculent* roots, bearing winged leaves and a bell flower.

" This, I have been informed, was brought first out of Virginia by Sir Walter Raleigh; and he stopping at Ireland, some was planted there, where it thrived very well, and to good purpose; for in their succeeding wars, when all the corn above the ground was destroyed, this supported them; for the soldiers, unless they had dug up all the ground where they grew, and almost sifted it, could not extirpate them; from whence they were brought to Lancashire, where they are very numerous, and now they begin to spread all the kingdom over. They are a pleasant food boiled or roasted, and eaten with butter and sugar. There is a sort brought from Spain, that are of a longer form, and are more luscious than ours; they are much set by, and sold for sixpence or eightpence the pound."[5]

Mortimer. The next writer is Mortimer, whose *Whole Art of Husbandry* was published in 1706, and has since run through several editions. It is a regular, systematic work, of considerable merit; and it does not appear that much improvement has been made since in the practices he describes, in many parts of Britain. From the third edition of Hartlib's *Legacy*, we learn that clover was cut green, and given to cattle; and it appears that this practice of *soiling*, as it is now called, had become very common about the beginning of last century, wherever clover was cultivated. Ryegrass was now sown along with it. Turnips were hand-hoed, and extensively employed in feeding sheep and cattle, in the same manner as at present.

Tull. The first considerable improvement in the practice of that period was introduced by Jethro Tull, a gentleman of Berkshire, who began to drill wheat and other crops about the year 1701, and whose "*Horse-hoeing Husbandry*," published in 1731, exhibits the first decided step in advance upon the principles and practices of his predecessors. Not contented with a careful attention to details, Tull set himself, with admirable skill and perseverance, to investigate the growth of plants, and thus to arrive at a knowledge of the principles by which the cultivation of field-crops should be regulated. Having arrived at the conclusion that the food of plants consists of minute particles of earth taken up by their rootlets, it followed, that the more thoroughly the soil in which they grew was disintegrated, the more abundant would be the "pasture" (as he called it), to which their fibres would have access. He was thus led to adopt that system of sowing his crops in rows, or drills, so wide apart as to admit of tillage of the intervals, both by ploughing and hoeing, being continued until they had wellnigh arrived at maturity.

As the distance between his rows appeared much greater than was necessary for the range of the roots of the plants, he begins by showing that these roots extend much farther than is commonly believed, and then proceeds to inquire into the nature of their food. After examining several hypotheses, he decides this to be fine particles of earth. The chief, and almost the only use of dung, he thinks, is to divide the earth, to dissolve "this terrestrial matter, which affords nutriment to the mouths of vegetable roots;" and this can be done more completely by tillage. It is therefore necessary not only to pulverise the soil by repeated ploughings before it be seeded, but, as it becomes gradually more and more compressed afterwards, recourse must be had to tillage while the plants are growing; and this is *hoeing*, which also destroys the weeds that would deprive the plants of their nourishment.

The leading features of Tull's husbandry are his practice of laying the land into narrow ridges of five or six feet, and upon the middle of these drilling one, two, or three rows,

Historical Summary.

distant from one another about seven inches when there were three, and ten when only two. The distance of the plants on one ridge from those on the contiguous one he called an *interval;* the distance between the rows on the same ridge, a *space* or *partition:* the former was stirred repeatedly by the horse-hoe, the latter by the hand-hoe.

The extraordinary attention this ingenious person gave to his mode of culture is perhaps without a parellel:—"I formerly was at much pains," he says, "and at some charge in improving my drills for planting the rows at very near distances, and had brought them to such perfection, that one horse would draw a drill with eleven shares, making the rows at three inches and a half distance from one another; and at the same time sow in them three very different sorts of seeds, which did not mix; and these, too, at different depths. As the barley-rows were seven inches asunder, the barley lay four inches deep. A little more than three inches above that, in the same channels, was clover; betwixt every two of these rows was a row of St Foin, covered half an inch deep.

