The scenery of Perthshire, as has been partially hinted, and as can scarcely fail to be inferred from the general contour of the country, is surprisingly varied, and almost uniformly rich; and, in its gross amount, if estimated by the number of first-rate pictures, or distinctive and individualized groupings which it contains, is probably quite equal to that of all the rest of gorgeously scenic Scotland. In close landscapes, especially, or in those which concentrate a thousand attractions within the winding of a glen, or the recess of a hill-range, it is peculiarly rich. In extensiveness of view, too, combined with surpassing beauty, and with all those properties which produce the most exquisite thrills of delight, what can surpass the visions from the hills of Moncrieff and Demyat? Scenery occurs of every extent, from the largest panorama which can be intelligently surveyed, to the smallest miniature which can be compressed into a nook,—of every class, from the sublimely wild or romantic, to the softly champaign and beautiful,—and of every style, from the sternest or most nakedly magnificent, to the fullest of amenities and lusciousness and ornament. Though all such striking combinations of marine and mountain landscape are awaiting, as form the grand attraction of the western Highlands, they are very abundantly, and somewhat in their own style, compensated by large lacustrine, and sometimes isletted sheets of water, screened by heights which, for alpine altitude and holdness of contour, and romance of dress, may challenge comparison with any in the west. Excepting only that of Loch-Lomond, nearly all the really fine lake-scenery of Scotland occurs in Perthshire; and without any exception whatever, the county's aggregate blendings of mountain and wood and water, into pictures of magnificence and romance, are quite unmatched, as to either extent or effect, in any other district of Britain. Who that gazes upon the type of all glorious things which bursts upon the eye at Killin, or at the debouch from the Trosachs, will ever again speak in superlatives of the brilliantly pretty Derwent-water, or the calmly beautiful Windermere, or the sullenly pleas-

ant Ulles-water, or any select sheet or point whatever of the Westmoreland lakes? Then, as to river scenery, where but in Perthshire shall be found such tumultuous assemblages of rocky eminences, all of whimsical and fantastic form, sbagged over with trees and shrubs, and grouped in the very confusion of boskiness and romance, with wondrous overshadowing hill-screens, as occurs at the Trosachs, at the head of Strathearn, and on the river Rannoch? or such closely approaching and sheer alpine descents, bringing down sheets of forest from the clouds, and standing with their bases on the margin of rapids and cataracts, as in the glens of the Tummel and the Tilt? or such uninterrupted series of distinctive landscape, ever varying, in all styles, now close and now expanding, playfully and almost whimsically various, in the disposal of a profusion of wood at first Highland, afterwards and long debateably Highland and Lowland, and eventually subsiding into the most luscious and ornate champaign, as occur along Strath-tay? or such tremendous defiles, such protuberances of hill almost in contact with hill, lifting a passenger into mid-air, sending down walls of rock tufted with scanty shrubs, to a dark chasm below, and suspending objects in dreadful giddiness over an impetuous rush and a deafening roar of a wild stream careering in darkness below, as occur at the passes of Killiecrankie, Leney, Spittal of Glenshee, Coheilig, and Aberfoil? But to go on specifying even classes of singular and arresting landscape, and especially classes of all that scenery which finely blends the grand and the beautiful, would be to write very far beyond our disposable limits. We shall, however, present the reader with the remarks of a most intelligent but anonymous tourist on the Highland scenery of this county:—"We have visited many parts of Scotland, but if we were to select a district to which we would give the name of the Scottish Arcadia, it would be the Highlands of Perthshire. We beg to remind our readers that Arcadia was not only a pastoral, but generally a rugged country, whose charms consisted in sweet wooded valleys, enclosed among lofty mountains and precipices; and such, precisely, is the country we allude to. From the one extremity of the journey to the other, the traveller will find an unbroken line of ornamental plantations, with the exception of 5 or 6 miles in the pass of Glen Ogle, which leads from Earn to Loch-Tay. The form and appearance of a Highland valley is pretty generally known. The bottom consists of an alluvial plain, a quarter or half-a-mile broad, with a surface which is almost a dead-level, and with its margin not melting insensibly into the slopes of the heights, but sharp and well-defined. Through this plain, the river flows sometimes along the side, rarely along the middle, but often winding across it in many a meander. Above the first or lowest bottom, at some places may be seen the remains of a second, a third, and even a fourth, in the form of terraces, with the same flat appearance, the one terrace rising sometimes six feet, and sometimes twenty, forty, or sixty, above the other. The lowest of these plains has the appearance of a meadow, and as the subsoil is entirely gravel, it is generally dry, and bears good crops of corn. The hills above partake of the same character, and in the very deep valleys these comprise the whole of the arable land. But when the declivities of the mountains are moderate, the alluvial soil, that is to say, the coating of gravel, sometimes extends 100 to 200 feet (of perpendicular height) above the river bottom, and the plough generally follows it to its upper extremity. When standing on one side of a valley, the eye can trace with ease the boundary of the alluvial soil on the other, both by the smoothness of its surface, and the crops of corn or hay which it bears.

Where the rock consists of clay-slate, mica-slate, or limestone, the natural grasses ascend two, three, or four hundred feet higher on the sides of the mountain; and heath, mixed with coarse and wiry grass, occupies all above to the summit, except where the bare rock is exposed. In mountains of granite and quartz rock, the heath descends a good deal lower. In the district we have been describing, the wood is variously distributed along the bottom and sides of the valley. In the bottom where the ground is valuable, it is seen in narrow belts, or running in slender lines like hedgerows, with here and there an ornamental clump covering a few acres. The hraes immediately above the bottom, when too steep for the plough, are sometimes entirely covered by copse-wood, and at other times by large timber, comprising most of the trees which succeed in the Lowlands. The Scotch fir occupies a higher situation, and is seen disputing the ground with the bardy heath, sometimes, we believe, at the height of 1,500 feet above the sea. In the bottom lands at Dunkeld and Taymouth, gigantic limes, elms, and heeches, are to be found, which we imagine would not yield the palm of heauty or grandeur to anything that England produces. Some of the subordinate hills rising 1,000 feet above the valleys, are entirely covered with pines. It is this abundance of wood, scattered over the bottoms and sides of the valleys, and often covering the smaller hills, which constitutes the great charm of the scenery. It takes away that appearance of bleakness and desolation which naked mountain masses present; and it adds richness, grace, and softness, to a landscape whose sole character otherwise would be that of stern grandeur. The lower and wooded part of the valley, with its glassy lake or murmuring stream, breathes the very essence of rural beauty; and a new charm is thrown over it by the rampart of rugged mountains which enclose it, and suggest at once ideas of shelter, seclusion, and sublimity. The distance from the top of the one enclosing ridge to that of the other, is seldom less than 2 miles, or more than 5 or 6; but in nearly all cases the hends and turns of the mountains also shut in the valley to the eye in the direction of its length, and thus give each section of it the appearance of being a sweet little pastoral world within itself. The passes where the mountains approach very near to one another, have a heauty and a grandeur quite peculiar. Dr. Clarke, we think, compares the pass of Killiecrankie to the celebrated Vale of Tempe."

The waters of Perthshire, hot lakes and streams, are so fully noticed in their respective alphabetical places, that here we need only name and classify them. The lakes of the first class as to size are, Tay, Earn, and Rannoch, in Breadalbane; Eriocht, on the boundary with Invernesshire; and Katrine, in Monteith. The second class lakes are Lydoch, on the boundary with Argyleshire; Garry, between Rannoch and Athole; Tummel, in Athole; Vennaboier, Monteith, and Lubnaig, in Monteith; and Voil, in Balquidder. Of numerous lakes of third class size, the most noticeable are Lyon and Dochart, in Breadalbane; Tilt, in Athole; Ard, Achray, and Chon, in Monteith; Doine, in Balquidder; Turret, in Strathearn; Freuchie, in Glenqueich; and Ordie, Lows, Butterstone, Cluny, and Drumellic, in Stornont.—The Forth, as we have seen, traces much of the southern boundary, and drains all the territory lying south of Strathearn. Its only noticeable tributaries on the side of Perthshire, are the Goody, the Teith, the Allan, the Devon, and the South Devon.—The Tay, as it drains all the country between the south screen of Strathearn and the northern boundary of the country, draws its waters in numerous and converging streams toward a great central chan-

nel. The Earn, its tributary along Strathearn, brings to it the Lednock, the Ruchil, the Turret, the Powaffray, the Machony, the Shaggy, the Ruthven, the May, and the Farg. The lake whence the main stream of the Tay issues, and that main stream itself, receive the Fillan, the Dochart, the Lochy, the Lyon, the Tummel, the Bran, the Isla, the Ordie, the Shochie, and the Almond; and of these the Lyon brings to it the Glenmore,—the Tummel brings the Gouir, the Eriocht, the Rannoch, the Garry,—and, through the last, the Edendon, the Endor, the Feachory, the Erachkie, the Bruar, the Turff, and the Tilt,—the Bran brings the Freuchie,—and the Isla brings the Shee, the Ardie, the Erochd, and the Lunan.—Of various mineral waters in the county, the most celebrated for medicinal properties are the wells of Piteathly.—In all the hilly districts, spring water is not only plenteous, but of the finest quality, descending from fountains in the face of rocks or mountains, in streams as pure as crystal; but in the level parts of Monteith, in the Carse of Gowrie, and in a few other localities of similar physical complexion, it is both scarce and of inferior quality. While, in consequence of the flatness of the districts, streams are rare, and springs are stunted, a dry season speedily carries off by evaporation all such water as exists, occasioning nauseous and pestiferous exhalations from putrid ditches; and a wet season converts the whole surface into a miry expanse, renders every foot-print of man or beast a receptacle of water, and, but for the relief of the surface by drainage, would speedily occasion an appalling rifeeness of agues, rheumatisms, and other intermittent diseases.—Though the county is strictly inland, it stretches sufficiently far along the navigable parts of the Tay and the Forth, to enable the inhabitants of Perth, of the Carse of Gowrie, and of the Culross and Tulliallan district, to conduct a considerable sea-ward trade.

The mineralogy of the county, though abundantly rich in the estimation of the scientific student, possesses comparatively small importance in the eye of the economist. The series of hill-chains along the south-east margin of the largely defined Strathmore, forms a barrier in the interior, or on the Highland side, of which coal has never been found. Every effort has been made to effect a discovery beyond this vast natural dyke, but hitherto without any probability of success. Coal has been wrought for ages at Culross, and it occurs in abundance in all the small districts south-east of the Ochils; and thence it is sent to the west end of Strathearn, to Stratballan, and to part of Monteith and Breadalbane, but to no other part of the county. The Carse of Gowrie, and the town and vicinity of Perth, are supplied with coal up the Tay, from the south coast of Fife, and from England; Strathmore Proper, and the eastern part of Strathearn, are supplied by inland carriage from the ports of Dundee and Perth; and nearly all the Highland districts are entirely dependent for fuel upon peats, and the periodical clearing of copses, enjoying from the two sources quite enough of material for all culinary and domestic purposes, but receiving it with such vicissitudes as often occasion great distress, and with such expenditure of labour as very extensively squanders away in processes upon the mosses and the thickets what is unabstractedly required for the working and culture of land.—Limestone was early discovered, and much used, as a building cement, in many parts of the county, especially toward the Highland districts, and came in the place of sea-shells; but, as a manure, it continued to be unknown till the last century, and did not come into general use till the century was far advanced. According to a law of adaptations which more or less potently is exhibited in every department and detail

of the Creator's works, limestone, where the soil is of an inferior staple, exists in abundance, and, where the soil is superior, lies remote, and can be procured only at a great expense. Inexhaustible rocks of it, uniformly of a grey colour, occur in Ramoch, Glenlyon, the southern part of Breadalbane, and the west end of Loch-Earn. A beautiful limestone, of the density of marble, of a blue ground, and finely variegated with streaks of white, occurs at Callander and at Aherfoil. Marble of superior quality, and much beauty, at once of a fine green, of a light grey, and of a pure white colour, is found likewise in Glentilt; and thence, as well as from the former places, has been exported to a great distance, as a material for fancy ornaments and architectural embellishments. Limestone quarries have been worked in Port-of-Menteith, in Glenartney, in Strathardle, and in Glenshee; but, in general, they were rendered uncomensating by the dearth of fuel. Extensive limeworks are maintained in Stormont from inexhaustible supplies of material on the south side of Loch-Cluny. Lime has also been burnt in Cargill and Longforgan; but in these, and other places, it is much limited by scarcity of fuel. Though limestone is unknown throughout Strathearn, and the country around Perth, the farmers purchase it at very high prices at the harbours, and carry it far into the interior.—Ironstone exists in abundance in the coal-field of the district south-east of the Ochils.—Large beds of fire-clay occur on the estate of Blair-castle, and other places in the vicinity of Culross. Roofing slates, some of a purple colour, some of an azure blue, and some of a muddy brown complexion along the cutters, are extensively quarried in the Highlands. Breccia, or plum-pudding stone,—consisting of a great variety of small and different-coloured stones, firmly cemented by a brown basis, and so compact as to form a very durable building material,—occurs in the vicinity of Drummond-castle, in Strathearn, around Callander in Monteith, and appears to extend south-west to Dumbartonshire. Sandstone, of very prime quality for building, has long and extensively been quarried, both for home use and for exportation, at Longannat on the Forth, and at Kingoodie in the Carse of Gowrie. Copper occurs among the southern Ochils. Lead has been extensively mined at Tyndrum; and it occurs also at Benedi, near Callander, and at Glenlyon in Breadalbane. Shell marl abounds in Stormont, and has been plentifully used; and in Strathearn, it was of later discovery, is less abundantly, and has been less highly appreciated. Boulders of the sulphate of barytes, each about the size of an egg, occur in the bed of the Shaggy in Strathearn.—The prevailing rocks in all the Highlands of Perthshire are mica-slate, gneiss, clay-slate, chlorite-slate, some varieties of hornblende-slate, with occasional beds of quartz, and some patches of granite. Mica-slate alone forms the entire mass of some of the monarch mountains, such as Ben-Lawers and Ben-Voirlich. A narrow tract of clay-slate may be traced north-eastward, along the lower edge of the Grampians, from boundary to boundary of the county, and, in one uninterrupted sweep, comes up from Gareloch in Dumbartonshire, and passes on to Stonehaven in Kincardineshire. A bed of limestone—furnishing some of those local supplies which we have noticed as quarried—extends from Leney, near Callander, north-eastward, quite to the extremity of the county, and passes on to Braemar. Greywacke, frequently running into sandstone, a coarse red conglomerate, and hornblende porphyry, composes most of those isolated hills which, in several localities, aggregate in crowds at the foot of the Grampians, and impart to the landscape an aspect of tangledness and picturesque confusion. A red sandstone, gene-

rally regarded as the old red, seems to lie beneath very nearly the whole of the large defined Strathmore, occupying all the Lowlands between the Grampians on the one side, and the Ochils and the Sidlaws on the other, and extending from the Forth to the boundary with Meigle. Sandstone, also pronounced to be the old red, but containing fossils, some curious specimens have engaged the attention of the most learned geologists, lies beneath the Carse of Gowrie. The geognostic features of the Ochils and the Sidlaws are noticed in the articles on these hill-ranges. Trap-dikes are comparatively unextensive, and where they do occur, consist principally of greenstone.

The soils of Perthshire are so endlessly varied, and run so much into one another, that they can with as much difficulty be perfectly separated as the blending colours of the rainbow; yet, for all the purposes of general description of their intrinsic nature, and of proximate calculation as to how far they severally prevail, they may be reduced to the six classes of clay, haugh, loam, till, sand or gravel, and moss or moor.—Along the Forth, from the bridge of Gartmore to the bridge of Allan, a tract of 18 miles, all the flat land is a deep stiff clay, of various degrees of fertility, the blue being generally more fertile than the yellow. In the Carse of Gowrie, all the flat land—which constitutes immensely the larger portion of the district—is a deep rich clay; and while the summits of the different swells, which run diagonally down the Carse toward the frith, are covered with a loam which is supposed to lie on iron ore, the skirts of the swells have a reddish-coloured soil, which possesses some affinity to clay, and which, owing to its having formerly been used for constructing the houses of the lower orders, bears the provincial name of mortar. From the bridge of Forteviot on the Earn, to the confluence of that river with the Tay, extends a tract of pale brown clay, modified by some fresh water deposits, and by the effects of prolonged tillage. At Gogar and Menstrie, on the Devon, occurs a small tract altogether similar to this in Strathearn. In some places about Cupar Grange, there is a strong stiff mould, which appears to be a deep till transmuted by georgical improvement, and which has more affinity to clay than to any other description of soil. On the banks of the Isla, particularly about Bendochy, clay prevails over several pendicles of land; hut, wherever it has been much overflowed by the river, it has received large deposits of fine sediment, and has been mixed up with it into a soil of great fertility. About the town of Perth, in Strathtay, below Dunkeld, and in various limited localities throughout the Lowlands of the county, are pendicles of rich soil more or less thoroughly argillaceous,—clay either in a comparatively native state, or partially transmuted by manures and by the deposits of streams.—Haugh soil, or the fructiferous crust of flat stream-washed lands, formed by the fresh water deposition, of the finest and most attenuated particles of earth, necessarily varies in quality with its deepness and with the nature of the materials of which it is composed. Much haugh land occurs on the Earn, wherever the river occasionally flows beyond its ordinary channel,—on the Povis,—on the Allan,—on the Goodie,—on the Devon below Dollar,—in various parts of Balquidder and Callander,—at Killin,—and in such portions of Glendochart, Glenfillan, Glenloch, and other districts, as are frequently overflowed by their streams. On the Isla, where it holds a westerly course, the haughs are uncommonly rich and extensive; on various parts of the long course of the Tay, especially for some miles before it receives the Isla, they are considerable; and at the mouth of the Erieh, and at the west end of Loch-Tummel, they are of very noticeable extent.—Loam, or soil of

any natural variety, which has been worked up by long tillage and rich manuring into a fertile vegetable mould, is, in most situations, so greatly interspersed with other soils, that notices of its occurrence, unless they would be insufferably minute, must be very general. A fine bank of loamy soil, of considerable length, extends from Rednock-house to Blair-Drummond. A long tract of loam, interspersed in different places with till or clay, extends behind the haughs of Strathearn; and a stripe of fine loam stretches behind the haughs of the Wester Pow from Methven to Innerpeffrey. The same class of soil occurs often, though not in continuous tracts, around Kier, Muthill, Auchterarder, Dunning, and many other places. Loamy soil prevails in all the district between Dunkeld and Perth, especially southward from Auchtergaven; and it occupies a large area, but is various in colour and quality throughout Strathmore Proper, or the vale of the Isla. A rich mould, loose and tender, which easily yields to the plough, covers nearly all the south-east face of the Sidlaws.—On the declivities of by far the greater part of the hills, a strong stiff till abounds. A poor kind of till covers all the north face of the Ochils, from Dunblane to Aherneath, a tract of at least 20 miles. A wet, unkindly till, skirts all the moor between the vales of the Teith and the Forth, and terminates only a few miles above the junction of the rivers; and it also covers a large extent of land on both sides of Menteith-loch. A cold, deep, spouty till soil occupies the north-west brow of the Sidlaws, and, in general, has a prevailing place on the northern declivities of hills. A red kind of till, quite superior in quality to most which occurs, and capable of high cultivation, is found around Auchterarder and Dunning, and covers the face of a bank above the public road from Methven to Ferntown, and carpets many considerable patches of sloping land which lie upon rocks, especially pulverized by the alternate action of frost and thaw, and of rain and wind. A pale-coloured till, more barren and more difficult to be drained than the red, and the most reluctant of all the Perthshire soils to reward the labours of the husbandman, spreads over the face of most of the schistose hills which are porous with springs, and not very abrupt in descent, and may be observed on both sides of the Allan, at Kinbuck, in the glen of Condie, in the upper grounds of Culross and Tulliallan, in the hollows among the Sidlaws, in Glenshee, Glenquiech, Glenalmond, and less or more on the lower declivities of hills in all the glens of the Highlands. An uncommonly rich tilly soil, consisting chiefly of calcareous matter, occurs in some parts of the Highlands, superincumbent on limestone rock, whence it derives its excellence.—Light free soil, easily pulverized, and consisting principally of sand or gravel, is the most frequent in Perthshire. This soil prevails in all the valleys north of Alyth, Blairgowrie, and Dunkeld, and west of Crieff, Callander, and Gartmore, except where, at the confluence of streams, or in parts subject to inundation, haughs have been formed, or on the sloping face of hills where the soil is spouty, or on the confines of moors, where the soil is a mixture of peat earth: and it occurs in considerable tracts at the head of the Allan, along the Machony, at the foot of the Ruthven and the May, near Muthill, round the moor of Orchill, on both sides of the Almond in Monzie, at Crieff, at Monivaird, from Doune to Callander, betwixt Cupar-Angus and Meikle, betwixt Seone and Cargill, north and west of Auchtergaven on one side of the Tay, and in the neighbourhood of Delvin on the other, on the ridge of high ground between the Pow and the Earn, and in parts of the parishes of Rattray, Blairgowrie, Muckart, and Glen-devon. Land with this soil is, for the most part,

altogether incapable of being constantly cropped with grain, but yields excellent green crops, and makes good returns in grass.—Mosses of various dimensions, of various depths, and of various degrees of firmness, corresponding to the time they have had for acquiring solidity, expand on some parts of almost every flat, and on not a few slopes of the higher hills. In the Highlands, they are so frequent that to enumerate them would be intolerably irksome. In the Lowlands, they may be viewed as concentrating all their interest in the famous Flanders Moss in the vale of the Forth, originally computed at 10,000 acres, but the scene of those novel, remarkable, and extensive georgical operations which have worked the localities of Blair-Drummond and Kincardine into supereminent fame among reclaimers of waste lands. Moorland, or a thin stratum of moss superincumbent on gravel or sand, occurs in the moor of Orchill, computed to be about 10,000 acres; the Sheriff Moor, computed to be about two-thirds of that extent; the moor of Dollary, stretching eastward to the vicinity of Perth; the moor of Methven; the moor of Thorn, south of Dunkeld; the moor of Alyth, very extensive; the moor around Dunsinnan, both broad and long; and some moor on the high grounds of Culross, and at Dalganross, Doune, and Callander. But a large aggregate area of these lands has been the scene of spirited improvements, and now continues moorland only in name.

The proprietors of Perthshire are of all the different ranks of landowners known in Britain, from the nobleman of vast possessions, to the peasant owner of a few roods. The commoners are distinguished above those of most counties by the extent of their property, the excellence of their education, the polish of their manners, the enlargedness of their views, and the warmth and enlightenment of their love of country. Those among them who are not engaged in the arduous duties of legislation, government, law, or military affairs, for the most part live upon their estates, and show a pleasure in embellishing their residence, ornamenting their grounds, and superintending or inciting operations of improvement by their tenants. Estates, as in most of Scotland, consist, as to their tenure, of superiorities or heronial rights, reserved under the name of feu-duties, or of the gross possession of landed property, which is either freehold, or held in feu from a superior. A great proportion of the county is freehold; yet many of the small proprietors hold in feu. The boundaries of estates in the Highlands are principally brooks, the water-shed of mountains, and strong stone-walls without mortar, provincially called dry stone-dykes; and, in the Lowlands, substantial walls of quarried stone, open ditches of such width as to prevent the depredations of cattle, and fences of hedge and ditch, with flanking lines or helts of plantation. The farm-houses, instead of the mean hovels of a former generation, without light, and air, and ventilation, are now very generally substantial and neat two-story houses, constructed of stone and lime, roofed with blue slate, and disposed in methods of commodiousness and comfort.—Exclusive of diminutive possessions called pendicles, which are small portions of land allotted by farmers to cottagers and servants, farms which may be regarded as arable, range, as to extent, between the extremes of 30 and 500 acres, and farms under a regular system of husbandry, average from 100 to 300 acres. In the Carse of Gowrie, the lower parts of Strathearn, the district in Strath-tay between Perth and Dunkeld, and Strathmore or the vale of the Isla, especially about Meikle, some of the farms comprehend 400, and a few even 500 Scottish acres, all arable land, and the richest in the county. Large tracts of grass, or pasture-ground,

on the skirts of moors and hills, are very frequently annexed to arable farms; and may be observed in a state of appendage to them on the confines of the Ochils and the Sidlaws, and in all the Highland valleys which intersect the Grampians. Even in the most forbidding situations, at the very head of the stupendously screened glens, some arable grounds, with the house and the garden of the cultivator in their centre, are very generally associated with a great extent of hill pasture. But in these regions, the farms are more frequently reckoned by miles than by acres; and distant wildly upland grazings which, a brief period ago, were temporarily visited only in the style of the ancient Scythians, are now disjoined from the farms to which they formerly belonged, and let as distinct and continuously occupied possessions. Leases in the lowlands, as in most other agricultural districts of Scotland, are generally for 19 years, though a few are for 36 years; and in the highlands they extend, for the most part, to 9, 19, and 21 years, and, in some instances, have been granted for one life, and 19 years after its expiry.—In a country intersected with so many mountains, a great proportion of the surface must remain for ever unenclosed; yet all the arable and the green grounds in the Lowlands are, with some trivial exceptions, substantially, and in many instances beautifully fenced, and a large proportion of the green grounds, as well as nearly all the arable land, in the Highlands, is enclosed. Stone-walls without mortar, or what are called double dykes, prevail where quarries are convenient, or where stones are found of sufficient size and quantity in the fields, or where the exposed situation and the sterility of the soil render the growth of thorns precarious. Hedge and ditch prevail where the land requires draining, and where the soil is of a good quality for rearing the quicks. Besides the hedges of common hawthorn, which are general and thriving, and give much of the county a frilled and lively appearance, some hedges are made of larch trees planted diagonally, or in a zigzag manner, along the face of ditches; and others called indifferently Surrey-fences and snap-dykes, consist of thorns defended, not by stakes and rafters, but by single stone walls of about 2½ feet in height, constructed along the top of the ditches. At Glendevon, about Blaigowrie, at Peter, and in a few other places where the ground is high, and there are suitable stones, the fences are Galloway dykes. In the Carse of Gowrie, and in most of the flat land in other parts of the county, where the cultivation of grain is the principal, almost the sole object of the farmer, open drains are a succedaneum for both hedge and wall, and serve the double purpose of fencing and of draining. Rows of trees accompany many of the stone-walls and the hedges, and impart much warmth of tint and embellishment of aspect to the general landscape. Where the ground is of little value, and the object sought is shelter, these belts of wood are in many cases 40, and in some 120 feet broad, and consist almost wholly of common firs; but where ornament alone or chiefly is studied, they are often narrower, and have generally an intermixture of various kinds of trees.—In the lower parts of the county, where much of the ground has a gradual slope, or is nearly in the plane of the horizon, and also in the bottom of some valleys of the Highlands, tillage is well understood, and is executed with masterly skill. In the hleaker and less skilfully managed districts, land intended for barley either is virtually fallowed by being cropped with potatoes,—a species of produce for which the soil is admirably adapted,—or it is ploughed before winter, or early in spring, to prepare it for the seed-furrow in May. In the more fertile districts, where soil and climate are calculated for raising various

kinds of grain, and where the farmers fully understand their business, and have stock to enable them to make the most of their land, either a clean summer-fallow, or at least a fallow crop, consisting almost invariably of turnips, is introduced to every rotation. On strong soils, the fallow is a preparation for wheat; and on light land, it is succeeded by barley with grass seeds. In most of the light and gravelly districts of Strathearn and Strathallan, the farmers practise a winter fallow by a process, when winter commences, of what they call 'ribbing' their land, or of alternately turning up and leaving a furrow in such a way that the soil brought up is laid exactly along the top of the unstirred line. Closely similar, or nearly identical rotations of crops, are practised by intelligent and substantial farmers on soils of the same nature, and in kindred climates, shelters and exposures; but the generic soils, and the grand modifying circumstances being very various, not fewer than about eleven regular systems of regular rotation more or less extensively prevail,—one of them of eight years, and including twice wheat, once harley, once oats, and once pulse,—another of eight years, and including once wheat, once barley, and once oats,—two of seven years, and including once harley and once oats,—one of six years, the richest and the most extensive, including once each of wheat, harley, oats, pulse, and hay,—three of six years, severally including, but in various ways, once harley and once oats,—two of five years, one of which includes wheat, barley, oats, and pulse, and the other only harley and oats,—and one of four years, which includes once barley and once oats. Yet some of the farmers, especially in the hleaker districts, have no regular system or fixed rotation; and in a few instances, they display but a transition state of advance from the barbarous practices of unenlightened times.

Horses have always been used in draught in Perthshire, where oxen have never been wrought in the ordinary practice of farmers. Formerly four horses a-breast was the plough-team of the Highlanders; and, in some parts, are still in use, though nearly superseded by that of two horses with reins, now the almost general plough-team of the northern provinces; but the old breed of Highland horses are found too light for this purpose. Of late years, oxen have been tried both for the plough and cart; but the slowness of their motion will greatly prevent their general introduction, especially among practical farmers. What may be properly termed the true Highland horse, is somewhat below the middle stature, viz., about twelve or thirteen hands high, the back generally hollow, and the sides flat, but mostly wide behind; the chest deep, the bosom broad, and the legs generally good; the prevailing colour grey, changing early to white, with a long shaggy mane, and thick hushy tail. These animals travel with steadiness and endurance, and for roads over rugged or rotten surfaces, it would perhaps be difficult to introduce a better breed.—The great objection which modern sheep-farmers have to horses on the hills, has checked the breeding of this useful species. The number of horses still kept, however, may be considered as one of its greatest evils, and must remain such while the present method of supplying fuel continues. Perthshire is destitute of coal; wood and peats constitute the principal articles for fuel; and, in many places, every villager and every tradesman is under the necessity of keeping a horse, to bring down his peats; and even the farmers are obliged to keep an extra number for the same purpose. The native breed of Highland cattle—a breed which has been common to the country beyond memory or tradition—are so well known, as not to require description. They are small compared to the Lowland

and English breeds. For fattening upon turnip, they rank among the first breeds of the island, but are by no means profitable for the dairy. Several attempts have been made to cross this valuable breed with a larger, in order to improve the species, but without success.

The old Highland sheep were of a race almost as different from those of the southern counties, as goats or deer are from that primitive breed whose fur consisted of a sort of down, overtopped by long, straight, rugged hair, somewhat like the coat of the beaver, and other furred animals, widely different from the wool of European sheep in general. There is another characteristic difference, which marks them still more strongly,—the tail, which in all the varieties of woolled sheep is long, and covered with wool, resembling that of the rest of the body, is, in this species, short, slender, tapering, and thinly covered with strong, silvery hairs, and not exceeding in size that of the deer or goat. The face, too, is covered with sleek hairs, as that of the deer, and the eyes are prominent. In every part of the central Highlands vestiges of this breed are still to be seen. They are most numerous on the southern banks of Strath-Tay, and between that and Strath-Bran. In the northern Highlands, on the banks of Loch-Ness, they are still to be found nearly pure, and perhaps without any mixture of extraneous blood. They are small, remarkably tame, and apparently of a tender, delicate form, as if housed during the night, a treatment which was common to this ancient breed. The flesh of these animals is deliciously sweet: vast numbers of hind-quarters are smoked and dried for hams, and brought down to Perth, Crieff, and Dunkeld, in summer, for sale. But the animal under notice has, in a great measure, been supplanted by the common black-faced sheep from Tweeddale. For the sake of the wool, the white-faced breed from the Cheviot hills have been tried, but not extensively. The asperity of the surface, and the rigours of the northern climate, especially the moisture, seem but ill suited for their southern constitutions. They soon begin to get lame in the feet, and, being unable to travel for pasture, in a short time pine away.

The flesh of swine is not generally eaten by the native Highlander, although their ancient prejudices are fast wearing out. Considerable droves are sometimes to be seen in summer, travelling to the Lowlands, for the more southerly markets. Goats were formerly kept in great numbers, but now a few only for whey in the summer season, as an alternative to draw company to the 'goats' whey quarters.' These are now almost entirely deserted, for the more fashionable resorts of watering-places, especially for the justly-famed wells of Pitcaithly, in the neighbourhood of Perth, and those lately discovered in the vicinity of Dunblane. Geese and ducks are not reared by the common Highland farmers: a few dunghill fowls constitute their whole stock of winged animals. A vast quantity of eggs are eaten by the common peasantry, and these are placed in rows upon the hearth among the peat-ashes to be roasted. Grates are not in use among them. The native Highlander has no relish for garden vegetables, except the onion. A peel-and-eat potato, with a raw onion, is to him a luxury.

Horticulture has made rapid and great progress in Perthshire, and renders many a spot luxurious in the delights of orchard and garden. Upwards of twenty orchards—most of them extensive—occur in the Carse of Gowrie, and send off supplies of all the various kinds of apples and pears to the neighbouring towns, and to Montrose and Aberdeen, and the whole north-east of Scotland. The gardens of the same district are not only of large aggregate extent, but singularly

rich and luscious; and, in addition to their gorgeous and opulent produce in the open air, they teem in their peach-houses and their vineries, with peaches, neectarines, apricots, walnuts, almonds, and figs. On the hanging plain at the foot of the Ochils, from Bridge-of-Allan to Dollar, along the whole of the north side of Strathearn from Comrie to the Tay, in tracts on the north bank of the Isla in Strathmore, and in tracts in Monteith and in the district between Perth and Dunkeld, the ingenuity of man has seconded the benignity of nature, in extracting from numerous pendicles of soil the endless rich and varied produce of fruit and flower. Even in the valleys of the Highlands, though the larger fruits are rare, stone-fruits abound, and the fruits which grow on shrubs spring up in a thousand places, in perfection. The cream-coloured cherry of Advorlich, and the black gean or dwarf cherry of Castle-Menzies, are highly esteemed for their beauty and relish; and the gooseberries and currants which, even fifty years ago, grew at Lawers and Kippenross, were remarkable instances, as to at once their variety, their size, and their flavour, of what charming results are deduced from persevering and skilful industry.—Woods at one time covered the greater part of Perthshire; but, during the barbarous policy of the feudal times, they were banished into steep declivities of glens, or among rocks and rough stones, or into whatever other positions were deemed inaccessible to cultivation. The common people imagined the growth of timber to be an obstacle to abundance of food, and did not pause in their devastations till they totally divested the low grounds of cover; and the ancient barons, more eager for the support of numerous tribes of warriors than for the improvement of their property, willingly consented to the general desolation. About the beginning of last century, other views began to be adopted,—such as saw the growth of timber to be as conducive to profit as to embellishment, and as consistent with the progress of population as with the improvement of the taste. From about the year 1730 to 1735, the possessors of various states saved what remained of ancient woods, and began to make plantations on the most convenient or available lands. During the last 70 years, plantations have rapidly increased, both in number and in extent, and, in a few instances, have suddenly spread away athwart a territory in a sea of forest. In Stormont, in Athole, in Breadalbane, in Strathearn, in the Carse of Gowrie, in Strathallan, in Monteith, in the vicinity of Culross, almost in every corner of the county, plantations, consisting of varieties of forest-trees adapted to the several soils, wave in far-spreading umbrageousness on the landscape, and do honour to the spirit and judgment of the planters. While the *pinus rubra*, or Scotch fir, is the most common pine of these woods, ash, elm, plane, beech, oak, laburnum, and various other kinds, are so intermixed with it, and with the larch, as to diversify the general aspect, exhibit endless tints and shadings of the prevailing green, and relieve the eye from the dull sameness which invariably tires or disgusts. The oak prevails in the valleys of the Grampians, where the climate is genial, and the soil light and dry; the ash grows spontaneously by the side of every stream or lake; the alder delights in swamps and spouty ground; and the hirsch climbs boldly to the brow of every hill. Among the various noblemen and gentlemen who have added largely to this splendid and always prominent element of scenic adorning, the late Duke of Athole, whose accession occurred in 1774, holds much the most distinguished place. That nobleman, after he became Duke, planted the enormous amount of 15,473 English acres of wood, or somewhere about 27,000,000 of trees. A fraction more than one-half

of all his plantations were larches; about 1,000 acres were oak; and the rest were principally Scottish fir, spruce fir, and birch. Only about 1,000 acres of wood existed on the Duke's lands when he commenced his magnificent forest operations.

The aggregate extent of meadows, pastures, moors, and wastes in the county, is necessarily very great; and it possesses, in many views, an interest of its own, as the scene and the sustenance of a vast amount of animal life. Meadows are most frequent at the upper ends of lakes, where the principal lacustrine feeder has for ages been bringing down soil and other loose materials, encroaching annually on the lake's dimensions, and gradually forming additions to the solid land; and they occur also with frequency, though seldom to a large extent, at the confluence of streams, at low and level parts of the course of brooks, and wherever obstructions of any kind temporarily fling running waters into the expansion of lakes, and render the land which they occasionally cover too wet and precarious for tillage. But these flat expanses of green land, which might easily be rendered rich pasture, or reclaimed to the uses of the plough, are, in general, very much neglected; they are, over a great part of the year, allowed to lie constantly under water; they, in many instances, produce little or nothing except rushes, flags, willows, and a grass so coarse as to be unpalatable for cattle, and unfit for hay; and while, in some parts of the country, they are drained, cleaned, and regularly shaven, in others they are altogether and recklessly abandoned. Pastures on comparatively elevated situations are every where to be met with in the Highlands; and they consist partly of land which has been exhausted by scouring crops till it can yield no more to the gripe of avarice, and partly of unreclaimed green ground, in situations inaccessible to the plough. But, in addition to these, there lie in pasture around the houses of wealthy proprietors many thousand acres of the very best arable ground, which have not carried an ear of corn for many years, and may for ages to come remain unripped by the plough; their owners choosing to sit alone in sullen and solitary magnificence, surrounded with sheep instead of men.—The black cattle which graze on the pastures are singularly various in their breeds. The cows proper to the county, and still, perhaps, more numerous than those of any other variety, are of a decidedly inferior breed, neither so well haired and shaped as the cows of the northern parts of Argyle, nor so lactiferous as those of the several counties and districts in the south. The Angus and the Fife breeds prevail in the Carse of Gowrie, and in the vicinity of Perth and the Bridge-of-Earn; the Argyleshire in Rannoch, Glenlyon, Glenloch, Strathfillan, and some other places in the west; the Lanarkshire, or those from the lower ward of that county, much akin to the Galloways, in Monteith; and the Ayrshire and the Galloway diffusively in particular parishes or estates. Breeds of black cattle have likewise been introduced from Devonshire, from Lancashire, from Guernsey, from the East Indies, and from other places; and they have been so heterogeneously blended with one another, and with previously introduced breeds, that to any ordinary eye either confusion prevails as to distinctiveness of character or prevalence of variety. Yet, chiefly from the stimulating surveillance and encouragement of the Highland Society, great improvements in the aggregate excellence of their properties have been made.—Besides the sheep-walks on the Sidlaw hills, 5 parishes among the Oehills, and 22 of the averagely vast parishes along the lower declivities, and in the bosom of the Grampians, are, to quite a characterizing extent, occupied by sheep stock; and they are

estimated, in round numbers, to maintain 222,000 sheep. Great and skilful attention has been given to the improving of the breeds. The ancient stock were the whitefaced, few in number compared to the present flocks; and in the Highlands, they were, every night during winter and spring, housed in cots. About the year 1770, the blackfaced breed were introduced from the south; and even before the end of the century, they increased to a surprising amount in number, and became exhibited in kinds and crosses too numerous to be unperplexing to almost any eye but that of a practised sheep-farmer.—Goats, once so numerous and so much in favour, were necessarily sacrificed to improvements in the prime departments of sheep husbandry and of planting. Hogs are more numerous reared in Athole, Strathardle, Glenshee, and Glenisla, than in all the other districts of the county combined.—Rabbits occur in warrens on four estates, and in a wild condition in the vicinity of Callander, and in various other parts of the county.—Red-deer occur in vast numbers in the forest of Athole, and limitedly in that of Glenartney; fallow-deer occur only at Blair-Athole and at Taymouth; and the roe-huck and doe are in many of the upland parts of the county,—in almost all of them which are not divested of wood.—Common poultry are at every door, from the hen-house of the lord of the manor down to the meanest cottage; and turkeys and geese are reared in great numbers, and in great perfection, in almost every district. Dove-cots are rare in the Highlands, but are frequent about Cupar and Perth, in the Carse of Gowrie, and in the lower parts of Strathearn and Monteith.—Bees are an object of great attention and profit in the sheltered parts of the hilly country.—Game of nearly every description abounds on the moors and the mountains, and among the forests.

Perthshire cannot be viewed as distinctively, or as in any other, than a very limited sense, a manufacturing and commercial county. Though the linen-manufacture has long been established, it has never attained either steadiness or eminence, and it exists rather in humble subordination to that of Forfarshire than as an independent trade. The cotton-manufacture sprang up toward the close of last century, and made promise of achieving wonders; but it has made little progress, and occasionally all but stood still; and now it wears as sickly and feeble an aspect as can well comport with the fact of its holding several factories, and some two or three thousands of looms in employment. The principal mills are at Doune on the Teith, Stanley on the Tay, and Cromwell-park on the Almond; and the chief seats of the weaving population—employed for the most part by the manufacturers of Glasgow—are Auchterarder, Crieff, Dunblane, and other places in the south-east quadrant of the county. Paper-mills were established chiefly toward the end of last century, in six or seven places; but they have in some instances been abandoned, and in others only partially successful. Extensive bleachfields have long been maintained, and are prosperously conducted in Strathmore, and in several villages within 4 or 5 miles of Perth. Several flax spinning mills, one or two small fulling mills, seven or eight linseed oil mills, and a limited manufactory of shawls, blankets, and other woollen fabrics, exist in various localities, principally in Strathearn and Strathallan. The manufacture of leather, though not a large trade, is long established and comparatively steady.—The extensive pastures on the valleys and mountains of the Grampians send down for sale, in the spring and fall of every year, immense droves of black cattle; and they send also from their flocks, to the shambles of the southern counties, and particularly of the districts along the

Forth and the Clyde, numbers of lambs in summer, and of sheep in autumn, which almost baffle calculation. Great quantities of grain are exported from the Carse of Gowrie, the vale of the Isla, Strathearn, Monteith, Strathallan, and the district of Tulliallan and Culross. Large supplies of the prime freestone of the Carse are shipped at the small ports of Kingoodie and Pov of Errol; and of freestone and coals from the ports of Culross and Kincardine. Other exports are principally slates, timber, potatoes, and leather. The chief imports are coals, lime, salt, bone-dust, Baltic produce, clover-seed, linseed, cheese, hides, and bark. Excepting what belongs to the small harbours on the coast of the Carse of Gowrie, nearly the whole coastwise and seaward commerce of the county passes through the ports of Perth and Kincardine. Every town, and almost every village, have their weekly market, for the local convenience of the inhabitants, or for the purposes of general traffic,—Perth on Friday; Cupar, Methven, Dunblane, Crieff, and Callander, on Thursday; Meikle and Blairgowrie on Wednesday; Dunkeld and Auchterarder on Saturday: and other places on the days most suitable to their respective neighbourhoods. Six or eight annual fairs, chiefly for horses and cattle, are held at Perth; nearly as many, for the same objects, at Cupar; four for cattle, and two for sheep, at Alyth; two for cattle at Blairgowrie, and the same at Meikle; three for cattle and swine at Kinrossie; one or more for general traffic in almost every village of Strathearn, Breadalbane, Strathallan, and Monteith; and some for disposing of linen and woollen yarn, and other commodities, in different parts of Athole. But the most famous marts of the whole county are fairs at Doune in autumn and in the beginning of winter, for the sale of black cattle, and a great cattle-market on the 15th of May at Callander.—The Lowland division of the county is so thoroughly and even intricately ramified with excellent roads, that any attempt to delineate them would only confuse and perplex; and the Highland division is traversed by military or parliamentary roads, up Glenshee, Strathardle, Glentilt, Glenbruar, Glen-garry, Rannoch, Glenlyon, Glendochart, Glenartney, Glenogle, and the north, south, and centre of Monteith.—The county has no canal; and only partially, and in its district of Strathmore, has it as yet the benefit of one railway,—that from Dundee to Newtyle and Cupar-Angus.—A line of railway has, however, been projected between Stirling and Perth, and has been reported upon as follows by Mr. Erington: The line crosses the Forth a short distance below the new bridge at Stirling; running along the flat ground by Cornstown, and crossing the Allan water near Keir-hleachfield, it enters the valley of the Allan immediately above the village. In following the course of the valley, we cross the river three times between the Bridge-of-Allan and Kippenross-house. Continuing from this point on the east bank of the river, it crosses the turnpike road through Dunblane close to the inn, passes between the cathedral and the river, and follows the course of the Allan to Kinbuck. From Kinbuck the valley opens out, and presents an even surface, as far as Greenloaning, where we cross the turnpike road to Perth by Crieff. The line then passes by the farm of Buttergask to the flat ground at Blackford, and still keeping the course of the Allan, it reaches the summit near Gleneagles. From this summit the water flows on one side into the Allan, and from the other into the Ruthven. We accordingly follow the course of the Ruthven through Kincardine glen, and as far as Smiddyhaugh. The line then passes by Strathie, Masterfield, and Inverdunning, and crosses over the road from Dunning to Perth near Forteviot-bridge.

Following the low ground below Condie and Rossie, we cross the Earn near Dumbarney, and running parallel to the course of the great north road over Moncrieff-hill, the section terminates on the South Inch in front of Marshall-place. The total length of the railway is 33 miles 58 chains. The bridges over the Forth and the Earn, and the tunnel through Moncrieff-hill, although the heaviest works on the line, are not formidable; and for 22 miles out of 34, there is little to do beyond the mere forming of the road. The estimated cost is £450,000, including land; but at all events, £500,000 should cover every expense. From the efforts now making, and the favourable report of the Commissioners, it can hardly be doubted that one unbroken line of railway communication will ultimately be formed, joining London to Perth, and making, at the utmost, a journey of 24 hours. The following table, reckoning from Stirling, shows the gradients which may be expected:

Length.		Gradient.
2 Miles 30 Chains,		1 in 1254
5 — 29 —		1 in 100
4 — 35 —		1 in 650
2 — 61 —		1 in 215
2 — 21 —		1 in 853
5 — 16 —		1 in 100
3 — 56 —		1 in 232
5 — 28 —		Level.
2 — 22 —		1 in 500

Perthshire contains only two royal burghs,—Perth, the county-town, and Culross, a small decayed town on the frith of Forth. But it possesses upwards of 70 towns and considerable villages, including several burghs-of-barony. Not a few have greatly increased during the last 60 years, not only in size, but in the neatness and the taste of their buildings. Five or six are of quite recent origin; several, such as Callander, Comrie, Crieff, Longforgan, Muthil, Methven, and others, were almost entirely new at the close of last century; and five were built at one time, by the trustees of Government for managing the estates forfeited to the Crown in 1746, and were set apart for the use of such soldiers as had merited attention by their services in war. The principal towns and villages are Doune, Norriestoun, Thornhill, Callander, Kilmahog, and Gartmore, in Monteith; Blackford, Ardoch, Dunblane, Bridge-of-Allan, and Blair-Logie, in Strathallan; Comrie, St. Fillan, Muthil, Crieff, Monzie, Gilmerton, Fowles, Auchterarder, Smithyhaugh, Gask, Dunning, For-gandenny, Bridge-of-Earn, and Abernethy, in Strathearn; Kincardine, Culross, and Tulliallan, in the detached district on the Forth; Muckhart, on the Devon; Longforgan, Kingoodie, Inchtute, Errol, and Inchrya, in the Carse of Gowrie; Perth, Bridge-end, Tulloch, Scone, Pitcairn, Luncarty, Stanley, Methven, Almondbank, Balbeggie, Auchtergaven, Cairneyhill, Strelitz, Mickleour, Caputh, and Dunkeld, in Perth Proper and Lower Strathay; Meikle, Cupar-Angus, Alyth, Rattray, and Blairgowrie, in Strathmore; Clunie and Letbendy, in Stormont; Aberfeldy, Weem, Logierait, and Kenmore, in Upper Strathay; Pitlochrie, Blair-Athole, and Moulin, in Athole; and Killin and Tyndrum, in Breadalbane. The mansions of Perthshire which stand amid a profusion of delights, and luxuriate in landscapes either close or extensive of thrilling attractions, are so many, and at the same time so various, that they might be the subject of a large and very interesting descriptive volume; but are too numerous to bear enumeration in our pages.

The antiquities of even the town of Perth are numerous and interesting, and will be found noticed in detail in their proper place; and those of the county are so many and far-spread and various, as to offer ample scope for the peerings of science and the researches of curiosity. We cannot attempt a com-

plete list; and, even in naming the most interesting or prominent, must refer to the articles on their respective localities, for notices of their condition. Of ecclesiastical antiquities, the chief are the abbey of Culross; the church and the abbey of Scone, the scene of the middle-age coronations; the abbey of Inchaffray; the cathedral of Dunblane: the monastery, originally the Culdee establishment, of Abernethy; the abbey and cathedral of Dunkeld; the priory of Strathfillan; the cell or priory of the Isle of Loch-Tay, belonging to the abbey of Scone; the nunnery of Elcho in Rhynd; the abbey of Cupar-Angus; the collegiate church of Methven; the collegiate church of Tullybardine; and the monastery of Inchmahome. Of civil antiquities, the chief are Bertha, the ancient Perth; the Boot-hill, and the extinct royal palace of Scone; the cylindrical tower of Abernethy; Huntingtower-castle, formerly Ruthven-castle, in Tibhermuir; the Castle of Macheth, on Dunsinnan hill; Castle-Campbell, above the village of Dollar; Elcho-castle, in the parish of Rhynd; Doune-castle, in the vicinity of the cognominal village; the fortress of Loch-Tummel; some curious objects preserved in the Castle of Kinfauns; various large Roman camps, and, among them, the celebrated one at Ardoch, the largest in Scotland; three rocking-stones, respectively in the parishes of Dron, Kirkmichael, and Abernethy; vestiges of watch-towers in many places in Athole, Breadalbane, Glenlyon, and Monteith; a profusion of Druidical circles, and among them, a remarkable cluster in Kirkmichael; some curious monumental reminiscences in Meikle churchyard, of those puzzles to the grave historian, Vanora, the British Helena, and King Arthur, the subject of a maze of fables; and various interesting, but very doubtful, memorials of Fingal and his heroes, in Glenalmond, and other parts of Monzie. The most celebrated battle-fields in Perthshire,—those objects which occupy so graphically a medium place between antiquities and history,—are the fields of Luncarty, in the vicinity of the cognominal village, and the field of the notable battle of the Grampians at Ardoch, or in Stormont, or in Glenshee, or nobody knows where. The secondary and the minor antiquities, consisting of baronial halls and towers, moats, British hill-forts, Roman roads, the battle-fields of clans, cairns, coins, and the *mélée* memorials of Damii, Horestii, Alhani, Caledonians, Picts, Scots, Saxons, Highland clansmen, and haronial serfs, would, were they enumerated, compose a list as long and churlish as half of the most crabbed names in the county's topographical nomenclature strung together in capricious random.

Perthshire abounds in associations and institutions both of a light and of a useful character. A large association exists for the protection of game, copsés, and plantations. Another exists for the purposes of a county hunt, and of races at Perth. Similar associations, under the name of clubs, take their designations from Strathearn and from Doune. Associations for promoting improvements in matters connected with agriculture and kindred pursuits, are laudably prominent, and not a little active. The Perthshire Farming society meets four times a-year at Perth. The Athole and Weem Agricultural club meets annually in October, and wields an influence over nearly the whole Highlands of the county. The Carse of Gowrie Agricultural society meets in spring and in autumn. The Dunblane Farming society meets in July on the subject of the state of farms and crops; meets again in November on the subject of turnips, stack-yards, and kindred matters; and holds a ploughing-match, and distributes prizes, in spring. The Strathmore Agricultural society holds large, respectable, and influential meetings at Cupar-

Angus. The Burrel Agricultural Ploughmen society has reference to the work of tillage. The Strathmore Horticultural society meets in May, July, and August, at Cupar-Angus. Another Horticultural society holds its meetings in Perth. The St. Fillan's Highland society holds an annual prize exhibition toward the end of August, in the village of St. Fillans, for athletic exercises. The Athole Gathering, or Highland meetings, were associated in 1824, to revive and promote a taste for tartan and linen fabrics, and for the ancient dress and athletic games and exercises of the Highlanders. The Literary and Antiquarian society of Perth was instituted in 1784, and remodelled in 1787, to promote historical and archaeological investigations, and matters of chorography, natural history, literature, and the fine arts. Among religious institutions are the Perthshire Bible society, the New Perthshire Bible society, the Perthshire Missionary society, the Perthshire Religious Tract society, and the Perthshire Gaelic society. Some of the numerous institutions, also, which take their designation from the town of Perth, and move round it as their centre of influence, have an intimate connexion with much or all of the county.

Perthshire, previous to the Reformation, and during the periods of the Stewart episcopacy, contained within its ample limits the seats and most of the territory of the two bishoprics of Dunkeld and Dunblane, and also contributed a quota of its parishes to the archdiocese of St. Andrews. Its ecclesiastical distribution, subsequently to the final establishment of Presbyterianism, has been variable, and, to a certain extent, whimsical. Changes have occurred as to both its parishes and its presbyteries, more numerous, perhaps, than in any other county of Scotland, and, in several instances, of such a nature as to render any attempt at an interesting history of them quite futile. A little after the commencement of the present century, it had 76 parishes, 18 of which were in the Highlands, and 58 in the Lowlands. The Highland parishes were all then of great extent, each comprehending, on the average, nearly seven times as much area as a medium-sized Lowland parish; and even yet, when reduced by the erection of a large aggregate extent of them into *quoad sacra* parishes, they are, for the most part, of such dimensions as to be quite unmanageable by efficient pastoral superintendence and care. In 1839, the ecclesiastical distribution consisted of 77 entire *quoad civilia* parishes, 13 entire *quoad sacra* parishes, 2 *quoad civilia* parishes, partly in Perthshire and partly in Stirlingshire, 1 entire *quoad civilia* parish annexed to a parish in Forfarshire; and 2 chapelries, possessing all the properties of *quoad sacra* parishes, except the name and the church-court influence. Of the *quoad sacra* parishes, 3 have churches built, endowed, and maintained by parliament, and 10 owe their churches and their support to voluntary societies, or voluntary subscription. All the *quoad sacra* parishes, and the two chapelries, belong to the synod of Perth and Stirling; and of the *quoad civilia* parishes, including the 3 which are partially connected with other counties, 68 belong to the synod of Perth and Stirling, 11 to that of Angus and Mearns, and 1 to that of Fife. One *quoad sacra* parish, Tennandy, and 12 *quoad civilia* parishes, Auchtergaven, Blair-Athole, Caputh, Cargill, Clunie, Dunkeld, Little Dunkeld, Kinclaven, Kirkmichael, Lethendie, Moulin, and Rattray, constitute the preshytery of Dunkeld. Four *quoad sacra* parishes, Foss, Glenlyon, Ramoch, and Strathfillan, and 6 *quoad civilia* parishes, Dull, Fortingall, Kenmore, Killin, Logiecrail, and Weem, constitute the preshytery of Weem,—a preshytery of very recent erection, and not a little remarkable for the dismemberment of its *quoad civilia* parishes into far

scattered fragments, that of Weem alone consisting of no fewer than 8 sections, dispersed over a great part of the Highlands of the county, and some of the others being but a degree less absurdly situated. Three *quoad sacra* parishes, St. Leonard's of Perth, St. Stephen's of Perth and Stanley, and 24 *quoad civilia* parishes, Aberdalgie, Abernethy, Arngask, Collace, Dron, Dunbarney, Errol, Forgandenny, Forteviot, Kilspindie, Kinfauns, Kinnoull, St. Madoes, St. Martin's, Methven, Monadie, East Kirk of Perth, Middle Kirk of Perth, West Kirk of Perth, St. Paul's of Perth, Redgorton, Rhynd, Scone, and Tibbermuir, constitute the presbytery of Perth. Three *quoad sacra* parishes, the New Church of Crieff, Blairingone, and Ardoch, and 15 *quoad civilia* parishes, Auchterarder, Blackford, Comrie, Crieff, Dunning, Fossaway, Fowlis-Wester, Gask, Glendevon, Mad-derty, Monivaird, Monzie, Muckart, Muthil, and Trinity Gask, constitute the presbytery of Auchterarder. Two *quoad sacra* parishes, Gartmore and Norriestoun, 2 *quoad civilia* parishes, only partly in Perthshire, Logie, and Kippen, and 9 *quoad civilia* parishes, wholly in Perthshire, Aberfoil, Balquidder, Callander, Dunblane, Kilmadoek, Kincardine, Le-cropt, Port-of-Monteith, and Tullihallan, constitute, along with one parish from Clackmannanshire, the presbytery of Dunblane. These 5 presbyteries, along with that of Stirling, which contains 13 *quoad civilia* and 2 *quoad sacra* parishes, constitute the synod of Perth and Stirling. One parish, that of Culross, belongs to the presbytery of Dumfermline, in the synod of Fife. One suppressed parish, that of Fow-lis-Easter, annexed to Lundie in Forfarshire, and 4 *quoad civilia* parishes, Abernyte, Inchture, Kinnaird, and Longforgan, belong to the presbytery of Dundee; and 7 *quoad civilia* parishes, Alyth, Bendochy, Blairgowrie, Cupar-Angus, Meikle, and Ruthven, belong to the presbytery of Meikle, in the synod of Angus and Mearns. Several of the parishes both of Perthshire and Forfarshire, in the presbytery of Meikle, overleap the county boundaries, but not to such an extent as to be noticeable in a general statement.—In 1834, there were in the county 73 parochial schools, conducted by 75 teachers, and attended by a maximum of 5,213 scholars, and a minimum of 3,138; and 251 other schools, conducted by 259 teachers, and attended by a maximum of 13,649 scholars, and a minimum of 7,435.

Perthshire, as hinted near the outset, is divided, for the purposes of the new small debt act, into ten districts, each under the jurisdiction of a justice-of-peace court, and of a body of lieutenants; and it is divided also into two districts, subject to a sheriff-substitute, the seat of the one at Perth, and that of the other at Dunblane. The courts under the new small debt act, are held at Crieff every first Saturday of January, April, July, and October; at Callander every first Monday of March, June, September, and December; at Kincardine, in Tullihallan, and Culross, every first Monday of February, May, August, and November; at Dunkeld, every third Monday of January, April, July, and October; at Aberfeldy, every third Tuesday of April, July, and October; at Blairgowrie, every second Monday of January, April, July, and October; and at Cupar-Angus, every second Tuesday of January, April, July, and October. The sheriff-court at Perth is held every Wednesday and Friday, and at Dunblane every Wednesday during session; and the commissary-court is held in the former every Friday, and in the latter every Wednesday, during session. The sheriff small-debt-court is held every Wednesday and Friday; the justice-of-peace small-debt-court is held at Perth on the first Monday of every month; and the quarter-sessions are held on the statutory days, and by adjourn-

ment.—Perthshire, though so large, so influential, so populous, and, in all respects, so important a county, is coolly placed on a level with things called counties, such as Selkirkshire and Buteshire, which several of its single parishes could almost match, either in number of inhabitants or in extent of territory, and is permitted to send only one member to parliament. Constituency, in 1840, 4,382.—The valued rent of the county, in 1674, was £339,892 Scottish; and the annual value of real property, as assessed in 1815, was £555,532.—The population, in 1795, as estimated by Dr. Rohertson in 1799, upon the best data he could laboriously procure, was 143,123, evidently an over-estimate; and it was computed to have increased from 1755 to that period, 19,781. Population, according to government census, in 1801, 126,366; in 1821, 139,050; in 1831, 142,894; in 1841, 138,151. The population, in 1831, were distributed into 2,482 occupiers of land, employing labourers; 2,787 occupiers not employing labourers; 6,778 agricultural labourers; 5,204 labourers not agricultural; 4,942 manufacturing operatives; 9,965 persons employed in retail trades and handicrafts; 1,519 capitalists; 496 male servants; and 7,054 female servants. In the same year, the number of families was 31,749; and the number of inhabited houses 23,809. In 1841, the number of inhabited houses amounted to 29,172; uninhabited, 1,798.

PETERCULTER, a parish on the southern frontier of Aberdeenshire; bounded on the north by Skene and Newhills; on the east by Banchory-Devinick; on the south by Kincardineshire and Drumoak; and on the west by Echt. It is a slender oblong, of 5½ miles by 2, extending from east to west, with a southerly projection of 2 miles by 1; and it comprehends about 9,690 acres. The southern division commences with a small haugh, and recedes in a very gentle ascent; and it is all in a high state of cultivation, and possesses the embellishment of no fewer than five mansions, with their gardens, parks, and woods. The other districts are a continued series of holdly broken and very rugged ground,—a wilderness of slopes and hollows, rocky eminences, and marshy flats, with occasionally a small conical hill or a conical ridge, zoned around the base with arable land or with swamps, traversed sometimes by a rivulet. Much of the surface is moorish, heath-clad, and strongly overgrown with furze and broom. The soil in the south is gravel and sand, with a mixture of vegetable earth, and in the north is respectively on the high grounds and in the hollows, a red earth on clay, and a mixture of black earth and moss. The extent of cultivated land compared to that of uncultivated, over the whole area, is as 13 to 6. About 1,600 acres, not included in either of these classes, are covered with plantation. The woods are very thriving, and greatly adorn the rich south-exposed district. A cluster of hard timber-trees around Culter-house exhibits probably as old and majestic specimens of the beach, the oak, and the chestnut, as any which are to be found in the north of Scotland. Two lines respectively, of *Arbor vitæ* and Athenian poplar, adorn the garden of Murtle; and an avenue of very noble old spruce trees leads up to Countesswells. Soil and climate seem peculiarly favourable to the rapid and sound growth of most species of trees; and the air is remarkable for its salutiferousness to both animal and plant. Large boulders of a very hard stone cover much of the surface of the moors; and granite is everywhere abundant, and was for years extensively quarried in subordination to the demand over Britain for 'Aberdeen granite.' The river Dee—here a large and beautiful stream, and subject to great and sudden

floods—traces all the southern boundary, with the exception of placing on its right bank the small farm of Inch, once an island in the stream. The burn of Leuchar or Culter cuts the main body of the parish into two nearly equal parts, and runs across the neck of the projecting district to the Dee, at the south-east corner of the glebe. On this burn are three factories; the lowest a small quadrangular thatched snuff-mill; the highest a woollen-carding, spinning, and weaving factory, erected in 1831, and employing nearly 20 persons; and that in the middle a large and neat paper-mill, commenced in 1751, and recently very much enlarged. This last establishment stands upon a fine haugh, overhung on two sides by a curved sweep of almost perpendicular and richly wooded hill, nearly 400 feet high, and flanked on the other two by grounds which, though not very high, are craggy, hold, and strongly featured. At both ends of the haugh are bridges, spanning the chasm from rock to rock, and carrying along the old and new lines of road down the Dee to Aberdeen. In the gorge of the burn, a strong artificial dike dams up a reservoir nearly 20 feet deep, and half-a-mile long; and, during a flood, or after heavy rains, tosses the superfluous waters over its brow in the profuse and glistening ringlets of a fine cascade. "The beauty of the situation and scenery of this establishment," says the statist in the New Account, "is much admired. The extent of artificial works, the large pile of buildings on the left, the spacious reservoir on the right, with an occasional cascade over its dike; the aqueduct supported in the air, with its large column of rolling water passing under the spacious bridge, with the surrounding rocks and woods, all at this point of view burst upon the eye of the traveller, and present to his view a combination of the beauties of nature and the works of art, in a variety, and to an extent seldom, if ever, to be met with in so narrow a compass." Murtle-house, a neat modern Grecian edifice, commands a fine view of the vale of the Dee, overlooked in the far distance by Lochnagar and other Grampian summits. Binguill, Bielside, and Countesswells, are all pleasant modern seats. Culter-house, though an antiquated structure, is large and commodious. A Druidical temple, and an almost effaced Roman camp, popularly called Norman Dikes, are the only antiquities. Population, in 1801, 871; in 1831, 1,223. Houses 245. Assessed property, in 1815, £2,641.—Peterculter is in the presbytery and synod of Aberdeen. Patron, Duff of Fetteresso. Stipend £196 0s. 3d.; glebe £11. In 1834 the parish-school was attended by 54 scholars; and four other schools—one of them a boarding-school—by 101. Parochial-schoolmaster's salary £28, with £14 fees, and £3 14s. 2d. other emoluments.