"I had a good crop of barley the first year; the next year two crops of broad clover, where that was sown; and where hop-clover was sown, a mixed crop of that and St Foin; but I am since, by experience, so fully convinced of the folly of these, or any other mixed crops, and more especially of narrow spaces, that I have demolished these instruments, in their full perfection, as a vain curiosity, the drift and use of them being contrary to the true principles and practice of horse-hoeing."[1]

In the culture of wheat, he began with ridges six feet broad, or eleven on a breadth of 66 feet; but on this he afterwards had fourteen ridges. After trying different numbers of rows on a ridge, he at last preferred two, with an intervening space of about ten inches. He allowed only three pecks of seed for an acre. The first hoeing was performed by turning a furrow from the row, as soon as the plant had put forth four or five leaves; so that it was done before or at the beginning of winter. The next hoeing was in spring, by which the earth was returned to the plants. The subsequent operations depended upon the circumstances and condition of the land and the state of the weather. The next year's crop of wheat was sown upon the intervals which had been unoccupied the former year; but this he does not seem to think was a matter of much consequence. "My field," he observes, "whereon is now the thirteenth crop of wheat, has shown that the rows may successfully stand upon any part of the ground. The ridges of this field were, for the twelfth crop, changed from six feet to four feet six inches. In order for this alteration the ridges were ploughed down, and then the next ridges were laid out the same way as the former, but one foot six inches narrower, and the double rows drilled on their tops; whereby, of consequence, there must be some rows standing on every part of the ground, both on the former partitions, and on every part of the intervals. Notwithstanding this, there was no manner of difference in the goodness of the rows; and the whole field was in every part of it equal, and the best I believe that ever grew on it. It is now the thirteenth crop, likely to be good, though the land was not ploughed crossways."[2]

It follows, from this singular management, that Tull thought a succession of crops of different species altogether unnecessary; and he labours hard to prove against Dr Woodward, that the advantages of such a change under his plan of tillage were quite chimerical; though he seems to admit the benefit of a change of the seed itself.

In cultivating turnips he made the ridges of the same breadth as for wheat, but only one row was drilled on each. His management, while the crop was growing, differs very little from the present practice. When drilled on the level, it is impossible, he observes, to hoe-plough them so well as when they are planted upon ridges. But the seed was deposited at different depths, the half about four inches deep, and the other half exactly over that, at the depth of half an inch. "Thus planted, let the weather be never so dry, the deepest seed will come up; but if it raineth immediately after planting, the shallow will come up first. We also make it come up at four times, by mixing our seed half new and half old, the new coming up a day quicker than the old. These four comings up give it so many chances for escaping the fly; it being often seen that the seed sown over night will be destroyed by the fly, when that sown the next morning will escape, and *vice versa:* or you may hoe-plough them when the fly is like to devour them; this will bury the greatest part of these enemies: or else you may drill in another row without new-ploughing the land."

Drilling and horse and hand hoeing seem to have been in use before the publication of Tull's book. "Hoeing," he says, "may be divided into deep, which is our horse-hoeing; and shallow, which is the English hand-hoeing; and also the shallow horse-hoeing used in some places betwixt rows, where the intervals are very narrow, as 16 or 18 inches. This is but an imitation of the hand-hoe, or a succedaneum to it, and can neither supply the use of dung nor fallow, and may be properly called scratch-hoeing." But in his mode of forming ridges his practice seems to have been original; his implements display much ingenuity; and his claim to the title of father of the present horse-hoeing husbandry of Great Britain seems indisputable. A translation of Tull's book was undertaken at one and the same time in France, by three different persons of consideration, without the privity of each other. Two of them afterwards put their papers into the hands of the third, M. du Hamel du Monceau of the Royal Academy of Sciences at Paris, who published a treatise on husbandry, on the principles of Mr Tull, a few years after. But Tull seems to have had very few followers in England for more than 30 years. The present method of drilling and horse-hoeing turnips was not introduced into Northumberland till about the year 1780;[3] and it was then borrowed from Scotland, the farmers of which had the merit of first adopting Tull's management in the culture of this root about 1760, and from whom it has since made its way, but slowly, into the southern parts of the island.