PETERHEAD, a parish on the east coast of Buchan, Aberdeenshire. It is bounded on the north and north-east by the river Ugie, which divides it from St. Fergus; on the east by the German ocean; on the south by Cruden; and on the west by Longside. Its greatest length, from north to south, is 5 miles; its greatest breadth is 4 miles; and its superficial extent is about 9,000 imperial acres. A sweep of hill, nowhere attaining an elevation of 300 feet above sea-level, and hearing the various names of Stirling-hill, the hill of Invernettie, the Blackhill of Peterhead, and the hill of Cowsrieve, commences at the coast, and forms a line of water-shed round all the southern and most of the western boundary. Its highest part was a frequent point of observation seaward during the war; and serves so well as a landmark that the fishermen on the coast long trusted entirely to its guidance, and did not use a compass. A conical height, called Meethill, possessing an alti-

tude of probably 200 feet, and consisting of an argillaceous diluvium superincumbent on granite, lifts its isolated form on the lands of Invernettie. All the rest of the parochial surface is a slightly rolling plain, whose rising grounds are just sufficiently variegated and high as to render the landscape cheerful, and produce numerous combinations of scenery. About a mile west of the town is the most remarkable of the hollows, called the How of Buchan, probably from being the lowest ground in that district, and being so circularly concave that, previous to the erection of some modern houses on its margin, a person at its bottom could see nothing but the ascent of its sides all round, and the overarching of the firmament above. The east end of Stirling-hill runs out in a narrow promontory into the sea, and forms the well-known Buchanness, the most easterly land in Scotland. Opposite the hill are two islets, the one green and the other rocky; the former once the site of a salt-pan, and the latter now the site of the Buchanness lighthouse. The coast, from the boundary with Cruden to the entrance of the bay of Sandford on the north side of Buchanness, is a series of high mural cliffs, all consisting of plutonic rock, and torn or perforated with numerous fissures, chasms, and caves. The bay of Sandford, measuring  $1\frac{1}{4}$  mile across the entrance, and  $\frac{3}{4}$  of a mile from entrance to head, makes a fine semicircular sweep between Buchanness and Salthouse-head, and is fringed with a beautiful low beach of sand and pebbles. The bay of Peterhead, penetrating nearly a mile inland, and measuring quite a mile at the entrance, is bounded by Salthouse-head and the promontory of Keith-Inch, and has shores at first rocky but flat, and afterwards gravelly and low. Keith-Inch, the site of the town of Peterhead, is a small flat rocky peninsula, terminating in two tiny headlands, called the North and the South Heads. The prevailing rocks of the parish are granite and syenite, veined or alternated with quartz, compact felspar, gneiss, and primitive trap. Various very extensive quarries are worked, and they produce blocks of large size of finely polishable structure, and of high attractions for the market;—the stones from some of the quarries a gray or white granite, and from others a syenite resembling that of Sienna in Egypt, whence this species of rock had its name. The soil of the arable lands is of great variety, from a sandy loam to a rich deep black earth, and a strong clay; and it possesses, for the most part, the highest fructiferous powers. About 8,260 acres are under cultivation; upwards of 500 are moorish and mossy, but are partly of value for the supply of fuel; about 120 are destitute of soil, and display the naked rock; and about 70 are covered with plantation. The pastures, natural and artificial, maintain about 1,400 black cattle, and only a little upwards of 100 sheep. The river Ugie diversifies the landscape of the northern frontier with its windings and its fertile haughs; and it produces excellent salmon and great varieties of fine trout, eel, and flounders. Along the coast the sea-fish are of prime quality and very various; and include haddocks, whittings, roughhack, plaice, sole, halibut, turbot, skate, lobster, and crab. Four fishing-villages overlook the coast,—Ronheads, a suburb of Peterhead and identified with it; Boddom, [which see,] nearly 3 miles to the south; Buchanhaven, half-a-mile north of the town, but within the parliamentary boundaries; and Burnhaven, of modern origin, situated on the north side of the bay of Sandford, and provided with a small harbour for the accommodation of boats. A spinning and carding-mill stands on the estate of Boddom; a hrick-work has long been in operation about a mile south of the town; and two large grains are situated respectively at Ravenscrag and Inver-

nettie. Two ancient but small forts occur 2 or 3 miles west of the town. A moat, the memorial of feudal courts and haronial jurisprudence, graces, or it may be, disgraces the parish. Old Crag, or Ravenscrag-castle, a fine old ruin of great thickness of wall, and not very greatly dilapidated, stands on the Ugie, and was, for a long period, the seat of a branch of the Marischal family. Boddom-castle, built centuries ago by the family of Keith, a branch of the Marischals, lifts its picturesque ruins from the brow of a narrow promontory a little south of Buchanness; two very deep fissures or chasms cutting down the high craggy rocks into mural precipices on the two sides, and often bringing up such impetuous onsets of the sea that the spray sails over the ruin. The Earls-Marischal resided chiefly at Invergie-castle, on the St. Fergus bank of the Ugie, half-a-mile east of Ravenscrag; but they possessed the larger portion of the parish of Peterhead, and were the founders and superiors of the town. After their forfeiture, in 1715, most of the property was purchased by a fishing company; and, their affairs becoming embarrassed, it was sold, in 1728, to the Merchant Maiden hospital of Edinburgh. This institution is, in consequence, the superior of the town, as well as the proprietor of adjacent estates; and, in 1783, it purchased another part of the quondam Marischal property in the parish from the York Building company. The first purchase by the institution cost £3,420, and is now worth about £2,370 a-year; and the second cost £3,886, and besides income from fees and town-dues, and freeholds sold for £727, is worth £475 a-year. The parishioners, owing to the influence over them of the Earls-Marischal, were noted Jacobites; and, when the Pretender landed at Peterhead, in 1715, they readily joined his standard. Three great lines of road diverge from the town northward, southward, and eastward; and subordinate roads are minutely ramified throughout the kingdom. Population, in 1801, 4,491; in 1831, 6,695. Houses 788. Assessed property, in 1815, £9,019.

Peterhead is in the presbytery of Deer, and synod of Aberdeen. Patron, the Crown. Stipend £235 9s. 5d.; glebe £50. Unappropriated teinds £432 4s. 9d. The parish-church was built in 1803. Sittings 1,863. A section of the town having, in 1836, been made, by ecclesiastical authority, a separate parochial erection, the parish of Peterhead, or West parish, consists, *quoad sacra*, of hut a part of the town and of all the landward district. Its population, in 1837, as shown by ecclesiastical census, was 6,346; of whom 4,931 were churchmen, 1,305 were dissenters, and 110 were nondescripts.—A Scottish Episcopalian congregation was established in the parish at the Revolution, in 1688. Their chapel was built in 1813-14, at a cost of about £3,500. Sittings 763. Stipend £150.—An United Secession congregation was established in 1800. Their place of worship was built in the same year, and cost between £600 and £700. Sittings 500. Stipend not known.—An Independent chapel in the town formerly belonged to a Secession congregation now extinct; and is of unascertained date of erection. Sittings 507. Stipend not known.—A Wesleyan Methodist congregation was established in the parish in 1833; and assembles in a small house fitted up as a place of worship. Sittings 240. No stipend.—The *quoad sacra* parish of East church of Peterhead, erected in 1836, consists solely of a small triangular section of the town. Its population, in 1837, according to a survey by the session, was 1,461; of whom 903 were churchmen, 377 were dissenters, and 181 were nondescripts. The church was built in 1767, and was purchased, by certain individuals,

in 1834, to be a church in connection with the Establishment. £500 was its price; £100 additional were expended in altering and repairing it. Sittings 702. Stipend £150.—The educational institutions in the landward district and villages are simply two private schools; and in the town are a parish-school, a town-school, a Lancasterian school, two ladies' schools for the higher departments of female education, and six private and ordinary schools. Salary attached to the parish-school £34 4s. 4½d., with from £40 to £30 fees, and about £20 other emoluments; to the town-school £10, with fees; to the Lancasterian school £20, with fees.

PETERHEAD, a considerable town, a parliamentary burgh, and an unimportant sea-port, is situated on the coast of the cognominal parish, 18 miles south-east by south of Fraserburgh, 32 north-north-east of Aberdeen, 40 east-south-east of Banff, and 145 north-north-east of Edinburgh. Its site is a peninsula, 4½ furlongs in extreme breadth, and between 6 and 7 furlongs in length or projection, on the north side of Peterhead-bay, and about ¾ of a mile from the mouth of the Ugie. On the extremity of the peninsula stands a suburb called Keith-Inch, whose principal thoroughfare extends about 220 yards from south-west to north-east, and bears the name of Castle-street. The two harbours, afterwards to be described, now indent the peninsula at points directly opposite to each other, and leave between them an isthmus of less than 100 yards broad to connect Inch-Keith with the rest of the town. Immediately within the harbours, and along the shore of Peterhead-bay, stands Peterhead proper. Its principal thoroughfare, under the name of Broad-street, extends about 270 yards on a line with the isthmus between the harbours; and then, under the name of Marischal-street, inclines a little to the west, and is prolonged 300 yards, to a point not more than 60 yards from the shore of the bay. At this point it is joined, at acute angles, by partially edificed thoroughfares, which converge hither along the sides of the town; and, about 130 yards from its commencement at the harbours, it is crossed at right angles by Long-gate-street, which is 400 yards in length, and connects the sides of the town. Peterhead is thus somewhat triangular in outline; yet it has, both on its landward side, and especially in its interior, several short streets which preserve no uniformity with its main thoroughfares. One street, on a line with Long-gate-street, and continued from its north end, connects the town with the suburb of Ronheads, at 250 yards' distance; and another, on a line with Marischal-street, connects it with that of Kirktown, so near as to be simply a wing of the main body. The aggregate length of the streets is upwards of 4½ miles; and the superficial extent of ground which they cover is about 20 acres. Most of the houses are built of a beautiful granite, found in the vicinity; and many of them have fronts of ashlar either dressed with the pick, or axe-dressed, and closely jointed. The carriage-ways are kept in good repair; and the side-paths are either paved with dressed granite, or fitted out with crib and pebbles. An ample supply of pure spring-water is furnished by pipes from a very copious spring upwards of 2½ miles distant; and gas is furnished for night-lighting, from works situated in Long-gate-street, and belonging to a joint-stock company formed in 1833. In general the town may be summarily regarded as clean, dry, and well-aired; with spacious and open streets, and a prevailingly neat and even handsome appearance.—The town-house, situated in Broad-street, and built in 1788, is a neat edifice 60 feet long and 40 wide, surmounted by a handsome

spire of granite 125 feet high. The building consists of a ground floor, fitted up as shops; a second floor, distributed into school-rooms; and a third floor, arranged into apartments for public business. The cross, erected in 1832, on occasion of the town being created a parliamentary burgh, is a Tuscan pillar of granite, crowned with the armorial bearings of the Earls-Marischal. Two public halls or buildings are occupied respectively as a reading-room and a billiard-room; and another public structure contains a suite of cold and hot baths. The parish-church, situated at the entrance of the town, or west end of Kirk-town, is a substantial edifice, pavilion-roofed, lighted by round arched windows, and ornamented by an attached spire, 118 feet high. The Episcopalian chapel, situated in Merchant-street, displays much taste, and has a front of Gothic architecture, executed in axe-dressed granite.

Peterhead has been called the Scarborough of the north of Scotland; and it resembles its prototype not alone in situation, but in being doubly a watering place,—a resort both for sea-bathing and for the use of celebrated mineral water. Exertions have been both long and extensively made to accommodate bathers. One bath, constructed in 1799, measures 40 feet by 20; and another, constructed at a later date, measures 90 feet by 30, is hewn out of the solid rock, and, by means of a valve, is filled every tide with pure sea-water. The apparatus of the bathing-house, which adjoins, enable an invalid to take vapour, hot air, projecting, or shower baths, as he finds most suitable. The mineral water of Peterhead is said to have been in repute during nearly 250 years. Of six separate springs in which it wells up, one called the Wine-well, and situated at the lower end of Wine-Well-street, on the south side of the town, is much the most famous. Twelve pounds avoirdupois of the water of this spring, as analyzed by Dr. Laing, were found to contain 3½ grains of aerated iron, 30½ of muriated iron, 7 of muriated lime, 2 of siliceous earth, 2 of gypsum, 13½ of Glauber's salt, 7½ of common salt, and 83½ cubic inches of fixed air. The water has been in repute chiefly for stomach and bowel complaints, nervous affections, and general debility; it has been advantageously used by persons of leuco-phlegmatic habits; and is not without fame as a remedy against scrofula. The celebrity at once of the spa, the baths, and the bathing-grounds of Peterhead, is said to be on the decline.

Two capacious and excellent artificial harbours, joined to geographical peculiarity and great natural advantageousness of position, render Peterhead one of the most valuable ports in Scotland, and one even of importance to the whole kingdom. The peninsula which they indent contests with Buchan-ness the distinction of being the most easterly land in Scotland; and is very often the first land which can be reached by vessels arriving from foreign stations, or overtaken by storm and tempest in the German ocean. The configuration of the peninsula possessed much natural capacity for the purposes of a port and a place of marine shelter; and, now that it has been deeply indented with the berthage of the harbours, and aided by their piers and their jetties, it can be entered in almost any circumstances, and affords complete protection from every wind. From the origin of the town till after the middle of last century, an old harbour, situated between the present north one and the suburb of Ronheads, figures lustily in documents; but seems to have been rude, small, and comparatively valueless, and is now surrendered almost exclusively to the uses of fishing-boats. Another early harbour on the site of the present south one, of unknown date of formation, and

constructed on principles the reverse of those which render the present so excellent, figures also so early as the beginning of the 18th century; but never seems to have been of much capacity, and is noted in record principally for alternations of coming into use and going into decay. The two modern harbours were commenced, the south one in 1773, according to a plan by Mr. Smeaton, and the north one in 1818, according to a plan by Mr. Telford. They are accessible from opposite directions, and, in consequence, are characterized by the single and occasionally serious disadvantage of sometimes holding vessels wind-bound; but were they united by a cut or canal—an improvement which has long been contemplated, and which is deferred only from want of means to defray the expense, they would always admit the departure as well as the arrival of a vessel with the wind at any point of the compass. The south harbour covers 66 imperial acres, and can accommodate from 100 to 120 vessels; and, besides being furnished with quays and other interior appliances for the purposes of a port, it has extensive and very costly outworks for rendering it a place of complete safety. Its south pier is concave toward the sea, so as to occasion waves which strike it to run along to its centre, and there destroy each other, and fall back toward the sea; it also covers the west pier, which is nearly at right angles with it; and, in its turn, it receives aid from a jetty, running parallel to it, eastward, out from the west pier, and protecting the interior of the harbour from such waves as the devices of the south pier fail entirely to repel. The north harbour covers an area of 10.86 imperial acres, and is thus more than one-half larger than the south one; and being, according to Mr. Telford's plan, unprotected on the north side, it began, in 1837, to receive a pier on that side at the cost of nearly £5,000, and is now as singularly well-protected as its fellow, and has the additional advantage of offering accommodation to steam-vessels. The quays of the two harbours comprehend an area of nearly 5 acres; and extend in aggregate length about 3,352 feet. The total expenditure upon the two harbours from 1773 till 1840, amounted to the large sum of about £85,000. A considerable part of this sum was furnished by the trades of the town; a larger part was furnished by the commissioners of Highland roads and bridges, out of the forfeited estates' fund; and the greatest or chief part was furnished by the governors of the Merchant Maiden hospital of Edinburgh, the superiors of the burgh, who gave up for the purpose not only all the harbour dues, but all the town revenue arising from common lands, petty customs, and other sources. An excellent lighthouse, constructed on the opposite corner of the bay by the commissioners of northern lights, marks the entrance to the port; and is of great utility. The New Statistical Account informs us that the number of vessels which entered the harbours in the year ending 1st March, 1837, was 832, of aggregate 48,136 tons; that the number of vessels belonging to the port, on the 1st of January of the same year, was 82, of aggregate 11,022 tons; that the number of wind-bound vessels which entered from 1833 to 1836 averaged 229 in the year; and that the revenue of the harbours, from 1808 to 1837, rose, by an almost regular annual increase, from £367 1s. 5½d. to £2,879 8s. 2d. A full custom-house establishment for the port was long earnestly desired, and quite as stoutly denied; but, since 1838, has at length been granted.

Peterhead traded, at an early period of its history, with the Baltic, the Levant, and America; and, though more domestic in the general range of its traffic, it ranks high as a commercial town and sea-

port. The whale-fishery was, for many years, of prime importance to it, rendering it second in that department to only one port in Scotland; and, though the trade has declined, it still employs 10 ships. The herring-fishery, quite in a nascent state so late as 1820, has for years been a great, an increasing, and a very profitable branch of employment and traffic; it is judiciously encouraged by both the superiors of the town and the trustees of the harbour; and, in 1836, it employed 262 fishing-boats; and produced upwards of 40,000 barrels of herrings. The departure of the vast fleet of boats from the harbour at the fishing-season, is a peculiarly animating sight, and suggests crowding recollections of the enterprise and zealous industry for which the people of the town and the adjacent villages have long been distinguished. Other fisheries, particularly of the several varieties of white-fish, furnish much employment to the inhabitants, and increasing cargoes to the ship-owners. One bulky article of export is, "Peterhead butter," gathered from most parts of Buchan to Peterhead as its capital, and favourably known in various distant markets. A single merchant has been known to purchase, at a time, 100 tons in the province for exportation at the port; and the quantity shipped, in 1837, amounted to 167 tons, or a little more than 3,300 casks. Grain also is brought for shipment from most parts of Buchan; and, in 1837, was exported to the amount of upwards of 270,000 quarters in its unground state, and to that of nearly 14,500 bolls in the state of meal. Eggs likewise are annually shipped to the amount of about 150,000 dozen. The principal imports are British and foreign timber, wooden hoops, lime, bone manure, soft goods, wool, groceries, flour, salt, and iron.—The manufactures of the town are very limited. A distillery, formerly at work, is happily extinct; a thread manufactory, once of some importance, has disappeared; and a manufacture of woollen cloth, once extensive, has dwindled to insignificance. A number of weavers are employed by the manufacturers of Aberdeen; and, in the town and parish, are breweries, dye-works, a rope-work, and a brick-work, and a small carding and spinning-mill.

There are in Peterhead branch-offices of the Commercial bank of Scotland, the Aberdeen, Town, and Country bank, the Aberdeen banking company, and the North banking company. A merchants' society was instituted in 1712; a trades' society, in 1728; a gardeners' society, in 1760; a weavers' society, in 1778; a Buchan farmers' society, at a date not known; and a Keith lodge of masons, in 1754;—and they all possess property in houses and money, and, besides attending to objects indicated by their respective titles, they act as benefit institutions. A scientific society, instituted in 1835, and called the Peterhead Association for Science, Literature, and the Arts, maintains occasional lectures, and has fitted up a museum. A weekly well-supplied market is held on Friday; and annual fairs, both of them for hiring servants, and the latter for the sale of cattle and horses, are held on the third Tuesday of May, and the second Tuesday of November, both old style.

Previous to the latter part of the 16th century, Peterhead, or rather Keith-Luch, or what stood on the site of that modern suburb, was only a trivial fishing-village. Along with the adjoining lands, which were of considerable value, it belonged to the abbey of Deer; and, in 1560, it passed with them, by grant of Queen Mary, to Robert Keith, son of the fourth Earl Marischal, and commendator of Deer-abbey. The abbey lands having afterwards passed to the Earls Marischal, Peterhead Proper was, in 1593, founded and erected into a burgh-of-barony by Earl George;

and it subsequently followed the fortunes of the Marischal property, and came to hold feu of the governors of the Merchant Maiden hospital of Edinburgh. The feuars, originally but 14 in number, obtained from the Earl Marischal, along with the privileges of burgh-ship, considerable property in moss-lands, fisher-lands, commonage, and pasturage; and the successors of these feuars having, in 1774, made a new arrangement with the governors of the Merchant Maiden hospital, a dispute existed, at the date of the Report on Municipal Corporations, whether what remained of this property fell to be administered by the baron-bailie and a committee of the feuars, or by the magistrates appointed under the Reform act. The sum of £100, bequeathed to the town, in 1825, by Mr. Rhind, was, on both sides, regarded as belonging to the new administration. The annual revenue from the disputed property, at the date referred to, was £267 15s. 7½d.; the revenue from petty customs belonging to the feuars was very small, and, in some cases, disputed; the expenditure for the year, was £173 19s.; and the nett amount of debt was £386 2s. 4¾d. The preses of the governors of the hospital, the factor and the treasurer of the same institution, the bailie or bailies of the burgh-of-barony, and a certain number of individuals chosen by the majority of the votes of the feuars and burgesses, are, by act of parliament, trustees of the harbour, declared a corporate body, under the designation of "the trustees of the harbour of Peterhead." Both the harbour act, and a police act for the burgh, are perpetual acts. The baron-bailie held his appointment for a long series of years, exercised jurisdiction over the whole lands of Peterhead, and, in his court, entertained no civil causes, but only actions for petty delinquencies. The magistrates, under the Reform act, are a provost, 3 bailies, a treasurer, and 7 councillors; and they exercise jurisdiction within all the parliamentary burgh, the limits of which are considerably more extensive than those of the old burgh. Municipal patronage extends only to the town officers, and the teachers of the town school. The burgesses import goods at ls. 3d. per barrel bulk less of shore-dues than strangers, but have no other exclusive privileges. There are no incorporated trades. Ten commissioners of police are elected by resident occupiers of tenements of £5 or upwards of annual rent; and they, along with the same parties connected with the hospital who are on the trusteeship of the harbour, constitute the board of police. There is no watching establishment, except on particular occasions, when the inhabitants subscribe for it. The only jail is a vault under the town-house; and it is never used as a place of punishment. Peterhead was, in 1840, made the seat of a sheriff-substitute. The burgh unites with Elgin, Banff, Inverury, Cullen, and Kintore, in sending a member to parliament. Constituency, in 1840, 241. Population, in 1821, 4,783; in 1831, 5,112. Houses, in 1831, 708. Assessed taxes £495 6s. 6d.—The Chevalier St. George landed at Peterhead, in his miserable expedition of 1715; and, appearing in the dress of a sailor, did not throw off his incognito till he had proceeded two days' journey from the town. The site of the house in which he slept on the night after his debarkation, is still pointed out in a back street; and the house itself, not many years ago, existed as a chief lion of the town. Peterhead, at a very recent date, was eminently jacobitical and prelatical; and, even yet, it contains a considerable proportion of episcopalianism, and not a few of those usages and opinions amongst people of the upper class which afford to a student of human nature distinct traces of the character which belonged to the partisans of the later Stuarts. But the influence of trade,

which brings men together in a sort of friendly *mêlée* of action, and the effects of extended intercommunication with the south of Scotland, which destroy the exclusiveness and seclusion of the place's former social position, are so rapidly bringing out their appropriate results, that, probably in the course of another generation, every vestige of peculiarity will have quite disappeared.

**PETTINAIN**, a small parish in the Upper ward of Lanarkshire; bounded on the north by Carstairs and Carnwath; on the south by Covington; on the east by Libberton; and on the west and north-west by Carmichael and Lanark. At the same time it is separated from Libberton, Carnwath, Carstairs, and Lanark, by the Clyde, on the opposite bank of which a small portion of Pettinain is situated, a disjunction from the main body of the parish, which has, no doubt, been caused by the frequent changes which have taken place in the course of the river. The parish is nearly rectangular in shape, and is about 3 miles in length, by  $2\frac{1}{2}$  in breadth. The only high ground in Pettinain is a hilly ridge, which commences in Covington, and runs in a north-westerly direction through the parish, terminating in the end of it, with an elevation of about 500 feet above the level of the river. With the exception of a very small portion, the whole parish belongs to Sir Windham Carmichael Anstruther, Bart., whose family inherited it from the last Earl of Hyndford. There are no minerals in the parish, and it is principally supplied with coal from the parishes of Carnwath and Douglas, which are driven a distance of from 7 to 9 miles. Lanark is the post-town, and Carnwath the nearest market-town,—the distance of the former being  $5\frac{1}{2}$  miles, and of the latter 3. Access to Lanark is obtained by the bridge over the Clyde at Hyndford, and to Carnwath by a large boat or commodious float, stationed at the old ford. It cost £500, and is capable of transporting carts, carriages, cattle, or other produce, over the stream. For 40 years the population has been stationary, if not retrograding. In 1801, it was 430; in 1811, 401; in 1821, 490; in 1831, 461; and in 1841, 416, with 103 families, and the same number of inhabited houses. Assessed property £2,082.—The parish is situated in the presbytery of Lanark, and synod of Glasgow and Ayr. Patron, Sir W. C. Anstruther, Bart. Stipend £162, with a glebe of 10 acres.—The church is believed to have been built or remodelled from an older building, about the end of the 17th century, and the belfry bears date 1696. It was repaired in 1820, and seated for 240 sitters, which is sufficient for the parish. The manse was built in 1820, and is a very commodious house. The salary of the schoolmaster is £34, in addition to fees. There is little of historical interest attaching to the parish. The only mansion-house worthy of note is that of Westraw, belonging to Sir W. C. Anstruther, and which used to be the favourite residence of the late Earl of Hyndford, by whose death the title became extinct.—Some time since the ruins of a house were pointed out at Clowburn, in this parish, in which it is asserted the first tea used in this country was drank towards the end of the 17th century. It was brought from Holland, according to tradition, by Sir Andrew Kennedy, who was then proprietor of that part of the parish; and who, being Lord-conservator of the Scotch privileges at Campvere, had received it as a present from the Dutch East India company.

**PETTY**, a parish on the coast of the narrow or interior part of the Moray frith, partly in Nairnshire, but chiefly in Inverness-shire. It forms nearly a rectangular band of territory, extending along the coast, from within 4 miles of Inverness, to about a

mile from Fort-George; and measures about 9 miles in length, between 2 and 3 miles in breadth, and about 8,100 imperial acres in area. It is bounded on the north-west by the Moray frith; on the north-east by Ardersier; on the south-east by Croy and Inverness; and on the south-west by Inverness. This parish, though all in the Highlands, has physically an altogether lowland character. The surface rises with very gentle undulations, and occasionally with steep and hilly banks, from the coast, then subsides into a belt of quite level land, and finally makes a regular rise to Culloden-moor along the interior boundary; but it aggregately possesses so inconsiderable an altitude above sea-level, as to be no more than an agreeably diversified plain. The aspect is rich and pleasant, and finely combines the features of extensive cultivation, rills of water trotting among fields or falling over rocks, clumps of forest-trees at almost every farm-house, and large expanses of wood over what was once bleak and heathy moor. The central belt of level ground was formerly all moss, and supplied the town of Inverness with rushes; but it has been extensively reclaimed, and rendered arable. The sea is shallow near the shore, and, at low water, retires to a great distance. An ancient castle, on the estate of the Earl of Moray, called Castle-Stuart, is a fine specimen of the baronial architecture of feudal times; it abounds in square and round projections, springing from corbels at the angles of the building; it seems to have been built early in the 17th century, and was once designed to be the modern family-seat, but, for many years, it has fallen into disrepair, or is kept in order only as a shooting-box. In a plantation near the school-house are two small artificial mounds, which were the scenes of baronial courts and executions, and have Gaelic names which mean the Court-hill, and the Gallows-hill. In various places are Druidical circles. The mansions of the parish are Gallanfield and Flemington; and the landowners are the Earl of Moray, Lord Forbes, Lord Cavdor, and Major Fraser. The only village is **CAMPBELLTOWN**; which see. An annual and long-established cattle-tryst, which takes its name from this village, is held at Lammas, on the boundary with Ardersier. Of several hamlets, one is the site of a private school, and another had formerly a school belonging to the Society for propagating Christian knowledge. The parish is traversed from end to end by the railroad between Inverness and Aberdeen. Population, in 1801, 1,585; in 1831, 1,826. Houses 358. Assessed property, in 1815, £3,852.—Petty is in the presbytery of Inverness, and synod of Moray. Patron, the Earl of Moray. Stipend £234 3s. 4d.; glebe £5. Unappropriated teinds £157 9s. 6d. Parochial schoolmaster's salary £36, with from £3 to £5 fees, and about £3 10s. other emoluments.—The present parish comprehends the ancient parishes of Petyn and Bracholy, united before the Reformation, and formerly belonging to the diocese of Moray. The original church of Petyn possibly dated high, and, at all events, was dedicated to Columba, the apostle of the Culdees. Dr. James Fraser, the well-known benefactor of King's college, Aberdeen, was a native of Petty; Lord-president Forbes was connected with the parish as a proprietor; and Sir James Macintosh was the descendant of a family whose mortal remains, down to those of his own father, were interred on the site of the present parish-church.

**PETTYCUR**, a harbour in Eifeshire, on the frith of Forth, about half-a-mile south by west of King-born. It is said to have obtained the name from the circumstance of a small body of French (*Petit corps*) having landed here, in the time of Mary

of Guise. It is one of the usual havens from Leith.

PHILIPHAUGH, a plain in Selkirkshire, celebrated as the scene of the Marquis of Montrose's defeat in 1645 by General Leslie. Ettrick-water, immediately after being joined by the Yarrow, makes a gently curving sweep to the right, steals insinuatingly along the base of a lofty bank on whose summit, at one point, stands the town of Selkirk, and leaves upon its left bank a beautiful haugh, a level plain, which extends north-eastward from a copse-clad hill called the Hareheadwood, to some high ground on the margin of the stream a little below Selkirk. This plain is Philiphaugh; it is about  $1\frac{1}{2}$  mile in length, and  $\frac{1}{4}$  of a mile in mean breadth; and being defended, on the one side, by the river with its hulwark-fashioned bank, and overhung, on the other, by a stretch of hold uplands, which intervene between the Yarrow and the Tweed, it possesses naturally, and on a grand scale, many of the securities and conveniences which were desiderated by the Romans in their camps. Montrose, after he had won six splendid victories over the Covenanters, was on his march southward to pour his conquering troops upon England, when Philiphaugh invited him to repose, and wooed him to destruction. Observing the advantageousness of the ground, he strengthened it with some trenches, and posted upon it his infantry, amounting to 1,200 or 1,500 men; and, seeing how near and accessibly to it stood the town of Selkirk, with its burghal accommodations, he there quartered his cavalry, and courted a night's freedom from a soldier's care. General Leslie, with his sturdy and high-spirited Covenanters, arrived at Melrose on the evening of Montrose's wrapping up himself and his little host in fancied security; and, favoured next morning by a thick mist, he reached Philiphaugh, and was in position for the onslaught, before being descried by a single scout. Montrose was apprized of danger only by the yell which followed the tiger's leaping upon his prey; he knew nothing of Leslie's vicinity till the rattle of musketry announced his activity in the encampment; and when he reached the scene of conflict, he beheld his army dispersed and fleeing in ir retrievable panic and confusion. After making a hold stand, a desperate but unavailing attempt to recover his lost fortunes of the hour, he cut his way through a body of Leslie's troops, fled up Yarrow and over the wild and lofty mountain-path of Minchmoor, and stopped not till he arrived at Traquair, 16 miles from the scene of action. His defeat at Philiphaugh occurred on the 15th of September, 1645, and produced at once conclusive advantages to the Covenanters, and ruin to the wild policy and the hapless cause of Charles I. in Scotland. Upwards of a mile south-west of the present farm-stead of Philiphaugh, and overhanging the Yarrow immediately above its confluence with the Ettrick, there are still traces of an intrenchment thrown up by Montrose. Two miles farther up the Yarrow, close to the ruin of Newark-castle, is a field called Slain-man's-lee, in which tradition says the Covenanters, a day or two after the fight, put many of their prisoners to death. In Selkirk the house is still standing which was occupied by Muntrose on the night of his ill-judged security.

PHILLANS (ST.). See FORGAN.

PICTS (THE). Many conjectures have been hazarded as to the derivation of the term *Pict*; but of this there can be no doubt, that the Picts were Celts, and that they were no other than a part of the race of the ancient Caledonians under another name. Of the twenty-one distinct tribes which inhabited North Britain, at the time of the Roman invasion, the most powerful was that of the Caledonii, or Ca-

ledonians, who inhabited the whole of the interior country, from the ridge of mountains which separates Inverness and Perth on the south, to the range of hills that formed the forest of Balnagowan in Ross on the north, comprehending all the middle parts of Inverness and of Ross; but in process of time the whole population of North Britain were designated by the generic appellation of Caledonians, though occasionally distinguished by some classic writers, proceeding on fanciful notions, by the various names of *Mæatæ*, *Dicaledones*, *Vecturiones*, and *Picti*. At the time of the Roman abdication, the Caledonians, or Picts, were under the sway of a chieftain, named *Drust*, the son of *Erp*, who, for his prowess in his various expeditions against the Roman provincials, has been honoured by the Irish Annalists, with the name of 'Drust of the hundred battles.' History, however, has not done him justice, for it has left little concerning him on record. In fact, little is known of the Pictish history for upwards of one hundred years, immediately after the Roman abdication. Although some ancient chronicles afford us lists of the Pictish kings, or princes, a chronological table of whom, according to the best authorities, is here subjoined:

TABLE OF THE PICTISH KINGS.

Names and Filiations.	Period of their Deaths.
1 Drust, the son of Erp . . . . .	451
2 Talore, the son of Aniel . . . . .	455
3 Nacton Morbet, the son of Erp . . . . .	480
4 Drest Gurthimnoch . . . . .	510
5 Galanau Etelich . . . . .	522
6 Darest . . . . .	523
7 Drest, the son of Girom . . . . .	524
Drest, the son of Wdrest, with the former . . . . .	529
Drest, the son of Girom, alone . . . . .	534
8 Gartnach, the son of Girom . . . . .	541
9 Gealtrach, the son of Girom . . . . .	542
10 Talorg, the son of Muirholalach . . . . .	553
11 Drest, the son of Munait . . . . .	554
12 Galam, with Aleph . . . . .	555
Galam, with Bridei . . . . .	556
13 Bridei, the son of Malloeu . . . . .	586
14 Gartnach, the son of Domelch . . . . .	597
15 Nectun, the nephew of Verb . . . . .	617
16 Cineoch, the son of Luthrin . . . . .	636
17 Garnard, the son of Wid . . . . .	640
18 Bridei, the son of Wid . . . . .	645
19 Talore, their brother . . . . .	657
20 Tallorean, the son of Enfret . . . . .	661
21 Gartnach, the son of Donuel . . . . .	687
22 Drest, his brother . . . . .	674
23 Bridei, the son of Billi . . . . .	685
24 Taran, the son of Entifidich . . . . .	689
25 Bridei, the son of Dereli . . . . .	710
26 Nechtan, the son of Dereli . . . . .	725
27 Drest, and Elpin . . . . .	730
28 Ungus, the son of Urguis . . . . .	761
29 Bridei, the son of Urguis . . . . .	763
30 Ciniod, the son of Wredech . . . . .	775
31 Elpin, the son of Bridei . . . . .	779
32 Drest, the son of Talorgan . . . . .	784
33 Talorgan, the son of Ungus . . . . .	786
34 Cavaul, the son of Tarla . . . . .	791
35 Constantin, the son of Urguis . . . . .	821
36 Ungus (Hungus), the son of Urguis . . . . .	833
37 Drest, the son of Constantin, and Talorgan, the son of Withoil . . . . .	836
38 Uen, the son of Ungus . . . . .	839
39 Wrad, the son of Bargoit . . . . .	842
40 Bred . . . . .	843

We have already observed that little is known of Pictish history for more than a hundred years after the Roman abdication; but at the time of the accession of Bridei in 556 to the Pictish throne, some light is let in upon that dark period of the Pictish annals. The reign of that prince was distinguished by many warlike exploits, but above all by his conversion and that of his people to Christianity, which indeed formed his greatest glory. His chief contests were with the Scoto-Irish or Dalriads, whom he defeated in 557. Passing over a domestic conflict, at Lindores in 621, under Cineoch the son of Luthrin, and the trifling battle of Ludo-Feim in 663 among the Picts themselves, we must notice the important battle of Dui-Nechtan, fought in the year 685, he-

tween the Picts under Bridei—the son of Bili, and the Saxons under the Northumbrian Egfrid. The Saxon king, it is said, attacked the Picts without provocation, and against the advice of his court. Crossing the Forth from Lothian—the Bernicia of that age—he entered Strathearn and penetrated through the defiles of the Pictish kingdom, leaving fire and desolation in his train. His career was stopped at Dun-Nechtan, ‘the hill-fort of Nechtan,’ the Dunnichen of the present times; and by a neighbouring lake long known by the name of Nechtan’s mere, did Egfrid and his Saxons fall before Bridei and his exasperated Picts. The Picts were, however, finally defeated by the Saxons, in 710, under Beorthfryth, in Mananfield, when Bridei, the Pictish king, was killed. The wars between the Picts and Northumbrians were succeeded by various contests for power among the Pictish princes, which gave rise to a civil war. Ungus, honoured by the Irish Annalists with the title of Great, and Elpin, at the head of their respective partisans, tried their strength at Moncrib, in Strathearn, in the year 727, when the latter was defeated. The conflict was renewed at Duncrei, when victory declared a second time against Elpin, who was obliged to flee from the hostility of Ungus. Nechtan next tried his strength with Ungus, in 728, at Moncur, in the Carse of Gowrie, but he was defeated, and many of his followers perished. Ungus, who was certainly by far the most powerful and ablest of the Pictish monarchs, died in 761. A doubtful victory was gained by Ciniod the Pictish king over Aodh-fin, the Scottish king, in 767. Up to this period, the pirate kings of the northern seas—or the Vikings, as they were termed—had confined their ravages to the Baltic; but, in the year 787, they for the first time appeared on the east coast of England. Some years afterwards they found their way to the Caledonian shores, and during the 9th century they ravaged the Hebrides. In 839, the Vikings entered the Pictish territories. A murderous conflict ensued between them and the Picts under Uen their king, in which both he and his only brother Bran, as well as many of the Pictish chiefs, fell. This event hastened the downfall of the Pictish monarchy: and as the Picts were unable to resist the arms of Kenneth, the Scottish king, he carried into execution, in the year 843, a project he had long entertained, of uniting the Scots and Picts, and placing both crowns on his head.\*

**PIEROWALL**, a small village in the northern peninsula of the island of Westray in Orkney.

**PILNOUR WATER**, a rivulet of Kirkcudbrightshire, a tributary of the Cree, chiefly in the interior, and partly on the southern boundary of the parish of **MINIGAFF**: which see.

**PILORTH**. See **FRASERBURGH**.

**PILTANTON BURN**, a considerable rivulet in Wigtownshire, chiefly in the Rhinns. It rises and runs  $3\frac{1}{2}$  miles south-eastward in Leswalt; divides, for  $2\frac{1}{2}$  miles in the same direction, Portpatrick on its right bank from Inch on its left; runs  $4\frac{3}{4}$  miles eastward between Inch on the north, and Stoneykirk and Old Luce on the south; and, measuring in a straight line, traverses the interior of Old Luce  $2\frac{1}{2}$  miles east-south-eastward, to the head of Luce-bay, there to form, jointly with Luce-water, a small estuary. It thus has, exclusive of windings, an entire course of upwards of 12 miles; but in the lower part of its course, it is constantly, though never boldly, sinuous.

\* The ridiculous story about the total extermination of the Picts by the Scots has long since been exploded. They were recognised as a distinct people even in the 10th century, but before the 12th they lost their characteristic nominal distinction by being amalgamated with the Scots, their conquerors.

**PINKIE**, a barony and a celebrated battle-field in the parish of Inveresk, and immediately east of the town of Musselburgh, Edinburghshire. The barony is now the property of Sir John Hope, the vice-lieutenant of the county: it originally comprehended little more than 30 acres lying south and east of the mansion; but it has recently been much extended by the purchase and addition of contiguous lands. Pinkie-house, the mansion of the barony, situated in the outskirts of Musselburgh, scarcely half-a-mile from the Esk and the same distance from the sea, is a large structure of various dates, and apparently was designed to be a magnificent Gothic quadrangle, but never was completed. An elaborately sculptured fountain, in the form of the papal tiara, stands on the green, in front, and seems to have been intended to occupy the centre of the court. The northern and oldest part of the edifice has great thickness of wall, is strongly arched on the ground floor, consists of a massive quadrangular tower shooting up in picturesque turrets, and contains a spacious apartment called ‘the King’s room,’ and a number of curious smaller apartments which are entered at angles of the staircase. The southern and newer part cannot be of more recent date than the reign of James VI.; and, in addition to several beautiful apartments not so anciently fitted up, contains what is called the painted gallery,—whose roof exhibits, in compartments, pedantic and medley groups of the images of heraldry, mythology, and capricious creativeness. The mansion was originally a country-seat of the abbots of Dunfermline, the superiors of the regality of Musselburgh; and when, after the Reformation, that regality was given to the Earl of Lauderdale, Pinkie was detached from it, and bestowed on the Earl of Dunfermline. James V., according to a traditional fama, had the use of the king’s-room during a summer from its mitred proprietor, for the covert and unhallowed indulgence of miserable concubinage. The first Earl of Dunfermline died in the house in 1622, and was laid out in state in the church of Inveresk. The wounded at the battle of Pinkie were lodged in the painted gallery, and occupied it as an hospital.

The battle of Pinkie, one of the most disastrous in which ever Scotland bled, was fought in 1547, during the infancy of Mary of Scotland, and the minority of Edward VI. of England. Protector Somerset warmly adopted Henry VIII.’s project of uniting the two kingdoms by matrimonially allying their monarchs; and, finding it still distasteful to the Scots, he fabricated pretexts for achieving it by force. News having arrived that he was at Newcastle, marching against Scotland at the head of 12,000 foot and 2,000 horse, the ‘fiery cross’ circulated through the country, and promptly summoned 36,000 men to dispute his access to the capital, and to deal with him as an invader. The Scottish army took post on Edmonston-Edge, in the parish of Newton,  $2\frac{1}{2}$  miles south-west of Musselburgh; and were disposed in three bodies, commanded by the Earls of Angus, Arran, and Huntly, with some light horse and a body of Irish archers under the Earl of Argyle. Their position was strong; on the one hand, the morass of the Shrechaugh; on the other hand, the hill of Inveresk, the mounds in the churchyard, and the bridge, all defended by cannon; and, in front, the steep banks of the Esk, then densely covered with wood. Protector Somerset, on coming up, was supported by a fleet of 30 ships of war, and 30 transports laden with ammunition and provisions, lying in the frith opposite the mouth of the Esk; and he drew up his army on Falside Brae,  $1\frac{1}{2}$  mile east of Musselburgh, and extended his right over the grounds of Walliford and Drummore, toward the sea. The

Scottish position being too strong to admit of his assailing it, he kept firmly on his post, and awaited an attack. On the morning of Friday, the 9th of September, Lord Hume, leading on 1,500 light horse, appeared on Edgheucklin Brae, at the east end of Musselburgh links, within a mile of the English position, and rushed so impetuously forward, that Somerset, suspecting him to be supported by some much greater though yet invisible force, strictly commanded his troops to preserve their ranks, and sustain the onset where they stood. Lord Grey, however,—stung with the taunt which Lord Hume's movement seemed to imply, and obtaining a reluctant but hasty consent to his attempting to chastise it,—moved down with 1,000 men-at-arms, and, when within 100 yards of the Scots, charged them at full speed, and, during a fierce and frightful conflict of 3 hours, cut 1,300 of them down, severely wounded their gallant but rash leader, and made prisoner of his son. But, excepting the mere deduction from the number of the force opposed to him, Somerset reaped no advantage; for he could neither advantageously attack the Scots, nor induce them to leave their strong position, nor draw from them any diplomatic concession. After some vain efforts had been made with him to negotiate a treaty, or to prevent general effusion of blood by the succedaneum of limited or personal combat, he intimated to the Scottish leaders that, on the simple condition of their queen being left unfettered by any matrimonial engagement till she should be of age, he would evacuate his post, and retreat to England. The Scots, rashly and proudly interpreting his message as a confession of weakness, and at the same time eager to rush upon what they supposed to be his doomed army, left their strong position, and defiled along the old bridge of Musselburgh to close with them on the east bank of the river. As they passed the bridge, and marched up the hill of Inveresk on the west side of the church, they were galled by cannon-shot from the English galleys in the bay, and lost on the bridge the Master of Graham, eldest son of the first Earl of Montrose, and many of his followers. Descending eastward down a slope, they began to be sheltered from the shot, and passing through the How Mire, which lies at the foot of the slope, and was then a morass, though now drained and cultivated, they saw the English army and the battle-field immediately before them, on a gently-hanging plain which recedes from the How to the base of Carberry-hill and Falside Brae. The conflict which followed was tremendous, but had too many details, and is too well-known, to admit of or need consecutive narration. After four hours sternly debated and general conflict, during which the Scots won achievements, but could not profit by them for want of well-appointed and sufficient horse, and the English could make no impression with their cavalry upon hedges of pointed spears which enclosed the antagonist foot battalions, the van of the Scots was somewhat driven in by a concentrated, multiform, and prompt attack, and a body of Highlanders, who had forgotten their duty amid their covetousness, and were gathering plunder from the bodies of the slain, mistook the retrograde movement for flight, flung down their arms, and consulted the mountaineer activity of their heels, and, infecting the Lowlanders with the panic of their example, drew the whole army after them in an indiscriminate race of defeat. The Scots ran toward the coast, toward Dalkeith, and toward Edinburgh; and in each direction they were hotly pursued by the hallooing and shouting English, and hevn down in excess, and sheer butchery of carnage. "With blade and slaughter of ye eneemie," says Patten, "this chase was continued v miles in length westward fro

the place of their standinge, which was in ye fallow felde of Undreske, untill Edinhorowe parke, and well nigh to the gates of the tounne itself, and unto Lyeth; and in hreadth nie iiii mile from the fryth sandes up unto Daketh southwarde: in all whiche space the dead bodies lay as thik as a man may mette cattell grasing in a full plenshed pasture. The ryvere ran al red with blode; soo that in the same chase wear counted, as well hy sum of our men that sumwhat diligently did maikie it, as hy sum of them takē prisoners that very much did lament it, to have been slayne above xiii thousande. In all thys cumpos of grounde, what with weapons, armes, handes, legges, heddes, hlood, and dead hodyes, their flight mought have easily been tracted to every of their iii refuges." Another account—perhaps quite sufficiently exaggerated—states the loss of the Scots in killed at 10,000, and that of the English at not 200. After the pursuers had chased and slaughtered for five hours, they mustered on Edmonston-Edge, the original position of the Scots, and raised a shout so loud and reverberating, as to be heard at 4 miles' distance on the streets of the metropolis; and then they retired north-eastward, and spent the night at Edge-hucklin Brae, the scene of the premonition defeat of Lord Hume. About 18 years ago, when the new line of road between Edinburgh and London was cut through Edgheucklin Brae, numerous rows of human skeletons were found about four feet from the surface, enclosed in stone slabs, such as for six centuries past have been worked from quarries in the vicinity, and they are believed to have been the remains of the slain English, interred by their comrades on the day after the battle. The Scottish cavalry, during the fight, were engaged chiefly in the How-mire; and, when the panic seized their army, they seem to have retreated down the steep hanks of the rill called Pinkie-hurn, and were slain in such numbers that, according to tradition, it was for three days tintured with their blood.

PITCAIRN, a modern village on the left bank of the river Almond, in the parish of Redgorton,  $3\frac{1}{2}$  miles west-north-west of Perth, and 3 miles east of Methven, Perthshire. It was commenced toward the close of last century, on the estate of Mr. Graham of Baldowan, and is the subject of a poem by Mrs. Cowley, in which she predicts that it will one day rival Manchester; but it has as yet attained a population of only 260. On the Almond at the village are two falls, or capacities of water-power, both of which are made subservient to industry. The upper one is drawn off by an oblique dam-dike which abuts on the rocky hasement of the old bridge of Almond; and it is employed to drive both a large flour-mill, and a considerable flax spinning-mill. The lower fall was used to drive a grain-mill at the earliest dawn of record; and, at present, it drives the beetles of a bleachfield which employs about 50 hands. In the village is a United Secession meeting-house: see REDGORTON.—About a quarter of a mile to the eastward of the village of Pitcairn, there are two very large cairns of stones. They stand at a distance of nearly a quarter of a mile from each other, almost in a south and north direction. The largest of them measures upwards of 300 feet in circumference at the base, and is between 30 and 40 feet in height; the other is not so large. When, or on what account, these huge heaps of stones were gathered, no person can now with certainty tell.

PITCAIRN (NEW), a small village in the parish of Dunning, half-a-mile south of the village of Dunning, Perthshire.

PITCAITHLY, a locality noted for its medicinal wells, in the parish of Dunharnie, Perthshire. It is situated in a sequestered nook of the lower district

of Strathearn, about a mile south-west of the village of Bridge-of-Earn, and  $4\frac{1}{2}$  miles from Perth; and is surrounded with fertile fields, a luxuriant landscape, and all the amenities of a soft rural retreat. The medicinal waters were discovered at a period of which neither record nor tradition gives any information; they have long and increasingly enjoyed reputation; and, in recent times, they have attracted vast numbers of both real and sentimental valetudinarians. They are esteemed efficacious, or at worst alleviative, in cases in scrofulous, herpetic, and scorbutic complaints; they relieve the stomach of crudities, improve its tone, and renovate its energies; they cool and purify the blood, they are gentle in operation, and—to crown the pyramid of eulogies which writers have erected in their honour—they exert a general strengthening influence on the very stamina of the constitution. They issue from five springs, called the East, the West, the Spout, the Dunharnie, and the South park wells, and are the same in quality from all, and differ only in the degrees of strength, and in the proportions of the ingredients held in solution. The following are the results of an analysis of the water of these springs, made by Professor Thomson of Glasgow, in 1839:—

1. *Mr. Grant of Kilgraston's spring.*

Specific gravity, . . . . .	1.00211
Constituents in the Imp. Gal.	
Chloride of Calcium, . . . . .	153.28 grains.
Common Salt, . . . . .	50.12 —
Chloride of Magnesium, . . . . .	3.44 —
Sulphate of Lime, . . . . .	12.13 —
	260.97

2. *Mr. Craigie of Dunharnie's spring.*

Specific gravity, . . . . .	1.00467
Constituents in the Imp. Gal.	
Chloride of Calcium, . . . . .	168.58 grains.
Common Salt, . . . . .	117.84 —
Chloride of Magnesium, . . . . .	4.16 —
Sulphate of Lime, . . . . .	25.92 —
	316.50

A large lodging-house stands beside the wells for the accommodation of visitors. Taste or caprice, however, has adopted the village of Bridge-of-Earn as the favourite seat of all the loungers, and of the great majority of persons really in quest of health; and it is daily supplied for their use with quantities of the waters of the spas. A supply is brought down every morning by six o'clock. The usual mode is to mix merely as much of the hot with the cold as takes off the chilliness. The taste of the water is but very slightly offensive; indeed, it is quite as palatable as what is drawn from many wells round Edinburgh, and it has been drunk, in small quantities, at the dinner-table, by mistake for ordinary spring-water. The quantity taken is from 3 to 8 large glassfuls. The society drawn to the place is, as may be supposed, of a very mixed character; and though partly sedate, and in every way consonant with the professed object of its aggregation, is preponderatingly fashionable, and even fashionably dissipated. Games, amusements, fetes, ball-room follies, and various paradiings of vanity, are sufficiently numerous and prominent to excite wonder in the mind of a simple onlooker, as to what the possible motive can be for persons so apparently strong and buoyant, and prodigal of ample stores of health, quaffing day by day draughts of putrid water.

PITFERRANE. See DUNFERMLINE.

PITLESSIE, a village in Fifeshire, in the parish of Cults, on the north side of the road to Cupar from Kinghorn, 4 miles west of Cupar, and 5 east of New Inn.

PITLOCHRY, a small village in the parish of Moulin, Perthshire. It stands on the left bank of the river Tummel, on the great military road from

Perth to Inverness, 1 mile south of the village of Moulin, and 4 miles south-east of the Pass of Killiecrankie. It has a corn-mill, a saw-mill, and a dyeing manufactory. Population, about 200.

PITRODIE, a hamlet in the parish of Errol, Perthshire,—the site of a United Secession meeting-house. While skulking under the protection of his uncle, Wallace is said to have concealed himself occasionally in a cave within the glen of Pitrodie, near Kilsindy. The glen is wild and lonely, with steep furzy slopes, and a little rill trickling at the bottom. In the face of a porphyritic rock overhanging the rivulet, there is a long slit—probably at one time masked with brushwood—in which a man might find concealment and shelter.

PITSCOTTIE, a village in the parish of Ceres, Fifeshire. There are two mills here for spinning linen-yarn.

PITSLIGO, a parish on the north coast of Aberdeenshire, 2 miles west of Kinnaird-head. It is bounded on the north by the Moray frith; on the east by Fraserburgh; on the south by Tyrie; and on the west by Aherdour. Its greatest length is  $3\frac{1}{4}$  miles; its greatest breadth is  $2\frac{1}{2}$  miles; and its area is about  $7\frac{1}{2}$  square miles, or 4,500 imperial acres. The coast, 4 miles in extent, consists, on the east, of a low flat beach, now sandy, and now strewn with loose rocks,—and, on the west, of high hold cliffs, torn with large and numerous fissures. The surface of the interior gently rises from both the north and the south to a line of hisection across nearly the middle of the parish; but nowhere attains a hilly elevation, and may be viewed as strictly champaign. Excepting about 500 acres, the whole area is enclosed, and subject to the plough; but the enclosures being of stone, and wood existing to the amount of less than 20 acres, it presents a bald and cold aspect, and occasionally suffers damage to its produce from the northerly storms. Some conical cairns, about 30 feet in height and 60 in circumference, are noticed in the Old Statistical Account as traditionally “the burying-places of hostile invaders from Denmark or Norway, who were defeated in the neighbourhood, and seem to have been pursued with slaughter a great way along the coast, where several such tumuli are still to be seen.” Pitsligo-castle, formerly the seat of the Lords Pitsligo—a title in the Forbes family attainted in 1746—is the ruin of a strongly constructed edifice, surrounded with extensive and still cultivated gardens. Pittulie-castle, likewise a ruin, appears to have been built by the Saltouns, but was afterwards possessed and enlarged by the Comyns. Both ruins are on the coast. The villages of the parish are ROSEHEARTY and PITLULIE: which see. In 1840, a new fishing-harbour was constructed at Sandhaven, in the extreme east. Mr. Andrew Cant, distinguished as a stout Covenanter and opponent of prelacy, was the first minister of the parish, and, with violence alike to good feeling and fair scholarship, is described in No. 147 of the Spectator as an illiterate minister in the north of Scotland, from whose name arose the opprobrious word “cant.” Roads diverge from Roseheart; and also run across in two lines from the town of Fraserburgh. Population, in 1801, 1,256; in 1831, 1,439. Houses 307. Assessed property, in 1815, £2,696.—Pitsligo is in the presbytery of Deer, and synod of Aberdeen. Patron, the Crown. Stipend £191 4s. 4d.; glebe £17 10s. The church was built in 1634, and repaired and slightly enlarged in 1792. Sittings 504. An United Secession place of worship is situated in Roseheart, and was built in 1799. Sittings 350. An ecclesiastical survey in 1837 exhibited the population then as consisting of 1,253 churchmen and 187 dissenters. The parish anciently formed part of Aherdour, and

was separated from it in 1633 by an act of the Scottish parliament. Parochial schoolmaster's salary £32 2s. 6d., with £19 8s. fees. There are 5 non-parochial schools.

**PITSLIGO (New)**, a *quoad sacra* parish, and a large village, in the north-east division of Aberdeenshire. The parish, as to its nucleus, was, in 1799, disjoined from Tyrie by the late Sir William Forbes of Pitsligo, under the sanction of the General Assembly; and about 1835, it received certain additions from Aberdour, New Deer, Strichen, and Tyrie, by authority of the General Assembly; but it has never undergone political or *quoad civilia* erection. Some portions of Aberdour lie contiguously to its church, but are not included within its limits. Its greatest length is 6 miles; its greatest breadth is 5 miles; and its superficial extent is nearly 30 square miles. Population, according to ecclesiastical survey in 1837, 1,696; of whom 1,403 were churchmen, 266 were dissenters, and 27 were nondescripts. The church was built in 1798, at the sole expense of the late Sir W. Forbes, and cost about £600. Sittings 469. Patron, Sir J. S. Forbes, Bart. Stipend £80; glebe £6, with a manse. A Scottish Episcopalian congregation was established in the parish between 1800 and 1805. The chapel was built in 1835, at the sole expense of Sir J. S. Forbes, and cost about £400. Sittings 160. Stipend £60; glebe about £13, with a manse. The parish is in the presbytery of Deer, and synod of Aberdeen.—The village of New Pitsligo is situated politically in the parish of Tyrie, 6 miles north of New Deer, 11 south-west of Fraserburgh, and 18 west-north-west of Peterhead. It is neat, and altogether of such origin and character as to witness to the genuine patriotism of the late Sir W. Forbes. Its inhabitants are all weavers, country tradesmen, small farmers, crofters, and day-labourers. Annual fairs are held here on the 3d Tuesday and Wednesday of February, old style; the 3d Wednesday of May, old style; and the Thursday in August after Tarland. Population, in 1837, 1,262.

**PITTENCRIEFF**, a village in Fifeshire, near Dunfermline, to which town it is joined by a mound of earth, on which a street has been formed.

**PITTENWEEM**, a parish in Fifeshire, about  $1\frac{1}{2}$  mile in length from east to west; and half-a-mile in breadth from north to south; bounded on the east by Anstruther-Wester; on the north by that parish and Carubee; on the west by the parish of St. Monan's; and on the south by the frith of Forth. It is level in its surface, and its soil in general a black loam, very fertile, yielding heavy crops of wheat and barley. The population, in 1755, was 939; in 1801, 1,072; in 1831, 1,317. The valued rent of the parish is £2,452 Scots. The annual value of real property, in 1815, was £1,712 sterling; of which £1,127 was assessed on the burgh, and £585 sterling on the landward part of the parish. Houses, in 1831, 234.—This parish is in the synod of Fife, and presbytery of St. Andrews. Patron, Sir W. C. Anstruther, Baronet. Stipend £166 1s. 10d.; glebe £12 12s. The church is obviously of considerable antiquity, and is supposed to have formed part of the Priory, but the period of its erection is uncertain. The teacher of the parochial school has the maximum salary, with a school-house, dwelling-house, and garden. The average attendance at the school is 90. Besides the parish-school there is one unendowed, at which the attendance of pupils is about the same; and a female school supported partly by subscription, at which from 60 and 80 pupils attend.