Tull's doctrines and practices being quite in advance of his own times, were, as is usual in such cases, vehemently opposed by his contemporaries. He was, in consequence, involved in frequent controversy, in conducting which he occasionally showed an asperity of temper which excites our regret, but which is not to be wondered at, when we consider the trials of patience which he encountered from the unreasonable opposition of the agricultural community to his improvements; the thwarting of his experiments by his own labourers, who, in their ignorant zeal against innovations, wilfully broke his machines, and disregarded his orders; and from acute and protracted bodily disease. The soundness of his views and practice, as regards turnip culture, came by and by to be acknowledged, and have ever since been generally adopted. But it is only now that his full merit begins to be understood. The Rev. Mr Smith, in his "Word in Season," has recalled attention to his peculiar system of wheat culture, in a way that has startled the whole community; while Professor Way, in his eloquent lectures recently delivered before the Royal Agricultural Society, has shown

Historical Summary.

that his science is true in the main, and even more strikingly ahead of his times than his practice.

Among the English writers of this period may be mentioned Bradley, Lawrence, Hales, Miller, Ellis, Smith, Hill, Hitt, Lisle, and Home. Most of their works went through several editions in a few years; at once a proof of the estimation in which they were held, and of the direction of the public mind towards investigating the principles and practice of agriculture.

Writers on Scottish husbandry. Donaldson.

Of the progress of the art in Scotland, till towards the end of the 17th century, we are almost entirely ignorant. The first work, written by Donaldson, was printed in 1697, under the title of *Husbandry Anatomized; or, an Inquiry into the Present Manner of Teiling and Manuring the Ground in Scotland.* It appears from this treatise, that the state of the art was not more advanced at that time in North Britain than it had been in England in the time of Fitzherbert. Farms were divided into infield and outfield; corn crops followed one another without the intervention of fallow, cultivated herbage, or turnips, though something is said about fallowing the outfield; inclosures were very rare; the tenantry had not begun to emerge from a state of great poverty and depression; and the wages of labour, compared with the price of corn, were much lower than at present; though that price, at least in ordinary years, must appear extremely moderate in our times. Leases for a term of years, however, were not uncommon; but the want of capital rendered it impossible for the tenantry to attempt any spirited improvements.

Donaldson first points out the common management of that period, which he shows to have been very unproductive; and afterwards recommends what he thinks would be a more profitable course. "Of the dale ground," he says, "that is, such lands as are partly hills and partly valleys, of which sorts may be comprehended the greatest part of arable ground in this kingdom, I shall suppose a farmer to have a lease or tack of three score acres, at three hundred merks of rent per annum (L.16. 13s. 4d. sterling). Perhaps some who are not acquainted with rural affairs may think this cheap; but those who are the possessors thereof think otherwise, and find difficulty enough to get the same paid, according to their present way of manuring thereof. But that I may proceed to the comparison, I shall show how commonly this farm-room is managed. It is commonly divided into two parts, viz. one-third croft, and two-thirds outfield, as it is termed. The croft is usually divided into three parts; to wit, one-third barley, which is always dunged that year barley is sown thereon; another third oats; and the last third peas. The outside field is divided into two parts, to wit, the one half oats, and the other half grass, two years successively. The product which may be supposed to be on each acre of croft, four bolls (three Winchester quarters), and that of the outfield, three ($2\frac{1}{4}$ quarters); the quota is seven score bolls, which we shall also reckon at five pounds (8s. 4d.) per boll, cheap year and dear year one with another. This, in all, is worth L.700 (L.58. 6s. 8d. sterling).

"Then let us see what profit he can make of his cattle. According to the division of his lands, there is 20 acres of grass, which cannot be expected to be very good, because it gets not leave to lie above two years, and therefore cannot be well swarded. However, usually, besides four horses, which are kept for ploughing the said land, ten or twelve nolt are also kept upon a farm-room of the above-mentioned bounds; but, in respect of the badness of the grass, as said is, little profit is had of them. Perhaps two or three stone of butter is the most that can be made of the milk of his kine the whole summer, and not above two heffers brought up each year. As to what profit may be made by bringing up young horses, I shall say nothing, supposing he keeps his stock good by those of his own upbringing. The whole product, then, of his cattle cannot be reckoned above fifty merks (L.2. 15s. 6d.). For, in respect his beasts are in a manner half-starved, they are generally small; so that scarce may a heffer be sold at above twelve pounds (L.1 sterling). The whole product of this farm-room, therefore, exceeds not the value of L.733 (L.61. 1s. 8d. sterling), or thereabout." The labourers employed on this farm were two men and one woman, besides a herd in summer, and other servants in harvest.

Donaldson then proceeds to point out a different mode of management, which he calculates to be more profitable; but no notice is taken of either clover or turnips as crops to be raised in his new course, though they are incidentally noticed in other parts of the work.

"I also recommend potatoes as a very profitable root for husbandmen and others that have numerous families. And because there is a peculiar way of planting this root, not commonly known in this country, I shall here show what way it is ordinarily planted or set. The ground must be dry; and so much the better it is if it have a good soard of grass. The beds or riggs are made about eight foot broad, good store of dung being laid upon your ground; horse or sheep dung is the proper manure for them. Throw each potatoe or sett (for they were sometimes cut into setts) into a knot of dung, and afterwards dig earth out of the furrows, and cover them all over, about some three or four inches deep; the furrows left between your riggs must be about two foot broad, and little less will they be in depth before your potatoes be covered. You need not plant this root in your garden; they are commonly set in the fields, and wildest of ground, for enriching of it." As to their consumption, they were sometimes "boiled and broken, and stirred with butter and new milk; also roasted, and eaten with butter; yea, some make bread of them, by mixing them with oat or barley meal; others parboil them, and bake them with apples, after the manner of tarts."

There is a good deal in this little treatise about sheep, and other branches of husbandry; and, if the writer was well informed, as in most instances he appears to have been, his account of prices, of wages, and generally of the practices of that period, is very interesting.

Lord Belhaven.

The next work on the husbandry of Scotland is, *The Countryman's Rudiments, or an advice to the Farmers in East Lothian, how to labour and improve their grounds;* said to have been written by Lord Belhaven about the time of the Union, and reprinted in 1723. In this we have a deplorable picture of the state of agriculture in what is now the most highly improved county in Scotland. His lordship begins with a very high encomium on his own performance. "I dare be bold to say, there was never such a good easy method of husbandry as this, so succinct, extensive, and methodical in all its parts, published before." And he bespeaks the favour of those to whom he addresses himself, by adding, "neither shall I affright you with hedging, ditching, marling, chalking, paring and burning, draining, watering, and such like, which are all very good improvements indeed, and very agreeable with the soil and situation of East Lothian; but I know ye cannot bear as yet a crowd of improvements, this being only intended to initiate you in the true method and principles of husbandry." The farm-rooms in East Lothian, as in other districts, were divided into infield and outfield. "The infield (where wheat is sown) is generally divided by the tenant into four divisions, or breaks, as they call them, viz. one

Historical Summary.

of wheat, one of barley, one of pease, and one of oats; so that the wheat is sowed after the pease, the barley after the wheat, and the oats after the barley. The outfield land is ordinarily made use of promiscuously for feeding of their cows, horse, sheep, and oxen; 'tis also dunged by their sheep, who lay in earthen folds; and sometimes, when they have much of it, they fauch or fallow a part of it yearly." Under this management the produce seems to have been three times the seed; and yet, says his lordship, "if in East Lothian they did not leave a higher stubble than in other places of the kingdom, their grounds would be in a much worse condition than at present they are, though bad enough."—"A good crop of corn makes a good stubble, and a good stubble is the equalest mucking that is." Among the advantages of inclosures, he observes, "you will gain much more labour from your servants, a great part of whose time was taken up in gathering thistles and other garbage for their horses to feed upon in their stables; and thereby the great trampling and pulling up, and other destruction of the corns, while they are yet tender, will be prevented." Potatoes and turnips are recommended to be sown in the yard (kitchen-garden). Clover does not seem to have been in use. Rents were paid in corn; and, for the largest farm, which he thinks should employ no more than two ploughs, the rent was about six chalders of victual "when the ground is very good, and four in that which is not so good. But I am most fully convinced they should take long leases or tacks, that they may not be straitened with time in the improvement of their rooms; and this is profitable both for master and tenant."