The burgh of **PITTENWEEM**, from which the parish derives its name, consists of a street running east and west, having the parish-church at the east end; the street which fronts the harbour; and a street of

modern erection built parallel to these, on the line of the toll-road, with several connecting lanes running north and south. Even the old part of the town is well-built, and both in the old and more modern parts there are several well-filled shops, and excellent houses, which, with its superior cleanness to most of the little coast-towns, gives it an air of comfort and respectability, which one would not at first expect to meet with. Originally it was a burgh-of-barony holding of the priors of the priory of Pittenweem, but by a charter granted by James V., dated February 1542, in favour of John, then prior, it was erected into a free royal burgh, and subsequently in 1547, the prior and convent granted to the provost, bailies, council, community, burgesses, and inhabitants, the burgh as the same was builded, or to have been builded, and the harbour thereof, and all moors, mosses, waste ground, common ways, and other commonities, liberties, customs, anchorages, &c. belonging thereto. In 1593, a charter was also granted by James VI. to the town, of that great house or lodging of the Monastery of Pittenweem. These charters were all ratified and confirmed by act of parliament in June 1633. The town is governed by a chief magistrate, three bailies, a treasurer, 19 councillors, and a town-clerk, who acts as assessor to the magistrates. The magistrates have the usual jurisdiction of magistrates of royal burghs; but very few cases are ever brought before them. There are no guildry or incorporations within the burgh. The property of the burgh consists of lands, mills, slaughter-house and byres, ship-building yard, cellar and shed, shares in a granary, washing-house and bleaching-green, seats in parish-church, harbour, petty customs, shore, hoom, and crane-dues, ironstone on the sea-shore, sea-ware, stances for curing herrings, feu-duties, and ground-annuals. The income is of course variable; for the year ending October 1839, it was £466 4s. 2d. sterling, besides considerable arrears owing to the town, and money in hawk. The debt owing by the town was about £1,200 sterling, but the expenditure is considerably within the income. The harbour is much exposed to winds from the south-east, but every attention is paid to its improvement by the magistrates, and should the herring-fishing continue for a few years, as valuable as it has been for the last two seasons, they will be enabled to expend still more upon its improvement than they have heretofore been able to do. A few sloops and schooners belong to this town, but they have of course been included in the harbour of Anstruther-Easter, of which Pittenweem is one of the creeks. Fish-curing is carried on to a considerable extent in the town, and large quantities of fish are besides sold fresh throughout the surrounding country. There are grain mills adjoining the town, which belong to it in property, but are let to a tenant. At one time, it is said, there were thirty brewers here; now, however, there is only one. The priory of Pittenweem was founded for canons-regular, who were first introduced into Scotland about 1114; it belonged to the priory of St. Andrews. It had many lands belonging to it, and the churches of Rhind, Anstruther-Wester, and others. John Rowle, prior of Pittenweem, was a Lord-of-session, and first appears in the Sederunt book on 5th November, 1544. In March 1542, he had been one of the lords for discussing of domes; and in March 1544, he was one of the Lords-of-the-articles. In 1550, he accompanied the Regent Murray to France, and died in 1553. In 1583, William Stewart, a captain in the King's guard, descended from Alan Stewart of Darnley, obtained a charter of the priory and lands of Pittenweem, and was afterwards styled Commendator of Pittenweem. In 1606, the lands and haro-

nics belonging to the Priory were erected into a temporal lordship, in favour of Frederick Stewart his son, who had farther charters in 1609 and 1618. He died, as is supposed, without issue, and the title never has since been claimed by any heir-general or assignee. Previous to his death he disposed the lordship to Thomas Earl of Kellie, who, with consent of his son Alexander Lord Fenton, surrendered the superiority of the same into the hands of the king. A considerable portion of the buildings of the Priory are still in existence, and inhabited. The prior's house is now the property and residence of the Right Rev. David Low, J.L.D., Bishop of the Scottish Episcopal united diocese of Ross and Argyle. The wall which surrounded the precinct is still in existence, and with the other buildings and ruins give some idea of the extent and breadth of this Priory. Below the Priory, and near the sea-beach, is a large cave, consisting of two apartments, in the inner one of which there is a well of excellent water. At the junction of the two apartments there is a stone-stair, which went up to a subterraneous passage, leading to the Abbey, at the end of which there was another stair, which landed in the fratory or refectory of the Priory. The two stairs still remain, but the passage, which would be about 50 yards in length, has for many years been destroyed by the falling of the superincumbent earth.

**PITTULIE**, a fishing-village on the coast of the parish of Pitsligo, Aberdeenshire. It stands 2 miles east of Rosehearty, and 3 miles west of Fraserburgh. A good harbour has recently been formed here by the Government commissioners for the herring-fishery. The fish caught at the station are cod, ling, skate, haddock, saith, and poddies. Population of the village, about 200.

**PLADDA**, a low rocky islet in the frith of Clyde, about 5 furlongs south of the south-eastern extremity of Arran, and divided from that island by a strait to which it gives the name of Pladda sound. Mr. Galbraith, in 1836, determined its position to be N. lat.  $55^{\circ} 25' 33''$ ; W. long.  $50^{\circ} 7' 0''$ . Stratified rocks, consisting of a white sandstone accompanied by limestone, appear to form the foundation of the whole islet. A continuous bed of trap overlies the whole, and reaches on almost all sides to the sea, but it wants such distinctive properties as would rank it with any of the ordinary subspecies of trap, being intermediate between basalt and greenstone, and consisting of an indurated clay-stone highly charged with protoxide of iron. Pladda is conspicuous chiefly for its lighthouse, erected in 1790. It exhibits two fixed lights, one above the other: the elevation of the one light being 130 feet, and of the other 77 feet above high water; and the lights are respectively visible at the distance of 15 and of 12 miles, from north-east by east, round by the south, to north-west by west. The bearings from the lighthouse, as taken by compass, are, the entrance of Campbelltown-bay W. N. W.,  $\frac{1}{4}$  N. distant 18 miles; island of Sanda W., distant 20 miles; Ailsa Craig, S. W. by S., distant 15 miles; entrance to Loch-Ryan, S. S. W., distant 25 miles; and the Heads of Ayr, S. S. E., distant 16 miles. The expense of maintaining the lighthouse, for the year 1840, was £683. In the sound of Pladda, at the south end of Arran, the charts have 4 fathoms marked, whilst there is a bridge of rock, with 2, 3, and 4 feet only of water, nearly right across, not justifying any vessel attempting the passage.

**PLEAN**, a village and *quoad sacra* parish in St. Ninian's, Stirlingshire. See **NINIAN'S** (ST.).

**PLEAN-MUIR**, a hamlet in the parish of St. Ninian's, Stirlingshire;  $2\frac{1}{4}$  miles north of Denny. Here is an extensive colliery.

**PLEASANTS (THE)**, a suburb of the city of Edinburgh, on the south-east; in the parish of St. Cuthbert. It formerly belonged to the Earls of Roxburgh, and was purchased from one of them by the magistrates of Edinburgh in 1636. Here was a priory of nuns, dedicated to St. Mary of Placentia; and the street still bears, corruptly, the name of The Pleasants. The date and the founder of this religious establishment are unknown.

**PLENDERLEITH**, an ancient chapelry in the district of Jedburgh, shire of Roxburgh, and parish of Oxnam. The chapel is demolished, but the cemetery continues still to be used. It is near the source of the river Oxnam, and at the distance of 9 miles south-east by south from Jedburgh.

**PLOCKTON**, a village and a parliamentary parish, situated *quoad civilia* in the parish of Loch-Alsh, on the west coast of Ross-shire. The village is a burgh-of-regality. The parish was erected by the General Assembly in May 1833, and attached to a previously built government church; and it is in the presbytery of Lochcarron, and synod of Ross. Patron, the Crown. Stipend £120; with a manse. A schoolmaster is supported by the Society for propagating Christian knowledge; and a female teacher is supported principally by annual subscriptions. The two schools were attended, in 1834, by 123 scholars. Population, in 1836, about 530.

**PLUNTON CASTLE**. See **BORCET**.

**PLUSCARDINE PRIORY**, an ancient edifice, partly a well-preserved monastic ruin, and partly a modernized mansion, in the parish of Elgin, Morayshire. It stands in a secluded and beautiful valley, 5 miles south-west of the town of Elgin. Its immediate site is surrounded with garden, lawn, and ornamental woods. Its valley is so pent up between parallel lines of hills as to have the dimensions only of a glen; but it possesses a rich soil, a pleasant stream, a sunny exposure to the south, and a hill-shelter from the blasts of the north; and it altogether presents those fine aspects of mingled solitude and luxuriousness which monks so keenly espied, and greedily appropriated, as the scenes of their stealthily revelry and gorgeous homes. The church, rising as the central or principal edifice, is cruciform. Its centre sent aloft a square tower; its transept extended on the east side; its nave never was finished. The structure, as it stands, bears, in its general outline, a close resemblance to Melrose Abbey; but is much smaller in size, and greatly inferior in profusion and gorgeousness of ornament. Its proportions are harmonious; its building material—a beautiful and firm sandstone, found in the vicinity—has well-resisted the erosion of the elements, and received a hoary coating of lichens and mosses; and, though the grandeur which awes, and the magnificence which thrills, are both wanting, a simplicity and a symmetry address themselves in fine blending to the eye, and incite calm emotions of pleasure. The church retains some of its beautiful windows, and some traces of the frescoes which adorned its walls. On one side stands the chapter-house, an octagonal structure, supported by a central arch, and resembling, in its style of architecture, the chapter-house of Elgin. On the south of the church are the buildings which formed the domicile of the monks. These consist of two stories; the lower, divided into the kitchen and the refectory,—an apartment of about 100 feet long; and the upper, containing the dormitory, 114 feet long, and the prior's chamber, provided with a dais, as a place of honour, and with a recess or stroughold in which were preserved the rolls and public documents of the monastery. The refectory is now fitted up as a place of worship; and some other parts of the

building are modernized into a residence. These restorations, or transmutations, were made about the year 1816; and they seem to have been suggested by the felicity of the situation, and the fitness of existing materials; but they were attended by the stripping away of picturesque coatings of ivy, and they present such a substitution of the neat front and tasty decorations of a mere snug mansion for the venerable and imposing aspects of an exquisite ruin, as is likely to please only a very prosaic class of tourists.—Pluscardine Priory was founded in 1230, by Alexander II., for Cistercian monks, and was dedicated to St. Andrew, under the designation of Vallis Sancti Andree. The establishment, for a time, was subject to the bishop of Moray; but afterwards, it claimed independence for its prior. A cell of it, or subordinate establishment, stood at Grange-hill. The property of the priory comprehended the valley of Pluscardine, the lands of Grange-hill and Durris, the baronies of Farnen and Urquhart, the churches of Pluscardine, Bellie, Urquhart, Durrus and Duloons, some mills in the vicinity of Elgin and Forres, some fisheries, and perhaps the Palmer Cross bridge across the Lossie; and, in 1563, as shown by Shaw, it yielded an annual revenue of £525 10s. 1½d. Scottish in money; 1 chalders and 1½ boll of wheat; 51 chalders and 5 bolls of meal, malt, and bear; 5 chalders and 15 bolls of oats; 9 chalders and 11 bolls of dry miltures, and 30 lasts of salmon; he-sides grassum, cain, customs, poultry, and some other items. Monks who managed to get so sweepingly away from their vow of poverty, will hardly obtain credit with even the most pitiful simpleton for baving very rigidly adhered to the abstemious regimen and exclusively vegetable diet prescribed in the rule of their founder, St. Bernard. The quondam property of the priory now belongs to the Earl of Fife.

**POLGAVIE**, a small village and sea-port on the north shore of the firth of Tay, and in the parish of Inchture, 8 miles west-south-west of Dundee, and 3 miles north of Errol, Perthshire. See INCHTURE.

**POLL-EWE**, a *quoad sacra* parish on the west coast of Ross-shire. It was disjoined from the parish of Gairloch in 1833; and is artificially divided from it by an imaginary line running from Raehed, on the west, to Loch-Tully, and thence crossing Loch-Maree to the east end of Letterewe property, about 4 miles from the head of that lake. Its greatest length is about 20 miles, and its greatest breadth about 12. In 1836 a district around the church to an extreme distance of 3½ miles, contained a population of 640; a small district on the eastern banks of Loch-Maree, contained 80; a district on the western shore of Loch-Ewe, contained 220; and a large district, called Laigh, situated from 6 to 12 miles distant from the church, and totally without a road of access or the means of crossing two intervening rivers which are unfordable in winter, possessed 1,547. The whole population are dispersed over the country in hamlets; and, with very few exceptions, are holders of small lots of land and poor fishermen. The only roads within the parish are one of 6 miles in the Laigh district, and one of 2½ miles from the church to Gairloch parish. Population, in 1836, 2,581,—all belonging to the Establishment. The church is a Government one, and was built in 1828. Sittings 350. Stipend £120; glebe £5. Patron, the Crown. In 1834 there were six schools, two of them wholly Gaelic, and the others both Gaelic and English, aggregately attended by 237 scholars.—The village of Poll-Ewe, the site of the church, is situated at the head of Loch-Ewe, 5 miles north-north-east of Gairloch, and at one of the western terminations of the parliamentary road from Diugwall through

the centre of Ross-shire. It is a chief continental post of communication across the Minsb with the Outer Hebrides; and sends a steam-boat once a-week to Stornoway, a distance of 42 miles.

**POLLOCK**, the ancient name of the parish of Eastwood, in Renfrewshire, revived and frequently used in our day. In old writings it is spelt Polloc and Pollok, which modes of orthography have of late been sometimes employed, but without good reason, for the common form has long been settled, and is in accordance with the practice (as in the case of the name Greenock) of using the letters *ck* in combination, to express the sound with which the word terminates. Besides, if the ancient orthography is to be reverted to, in the present instance, so it should in others, in which event the names of most places throughout the country would more or less undergo mutation.—The estate of Nether Pollock has been described under **EASTWOOD**, and that of Upper Pollock under **MEARNS**, to which parishes they respectively belong. The word, which is also a common surname, is vulgarly pronounced Pöck.

**POLLOCKSHAW**, a burgh-of-barony in the parish of Eastwood, Renfrewshire, 6 miles south-east of Paisley, and 2½ south-west of Glasgow. It is situated in a fine valley, interspersed with trees, upon the banks of the White Cart, at the junction of Auldhouse-hurn, which comes in from the south. It stands on the estate of Nether Pollock, from which, and the word *shaw*, 'a grove,' the name is derived. This place appears in Beau's map, published in 1654, with a bridge adjacent to it across the Cart. Crawford, in 1710, merely mentions it as a village with a stone-bridge of two arches over the river. This bridge still exists, and was a few years since widened and repaired, and furnished with a parapet railing on the south side. In 1742 a printfield, one of the earliest in Scotland, was established here by a Glasgow house, that of Ingram and Co. The bleaching of goods was afterwards commenced and hand-loom weaving for the Paisley and Glasgow manufacturers came to be extensively prosecuted. By 1782, when Semple wrote, the village contained nearly 220 houses, 311 silk and linen weavers' looms; the printfield just mentioned, and another at Thornliebank, in the neighbourhood; 4 bleacfields; 10 stocking-frames; and a tannery of chamois leather, being the first of that kind in Scotland. The tannery has been discontinued, and a glue manufactory is carried on on its site, which is still called 'the Skin-mill-yard.' Towards the end of the century the spinning of cotton was introduced here, by Mr. John Monteith, whose mill was the earliest that was lighted with gas in this country. In 1842, the branches principally carried on are, weaving by hand and power loom, cotton-spinning, bleacbing, calico-printing, and fancy dyeing. The turkey-red dyeing, which was prosecuted for some time at one establishment, was given up about the year 1837. In 1836, the treasurer to the Poors' fund gave the Commissioners of Religious Instruction the following statement of the average weekly wages of the different trades in Pollockshaws, as ascertained by him officially; but the numbers stated do not comprehend the whole of each, but only a certain number taken to obtain an average:—

366 (Hand-loom) Weavers, at	10s.
192 Quarriers, at	12s.
51 Twistors, &c., at	18s.
30 Bleachers and Dyers, at	15s.
29 Wrights and Sawyers, at	15s.
8 Colliers, at	12s.
31 Dyers, at	12s.
29 Carters, at	15s.
11 Smiths, at	15s.
13 Masons, at	14s.
18 Grocers and Spirit dealers, at	20s.

"The wages of the Hand-loom Weavers are those of able-bodied workers above 16 years of age. There were a few more classes the average of whose wages was above 12s. per week."

Pollockshaws has a town-house surmounted by a tower, consists of several streets, and is lighted with gas, by a joint-stock company which was formed in 1836, with a capital of £2,300. To the ecclesiastical details given when describing the parish (Vol. I. p. 426), we have to add, that the *quoad sacra* church of Auldfield—a neat structure with a spire—was lately erected in the town, and that, in 1840, the Secession congregation built a house for their minister at a cost of £670. Circuit small-debt courts are held here by the sheriff six times a-year, and courts by the justices once a-month. There is a post-office subordinate to Glasgow. A branch of the Western bank of Scotland was established in 1841. As the bank agreed to receive deposits so low as ten shillings, a branch of the National Security Savings' bank, which had previously existed, was discontinued. The population of the town alone was, in 1811, 3,084; in 1821, 3,850; in 1831, 4,269; in 1841, 5,007.—This place was erected into a burgh-of-barony by charter from the Crown dated 5th January, 1813, which conveyed generally "all powers, liberties, privileges, and jurisdictions pertaining and belonging, or which ought to pertain and belong, to any free and independent burgh-of-barony, which may have been erected in Scotland since the date of the act of parliament" passed in 1747 for abolishing heritable jurisdictions. The magistracy consists of a provost, baillie, treasurer, and six councillors, any three being a quorum. The qualification of electors, and of magistrates, is being a resident inhabitant within the burgh, possessor of a house, or other property within it, of the yearly rent of £4 sterling, and being a burges. To enter burges the requisites are, residence and possession of property of the yearly rent specified. The magistrates and council have the sole power of admitting burges. The provost and baillie remain in office two years, one of them going out alternately each year. The treasurer and councillors are elected annually. All are eligible to be re-elected. The magistrates and council have power by the charter "to make such bye-laws and regulations as are consistent with the public law of the realm, and conducive to the establishment and preservation of good order, and the advancement and prosperity of the said burgh." The burgh property consists of ground occupied as a washing-green; certain houses, including the town-house, and an inn. In 1833 the debts were £745. This debt had been gradually increasing since the erection of the burgh. The sum of £120 was incurred in defending an election of magistrates in 1825, which was challenged, the expense of which was taken out of the burgh funds by the magistrates. In 1833 the annual revenue was about £42 17s.,—of which £34 17s. was from rents, and £8 from freedom fines for entering burges. So many persons came forward to qualify themselves for voting at the contested election in 1825, that the freedom fines for that year amounted to no less than £130 14s. 6d. The ordinary annual expenditure, in 1833, amounted to £41 2s. There are no local taxes levied, and the charter confers no power of imposing them. From 1820 to 1833 only 15 civil cases had been tried, and 20 criminal: no regular courts had been held since 1821. The magistrates appoint a town-clerk (who acts as assessor) and an officer. Occasionally also they appoint a fiscal. Every manufacturer or trader is bound to enter burges, but the obligation is rarely enforced. The fees of entry are,—for strangers £1 1s.; sons of burgeses 10s. 6d. The number of burgeses is about 260. There are no corporations or

crafts, and no police statute, the preservation of the peace being attended to by the justices. As a burgh, Pollockshaws has no voice in parliamentary representation, persons qualified on property situate within it voting for the county member. In 1841-42 these persons, resident and non-resident, amounted to 146.—About the year 1826, thirteen years after Pollockshaws had been raised to the rank of a municipality, the magistrates and council sent a petition to the House of Peers against the Corn-laws. On its presentation by the Earl of Rosebery, the Earl of Lauderdale (another Scottish peer) denied or doubted the existence of any such place or corporation. Soon afterwards they transmitted to Lord Lauderdale a petition on another subject, and for proof of the existence of the town and corporation referred him to a Gazetteer. No notice was taken of this communication, and the petition was not even presented. 'The Shaws folk,' as they are popularly termed, suffered much bantering on account of this affair; and they, in turn, did not hesitate to express indignation against their countryman, the Earl, for what they could not but consider his inexcusable ignorance.

**POLLOCK AND GOVAN RAILWAY.**—This is a short line of railway connecting the rich mineral fields to the south of Glasgow with the city. The one terminus is at Rutherglen, and the other at the harbour of the Broomielaw, on the Gorbals side of the river Clyde, being a distance of about 3 miles. It passes through the parishes of Govan, Gorbals, Kingston, and Rutherglen, and county of Lanark. The formation was authorized by two acts of parliament, passed respectively in 1830 and 1831; and although the stock is held by a company, the work has principally been promoted by the enterprise of Mr. Dixon, the proprietor of the Govan iron-works and collieries in the immediate vicinity of Glasgow. From this cause, it is generally known in the neighbourhood by the name of Dixon's railway. The capital stock of the company amounts to £46,000. The width of the gauge is 4 feet 6 inches. No passengers are carried on the line; and coals, ironstone, freestone, fire and common brick, and malleable iron, are the principal articles of traffic. Hitberto horses have been employed as the moving power; but very important improvements are being made by laying an additional double line of rails to a 4 feet 8½ inch gauge, and forming a connexion with the Greenock and Ayr railways, at their joint terminus in Tradeston, when locomotive engines will be used as the motive power. Parliamentary plans have been lodged for extending this railway to the mineral districts of the Monklands and South Calder, by forming a junction with the Monkland and Kirkintilloch railway, and the Wishaw and Coltness railway, near Dundyvau iron-works. A bill, by which authority to this extent was taken, was brought into parliament in session 1840-41, but it was defeated. Parliamentary notices for a similar extension have, however, been given for session 1841-2. Parliamentary plans have also been lodged, and notices given, for session 1841-2, for extending the line to the town of Hamilton, and the rich mineral districts in that neighbourhood. When these contemplated extensions are finished, they will open up a direct railway connection to the harbours of Glasgow and Greenock with the most valuable mineral district in Great Britain.

**POLMADIE**, a place in that small section of the parish of Govan which belongs to Renfrewshire. Here coal is extensively wrought.

**POLMONT**, a parish in the extreme east of Stirlingshire; bounded on the north by the frith of Forth; on the east by the Avon, which divides it

from Linlithgowshire; on the south-east by Muiravonside and Falkirk; and on the west by Falkirk and Bothkenner. Its greatest length from north-east to south-west, is 6 miles; its greatest breadth is  $2\frac{1}{2}$  miles; and its area is about  $7\frac{1}{2}$  square miles. Nearly the whole area is finely enclosed, and in a state of the highest cultivation, and wears as opulent and joyous an appearance as that of any of the first class parochial districts in Scotland. A considerable part is rich carse ground, and very fertile; and the rest is naturally of a light and partly of a moorish soil, but reclaimed, and in fine order. The carse ground is level, and the district behind it swollen and undulated. The climate, even on the carse lands, is remarkably healthy. Coal, ironstone, and freestone, abound, and are very extensively worked. Several mineral springs exist, and are strongly impregnated with iron, from the great quantities of ore which are embowelled under the higher grounds. West Quarter or Grange-burn traces nearly the whole of the western boundary; another burn traverses the interior to the Avon; and a third runs for  $2\frac{1}{2}$  miles along the south-eastern boundary. The shore of the frith is low and flat, and opens at low water on an extensive stretch of sea-bed, coated over with silt. The parish is traversed cross-wise by Graham's-dyke, or Antoninus' wall, by the railroad between Edinburgh and Falkirk, by the Edinburgh and Glasgow railway, and by the Union canal. Four or five gentlemen's seats, and several villas, occur at agreeable intervals, and fling pleasant features on the landscape. The village of Polmont stands in the centre of the parish, on the railroad from Edinburgh,  $3\frac{1}{2}$  miles east of Falkirk; and the village of Nether Polmont stands on the road from Falkirk to Bo'ness, distant from the latter 4 miles. Both Polmont and the Avon give the title of Baron to the Duke of Hamilton. Population, in 1801, 2,197; in 1831, 3,210. Houses 627. Assessed property, in 1815, £8,785.—Polmont is in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. Patron, the Crown. Stipend £264 1s. 11d.; glebe £12 12s. Unappropriated tithes £598 1s. 5d. The church was built in 1731. Sittings 607. A place of worship at Bennetstown was erected in 1836, by several gentlemen, at a cost of about £100, and is occupied as a preaching-station by dissenting ministers of various evangelical denominations. A preaching-station at Reddingmuir has a room with 130 sittings, and is supplied every Sabbath by a preacher connected with the Establishment. According to an ecclesiastical census taken in the end of 1835, and beginning of 1836, the population then was 3,107; of whom 2,585 were churchmen, 503 were dissenters, and 19 were nondescripts. In 1834, the parish-school was attended by 246 scholars, and five private schools by 448. Salary of the parochial schoolmaster, who employs an assistant, £34 4s., with £70 fees, and about £5 other emoluments.

POLWARTH, a parish nearly in the centre of Berwickshire, lying on the line where the lower declivities of the Lammermoors glide into the great plain of the Merse. It has a triangular form; is bounded on the north by the parish of Langton; on the south-east by Fogo; on the south-west by Greenlaw; and on the north-west by Longformacus; measures  $3\frac{1}{2}$  miles along the north,  $2\frac{1}{2}$  along the south-east,  $2\frac{1}{2}$  along the south-west, and a mile along the north-west; and comprehends an area of 3,052 imperial acres. About one-third of this surface, from the western angle inward, is covered with heath, and moderately upland; and it has several hilly summits, the chief of which is Kyles-hill, a porphyritic eminence on the boundary, which is 1,110 feet above the level of the sea. The remaining dis-

trict is undulating, with a general declination to the eastern angle; and is all beautifully sectioned, chequered, and broadly dotted with woods and hedge-row trees. The western district lies above the old red sandstone, which is often conglomerate and coarse; and the eastern and south-eastern districts lie upon the new red sandstone, which in the latter is a silicious limestone, the siliceous predominating, and in the former partly a blue-rock marl, and partly a whitish sandstone, which in some parts is soft, in others it is of so hard a texture as to have been used for huilding. The soil on the upland is moorish, and elsewhere is sandy, but chiefly argillaceous, and generally on a retentive subsoil. About 1,300 acres are arable; upwards of 1,000 are moor; 260 are rich cultivated pasture; 400 are under wood; and 12 or 13 are moss. The climate is salubrious. The only streams are some small tributaries of the Blackadder, which runs parallel with the whole south-east boundary, at about half-a-mile's distance. Redbraes-castle, the seat of the Earls of Marchmont previous to the building of Marchmont-house by the last earl, about 90 years ago, stood about 200 yards to the east of the present house. Marchmont-house, the seat of Sir Hugh Hume Campbell, Bart., their representative, (being great-grandson of Lady Anne Campbell, eldest sister of Hugh, the 3d and last earl of Marchmont,) and the proprietor of the whole parish, stands in the southern angle, and with its beautiful sylvan scenery and long undulating avenue, contributes richly to the landscape on the north-west side of that splendid amphitheatre, the Merse.

The village of Polwarth stands a little inward from the northern boundary, and opposite its middle, on the road from Greenlaw to Dunse, about  $3\frac{1}{2}$  miles from the former, and 4 from the latter. It occupied a space of ground called Polwarth-green, over which it was sprinkled in a capricious and romantic manner, amongst old ash and sycamore trees. As the old houses became ruinous, they have been rebuilt partly in a more convenient and uniform manner, and the village otherwise much improved, particularly by two bridges being built over the burn which runs through it. Near the centre of the green stood two aged thorn-trees, around which for upwards of three centuries marriage parties were on every nuptial occasion accustomed to dance. There now remains only the root of one of these aged thorns, and a scion springing from it, along with two others of modern date. A tune was early composed in honour and aid of the custom, and called 'Polwarth on the green;' and thus, at various times, had songs been made in adaptation to it,—among others, a well-known one by Allan Ramsay, beginning

“ At Polwarth on the green,  
If you'll meet me the morn.”

The custom, unfortunately for Scotia's hygone sports and ancient harmless pastimes, has gone into disuse,—the last hymeneal visit that this aged thorn received was about 20 years ago. The male inhabitants, from encouragement in that department by the Earls of Marchmont, were almost all musicians, and in many instances were excellent violin players; but at present the cultivation of this science does not seem to be so much in esteem amongst them. Polwarth was at one time a rather noted seat of tanning and shoemaking, and more recently of weaving; but the former trade is now unknown in the village, and the two latter have very much declined. The trade most in repute is that of masons, of whom there are a considerable number; and about one-half of the inhabitants are employed in agriculture. The only roads additional to the Greenlaw and Dunse one, are strictly parochial or private. Population, in 1801,

291; in 1831. 288. Houses 63. Assessed property, in 1815, £3,166.—Polwarth is in the presbytery of Duise, and synd of Merse and Teviotdale. Patron, Sir H. H. Campbell, Bart. Stipend £194 16s.; glebe £19. Unappropriated teinds £185 4s. Schoolmaster's salary £30 16s., with £17 10s. fees, and £3 other emoluments.

The church of Polwarth stands  $\frac{3}{4}$  of a mile to the south-east of the village, and is beautifully situated amongst the woods, about the same distance north-east of Marchmont-house. According to an inscription on the walls, it was built before the 900th year of the Christian era, repaired in 1378, and rebuilt in 1703. The parish was anciently a rectory, and seems to have always been under the patronage of the lord of the manor. The font for holding holy water, used in Papistical times, is still to be seen at the church. The cemetery of the Marchmont family is a vault beneath the church. In this abode of the dead, Sir Patrick Hume, a distinguished statesman and patriot, sought refuge during the persecution of the Stuarts, in 1684; and in this sepulchral retreat he was supplied with food and other necessaries by his heroic daughter Grizel, then only 12 years of age,—afterwards Lady Grizel Baillie,—a lady of lofty attainments and energetic mind. The food, which she carried to him under night, she had to secrete at meal times, none but her mother and herself being privy to the circumstance that an additional and unseen guest was daily provided for from their table. Being very uncomfortable in the vault, from the cold and damp, he removed to Redbraes-castle, where, beneath the floor in one of the rooms, there had been dug a place of concealment, to which he could retire in case of a search being made for him. Finding this place, however, one morning partly filled with water, Sir Patrick at once abandoned all hope of remaining in security at home. He accordingly set out during the night, accompanied by a trust-worthy servant named John Allan, who was to conduct him part of his way to London. Travelling towards the Tweed, they had unconsciously separated, Sir Patrick having somehow quitted the proper road without being aware of it till he reached the banks of the river. This mistake, however, proved his safety; for, during the time they were separated, Allan was overtaken by those very soldiers who were in pursuit of him. Having thus fortunately escaped, Sir Patrick, in the assumed capacity of a surgeon, journeyed safe to London, and thence proceeded to Holland. He returned to Scotland at the Revolution, and was afterwards created successively Baron Polwarth and Earl of Marchmont, which titles became dormant at the death of the 3d Earl, in 1794. Hugh Scott, Esq. of Harden, succeeded in 1835, by judgment of the House of Peers, to the title of Baron Polwarth. The venerable Baron died in January, 1842, at the advanced age of 83, and is succeeded in his titles and estates by his eldest son, the Hon. Henry Francis Hepburn Scott. The peerage of Marchmont is at present in dependence before the House of Lords.—The frequency with which the trees, in the immediate vicinity of the church in the adjacent woods, have been struck by lightning, has been often a subject of remark. A very extraordinary instance of this occurred about 15 years ago. An aged ash, that had endured the severities of many a winter, stood about 100 yards to the north of the church, was struck by the electric fluid, rent from top to bottom, ignited, and burned down.

POMONA, or MAINLAND, the chief and much the largest of the Orkney islands. It occupies a somewhat central position in the Orcadian archipelago; but, on the whole, is situated southward of that centre, and immediately north of Scalpa-Flow.

Its coasts are so very deep, variously, and almost unintermittedly indented by the sea, that an idea cannot easily be conveyed of its outline, or a close estimate made of its extent. The western and main part of it may, in a general view, be regarded as an ellipsoid, whose longer axis extends north and south, and measures 16 miles, and whose shorter axis, at right angles with the former, measures 11 miles; and its eastern part extends nearly due east, or east by south, from the southern extremity of the ellipsoid, and measures  $11\frac{1}{2}$  miles in length, and from  $1\frac{1}{2}$  to  $7\frac{1}{2}$  in breadth. But such marine intrusions as render the latter division so various in breadth, greatly affect the outline and extent also of the western division; and the entire island, in consequence, has probably not more than 150 square miles of area. Safe harbours and places of anchorage occur at brief intervals round the whole coast; and are particularly good at Stromness, Kirkwall, Deer-sound, Holme-sound, and Cairston. That of Stromness especially excels, in combined safety and commodiousness, most harbours in all the north of Scotland. The western coasts are, in general, bold and precipitous, and often rise up in mural cliffs, which are covered by vast multitudes of sea-fowl, and shivered into detached pinnacles and masses, or perforated by caverns and natural arches. Near Skail, on these coasts, a magnificent and lofty arch, which conducts through a little promontory, may be safely entered during a calm; but, during the prevalence of a storm, it is tumultuously and sublimely scoured by spouting and careering surges which conflict with one another in their tempestuous chase. When a storm approaches from the west, a sudden rolling of large and sullen waves usually announces it several hours before it arrives; and, when it comes in contact with the country, it hurls enormous stones against the cliffs, and makes such a tremendous bellowing in the caverns as may be distinctly heard at the distance of 18 miles. Several fresh-water lakes, among which are those of Stennis, Orphir, Birsay, Skail, and Aikerness, occur in the interior, and send off streams which abound in various species of trout, and have considerable power for the driving of machinery. But as no spot is further than  $4\frac{1}{2}$  miles from the sea, and by far the larger part of the area is not more than 2 miles, rivers, and all their luxuries of salmon, scenery, and varied vale, are necessarily known. The western district, though nowhere mountainous or wildly upland, has a considerable extent of hill and moor; and presents a much larger aggregate of waste land than might be anticipated from the comparative softness of its features. Though the hilly grounds embosom various large and fertile valleys, possessing the double advantage of a sheltered position and a loamy soil, cultivation, as in the smaller Orcadian islands, and in all Shetland, feels fettered and utterly without appliances except where encouraged by a cheap, abundant, and easily obtained supply of sea-weed as a manure, and is, in consequence, confined principally to belts of territory along the shores. The very largeness of the western district—its great superiority in breadth over every other part of the Orkney and Shetland archipelagos—thus occasions it only to have a comparatively great aggregate of waste ground, unmarked by an enclosure, and extensively allowed to lie in a state of nature. The wastes, though now, like the rest of the island, quite bare of wood, and unornamented with so much as a single tree, bear decided indications of having once been covered by a forest of dwarf trees; and they seem also, from numerous instances of horns found in their peat-bogs, to have been once tenanted by herds of the now extinct stag. They possess not—nor indeed do any of the Orkney moors

or lands—either foxes, or hares, or partridges; but they greatly abound in plovers, snipes, and redgrouse. In the central and eastern parts of the west district, or within the parochial limits of Harray and Rendal, live most of the scanty remains of the ancient udallers, the once independent allodial proprietors of the soil. When feudal tenures were introduced by the Scottish Earls of Orkney, and forced upon the reluctant and limited landholders by their frontless tyranny, and by the unreflecting injustice of the Scottish government, a portion of the oppressed who inhabited the least valuable parts of the country, sullenly chose to retain their independence, or to forfeit their rude possessions; and, with a spirit quite characteristic of the predominant practices of resistance to oppression, they clung to all the distinguishing badges of their original condition, and bequeathed down to, less than a century ago, the Norse language, and, down to the present day, a sufficient amount of unmixedness of name with the pronouns and the surnames of the Gael and the Saxon as proclaims their pure Scandinavian descent. Attached to the clusters of small arable farms provincially called towns, there exist everywhere throughout Pomona, as in the other Orkney islands, large commons for the pasturing of sheep, and the maintenance of large herds of swine. The sheep of a district were formerly allowed to run wild, and in totally confused intermixture athwart these commons; and, once a-year, when they were collected to be shorn, they received on their ears, or on their nose, such marks as should enable their respective owners, at the next season of shearing, each to select his own from the general flock. These barbarous practices, so incompatible with all the principles and objects of skilful or even common-sense sheep husbandry, have now, in a great measure, been superseded, and have given place to a well-directed economy for improving the breed of sheep. The swine of the country are of a diminutive and very inferior character; and, existing in herds, with undomesticated habits, they work fearful havoc when accident allows them access to the cultivated lands.—Pomona possesses both of the only towns of Orkney,—Kirkwall, in its eastern division, and Stromness at the south-west corner of its western. The island is divided into 13 parishes, 8 of which are assorted in pairs into united parishes, while one of the pairs is again dissevered, *quoad sacra*, and made two separate erections. There are thus 9 *quoad civilia* parishes, and one *quoad sacra*, or parliamentary parish. On the east are Holme, St. Andrews, and Kirkwall, and the parliamentary parish of Deerness, annexed *quoad civilia* to St. Andrews; and on the west are Orphir, Sandwick, Stromness, Evie and Rendal, Birsay and Harray, and Firth and Steinis. Population, in 1801, 13,929; in 1831, 15,787. Inhabited houses, in 1831, 3,057.

**POOL**, a small village in the parish of Muckart, Perthshire. It stands 2½ miles west of Crook of Devon, and on the road from Perth to Clackmannan and Kincardine. Immediately north-east of it stands the parish-church.

**POOL-EWE.** See **POLL-EWE.**

**PORT-ALLAN**, nominally a harbour, but really a mere creek and unimportant landing-place at the mouth of a rill which divides the parishes of Sorbie and Whithorn, Wigtonshire.

**PORT-ALLEN**, or **POW-OF-ERROL**, a small harbour in the frith of Tay, 1¼ mile south of the village of Errol, Perthshire. It claims only one vessel, and is in a dilapidated state; but has been the scene of considerable rural commerce. A new pier is in progress ¾ of a mile further down the frith.

**PORT-ASKAIG**, a small harbour on the north-east coast of Islay. It is situated on the Sound of Islay, opposite Feoline in Jura, and 10 miles north-north-east of Bowmore. Here are a good pier, a safe haven, and a pleasant and commodious inn. The adjacent land almost everywhere rises immediately and rapidly from the sea; and is, to a great extent, and up to the summit of its ascent, clothed in plantation.

**PORT-BANNATYNE**, a beautiful village 2½ miles north-north-west of Rothsay, in the island of Bute. It consists chiefly of an edified terrace in the form of the segment of a circle round the head of Kames-bay; and looks out upon all the brilliance and beauty of the east end of the Kyles. The village has some good houses, presents a clean and tidy aspect, and is a choice summer-retreat of strangers for sea-bathing. Its stated inhabitants are maintained chiefly by herring-fishing, and possess about 25 boats. Within less than a mile west and west-north-west of the village stand the ancient fortified mansion of Kames-castle, still inhabited, and the *quoad sacra* parish-church of North Bute, erected by the Marquis of Bute, in 1836, at the cost of £1,000. Population 300.

**PORT-CHARLOTTE**, a village on the west coast of Lochindaal, opposite Laggan-point, and 16 miles south-west of Port-Askaig, Islay. It has an inn, a distillery, and an Independent chapel,—the last built, in 1830, at a cost of between £400 and £500. The village is in the parish of Kilchoman, and has long been a preaching-station of the parish minister. Population about 400.

**PORT-DOWNIE**, the basin at the west end of the Union canal, in the parish of Falkirk, Stirlingshire. Across the locks, in its vicinity, below Port-Downie mill, is a magnificent viaduct of the Edinburgh and Glasgow railway.

**PORT-DUNDAS**, a village in Lanarkshire, and suburb of Glasgow, about 1 mile from the city, where the Great canal terminates; so named in honour of Lord Dundas, to whose exertions the canal, in a great measure, owes its completion. Here are a spacious basin, and large warehouses and granaries.

**PORT-EASY**, an improving fishing-village 2 miles from Buckie, in the parish of Ratbven, Banffshire. It became a fishing-station, and received a nucleus of 5 houses in 1727. Population, in 1793, 178; in 1837, 420.

**PORT-EDGAR**, a small harbour on the frith of Forth, in the parish of Dalmeny, Linlithgowshire. It is situated ¾ of a mile west of Queensferry, and 2 miles east of Hopetoun-house, and is noted as the place at which George IV. embarked, in 1822, for England.

**PORT-ELLEN**, or **PORT-ELLINOR**, a new village on the south-east coast of Islay, 11 miles south-east of Bowmore, and directly opposite the island of Gigha. It is substantially built, and has a neat inn, and a very large distillery. The village was commenced in 1824, and, in that year, had only one erection; but now it numbers between 150 and 200 houses. A hay, at the head of which it stands, affords safe anchorage; and a commodious quay, on a rocky promontory near the middle of the bay, was constructed in 1826, and improved in 1832, by Campbell of Islay. The harbour has the important benefit also of a lighthouse; and is visited by the steamers which maintain a communication between Islay and Glasgow. The inhabitants are employed chiefly in fishing and agriculture. The village received its name in compliment to Lady Ellinor Campbell of Islay.

**PORT-GLASGOW**, a parish in Renfrewshire, bounded on the north by the frith of Clyde; on the

east and south by Kilmalcolm; and on the west by Greenock. It is of small extent, being only about a mile square, or containing an area of 844 English acres. The land is partly flat and partly hilly. The level tract along the coast, except that on which the town stands, is occupied as garden-ground, which furnishes an abundant supply of excellent vegetables and fruit. Behind there is a steep range of hills, about 400 feet in height, which, being covered with wood and verdure, present a fine appearance when seen from the river. This hilly portion is in tillage and pasture. The landward part of the parish belongs to Lady Shaw Stewart, daughter of the late Robert Farquhar, Esq., the transference of the barony of Newark to whom, has been mentioned at page 120 of this volume.—Newark-castle, a ruinous square building, with round turrets and battlements, stands on a point of land projecting into the river, and commands a splendid view of the surrounding scenery. On the west side, over the main door, are the arms of the Maxwells, the former proprietors, with this inscription underneath: "The Blessing of God be Heirin, Anno 1597." On one of the windows is the date 1599, and over others are the letters "P. M." (Patrick Maxwell). Other parts appear to be older than the period indicated by these dates. This fabric ceased to be the habitation of its owners in the beginning of the 18th century, but some of the apartments are still occupied by tradesmen.\*—The population of the parish, in 1801, was 3,865; in 1831, 5,192. The number of houses, in 1821, was 1,382; in 1831, the number was returned as 401; but that enumeration was made upon an erroneous principle, the number given being that of separate buildings, many of them comprehending several distinct houses. Assessed property, in 1815, £14,707.—The parish is in the presbytery of Paisley, and synod of Glasgow and Ayr. Patrons, the town-council of Glasgow. The church was built in 1823, at an expense of £3,000, upwards of £1,200 of which was subscribed by the inhabitants. Sittings 1,200. Stipend, as fixed in 1823, £280, including an allowance of £30 yearly for a house and garden. Within the *quoad civilia* bounds of Port-Glasgow is included the *quoad sacra* parish of Newark, which was constituted in February 1838, by authority of the General Assembly. What now forms the church of Newark was built as a chapel-of-ease in 1774. It cost about £1,350, which was raised by subscription. Sittings 1,600. Stipend £100, with an allowance of £16 13s. 4d. for communion elements. A United Secession congregation was established in 1790, and in the following year a church was built, the cost of which is unknown, but it could not now be erected under £1,200. Sittings 752. Stipend £130.—By census taken by the minister and elders in the beginning of 1838, there were in the *quoad sacra* parish of Port-Glasgow 1,939 persons belonging to the Established church, 698 belonging to other denominations, and 18 not known to belong to any; total, 2,655. In the parish of Newark there were, at the same time, belonging to the Establishment, 2,187; to other denominations, 1,189; total, 3,376.—There are eight schools, with one teacher in each. One of these is parochial. Salary £20 per annum, with from £40 to £50 school-fees. Another is a charitable institution, called Beaton's school, from its founder David Beaton, who,

in 1814, bequeathed £1,400 for building and endowing a seminary for the education of poor orphan children.

PORT-GLASGOW, a parliamentary burgh and sea-port in the above parish, is situated on the south side of the frith of Clyde, 2 miles east of Greenock, and 20 miles north-west of Glasgow, by the shortest turnpike road. It occupies a level tract on the shore, and is so much overshadowed by the heights behind, that the rays of the sun do not reach it for nearly six weeks in winter. As the name indicates, this place was originally intended as the sea-port of Glasgow, of which it was long regarded as a mere dependency. Soon after the Restoration, the magistrates of that city, experiencing great inconvenience from the shallowness of the Clyde, (the deepening of which was not, till long afterwards, thought of,) they resolved to erect a harbour nearer the mouth of the river. They first pitched upon Dumharton, but after much discussion, the civic rulers of that place rejected the proposal, fearing, with the short-sighted policy of the times, that the concourse of mariners would "raise the price of provisions to the inhabitants." The Glasgow magistrates next turned their attention to Troon, but there also they were, for a similar reason, repulsed. At length, in 1668, as their records show, and not in 1662, as is represented in several works of authority, they succeeded in purchasing from Sir Patrick (often erroneously called Robert) Maxwell of Newark, about 22 English acres of ground, on the bay of Newark, with the right of forming a harbour there. Immediately afterwards, they obtained from the Crown a charter of confirmation, erecting the ground and the harbour, which was authorized to be formed into a free port, with power to build a prison, to appoint bailies and other officers, to exercise jurisdiction, civil and criminal, competent to a baron, and to levy customs, tolls, and anchorage dues. A harbour was accordingly constructed, and streets were laid off. The name of New-Port-Glasgow was given to the place; but now that the port is no longer a novelty, the prefix 'New' has become obsolete. In 1695, the town, and a small adjacent district, were, by the competent authority, disjoined from the parish of Kilmalcolm, and erected into a distinct parish, under the name of New-Port-Glasgow. Two years afterwards, the Rev. Robert Millar, author of the 'History of the Propagation of Christianity,' and other works, was ordained minister of the new parish, but he did not continue long, having, in 1709, been appointed one of the ministers of Paisley. A church was not built till 1718, public worship having, in the interval, been conducted in a house which was appropriated for the purpose.† In 1710, Port-Glasgow was constituted the principal custom-house port of the Clyde, and for a time it took the lead of Greenock. The narrow limits originally proposed became too confined for the town, which extended itself over the adjacent village of Newark, then belonging as a burgh-of-harony to Hamilton of Wishaw. The town thus comprehended two burghs-of-harony, subject to two different superiors. In order to remedy this inconvenience, and at the same time to improve the place, there was passed, in 1775, an act of parliament, which gave it a municipality consisting of 13 councillors, therein called trustees, including 2 bailies, and which, at the same time, made provision for supplying the town with fresh water, for paving,

\* "It was the opinion of the learned Mr. David Buchanan," says Sir Robert Sibbald, "that there was a Roman camp on the Clyde, where New-Glasgow [or New-Port-Glasgow, the original name] stands, and where appear the vestiges of a tower." The author of *Caledonia* justly remarks that no such camp has appeared to more accurate eyes, and that the tower, idly mistaken for a Roman post, was probably either the castle of Newark, or that of Easter Greenock.

† The original bell of this church was some years ago sold to the proprietors of a Clyde steam-boat, where we have seen it in daily use, bearing the no longer applicable inscription of "Soli Deo Gloria." The community would do well in repurchasing and preserving so interesting a memorial of the early days of "the Port."

cleaning, and watching the streets, for erecting public markets, and for repairing the quays. These powers were enlarged by a statute passed in 1803, which also provided for the erection of a new courthouse, a jail, and other public buildings. By the Burgh reform act of 1833, the number of the council was reduced to 9, consisting of a provost, 2 bailies, and 6 ordinary members. The jurisdiction is exercised by the magistrates directly; and in civil cases it is unlimited, in point of extent, as the burgh, being one of barony, dependent upon a royal burgh, the jurisdiction was not affected by the stat. 20<sup>o</sup> Geo. II. There are no hurgesses nor incorporations, nor any persons entitled to exclusive privileges. It farther appears from the Commissioners' report, that in 1833 the property of the burgh, heritable and moveable, amounted to £31,841 1s. 8d., and that the debts due by it were £26,925 10s. 1d.; while the expenditure was £2,520 0s. 4d., and the revenue only £1,889 8s. 5½d. Since that time the revenue has gradually increased, having, in 1841, amounted to £2,917 19s. 11d. The town was, by the Reform act of 1832, elevated to the rank of a parliamentary burgh, and united with Kilmarnock, Rutherglen, Dumharton, and Renfrew, in electing a member of the legislature. Constituency of Port-Glasgow, in 1841-2, 200. According to the census of 1841, the population within the parliamentary boundaries was 6,938; inhabited houses 1,384; uninhabited 51; building 3. Although these boundaries comprehend only about the half of the parish, they contain nearly the whole of the population, the district not included being the hilly part on the north, which is very thinly inhabited.

The town presents an aspect of great neatness and regularity. The streets are straight, and for the most part cross each other at right angles; while the houses, pretty nearly equal in size, and generally white-washed, give to the whole a light and uniform appearance. The town-house is of plain workmanship, ornamented in front with a portico, resting on four massy fluted pillars, and surmounted with a handsome spire, rising from the centre. The only other modern building worthy of notice is the church, built in 1823; it is square in form, and plain in outward appearance, but is deservedly admired for the simple elegance of its internal construction. In the vicinity of the town there are some elegant villas with pleasure-grounds.—Attached to the port are two capacious harbours, substantially built, and completely sheltered from the storm. They are furnished with ample quay and shed room, together with a graving-dock, the oldest in Scotland, (having been built in 1762,) but lately improved at a great expense. East of these, the bay of Newark, which is naturally adapted to the purpose, has been converted into a spacious wet-dock, where vessels of the largest class may lie securely afloat in every state of the tide. It was commenced in 1834, extends over a space of 12 acres, and has cost about £40,000. Much delay and expense arose from a portion of the outer wall having given way during the progress of the work. Formerly the trade of this place was almost entirely carried on in ships belonging to merchants resident in Glasgow. Of late years, however, the people of Port-Glasgow have themselves become ship-owners, and at present about one-fourth part of the tonnage belonging to the place is owned by persons resident here. For several years back the tonnage belonging to the port, engaged in foreign trade, has ranged from 21 to 32,000 tons. The customs' revenue has very materially decreased, in consequence of a large proportion of the goods formerly warehoused here being now carried direct to Glasgow. More than half the trade of the port is with

the British North American possessions; about a fourth is with the West Indies; and the remainder with the United States, the Mediterranean, and the East Indies. This is the principal place on the Clyde for the importation of North American timber, the quantity varying from 16,000 to 30,000 tons annually. Port-Glasgow had once an extensive coasting trade, but in consequence of the improvements on the river, nearly the whole of it has been transferred to Glasgow. Ship-building is carried on here to a considerable extent, and ropes and sail-cloth are manufactured. There are two sugar-refining houses. The town supports four branch banks, and a provident bank. There is a public library, instituted in 1798. The numerous steam-boats navigating the Clyde touch here; and the railway from Glasgow and Paisley to Greenock passes close on the west of the town.

**PORT-GORDON**, a fishing-village, politically in the parish of Rathven, hut ecclesiastically in that of Enzie, Banffshire. It stands 2½ miles south-west of Buckie, and 3¼ miles east-south-east of the mouth of the Spey. A small brook divides it into two parts, —Port-Gordon Proper, on the east, and Port-Tanachie on the west. Salmon, besides other fish, are caught in large quantities; corn is extensively shipped; coals and lime are imported; and a small coasting trade is carried on. Population, in 1836, 460.

**PORT-GOWER**, a neat fishing-village in the parish of Loth, on the east coast of Sutherlandshire. It stands on the mail-road from Inverness to Wick, 2½ miles south-west of Helmsdale. It is the site of the parish-schoolhouse, and possesses a comfortable and agreeably situated inn. Most of the villagers are active fishermen; and others cultivate pendicles of some fertile land which lies in the vicinity.

**PORT-HOPETOUN**, the basin at the east end of the Union canal, and a modern suburb on the south-west side of **EDINBURGH**: which see.

**PORTINCROSS**. See **KILBRIDE (WEST)**.

**PORT-KNOCKIE**, a fishing-village politically in the parish of Rathven, hut ecclesiastically in that of Cullen, Banffshire. It stands 1½ mile west-north-west of Cullen, 1½ mile east of Findochtie, and 4½ north-east of Buckie. It was commenced in 1677. Population, in 1793, 243; in 1837, 750.

**PORT-LETHEN**, a fishing-village in the parish of Banchory-Davenick, Kincardineshire. It stands 1¼ mile south-south-west of Findon, and 8 miles north-north-east of Stonehaven. Population, in 1836, 220.

**PORT-LOGAN**, a village and harbour at the head of Portnessock bay, on the west coast of the parish of Kirkmaiden, Wigtonshire. The village is 14 miles south of Stranraer, and regularly communicates with it by carrier. The quay affords safe harbourage, but is so awkwardly constructed as to neutralize the natural capacity of the place for offering refuge to vessels at all stages of the tide.

**PORTMAHOLMACK**, a village and small seaport within Tarbet-ness, in the parish of Tarbet, Ross-shire. It stands on the north side of the long narrow peninsula which forms the south screen of the outer part of the Dornoch frith; and is south-west by west of Tarbet-ness, 11 miles east-north-east of Tain, and 15 miles north-east by north of Cromarty. At the beginning of the present century, it was chiefly a site of storehouses for receiving payment of rents in oatmeal and hear, and had only five buildings, and no road of communication with the interior; hut now it has a population of about 400, an extensive herring-fishery conducted by nearly 100 boats, a harbour whence considerable exportations are made of farm produce, and a public road which sends off ramifications to almost every sub-district

and important nook of Easter Ross. The shore here is flat, and the pier extends 350 feet in a direct line, ending with a return-pier 70 feet in length. The expense of this pier was £3,168, one-half of which was paid by Government.

**PORT-MARY BAY**, a creek in the parish of Rerwick, Kirkcudbrightshire, 5 miles east of the entrance of Kirkcudbright-bay, 6 miles south-east of the town of Kirkcudbright, and  $1\frac{1}{2}$  mile south of Dundrennan abbey. It has its name from the circumstance of having been the miserable Queen Mary's place of embarkation on her fatal flight to England. The vale leading to it from the abbey, her place of temporary refuge after the fight of Langside, is sequestered and beautiful. The margin of the creek is overhung by rugged and precipitous cliffs, which impart to the scene an aspect of wildness and solemnity. Tradition still points to the rock from which Mary took an eternal leave of her lost kingdom. See **DUNDRENNAN**.

**PORTMOAK**, a parish in Kinross-shire, lying between Loch-Leven and the boundary with Fifeshire. It is bounded on the north-west by Orwell; on the north-east by Strathmiglo and Falkland; on the east by Leslie; on the south by Auchterderran and Ballyngry; and on the west by Cleish, Kinross, and Loch-Leven. A farm belonging to it, and measuring about 140 acres, lies detached in the Fifeshire parish of Kinglassie. The main body consists of two distinct and almost dis severed parts. The larger section lies all on the east side of Loch-Leven, is bounded along the south by the river Leven, and measures, in extreme length, from north-north-west to south-south-east, 5 miles, and in extreme breadth, in the opposite direction,  $3\frac{1}{2}$  miles. The smaller section lies principally along the south side of Loch-Leven, is connected with the former section by a neck of only 3 furlongs at the mouth of the river Leven, and measures, in extreme length, from west-north-west to east-south-east, 5 miles, and in mean breadth about 6 or 7 furlongs. The superficial extent of the whole parish is about 6,404 Scottish acres. West Lomond-hill occupies a large part of the area in the north-east; it rises in beautiful undulations on the north-north-east, and breaks precipitously down at the opposite end; it extends in a ridge whose summit-line is from  $1\frac{1}{2}$  mile to  $2\frac{1}{4}$  miles distant from the east side of Loch-Leven; and it attains an extreme altitude of about 1,030 feet above sea-level, and, over a large part of its fine braes, is subject to the plough. Benartie-hill, very similar in configuration to the former height, and not much inferior to it in elevation, draws its summit-line along the southern boundary, parallel to the south side of Loch-Leven, and at a distance of from  $4\frac{1}{2}$  to 10 furlongs. The part of the parish not occupied by these heights and their skirts, consists of narrow hanging plains at their base. The whole surface is a rich landscape of braes, crags, fine meadows, fertile fields, and thriving plantations, reflecting their beautiful features from the mirror of Loch-Leven. Nearly all the good screen-scenery of that fine lake, in fact, lies within Portmoak. See **LEVEN (LOCH)**. Between two-thirds and three-fourths of the whole area are arable; about 300 acres are under plantation, and probably the same number are in meadow; and what remains is nearly all hill-pasture. The soil of most of the arable grounds is light, early, and exceedingly fertile. The pasture-lands usually maintain about 1,300 black cattle, and 1,400 Leicester and Cheviot sheep. Limestone occurs in great abundance, and is quarried and burnt to the amount of about 4,000 tons of carbonate in the year. Sandstone, both so soft as to be unfit for use, and so bard as to be a good building material, abounds, but is not quarried. Co-

pious springs of pure water are numerous on the Loch-Leven side of West Lomond; and in one place, near the village of Scotland-Well, three, which are situated within 400 yards of one another, emit as much water as, with a suitable fall, would drive a mill. These are said to have been called by Oliver Cromwell Fontes Scotie; and may have given name to the neighbouring village. Yet another, and perhaps a likelier origin, has been assigned for the village's name. See **SCOTLAND-WELL**. Excepting three hamlets, the only other village is **KINNESSWOOD**: which see. Both villages are about 5 or 6 furlongs from the east side of Loch-Leven; they are mutually distant about a mile; they have each an annual but little more than a nominal fair; and they contain respectively 500 and 315 inhabitants. Portmoak itself lies on the margin of Loch-Leven due west from Scotland Well, and consists only of a farm-stead, and a half-deserted burying-ground, with a thin cordon of trees. Directly opposite, and at 5 furlongs' distance in Loch-Leven, lies an islet of about 70 acres in extent, called St. Serf's island, and belonging to the parish. On this islet anciently stood a priory, dedicated to St. Serf or St. Servanus; and at Portmoak was the site of its church, and the landing-place of its monks. The first, or an early superior of the priory, or of a Culdee establishment which preceded it, is said to have borne the name of Moak or St. Moak; and, from him, the landing-place, and afterwards the kirktown and the parish, are supposed to have been called Port-Moak. The parish, however, appears to have originally borne the same name as the islet. Some ruins of the priory still exist. The establishment is said to have been founded by a Pietish king, and given to the Culdees; and it afterwards became a dependency of the Augustinian Abbey of St. Andrews. Its revenues in 1561 were £111 13s. 4d. in money; 1 chaldar and 12 bolls of bear; and 4 chalders and 8 bolls of oats. Among distinguished natives of Portmoak may be named Andrew Winton, prior of Loch-Leven in the reign of James I., and the native of 'The Loch-Leven Chronicle, or a History of the World from its creation to the captivity of James I.' in Scottish verse, a copy of which is preserved in the Advocates' library at Edinburgh, and published about the beginning of the present century; John Douglas, the first protestant archbishop of St. Andrews; and Michael Bruce, the amiable author of several of the finest sacred lyrics in the General Assembly's collection of Scripture Paraphrases, and the subject of a recent and interesting biographical volume by the Rev. Mr. M'Kelvie of Balgedie. The parish also figures largely in the preliminary history of the Scottish Secession, as the scene, for many years, of the ministry of the Rev. Ebenezer Erskine. The principal landowners are the Marquis of Northampton and Thomas Bruce, Esq. Two turnpike roads, respectively eastward and northward, pass through the two principal sections of the parish. Population, in 1801, 1,151; in 1831, 1,554. Houses 300. Assessed property, in 1815, £5,074.—Portmoak is in the presbytery of Kirkcaldy, and synod of Fife. Patron, Graham of Kinross. Stipend £254 2s. 5d.; glebe £10. Unappropriated tithes £12 4s. 3d. The ancient parish-church stood at Portmoak, but the modern one is situated in the vicinity of Scotland Well. A United Secession meeting-house stands at the hamlet of Balgedie, half-a-mile north of Kinnesswood. In 1834, the parish-school was attended by 54 scholars; and two private schools by 84. Parochial schoolmaster's salary £34 4s., with fees.

**PORT-OF-MONTEITH**. See **MONTEITH**.

**PORTNAHAVEN**, a fishing-village, and a *quoad sacra* parish, at the south-west extremity of Islay.

The village is picturesquely situated in a sheltered and rocky nook of a tempestuous bay at the point of the peninsula of the Rinns, 24 miles south-west of Port-Askaig. It consists of about 60 slated houses; and is protected by an island across the entrance of the bay from the fierce winds and surges which beat in from the west. On this island—around which mariners are menaced with dangers inferior only to those of the passage round the north of the continent—a lighthouse was erected in 1825. It stands in N. lat. 55° 24'; W. long. 6° 29'; and is elevated 150 feet above high water. The village is a well-known cod-fishing station; and stands on the property of Mr. Campbell of Sunderland.—The *quoad sacra* parish was detached by the church courts from the parish of Kilehoman; and is attached to a parliamentary church. Patron, the Crown. Stipend £120, with a manse and garden. The church, and also a school-house, are situated in the village.

PORT-NESSOCK, a hay 1½ mile broad at the entrance, and 1 mile inland, on the west coast of Kirkmaiden, Wigtonshire. It is 9 miles distant from the Mull of Galloway: see PORT-LOGAN.

PORT-NOCKIE. See PORT-KNOCKIE.

PORTOBELLO, a *quoad sacra* parish on the coast of the frith of Forth, Edinburghshire. It comprehends only the town of Portobello, and its immediate environs; and is somewhat more than a mile in length, and nearly half-a-mile in extreme breadth. It belongs, *quoad civilia*, to the parish of Duddingston, and was divided from it, in 1834, by authority of the General Assembly. Its population, according to a survey made by the minister and session, in 1835, was then 2,924; and consisted of 1,606 churchmen, 431 Relievers, 316 Episcopalians, 228 United Seceders, 90 Wesleyan Methodists, 80 Roman Catholics, 73 Independents, 66 nondescripts, 14 Baptists, 13 Glassites, Quakers, and members of other small bodies, and 7 Original Seceders.—There are in the parish seven places of worship. The parish church was built in 1810, as a chapel-of-ease, at the cost of £2,650; and it was enlarged in 1815. Sittings 1,022. Stipend £180.—The Relief chapel, belonging to a congregation formed in 1834, was built, in 1825, at the cost of nearly £2,000, and purchased, in 1834, by the Rev. David Crawford, the minister, for £900. Sittings 800. Stipend not known.—The United Secession chapel is of recent erection, and belongs to a congregation formed in 1835. Stipend £85.—The Independent chapel was built in 1835, at the cost of £420; and belongs to a congregation which was formed at its erection. Sittings 300. Stipend £80.—The Episcopalian or St. Mark's chapel is private property, and is rented at £40 a-year by a congregation which was established in 1825. Sittings 504. Stipend £80.—The Roman Catholic chapel was built in 1826; and it was purchased, in 1834, by the Roman Catholic bishop of Edinburgh, for £600. Sittings 200. No stipend.—The Wesleyan Methodist place of worship is simply a room in the glass-works.