Society of Improvers.

Such was the state of the husbandry of Scotland in the early part of last century. The first attempts at improvement cannot be traced farther back than 1723, when a number of landholders formed themselves into a society, under the title of the *Society of Improvers in the Knowledge of Agriculture in Scotland*. The earl of Stair, one of their most active members, is said to have been the first who cultivated turnips in that country. The *Select Transactions* of this society were collected and published in 1743 by Mr Maxwell, who took a large part in its proceedings. It is evident from this book that the society had exerted itself in a very laudable manner, and apparently with considerable success, in introducing cultivated herbage and turnips, as well as in improving the former methods of culture. But there is reason to believe that the influence of the example of its numerous members did not extend to the common tenantry, who are always unwilling to adopt the practices of those who are placed in a higher rank, and supposed to cultivate land for pleasure rather than profit. Though this society, the earliest probably in the United Kingdom, soon counted upwards of 300 members, it existed little more than 20 years. Maxwell delivered lectures on agriculture for one or two sessions at Edinburgh, which, from the specimen he has left, ought to have been encouraged.

Maxwell.

In the introductory paper in Maxwell's collection, we are told, that "the practice of draining, inclosing, summer fallowing, sowing flax, hemp, rape, turnip and grass seeds, planting cabbages after, and potatoes with, the plough, in fields of great extent, is introduced; and that, according to the general opinion, more corn grows now yearly where it was never known to grow before, these twenty years last past, than perhaps a sixth of all that the kingdom was in use to produce at any time before."

Invention of a threshing-machine.

In this work we find the first notice of a threshing-machine; it was invented by Mr Michael Menzies, advocate, who obtained a patent for it. Upon a representation made to the society that it was to be seen working in several places, they appointed two of their number to inspect it; and in their report they say, that one man would be sufficient to manage a machine which would do the work of six. One of the machines was "moved by a great water-wheel and triddles," and another "by a little wheel of three feet diameter, moved by a small quantity of water." This machine the society recommended to all gentlemen and farmers.

The next work is by the same Mr Maxwell, printed in 1757, and entitled the *Practical Husbandman; being a collection of miscellaneous papers on Husbandry*, &c. In this book the greater part of the *Select Transactions* is re published, with a number of new papers, among which, an *Essay on the Husbandry of Scotland*, with a proposal for the improvement of it, is the most valuable. In this he lays it down as a rule, that it is bad husbandry to take two crops of grain successively, which marks a considerable progress in the knowledge of modern husbandry; though he adds, that in Scotland the best husbandmen after a fallow take a crop of wheat; after the wheat, peas; then barley, and then oats; and after that they fallow again. The want of inclosures was still a matter of complaint. The ground continued to be cropped so long as it produced two seeds; the best farmers were contented with four seeds, which was more than the general produce.

The first act of parliament for collecting tolls on the highway in Scotland was passed in 1750, for repairing the road from Dunglass bridge to Haddington. In ten years after, several acts followed for the counties of Edinburgh and Lanark, and for making the roads between Edinburgh and Glasgow. The benefit which agriculture has derived from good roads, it would not be easy to estimate. The want of them was one great cause of the slow progress of the art in former times.

The Revolution in 1688 was the epoch of that system of corn laws to which very great influence has been ascribed, both on the practice of agriculture and the general prosperity of the country. But for an account of these and later statutes on the subject, we must refer to the article Corn Laws.