PORTOBELLO, a modern town, a parliamentary burgh, and a fashionable summer-resort, is situated on the shore of the frith of Forth; 3 miles east of Edinburgh, 2½ miles from Leith, and the same distance from Musselburgh. Previous to 1762 the ground on which it stands, and the rich, fertile, and highly cultivated lands in its vicinity, were an unenclosed and unproductive waste, called the Figgate-whins, covered with tall furze, and thin and stunted herbage; sweeping down to the naked sea-beach in an expanse of dreariness, and relieved, in the repulsiveness of its aspect, by the presence of only one human dwelling. The lands were then let to one of the Duddingston tenants for 200 merks Scottish

a-year, or £11 2s. 2½d. sterling; and in 1762 or 1763, they were sold by Lord Milton to Baron Muir for about £1,500. Immediately after being sold, they began to be feued out at £3 per acre; and so early as 1804, they had, in some instances, been subfeued at a feu-duty, or perpetual rent, for each acre of £40 a-year. Even the solitary human abode which sat amid their original waste, and was destined to give its name to the town, had a comparatively recent origin, and still stands on the south-west side of High-street nearly opposite Regent-street, an object of peculiar interest to the towns-people, and of curiosity to strangers. The building is an humble cottage; it was used as an hostelry for foot-travellers on a road which led out from the Fishwives' causeway, across the whins, toward Musselburgh; and, according to tradition, it was built by a sailor, or marine, who had served under Admiral Vernon, in his South American expedition of 1739, and was called by him Porto-Bello, in memory of his having acted a part in the capture of the town of that name in America. In 1765, Mr. William Jamieson, the feuar under Baron Muir, discovered near the Figgate-burn, a valuable bed of clay; and he erected on the banks of the stream, first a brick and tile work, and afterwards an earthenware manufactory. These public works, as well as others which followed them, necessarily made the place a seat of population, occasioned the appearance of a thriving village, and, by their continuance and prosperity, have powerfully aided the expansion of that village into a town. About the beginning of the century, the beauty of the beach, the fineness of its sands, and its general eligibility as a bathing-place began to draw the attention of the citizens of Edinburgh; and they speedily won for the incipient town a fame which prompted the erection of numerous villas and dwelling-houses, and which has steadily and increasingly secured a general local prosperity.

The present town is but partially compact or continuous; and, in most of its street-lines, is not completely edified, while in two or three it has hardly a house. The whole, including both real and projected, forms a belt along the margin of the beach 7 furlongs in length by from 200 to 350 yards in breadth, with one large and several smaller projections from the landward side into the interior. The principal street forms the edge of the belt, and extends from north-west to south-east; bearing, over its north-west end, the name of High-street, and over the remaining part the name of Abercorn-street. The two parts of the thoroughfare, though each straight in itself, are a quarter-point or two from being on a line with each other; and both are spacious, and carry along the Edinburgh and London railroad. The Figgate-burn intersects the town near the north-west end; the only parts on the Leith side of the stream being a kind of street of no great length along the Fishwives' causeway, and an area of about 400 square yards disposed in partially edified thoroughfares. All the principal streets south-east of the burn send off at brief intervals, and generally at right angles, alleys, and streets to the beach. These are 12 or 13 in number; those on the north-west are narrow and belong to the early periods of the town's existence; and those in the middle district, and toward the south-east, become increasingly elegant, and at the same time increasingly unedified, or streets *in futuro*, as the distance recedes from the burn. The principal—mentioning them in regular order—bear the names of Tower, Bath, Regent, Wellington, Melville, Pitt, John, James, and Hamilton streets. What—were the town an old one, and had it known the curious piece of masonry which Roman Catholic usages made essential to every mar-

keting locality—would be called the cross, is a point at which that thoroughfare is divided into its two parts, and whence Bath-street goes off to the sea, and a spacious and beautiful street called Brighton-street runs 400 yards to the south-west. Brighton-street is crossed near its head by an elegant imitation of the frequent street-refinements of Edinburgh,—a crescent bearing the name of Brighton, and presenting its front or concavity toward the sea. So formidable an array of street-lines, disposed over so great a space, would seem to indicate no small magnitude of town, and a very considerable bulkiness of population. But the principle which for a long period regulated the form of houses, and the disposal of plots of ground, having been merely the individual tastes and convenience of private persons, the town is, to a great extent, an aggregation of villas, has many open areas, and almost as often nestles its houses in umbrageous gardens, as places them in line, or continuously along the skirts of its streets. The parts of it, however, which have been built since about the year 1815, have been reared principally on speculation by builders; and they are greatly more regular, as to both the street-lines and the houses, and will probably unite with parts yet, and soon to be erected, to render it one of the neatest, or even one of the most elegant, second-rate provincial towns in Great Britain. The extensive brick-work which figured so prominently in the origination of the town, has contributed much to disfigure it by tempting the construction of many of the houses with bricks. But, over by much the greater part of the area, the building material is the same beautiful light-coloured sandstone which gives so pervading a charm to the architecture of the metropolis; and, as the brick edifices decay, it will probably be used for the houses which succeed them, and be allowed the universal adoption it deserves.

The public buildings of the town hardly correspond, in either numbers or elegance, with its importance. The most curious is a ruinous tower which overlooks the beach, and is situated a little south-east of the foot of Tower-street. This is a fantastic pile, designed in wildly capricious taste, and built by an eccentric gentleman, who was one of the earliest subfeuars under Mr. Jamieson. Antique carved stones appear in the cornices and the windows, and are alleged to have belonged partly to the cross of Edinburgh, and partly to the dilapidated ecclesiastical piles of St. Andrews.—An excellent suite of hot and cold salt-water baths was erected in 1806, at the cost of £4,000; and overlooks the beach between the foot of Bath-street and that of Regent-street. A commodious and neat suite of markets occupies a convenient situation in the centre of the town. The assembly rooms stand at the head of Bath-street. St. Mark's chapel, standing in an open space south of Abercorn-street, is the only one of the ecclesiastical edifices which has any architectural pretensions. The others are creditable buildings, but all plain,—built wholly for use, and in no degree for show.—Lodgings of every variety, and accommodations of all sorts usual at such places, exist for the use of sea-bathers, and all classes of summer residents and visitors. Many of the private houses—the mansions and the villas—are the homes of capitalists and annuitants who have adopted Portobello as their constant retreat, and who people it in sufficient numbers to give its resident or unshifting population a tone of selectness and elegance. In winter, the town is far from having the forsaken and wan aspect which pervades a mere sea-bathing station; and, in summer, it has an animation and a gaiety superior to those of any other sea-bathing station in Scotland. Its nearness to “modern Athens,”—its encirclement

by a cordon of the Mid-Lothian towns and villages of the most various population,—its position near the lower and waving eastern declivities of Arthur's-seat,—its easy access to a profusion of the choicest and most various promenades,—and its command of the superb and silken scenery of the lower frith of the Forth, with its gentle yet gorgeous Lothian and Fifeshire screens,—combine, with its interior advantages, to render it a place of no common attraction. —The sands of Portobello, or the expanse of beach between high and low water mark, consist of the finest and purest debris, and slope with a slow and almost insensible gradient, and have an average breadth of very nearly half-a-mile. Facilities, in the shape of wheeled machines, exist for carrying bathers over the inconvenience of the very slow descent. In 1822, George IV. reviewed on the sands a very large body of yeomen-cavalry.

Portobello, in spite of its name, is no sea-port, and neither has, nor probably ever will have, any seaward trade. A small harbour was constructed at the mouth of the Figgate-burn, by Mr. Jamieson, soon after his discovery of the clay-bed; but it never was of any use except for boats, and is now completely ruinous. Some stout talk has occasionally been heard about applying for an act of parliament to authorize the erection of a suitable harbour for vessels; but the Figgate creek, the only available spot, is all but impracticable, and could not be made to admit vessels of even small burden except at a heavy expense. The manufactories of the town, however, are of some importance, and consist of three brick-works, two potteries, one extensive glass-work, one soap-work, one lead-work, and one mustard manufactory. The number of persons employed in these works is estimated at between 500 and 600. The town has a branch of the Western bank of Scotland. Communication is maintained with Edinburgh by coaches at almost every hour of the day. The Dalkeith, Edinburgh, and Leith railway passes immediately behind the town. In 1839, a valuable oyster-bed was discovered direct out from the sands.

Portobello is governed by a provost, 2 bailies, a treasurer, and 7 councillors; and it has a town-clerk and a procurator-fiscal; but it has neither property, revenue, patronage nor police. Certain portions of it, or those which are occupied by the richer classes, are lighted and watched by subscription; but the portions occupied by the operative population are quite unprotected, and, owing to the vicinity of Edinburgh and Leith, are infested with numerous lurking depredators. The only peace-preserving force is a body of high constables, consisting of a moderator, a secretary, a treasurer, and 12 ordinary members. On the enactment of the statute, under the Reform ministry, creating a municipality, and erecting the town into a parliamentary burgh, some of the proprietors and inhabitants were adverse even to the election of a magistracy; while others, who constituted the majority, resolved to supply by subscription the funds necessary for procuring a court-house, paying an officer, and defraying the other more immediate expenses incidental to such an establishment,—and yet, at the date of the Report of the Commissioners on Municipal Corporations, they had subscribed only “a sum upwards of £72.” Persons who are averse to the creation of a police-establishment, say that it would seriously damage the prosperity of the town, or that, in consequence of the expense which it would occasion, a very great number of inhabitants would be driven away who prefer the place as a residence on account chiefly of its freedom from taxation. The lighting of the town, so far as practised, is by gas from the Musselburgh

gas-work. Portobello unites with Leith and Musselburgh in sending a member to parliament. Constituency, in 1840, 232. The parliamentary boundaries include the village of JOPPA: which see. Population, in 1821, of the whole district, 1,912; in 1831, 2,781; in 1831, 3,270 stately, and about 5,000 during the summer and autumn; in 1841, 3,585, of whom 3,201 resided in the town of Portobello. Number of houses, in 1821, 334; in 1831, 517. Houses of £10 and upwards of yearly rent, in 1831, 313; in 1834, 324. Rental, in 1834, £8,300. Assessed taxes, in 1831, £1,550 Os. 2d.

PORT-PATRICK, a parish near the middle of the Rhinns of Galloway, and on the west coast of Wigtonshire. It is bounded on the north by Leswalt; on the east by Inch and Stoneykirk; on the south by Stoneykirk; and on the south-west and west by the Irish channel. Its greatest length, from east to west, is  $4\frac{1}{2}$  miles; its greatest breadth is 4 miles; and its area is about 16 square miles. Its form is quadrangular and compact. Piltanton-burn traces the boundary for  $1\frac{1}{2}$  mile on the east; and one indigenous burn, and another from Leswalt, traverse the interior to the sea. The coast is  $4\frac{3}{4}$  miles in extent; and, except for a mile on the north, where it stretches nearly due north and south, it trends to the south-east. Over its whole extent, it is bold, rocky, and dangerous to navigation. Rocks and cliffs, locally called "heughs," beetle up in but a slightly interrupted line of natural rampart, and, in many instances, have an elevation of from 100 to 130 feet. Many of them are sheer precipices; others have a sufficient gradient to tempt the descent of youngsters to the water's edge, and are notched with protuberances which the adventurous occupy as fishing-seats; and a few have small caves and cavernous rents, in which wild-fowl and the spray of the angry sea contend for possession. The whole line of rampart is cloven down or shaven away by only four little bays; and, except at these points, forbids the existence of a beach. These bays, as to their extent, are mere creeks: but they are faced with level or gently-sloping belts of sand, they are hung round with declivitous rocky banks, or with green and swelling hills, and they, in a certain degree, or in given winds, afford safe entrance and shelter to vessels. Killantringan bay touches, or partly forms the northern boundary; Portkale and Portmurray, the next bay and a twin one, is  $1\frac{3}{4}$  mile to the south; and Portpatrick and Castle bays are respectively  $1\frac{3}{4}$  and 1 mile from the southern boundary. Portmurray, though separated from Portkale by only a slender promontory, and forming with it an outline like that of the curvive Greek omega,  $\omega$ , has a beach entirely different,—its composition being of the fine soft sand of freestone, while that of the others' beach is the grit and small boulders of primitive rock. A glen which comes down to the head of Portmurray, and brings to the sea the silvery waters of a brook, is pronounced by the writer of the New Statistical Account, "the most picturesque in Galloway;" its stream making "a very pretty wild waterfall," and its sides being traversed by walks which are "very tastefully cut, and connect the two bays with the present mansion-house of Dunskey, situated about a mile distant on the height."—CAIRNPAT [which see] is the biggest ground in the parish; it is situated  $3\frac{1}{2}$  miles east-north-east of the town; and it commands a map-like view of the parish and of the Rhinns, and a very extensive and varied circumjacent prospect. On the west, the larger part of the parish forms a foreground of tumulated and continually broken surface, sweeping away in a huddled crowd of low heights to the sea; the broad and beautiful belt of the Irish channel occupies the centre, stud-

ded with sails, or streaked with the smoke and foam of steam-ships; and the Irish coast seen over an extent of 70 miles, forms the back-ground, with the dark Mourne mountains on the one end, the bold summits and the long sweep of the Antrim hills on the other, and the town of Donaghadee, and the rich, gently-undulated grounds of Downshire in the middle. On the south, the Rhinns recede in a narrow belt of 18 miles, chiefly peninsular, to the Mull of Galloway, moorish and hillocky in aspect, but gorgeously girt round with "the deep blue sea;" and in the far but clear distance beyond them, after a broad interval of glittering ocean, appear the picturesque heights of the Isle of Man. On the east, the smaller part of the parish forms an immediate foreground, sloping rapidly down to Piltanton-burn; the broad, level, and low isthmus between Luce-bay and Loch-Ryan, forms a remoter foreground, rich, variegated, and embellished with the groves and the plantation-belts of the Earl of Stair, the lakes and wooded grounds of Castle-Kennedy, and the plantations of Garthland; and a wild and mountain-clad, though comparatively low country, forms a slowly receding back-ground, and rests its outer rim on the blue and dimly-seen mountains of Kirkcudbright. On the north, the eye is carried beyond the parochial boundary, over a surface ruggedly broken, and profusely rocky; it then wanders over the town and level shores of Stranraer, the whole expanse of Lochryan, and the sloping or soft-featured grounds of Leswalt and Kirkcolm; and thence it is lifted away up the broad and long gulf of the Clyde, past the bold bill-crag of Ailsa, to the far-distant mountain-ranges of Arran and Argyleshire.—The prevailing rocks are greywacke, greywacke slate, and alum slate; the first of which is quarried as a building material. The soil is almost everywhere moorish or mossy; and, where cultivated, it has become a brown mould, or a blackish, moss-streaked, or interworked with a marly clay, taken up by the plough from the subsoil. Mosses abound, and, even on the hill tops, are frequently 6 or 7 feet deep. Nearly two-thirds of the whole area is in a higher or lower sense arable; about one-third is waste or pastoral; and about 300 acres are under plantation. Dunskey castle, the ancient seat of the family of Blair, and now in ruins, stands on the brink of a giddy precipice at the head of Castle-bay; it was anciently secured, on the land side, by a ditch and drawbridge, the remains of which are still visible; and, before the invention of artillery, it must have been impregnable. In its vicinity are a streamlet and a cave which were esteemed, even in the last generation, to possess some magic properties of healing; and, at the change of the moon, were resorted to by infirm superstitious persons, who bathed in the streamlet, and dried themselves in the cave. Population, in 1801, 1,090; in 1831, 2,239. Houses 293. Assessed property, in 1815, £4,025. Port-Patrick is in the presbytery of Stranraer, and synod of Galloway. Patron, Blair of Dunskey. Stipend £158 6s. 8d.; glebe £30. An assistant and successor has £50. The parish-church was built in 1629, and has not since been enlarged, or materially altered. Sittings 300. A large hall in the old barracks was fitted up, in 1836, as a sort of chapel-of-ease, and is gratuitously supplied by licentiates resident in the parish. Sittings 120. The population, in 1836, according to ecclesiastical survey, consisted of 1,605 churchmen, and 376 dissenters,—in all 1,981 persons,—an increase of 200 or 250 taking place by immigration when the harbour-works are going on. In 1834, the parish-school was attended by 35 scholars, and 6 private schools by 140. Parochial schoolmaster's salary £30, with about £5 fees.—At

the village and haven now called Port-Patrick, there was anciently a chapel dedicated to St. Patrick. The Irish apostle is said, in one of the monstrous legends which found currency during the dark ages, to have crossed hither from Ireland at a single stride, and left a footmark in a rock so distinct as to be traceable till the rock was, in modern times, quarried; and he, at all events, seems to have been the adopted tutelary, or the favourite of the Roman Catholic natives. The barony of Portree comprehended the village and haven; it anciently belonged to the family of Adair of Kinhill; and, at the end of James VI.'s reign, it passed to Hugh Montgomery, Viscount of Airds, in the county of Down; and, for a considerable period, it remained in his family. Lord Montgomery speedily obtained the erection of the village into a burgh-of-barony, and imposed on it the name of Port-Montgomery, — a name which it for some time wore. Hitherto all the lands which constitute the present parish had belonged to the parish of Inch, and were called the Black Quarter of Inch. But, in 1628, a charter, granted by Charles I., detached them—consisting of Portree, Kinhill, and Sorries—from that parish,—erected them into a separate parochial jurisdiction,—ordained that a church which was then in the course of erection in the burgh-of-barony should be the parish-church,—and constituted the church a rectory under the patronage of the lord of the manor; and another charter, which was dated two years later, and which suppressed the abbey of Saulseat, granted as endowment for the new parish the unappropriated revenues of the parish-churches of Sauleseat and Kirkmaiden, which had belonged to the abbey.

The town of PORT-PATRICK stands on the coast of the parish just described,  $6\frac{1}{2}$  miles south-west of Stranraer,  $34\frac{1}{4}$  west of Wigton,  $56\frac{1}{2}$  south-south-west of Ayr,  $75$  west-south-west of Dumfries,  $90\frac{1}{2}$  south-south-west of Glasgow, and  $131\frac{1}{2}$  south-west of Edinburgh. It stands directly opposite the Irish port of Donaghadee, on the coast of the county Down, at the distance from it of only 21 miles; and, occupying the spot of British ground which is nearest to Ireland, and whence a passage can at any time be made without obstruction, it has acquired importance as a great international ferry-station between the two great insular sections of the United Kingdom. Its site is peculiar, and, on a small scale, romantic and wild. A semicircle of high ground, composed in the interior of soil-clad hills, and toward the sea of naked and bold cliffs, sweeps so completely round it, or sends the cliffy ends so far past it in abutments upon the sea, that not a peep of the outer world can be obtained, except right forward across the channel to the coast of Ireland. The declivities of the semicircle or amphitheatre are, at the sides of the little enclosed bay, steep and impracticable, and, even behind the town, except where a streamlet has cleft them into a cleugh and ploughed down a path for the highway, they are sufficiently rapid to give the whole enclosed space the appearance of a large quarry, or the half of a huge bowl. Neither by land nor northward or southward by the sea, is the town seen till it is almost entered; and from either position, especially from the latter, it has an aspect of dreariness and of suffocating seclusion which make a stranger from either the gay city, or the broad and bounding landscape, recoil from the idea of its ever becoming his home. Yet, though the nest in which it sits is almost as bare of embellishment as the bald bead of a hill of the hardest primitive rock, it hasks in a south-westerly exposure, and, during high winds from most points of the compass, is envially snug. Most of the houses are of very recent date; and all are

built of the greywacke of the rocks of the amphitheatre. The newest and principal street is about 350 yards in length; it commences near the centre of the basin at the harbour, runs up toward the gorge, or incision in the hill-screw, and carries out the railroad on the way to Stranraer; and it has on its south-side, the manse, the church, and the burying-ground. The street next in importance is bisected by the former nearly in the middle, has a slight curvature in its direction, and overlooks the harbour. Some smaller streets lie behind the angles made by the intersection of these.

The harbour of Port-Patrick, till a comparatively recent date, was a mere natural inlet between the two rocky ridges which project into the sea. As there is a prodigious swell from without when the wind blows upon the shore, while naturally no elbow or recess existed where there was either smooth water or shelter, vessels which entered the harbour had to be run aground, and, with the aid of probably all the inhabitants both male and female of the village, dragged up the beach, to be in a similar manner laboriously re-launched on occasion of their next trip to sea; and, in consequence, they all required to be of flat-bottomed construction, and were comparatively rude and small. Not till 1662, and then only once a-week, was a regular post established through Port-Patrick between Scotland and Ireland; but long after that date, the flat-bottomed boats and the rude natural harbour continued to be in use; and even toward the end of last century, two large flats, which had formerly been Government packets, were to be seen on the shore, as monuments of modern barbarity. Eventually, in 1774, a very fine pier, one of the best in Britain, was built, and, before 1790, was provided with a reflecting lighthouse, to correspond with one which had long previously existed on the opposite coast at Donaghadee. But greatly better harbourage being required, a project for new works on a magnificent scale was brought before parliament in 1820, and begun to be executed in the spring of next year under the superintendence of a board of commissioners; and it has since been carried on, under the designing and direction of the celebrated engineers, the elder and the younger Rennie, till now it is not far from being completed. The new works have already cost upwards of £130,000, and are incomplete only in the north pier. Their form is nearly that of a horse-shoe; the sides running out into piers, which are furnished near their extremities with jetties, and are slightly curved toward each other, and, at the jetties, contract the entrance to 180 feet. On one side of the enclosed basin, a large rock looks up from the surface, and partially protects the interior from the wind and swell at the entrance; and, on the other side, the old pier of 1774 projects inward on a line nearer the land than the centre of the basin. The parapets of the new piers are formed of large blocks of grey limestone from Wales; and that of the southern one terminates in a semi-circular sweep, within which rises a handsome light-house of the same material, and 46 feet high. But the stupendous, and by far the costliest parts of the works, are concealed from the eye by the tide, and were constructed chiefly with the aid of the diving-hell. A lively article in the Dumfries Magazine, written in 1825, when the works were in a state of but small forwardness, affords a fine conception of the enormous labour of erecting them, and hints by anticipation the magnitude of their completed state. "Port-Patrick, as it is," says the writer, "no more resembles Port-Patrick as it was, than a little rural hamlet resembles a great trading town. No doubt the original shielings which formed

the village stand, for the most part, where they were—the Irish coast is still in view, with the wide Atlantic flowing between (in summer, as tranquil as a sleeping child; in winter, vexed and agitated by every wind that blows, as if threatening to drive ‘the Mull’ from its base); but, in every other respect, the aspect of ‘the Port’ is wholly changed. In place of a few cock-boats or timid coasters, you see a brace of steamers, each of the power of 40 horses, and so splendidly fitted up as to deserve the name of floating palaces; in place of one packet in the offing unable to gain, another to leave, the olden harbour—that beating painfully about in the offing, this afraid to dip her keel in the waves, you see vessels that start as regularly as the clock strikes, that gallantly bear up against wind and tide, complete the passage in little more than two hours, and serve all the purposes of those marine bridges which only Michael Scott, the wizard, could build. In place of a few fishermen lounging about, and wondering why the herrings had not arrived, you see 800 able-bodied men, whose labours are all directed to one great object, and who, under the guidance of a skilful engineer, are triumphing over the most formidable obstacles of nature. Even the din of the ocean is stilled by the clang of hammers, the suction of pumps, the hissing of boilers, and the roar of hells, such as the Cyclopes themselves might have coveted. A hundred jumpers are set home at once, trains are laid, matches applied, and as blast succeeds blast, large masses of rock are hurled headlong into the depths below, from positions they had occupied since the era of the flood. There, an artificial dike or mound shuts out the waves, and, with the aid of the pump, enables the workmen to bid defiance to an element which, to a stranger, seems fraught with destruction and death; here the punt approaches, and the crane discharges its ponderous load; and farther on still the diver descends in his house of iron, and even at the lowest depths, founds and fashions the base of erections which give extension to the commerce, and safety to the unequalled navy of Britain.” Neap-tides rise in the harbour from 8 to 11 feet, and spring-tides from 14 to 17 feet. Steamers of 80 horse-power could he so built as to enter and remain afloat in any state of the tide; but as yet only steamers of at most 50 horse-power have been employed.

The traffic and the connexional importance of Port-Patrick are sadly pigny affairs compared with the greatness of the place as a ferry-station, and with the sumptuousness of its harbour. It has, indeed, rapidly passed from the state of a miserable fishing-hanlct to that of a large village or small town, and from numbering only about 100 inhabitants at a period less than a century ago, has come to number somewhat upwards of 1,000; but, apart from the stir of mere passenger and mail transit, and the turmoil which has attended the construction of its great public works, it is wrapped in comparative insignificance, and even appears half-threatened with desertion. So far back as 1760 its inhabitants were very nearly equal to a moiety of the present number; and, in 1791, it had upwards of a dozen trading vessels of from 40 to 60 tons each,—it had some companies of ship-wrights who displayed enterprise in ship-building, and promised to make it a large local employment,—it annually, as an entrepot for Scotland, imported from Ireland upwards of 17,000 horses and cattle,—and it made extensive exchanges between the linen of the Irish factories and the cotton goods of Glasgow, Paisley, and Manchester; but now it has only four sailing-vessels, aggregately but 180 tons,—it has not, for very many years, and probably may never again, be witness to the construc-

tion of a vessel,—it has all but ceased to be an entrepot of any sort of produce from Ireland, and does not on the average import more than about two cattle in the day,—and, in general, it has sunk so low that, according to the New Statistical Account of it, dated December 1833, “There is no trade worth mentioning. Lime from Ireland and coals from Ayrshire are imported for the use of the parish, and occasionally the agricultural produce of the district is exported; but rarely, as the greater part is sold at Stranraer, either for consumpt there, or for exportation.” A large custom-house establishment, which not many years ago existed at the port, has dwindled away to a single tide-waiter. Large portions of the national community, too, have for years past freely talked of the possible prudence of depriving it of its only profitable or hoasted characteristic,—its being the most favourable point of inter-communication between Scotland and Ireland; and the trial which has been already for some months experienced of how rapidly intercourse is maintained between Belfast and the great emporia of western Scotland, by means of steam-vessel to Ardrossan, and railway to Paisley, Greenock, and Glasgow, may not improbably do Port-Patrick irreparable damage.

The only manufacture is weaving on some half-score of looms, and the embroidering of muslin by a few women. A fishery of cod employs ten or eleven boats, and about 30 fishermen. A herring-fishery annually employed, for eight years, about 100 men; but, since 1821, it has been extinct. A few families resort to the town in summer for sea-bathing, and help to relieve its dulness. A large traffic was at one time carried on in the celebration of marriage between fugitive pairs from Ireland,—in a similar way for ‘the Emerald isle’ as is done at Gretna-Green for England, though not quite so discredit-able and with much less indecorum; but, in 1826, the practice was happily annihilated by the interference of the church courts. The town’s charter, erecting it into a burgh-of-harony, is practically a carte blanche, and seems never to have been turned to any account. A sub-constable, connected with the county police, and having under his charge three parishes, is the only peace-officer. A miserable lock-up-house exists for the temporary incarceration of a depredator. The town is in no way distinguished for cleanliness; yet has a fair proportion of respectable and intelligent inhabitants.

PORTREE, a parish in Inverness-shire, comprehending the islands of Rasay and Rona, and a large district on the east coast of Skye. This district is bounded on the north by Suizort; on the east by the sound of Rasay; on the south by Strath; and on the west by Bracadale. The greatest length of the parish, measured from north-north-west to south-south-east along Skye, is nearly 18 miles, but, measured from north to south along Rona and Rasay, is 20 miles; its greatest breadth, including the ferry to Rasay, is about 12 miles; and its superficial extent has been estimated at 41,900 acres. The two attached islands will be separately described: see RASAY and RONA. The main part of the parish is a very slender oblong, quite serrated in its outline on the east by frequent indentations of the sea, and possessing a mean breadth of not more than 3 miles. The principal bays are Loch-Portree,  $5\frac{1}{2}$  miles from the northern extremity; Loch-Sligichan, 7 miles farther south; and Loch-Inord, at the southern extremity; and each of these is from  $2\frac{1}{2}$  to  $3\frac{1}{4}$  miles in length. The coast, at the head of the lochs, and in a few other places, is low, and terminates in a sandy, silty, or clayey beach; but, in general, it is bold and picturesque; and, occasionally, it becomes soaring, stupendously mural, and not a little sublime. The

cliffs, towards the mouth of Loch-Portree in particular, are singularly imposing, and form the commencement of a most magnificent range of coast-scenery, which stretches along all the north of the parish, and away to near the extremity of Snizort. The cliffs on the north side of the loch exhibit one specimen which closely resembles Salisbury-crags at Edinburgh; but they, at the same time, present much variety of form, and rise emulously aloft, cliff behind cliff, and crag beyond crag, stupendous in height and impressive in their grandeur. A very steep declivity of about  $\frac{1}{4}$  of a mile in length on the sides of these vast rocks overhangs precipices which fall sheer down to the sea, and is powdered over with blocks and masses which have fallen from the cliffs above; yet, on account of the excellence of its pasture, and in spite of an occasional loss by a fall from its seaward edge, is every summer used as grazing ground for milk cows. At the head of Loch-Portree rises the monarch-mountain of the parish, called Ait-Suidhe-Thuin, or Fingal's sitting-place; because, according to tradition, that hero was accustomed, from a green hillock on its summit, to survey and direct the chase. It rises at first with an easy and gentle ascent, but becomes steep as it approaches the top; it attains an altitude of more than 2,000 feet above sea-level, and commands a view of nearly all the west coast of Ross-shire, of the greater part of the Skye and Long-Island groups of the Hebrides, and of multitudinous and picturesque forking and dissections of the Deucealedonian sea; and, over all its surface, with the exception of brown and rocky acclivities toward its summit, it is either finely pastoral or covered with crops, and is distributed into a variety of farms. On the east side of Loch-Portree rises Bendeanaivaig, 'the hill of defence,' nearly equal to the former mountain in altitude, and capped, like it, with a green hillock. This height is so remarkable in form as to be a sure landmark to mariners; it is perforated in its seaward base with caverns, which the tides wash, and where wild pigeons and sea-fowl nestle; and, athwart its rapid declivities, which overhang the sea, are numerous conical rocks, green or heathy on their tops, and interspersed with pastoral hollows and ravines. A range of hills of various heights and forms runs from north to south along the whole interior boundary of the parish; and another range, quite parallel to it, and broken only by the principal inlets of the sea, runs from end to end along the coast. These ranges enclose between them a long glen, or concatenated series of vales, traversed by streams which run at right angles to the head of the lochs; and, with very unimportant exceptions, they are covered with rich verdure from base to summit; and, abounding in luxurious springs and playful rills and rivulets, each with its tiny dell or ravine, they combine, with the windings of the long glen, and the sweeps of the marine lochs, and the variety and grandeur of the coast, to exhibit a profusion of decidedly picturesque landscape. Wood, however, is exceedingly scarce; and does not seem to thrive either as coppice or as plantation,—some natural birch and alder on Ait-Suidhe-Thuin having died away in dwarfishness, and an experiment in planting firs having completely failed. The climate is surpassingly changeable, very moist, and not a little severe. Scarcely one day in four throughout the year is free from rain, still less from clouds; the varieties of frost, thaw, snow, rain, storm, and calm, are often experienced in a single day; snow sometimes lies from three to seven weeks, and may occasionally be seen on the highest grounds in the middle of June; winds prevail in August and September so tempestuous as frequently to demolish the expectations of the husbandman; and suddenly amassed

clouds sometime burst asunder on the mountains, and pour down their contents in impetuous and thundering torrents which deluge the plains below, and render the merest ordinary rill impassable. Yet the inhabitants, though subject to distempers affiliated to such a climate, are, in general, as strong and healthy, and arrive at as advanced an age as persons who live in milder air and under a serener sky. Of several fresh-water lakes, the most considerable are Loch-Fad and Loch-Leathen, each probably about two miles in circumference, and both stored with fish, very highly situated, and quite romantic in their scenery. A streamlet from Loch-Leathen falls sheer over an extraordinarily high precipice, and forms a cascade which, though but a toy in bulk of water, appears, as seen from the sea below, to be singularly beautiful and grand. Rivulets, though inconsiderable in either length or volume, possess, in two instances, noticeable salmon-fisheries. Geognostic details will be given in the article on SKYE. A very hard granite is quarried for mill-stones; sandstone is quarried as building material; limestone abounds; and coal exists, but in too thin and limited seams to be profitably worked. The soil is principally a wet gravel, and occasionally a spouty moss; and everywhere it is naturally infertile. The arable land bears quite a pitiful proportion to the pastures and moorlands. Husbandry, in all its departments, both in hill and vale, is in a backward condition,—much of the hill pastures existing in commouage, and few improvements having been made on the arable grounds; yet, chiefly through the influence of the Highland society, incipient skill is already quite apparent in the departments of sheep husbandry and of grazing. The cascroim, a crooked kind of spade, respecting which the statist, before the close of last century, said: "Let it be hoped that this tiresome instrument of vast unnecessary toil and labour will be soon laid aside," is still the prevailing succedaneum for a plough. The farmers, with one exception, have no leases; and, even if they could obtain them, are too poor and embarrassed to effect any georgical improvement. The herring-fishery, on which many of the parishioners depended for maintenance, has steadily and seriously declined; and its failure, in 1836 and 1837, occasioned painful and extensive destitution. The antiquities are two circular Dunes, which bear marks of being very ancient; and a Roman Catholic chapel, near the village of Portree, pretty entire in its walls, and surrounded by a deserted hurying-ground. The landowners are Lord Macdonald and Macleod of Rasay. Population, in 1801, 2,246; in 1831, 3,441. Houses 593. Assessed property, in 1815, £731.—Portree is in the presbytery of Skye, and synod of Glenelg. Patron, the Crown. Stipend £157 13s. 4d.; glebe £11. The parish-church was built about the year 1820. Sittings about 800. A thatched house, about 2 miles north of Loch-Sligichan, and possessing accommodation for about 150, is occupied once in three weeks, on Lord's days, by the minister as a preaching-station. Two places of meeting, in connexion with the Establishment, exist in Rasay; the one a barn, used for secular purposes, and the other a school-house, belonging to the Gaelic School society. A missionary minister, who receives the usual salary, officiates alternately at these places, and at the station near Loch-Sligichan. The parish minister supposed the population of the parish, in 1836, to be between 3,840 and 3,940, and stated the whole to belong to the Establishment. In the same year the portion resident on Rasay, Rona, and adjacent islets, somewhat exceeded 1,400, showing an increase of about 200 during the five preceding years. The parish anciently formed part of the parishes of

Snizort and Kilmuir; and was made a separate erection in 1726. Its place of worship, previous to its independence, was the chapel in the vicinity of the village. The parish is deplorably ill provided with schools; there being only a parochial school in the village, attended, in 1834, by 52, and a branch of it in Rasay, little more than nominal, and, in 1834, attended by not one scholar. Parochial school-master's salary £34 4s. 6d., with £5 fees, and £4 other emoluments.