The exportation of wool was prohibited in 1647, in 1660, and in 1688; and the prohibition strictly enforced by subsequent statutes. The effect of this on its price, and the state of the wool trade, from the earliest period to the middle of last century, are distinctly exhibited by the learned and laborious author of *Memoirs on Wool*, printed in 1747.

Progress from 1760 to 1792.

The gradual advance in the price of farm produce soon after the year 1760, occasioned by the increase of population, and of wealth derived from manufactures and commerce, gave a powerful stimulus to rural industry, augmented agricultural capital, and called forth a more skilful and enterprising race of farmers. The arable lands of the country, which, under the operation of the feudal system, has been split up into minute portions, cultivated by the tenants and their families without hind labour, began now to be consolidated into larger holdings, and let to those tenants who possessed most energy and substance. This enlargement of farms, and the letting of them under leases for a considerable term of years, continued (in Scotland) to be a marked feature in the agricultural progress of the country until the end of the century, and is to be regarded both as a cause and a consequence of that progress. The passing of more than 3000 inclosure bills during the reign of Geo. III., before which the whole number was but 244, shews how rapidly the cultivation of new land now proceeded. The disastrous American war for a time interfered with the national prosperity; but with the return of peace in 1783, the cultivation of the country made more rapid pro-

Historical Summary.

gress. The quarter of a century immediately following 1760, is memorable in our agricultural annals for the introduction of various important improvements.

Bakewell.

It was during this period that the genius of Bakewell produced such an extraordinary change in the character of our more important breeds of live stock; but especially by the perfecting of a new race of sheep—the well-known Leicesters—which have ever since proved such a boon to the country, and have added so much to its wealth. Bakewell's fame as a breeder was for a time enhanced by the improvement which he effected on the long-horned cattle, then the prevailing breed of the midland counties of England. These, however, were ere long rivalled, and have now been entirely superseded by the short-horn or Durham breed, which the brothers Colling obtained from the useful race of cattle that had long existed in the valley of the Tees, by applying to them the principle of breeding which Bakewell had already established.

Alternate Husbandry

A more rational system of cropping now began very generally to supersede the thriftless and barbarous practice of sowing successive crops of corn until the land was utterly exhausted, and then leaving it foul with weeds, to recover its power by an indefinite period of rest. Instead of this, green crops, such as turnips, clover, and ryegrass, began to be alternated with grain crops, and hence the name *alternate husbandry*, by which this improved system is generally known. The land was now also generally rendered clean and mellow by a summer fallow, before being sown with clover or grasses. Hitherto, the husbandry of England had been very superior in every respect to that of Scotland.

Stimulus given to agriculture in Scotland

Improvements now, however, made rapid progress in the latter. So early as 1764, Mr Dawson, at Frogden, in Roxburghshire, is said to have had 100 acres of drilled turnips on that farm in one year. A few years after this, the Messrs Culley—one of them a pupil of Bakewell—left their paternal property on the banks of the Tees, and settled on the Northumbrian side of the Tweed, bringing with them the valuable breeds of live stock and improved husbandry of their native district. The improvements introduced by these energetic and skilful farmers, spread rapidly and exerted a most beneficial influence upon the border counties. An act passed in 1770, which relaxed the rigour of strict entails, and afforded power to landlords to grant leases and otherwise improve their estates, had a beneficial effect on Scottish agriculture. From 1784 to 1795, improvements advanced with steady steps. This period was distinguished for the general adoption and industrious working out of ascertained improvements. Small's swing plough, and Meikle's thrashing-machine, although invented some years before this, were now perfected and brought into general use, to the great furtherance of agriculture. Two important additions were about this time made to the field crops, viz., the Swedish turnip and potato oat. The latter was accidentally discovered in 1788, and both soon came into general cultivation.

Merino Sheep.

In the same year, Merino sheep were introduced by his Majesty, George III., who was a zealous farmer. For a time, this breed attracted much attention, and sanguine expectations were entertained that it would prove of national importance. Its unfitness for the production of mutton, and increasing supplies of fine clothing wool from other countries, soon led to its total rejection.