PORTREE, a village, a sea-port, and the capital of the Skye group of the Hebridean islands, is distant 25 miles from Broadford, 28 from Dunvegan, 80 from Tohermory, 110 from Oban, and 113 from Inverness. It stands at the head of Loch-Portree, a little inward from the shore, on the face of a steep and wooded acclivity. Its name means in Gaelic 'the King's harbour,' and by some is supposed to have originated so far back as the 13th century, when Haco, King of Norway, sailed into the loch with the remains of his limited and wrecked fleet after the battle of Largs, but by others is believed to have arisen only in the reign of James V., when that monarch lay some time at anchor in the loch, on his voyage round Scotland. A high octagonal tower erected, in 1834, on the tongue of a rocky promontory which intrudes upon the loch, commands a fine prospect. The village consists of little more than a score of houses, the half of them slated; and it needs to include some straggling rhodes in its environs, to muster a feasible amount of village population, which, after all, falls short of 300. But, owing to the sort of metropolitan character of the place, it is the site of a good jail, a branch of the National bank of Scotland, and an elegant and comfortable inn. These, and the parish-church, a neat and pleasant structure, all overlook the sea. The jail has had an amount of inmates more than might have been anticipated for Skye; and it is ill-conditioned and insecure. Attached to it is a court-room, in which the sheriff-substitute of the Skye district of Inverness-shire holds his courts. Annual fairs are held in the village in May and July for the sale of black cattle, and in November for general traffic and for the hiring of servants. The natural harbour of Portree is quite landlocked, can accommodate several hundred sail, and has a fast clayey bottom. The quay, at the head of it, has no great depth at low-water, but overlooks an aggregately very high tide. The principal exports are black cattle, sheep, wool, kelp, salted herrings, pickled salmon, and dried cod and ling.

PORTSBURGH (EASTER and WESTER), two suburbs, or rather portions of Edinburgh, architecturally incorporated with the old town, and included in the parliamentary and police boundaries, but possessing separate burghal jurisdiction: see EDINBURGH, p. 461.

PORT-SEATON, a fishing-village and small harbour on the frith of Forth, in the parish of Tranent, about a mile east of Prestonpans. It stands contiguously with Cockenzie, the latter on the west, and Port-Seaton on the east; the two forming one village, with a population of about 750: see COCKENZIE. The fishing-boats of the joint village are 30 or 31 in number, all open or undecked, and one-third of them each about 16 tons burden, and remarkably seaworthy. The fishermen dredge oysters on a bank off from the village, and frequently fish for cod and other species on the Marr bank, 30 miles off the coast of Berwickshire. Port-Seaton has a linseed-oil and rape-cake manufactory; and, so early as about 1630, through the patronage or bounty of George, 3d Earl of Winton, it had twelve salt-pans, some of which, or successors to them, still exist. The village has its name from the ancient predominance of the noble

family of Seaton, and the prevalence of their name in the surrounding topographical nomenclature. See SEATON.

PORT-SKERRY, a small hay in the parish of Reay, on the north coast of Sutherlandshire; 15 miles west of Thurso, and 16 east of the entrance of the Kyle of Tongue. Herring and salmon fisheries have for several years past been established here.

PORTSOY, a *quoad sacra* parish on the coast of Banffshire. It was disjoined, in 1836, by authority of the General Assembly, from the parish of Fordyce; and is in the presbytery of Fordyce, and synod of Aberdeen. Its greatest length is 3 miles; its greatest breadth is  $2\frac{1}{4}$  miles; and its superficial extent is about 5 square miles. Population, according to an ecclesiastical survey in 1837, 1,767; of whom 1,589 were churchmen, and 178 were dissenters. All, except 137, were segregated in the hurgh of Portsoy. The church was built in 1815, at a cost of £878. Sittings 650. Stipend £120, of which £40 is paid by the Earl of Seafield.—A Scottish Episcopalian congregation was established in Portsoy previous to the Revolution. Their chapel was built in 1797. Sittings 120. Stipend £40.—A Roman Catholic chapel in the hurgh was built in 1829, at a cost of £332 15s. 8d. Sittings 176. Stipend about £21. The minister or priest officiates on alternate Sabbaths at Banff.

PORTSOY, a small town, a burgh-of-barony, and a considerable sea-port, politically in the parish of Fordyce, and ecclesiastically in that of Portsoy, Banffshire. It is situated on a point of land, on the west side of the little bay or estuary of the rivulet Durn; 6 miles east of Cullen,  $7\frac{1}{2}$  west of Banff, 18 east-north-east of Fochahers, 80 east-north-east of Inverness, and 178 north of Edinburgh. The town is irregularly built; but acquires importance both from its antiquity and its recently thriving condition. Its harbour, though small, is safe, and accommodates vessels of upwards of 200 tons burden; and was greatly improved by the Hon. Colonel Grant, now, and since the death of his brother in October, 1840, the Earl of Seafield. Much and successful attention is given to the herring-fishery; a considerable export and import trade is conducted respectively in grain and in coals; and a number of the inhabitants are employed in fish-curing, flax-dressing, and woollen manufactures. Descriptions of the place, written from 50 to 30 years ago, give prominence to manufactures of thread and fine linen for the markets of Nottingham and London. But Portsoy is known both to commerce and to fame chiefly for a very beautiful marble, and several other rare and curious minerals, found in its vicinity, and exported from its harbour. The marble, properly not limestone but serpentine, occurs in a fine vein, and is commonly known as Portsoy marble. It is a beautiful mixture of red, green, and white, and is wrought into tea-cups, vases, and various small ornaments; but is too hard and brittle to be wrought into chimney-pieces. The other principal minerals are some singular specimens of micaceous schist; a species of asbestos, of a greenish colour, which has been wrought into incombustible cloth; and a remarkable granite, of a flesh colour, which is not known to occur elsewhere in the world, except in Arabia. This granite contains a large proportion of felspar, and shows a brilliancy like the Labrador spar; when viewed in a particular light, it shows a purple and blueish tint; and when polished, it exhibits figures resembling in outline the Arabic alphabetic characters.—The town has a branch-office of the North of Scotland bank. Portsoy was made a burgh-of-barony by charter from Queen Mary; and received a parliamentary ratification of its charter in 1581. The Earl of Seafield is

superior, and appoints a baron-bailie and officers. The bailie has the ordinary powers, but holds no regular courts, and usually interposes his authority rather as an arbiter than as a magistrate. The burgh has neither property nor revenue. The only duties imposed are a small amount of custom levied in the weekly market to pay a person for superintending it; and the quota of the burgh towards the sum paid for the relief of the royal burghs, on account of the participation in foreign trade enjoyed by burghs of royalty and barony.—Population, in 1837, 1,630.

**PORT-WILLIAM**, a thriving village and seaport in the parish of Mochrum, on the east coast of Luce bay, Wigtonshire. It stands on the coast-road between Stranraer and Whithorn, 24 miles south-east of Stranraer, 7 miles west-north-west of Whithorn, and 11 miles south-west of Wigton. The village was erected about the year 1770, by Sir William Maxwell of Monreith, in honour of whom it is named. It consists chiefly of a terrace-line of cottages, well built, slated, and fronting the sea, and has a neat and tidy appearance. In 1788, a small harrack-house was erected for the accommodation of military, and of custom-house officers occasionally sent for the suppression of smuggling. The harbour, though small, is safe, and sufficiently commodious; on all sides but the south, it is well-sheltered by the land; on the south, it is defended by an artificial rampart or strong wall; and it easily admits vessels of 200 tons burden. The vessels belonging to it are 12 in number, and aggregately about 750 in tonnage. Large quantities of agricultural produce are shipped for Liverpool and Lancaster. Population of the village, in 1792, 210; in 1836, between 400 and 500.

**PORT-YARROCK**, a small bay in the parish of Whithorn,  $\frac{1}{2}$  mile north of the village and port of Isle-of-Whithorn, Wigtonshire.

**POTTECH (Loch)**, an arm of the sea on the west coast of the isle of Skye.

**POW**, the name of numerous sluggish or slow-running streams in Scotland. *Pul* in Cambro-British, and *Pol* in Gaelic, signify 'a ditch, a stagnating stream, a marshy place;' and, in the Angloicised or softened form of *Pow*, they are so generally used to designate stagnant burns and sleepy rills and rivulets, that almost every marshy or flat district in the kingdom has its *Pow*. A few of the larger *Pows* may be noticed. A *Pow*, called the *Pow* of Cummertrees, traverses the western side of the Howe of Annandale, from near the northern extremity of Dalton, through that parish, and the parishes of Ruthwell and Cummertrees, to the Solway frith,  $2\frac{3}{4}$  miles west of the estuary of the Annan. It has 8 miles length of course, and generally a southerly direction; and it is joined on its left bank by an overflow or feeder from the Annan, which appears, in common with the lower part of the *Pow*, to occupy the ancient channel of that river.—A *Pow* in Forfarshire aspires to be called *Pow-water*, and imposes names on various objects on its banks, such as *Pow-side*, *Pow-mill*, and *Pow-bridge*; it rises in numerous head-waters in Mourithmont-moor, principally in the parish of Guthrie; and drains the parishes of Guthrie, Kinnell, and Farnell,  $7\frac{1}{2}$  miles north-eastward to the South Esk,  $\frac{1}{2}$  mile above Montrose basin.—A *Pow* in Perthshire, noted in some doggerel song well known in the district, rises in some mosses below Methven, and along an artificial canal or ditch, formed to drain off its stagnant and marsh-making waters, pursues a sluggish course of about 11 miles to the Earn, near Inuerpeffray.—A *Pow* in Kirkeudbrightshire, rises, under the name of *Glaister's-burn*, in Kirkgunzeon, circles round the north end of the Criffel range of hills, traverses one lake, and draws off the superfluent waters of another, on the limits

of Newabhey, is joined near its mouth by Newabhey *Pow*, which is navigable by small vessels, and, 15 miles from its source, falls into the estuary of the Nith, 7 miles below Dumfries.—A *Pow* in the carse grounds of Stirlingshire, which, like the Forfarshire *Pow*, gives name to various seats and other objects on its banks, rises near Bannockburn-house in St. Ninian's, and flows 8 miles eastward to the Forth, at a point  $1\frac{1}{2}$  mile east of the village of Airth.—Another *Pow* in the carse grounds of the Forth drains part of the parish of Kippen, and bears the name of the *Pow* of Glins.—A *Pow* in the low grounds of Kyle in Ayrshire, rises in 3 or 4 head-waters, and enters the frith of Clyde  $3\frac{3}{4}$  miles north of the mouth of the river Ayr.—Other *Pows* are too unimportant to hear separate notice.

**POWFOOT**, or **QUEENSBERRY**,\* a delightful rural watering-place on the Solway frith, in the parish of Cummertrees,  $3\frac{1}{2}$  miles west of Annan, Dumfries-shire. See **CUMMERTREES**.

**PREMNAY**, a parish in the district of Garioch, Aberdeenshire. It is bounded on the north-west and north by Insch; on the east by Oync; on the south by Tough; and on the west by Tough and Tullynessle. It forms a slender oblong of 4 miles by  $1\frac{1}{2}$ , extending north and south; but expands to a breadth of  $2\frac{1}{2}$  miles a little north of the middle. The mountain of **BENNOCHIE** [see that article] extends along the southern boundary; and has a large part of its area of about 4,000 acres within the parish's limits. It is nearly all unarable, and, except scantily on the skirts, is unroofed with wood. The rest of the parish comprehends about 3,000 acres; and, over about one-third of its extent, is not subject to the plough. The rivulet *Gady*, running north-eastward, cuts the parish into nearly equal parts, and the rivulet *Shervaek*, running eastward, traces the northern boundary. Both streams are feeders of the Urie. The soil, on the side of *Bennochie*, is poor; on the banks of the *Gady*, is very rich; in several places, a strong clay; and, on some hillocks in the north, is a sandy loam, both early and fertile. A great obstacle to improvement is the dearth of lime; *Aberdeen*, the nearest port whence it can be obtained, being distant 24 miles.—Population, in 1801, 486; in 1831, 625. Houses 126. Assessed property, in 1815, £1,580.—*Premnay* is in the preshery of *Garioch*, and synod of *Aberdeen*. Patron, *Hay of Rannes* and *Leith-hall*. Stipend £158 19s. 4d.; glebe £12. Schoolmaster's salary £27, with from £10 to £11 fees, and £1 11s. 8d. other emoluments.

**PRESS**, a stage and inn on the great east road between Edinburgh and England, in the centre of the parish of Coldingham, 15 miles south-east of Dunbar, and 12 north-west of Berwick.

**PRESSMENNAN-LOCH**, a very beautiful though artificially formed sheet of water, in the parish of Stenton, in Haddingtonshire. It is about 2 miles in length, hut, from its serpentine windings, appears much longer; and averages 400 yards in breadth.

**PRESTON**. See **KIRKBEAN**.

**PRESTON**, a small village in the parish of Cranstoun, 5 miles east-south-east of Dalkeith, Edinburghshire. The splendid mansion of *Preston-hall*, the seat of *William Burn Callender, Esq.*, stands on the right bank of the *Tyne*, less than half-a-mile to the west. *Oxenford-castle*, the superb seat of *General Sir John H. Dalrymple*, is immediately opposite, on the left bank of the *Tyne*.

**PRESTON**, a decayed hut once famous village in the parish of *Prestonpans*, *Haddingtonshire*. It stands half-a-mile south of the village of *Preston-*

\* The former is the popular and old name; and the latter an infrequently used and new one.

pans,  $1\frac{1}{4}$  mile north-west of Tranent, and 8 east of Edinburgh. It has its name from being a *priest's town* of the monks of Newhatle; it either had its origin, or acquired much of its importance, from their grounds of Preston-grange which lay around it; and it figures prominently in traditional tales respecting their character and their mercantile achievements. See NEWBATTLE. Both its relation to the enterprising and festive coal-merchants of the cowl, and its position on the great road of a former period, and in the focus of interesting movements, occasioned it to be frequently visited by the Scottish princes, and to be often, if tradition may be believed, the scene of revels which indicated more opulence than good principle. It was formerly noted also for a fair, held on the second Thursday of October, and called St. Jerome's fair. The chapmen, or pedlers, or travelling merchants of Lothians, had, at a period when their craft was one of no small importance to the country, formed themselves into a regular society; and they annually attended this fair to elect their office-bearers for the following year. In a garden at the side of the road, near the east end of the village, stands an ancient cross to which they laid claim,—a stone pillar about 15 feet high, surmounting a small octagonal erection about 9 feet in height. The villagers, affecting to be successors of the chapmen, annually in July held a rustic fete around the solitary cross, in commemoration of the ancient scenes of importance in which it conspicuously figured. The village has now an appearance of abandonment and desolation which flings a chill over the spirits; yet it retains some venerable pieces of architecture which are fraught with lessons to both the imagination and the heart.—At its west end stands Northfield-house, the whole family connected with which, like the monkish community who so long lorded it over Preston-Grange, have not a representative, but the legend or the whispered tradition.—North of the village stands, in a ruinous condition, a venerable tower which Sir Walter Scott supposed to have been originally a fortalice of the Earls of Home, when they bore almost a princely sway over the south-east of Scotland, and which, for a long time after the close of the 14th century, when the circumjacent barony came by marriage into the possession of the Hamiltons of Fingalton and Ross, was the seat of that family, the principal one of their name, and afterwards called Hamiltons of Preston. The seat or castle, of which the ruined tower is but a vestige, was burned in 1544 by the Earl of Hertford, by Cromwell in 1650, and by accident in 1663, and was then abandoned.—Preston-house was built as a successor, and still stands near the south-west turn of the road which leads through the village. The Hamiltons ceased to be connected with it, and appear to have sold the barony a little before the Revolution; but they are represented by Sir William Hamilton, Bart., the Professor of Logic in the university of Edinburgh, and they live illustriously in history as staunch partisans of the cause of civil and ecclesiastical liberty. They afforded marked protection to Mr. John Davidson, the eminent confessor and 'Scottish worthy;' and, in the stirring times of the ecclesiastico-civil war, Robert Hamilton, the brother of Sir William of Preston, led the Presbyterians in the actions of Drumclog and Bothwell-bridge.—James Schaw, whose family succeeded the Hamiltons in the property, and who died in 1784, bequeathed Preston-house to be fitted up as an hospital for the maintenance and education of poor boys, and the lands and barony of Preston, with the proceeds of other property, for the support of the establishment: Schaw's hospital, or the house under its new and charitable destiny, was opened in 1789; it

at first admitted only 15 boys, but afterwards afforded space for 24; it gives a preference to four names in the order of Schaw, Macneil, Cunningham, and Stewart; and it admits boys at from 4 to 7 years of age, and may retain them till 14. A new house, in the old English style, of some exterior neatness and great interior accommodation, was built in 1831, on the north-east of the village. Nineteen trustees superintend the institution; and, when boys leave it, they bind them as apprentices, or dispose of them according to their discretion, for the youngsters' benefit.—In 1753, under authority of an act of parliament obtained for the purpose, a house with a small garden was purchased in Preston, and fitted up as a workhouse, to be supported by an impost of two-pence Scottish on each Scottish pint of ale brewed or sold in the parish; but, after a few years' trial, it was abandoned, and made to yield its rental as an augment to the ordinary parochial funds for the poor.—In the vicinity of Preston was fought the action of 1745, which usually bears its name. See PRESTONPANS.—Preston gave the title of Viscount to the Baron Grahams of Esk; a title which became extinct in 1739, at the death of Charles, the 3d Viscount.

PRESTON, an ancient parish, now united to the parish of Bonkle, in the shire of Berwick. The church is demolished. It is nearly 2 miles south-west of Bonkle, and  $2\frac{1}{2}$  miles north from Dunse.

PRESTON (EAST and WEST). See COLDINGHAM.

PRESTONFIELD. See DUBBINGSTON.

PRESTON-GRANGE, a hamlet in the parish of Prestonpans and shire of Haddington. It is a hugh-of-barony, and is commonly called The West Barony. It has the adjunct of Grange, from the grange which the monks of Newhatle settled here. See PRESTONPANS.

PRESTON-ISLAND. See TORRYBURN.

PRESTONKIRK,\* a parish in Haddingtonshire, a little north-east of the centre of the county. Its form is irregular; yet nearly consists of a rectangle of 4 miles by  $3\frac{1}{2}$ , with an elongated projection of  $2\frac{1}{2}$  miles by between 5 and 12 furlongs from the middle of the north side. The area is 6,270 acres. The parish is bounded on the north by North Berwick; on the east by Whitekirk and Dunhar; on the south by Stenton, Whittingham, and Morham; and on the west by Haddington, Athelstaneford, and Dirleton. In the southern extremity rises TRAPRAIN LAW: which see. From near the north base of this hill a curved dell, of great depth, picturesque irregularity, and rich verdure and fructiferousness, carries down a little rill to the Tyne. All the rest of the surface is but softly though agreeably varied with undulation and gentle swell; and, could the great opulence of its soil admit the sacrifice of converting wheat-ground into grove, it would afford as beautiful views as any part of the glad and exulting Lothians. But Agriculture rules here in all the skill and with the highest aids of her mastery, and obliges the whole surface, except about 200 acres, to reflect the changeable and mellowing tints of her dress. The river Tyne runs  $\frac{3}{4}$  of a mile along the western boundary, and  $3\frac{1}{2}$  miles north-eastward through the interior, dividing about a third of it on the south from two-thirds on the north, and leaving it about  $2\frac{1}{2}$  miles from the sea. Its banks, for the most part, are the inner

\* This parish bore for centuries exclusively the name of Linton,—that still borne by its principal village; during some time before the Reformation, it was called indifferently Lintou and Haugh; after the Reformation, it was called Prestonhaugh; at a later period, it got its present name of Prestonkirk; in legal documents, it is still designated 'Prestonhaugh, otherwise called Prestoukirk;' and, in popular usage, it is very frequently called Preston.

edges of easy and pleasant slopes; but, before it takes leave, they become flattened into the lips of a level, luxuriant haugh. A tier of broken rocks in the channel at Linton-bridge, which formerly occasioned a fine cataract, has been so far shattered as to destroy the water-scenery, and yet not enough to serve the design of damaging them,—the enticing of salmon farther up the river. The salmon produce of the Tyne, except at its mouth, where the parish claims no connexion with it, is inconsiderable. The eastern Peffer-hurn runs along the neck of the northerly projecting district, and most of the northern boundary of the main body of the parish. Its basin is nearly flat, and was at one time a marshy waste, but is now a series of valuable and highly cultivated corn-fields. Clay-marl abounds in the south, and is extensively used by the farmers instead of lime. A dark-coloured limestone, veined with siliceous matter, lies below the marl. The prevailing rock is claystone,—partly porphyritic.—Hailes-castle—a fine old ruin—stands on a rock close on the right bank of the Tyne, a mile from the western boundary. It is noted as having been anciently the property of the notorious Earl of Botwell, the temporary residence of Queen Mary, and the place to which Bothwell conducted her after seizing her near Lullithgow: it now belongs to Miss Dalrymple of Hailes, the descendant of the celebrated Sir David Dalrymple; but it is quite a ruin, and, so far as it can be used, has very prosaically been made a dovecot and a granary.—Beanson-house,  $1\frac{1}{2}$  mile to the north-west, and the property of the Earl of Wemyss, is at present uninhabited, and going to decay.—Smeaton-house, a little east of Preston village, and the seat of Sir Thomas Hepburn, Bart., M. P. for the county, is the only modern mansion.—A stone, 10 feet high, on the road-side, a little west of Linton, is said to mark the grave of a Saxon commander.—The great eastern road between Edinburgh and London goes direct eastward through the parish, and is carried across the Tyne, at the end of Linton, by a narrow and antiquated bridge. LINTON [which see] contains between a third and a half of the whole parochial population. The little village of Preston, 5 furlongs to the east, has only about 50. Population of the parish, in 1801, 1,741; in 1831, 1,765. Houses 341. Assessed property, in 1815, £13,183.—Prestonkirk is in the presbytery of Dunbar, and synod of Lothian and Tweeddale. Patron, Sir C. Dalrymple Fergusson, Bart. Stipend £310 13s. 2d.; glebe £27 10s. Unappropriated teinds £1,091 5s. 5d. The church was built in 1770. There is a United Secession chapel at Linton.—Baldred, who flourished in the latter part of the 6th century and the beginning of the 7th, was long the tutelary of the parish, and is said to have dignified it by his residence, and founded its earliest church. Preston, the site of the church, was one of three villages which contended for his body after his decease. His statue long lay in the burying-ground, and was intended to be huilt into the church-wall, but was broken in pieces by an unromantic mason. The predecessor of the present church was very ancient, and is mentioned in records of about a millennium old as 'ecclesia sancti Baldridi.' A spring of the purest water in the vicinity is called St. Baldred's Well; and a pool or eddy in the Tyne is known as St. Baldred's Whirl. The Earls of Dunbar were anciently the patrons; and when Earl Patrick formed his collegiate establishment in the church of Dunbar, he made the church of Prestonkirk—or Linton, as it was then called—one of the prebends. On the farm of Markle stand the ruins of an ancient monastery, considerable in extent, but

unrefined in architecture, of whose history little is known. The lands belonging to this establishment were nearly all alienated from it in 1606, and attached to the chapel-royal of Stirling.—In 1834 the parish-school was attended by 92 scholars; and four private schools, two of which were for females, were attended by 151. Parochial-schoolmaster's salary £34 4s. 4½d., with £30 fees, and £12 other emoluments.—George Rennie, Esq. of Phantassie, and Mr. Robert Brown, tenant of Markle, two eminent agriculturists and modern improvers, lived and died in the parish. Mr. Brown was the projector and original conductor of the 'Farmer's Magazine.' John Rennie, Esq., the brother of the former, and a well-known eminent civil engineer, was a native. Mr. Andrew Meikle, the improver and disputedly the inventor of the thrashing-machine, was long an inhabitant of this parish, and is commemorated by a tombstone in the churchyard. There is also a handsome tombstone, with an appropriate inscription, to the memory of Mr. Brown.

PRESTONPANS, a small parish in the north-west extremity of Haddingtonshire; bounded on the west by Ravensbaugh-burn, which divides it from Edinburghshire; on the north by the frith of Forth; and, on other sides, by Trautun. It forms a stripe of  $2\frac{1}{2}$  miles in length from south-west to north-east, by a breadth of from 6 to 10 furlongs; and comprehends an area of about 760 acres. The surface swells into two or three small knolls in the vicinity of the village of Preston; but everywhere else it is level, or falls off with a very gentle declination toward the sea. The beach is a broken and imperforated pavement of rock, exhibiting marks of invasion by the sea, and denudation of earthy strata. The soil of the parish is loam; part heavy, on a clay bottom; part light, on a sandy or gravelly bottom; and is cultivated in the improved and model style for which Haddingtonshire is famed. Coal was wrought here as early perhaps as in any district in Scotland, and continues still to be plentifully mined. The shale and sandstone of the coal measures are singularly abundant in vegetable fossils. The villages of the parish are PRESTONPANS, PRESTON, DOLPHINSTON, MORISON'S HAVEN, and MEADOW MILL: which see. The principal seats are Preston-Grange, the property of Sir George Grant Suttie, Bart.; and Drummore, the property of William Aitchison, Esq. Among eminent men who have been connected with the parish may be mentioned, the Rev. John Davidson, one of Scotland's worthies, and long the minister of the parish, some notices of whom occur in M'Crie's Life of Melville, and in numerous older historical works; Alexander Hume, the grammarian, who was for 10 years the parochial schoolmaster, and some notices of whom also occur in M'Crie's Life of Melville; the Hon. James Erskine of Grange, brother to the Earl of Marr, and Lord-justice-clerk in the reign of Queen Anne, who, in 1734, resigned his judgeship that he might oppose Sir Robert Walpole in parliament; Hew Dalrymple, who, under the title of Lord Drummore, acted a distinguished and popular part as a member of the college-of-justice; and William Grant of Preston-Grange who, as Lord Advocate, in 1746, performed with general approbation the difficult task of conducting the prosecutions against the defeated Jacobites, and who afterwards was a senator of the college-of-justice, and one of the Lords commissioners of Justiciary. The parish is traversed across the rising grounds of the south-west wing, through the hamlet of Dolphinston, by the Edinburgh and London railroad; and along the coast through Prestonpans, by the Edinburgh and North Berwick road by

way of Aberlady. Population, in 1801, 1,964; in 1831, 2,322. Houses 341. Assessed property, in 1815, £5,695.

The only event of note in the history of the parish is the battle of Preston, fought in 1745. While, on the 16th of September, 1745, the heralds were proclaiming King James at the market-cross of Edinburgh, Sir John Cope was landing his troops at Dunhar. The landing was finished on Wednesday, the 17th of September; but the disembarkation of the artillery and stores was not completed till the 18th; but desirous of engaging the Highland army before the arrival of their expected reinforcements, Cope left Dunhar on the 19th, in the direction of Edinburgh, and halted on a field to the west of the town of Haddington, and 16 miles east from Edinburgh, on the evening of that day. Resuming his march on the morning of the 20th, along the high road to Preston, he halted his army, and formed his troops in order of battle, with his front to the west, on reaching the plain betwixt Seaton and Preston. His right extended towards the sea in the direction of Port-Seaton and his left towards the village of Preston. These dispositions had scarcely been taken when the whole of the Highland army appeared descending the heights in the direction of Tranent. On approaching Tranent, the Highlanders were received by the King's troops with a vehement shout of defiance, which the Highlanders answered in a similar strain. About two o'clock in the afternoon the Highland army halted on an eminence called Birsleybrae, about half-a-mile to the west of Tranent, and formed in order of battle about a mile from the royal forces. In the expectation that the Highlanders were advancing by the usual route through Musselburgh, Cope had taken up the position we have described, with his front to the west; but as soon as he observed the Highlanders on the heights upon his left, he changed his front to the south. This change of position, while it secured Cope better from attack, was not so well-calculated for safety as the first position was in the event of a defeat. On his right was the east wall of a park belonging to Erskine of Grange, which extended a considerable way from north to south, and still farther to the right was the village of Preston. The village of Seaton was on his left, and the village of Cockenzie and the sea in his rear. Almost immediately in front was a deep ditch filled with water, and a strong and thick hedge. Farther removed from the front, and between the two armies was a morass, the ends of which had been drained, and were intersected by numerous cuts. And on the more firm ground at the ends were several small enclosures, with hedges, dry stone-walls, and willow trees. As the Highlanders were in excellent spirits, and eager to close immediately with the enemy, Charles felt very desirous to comply with their wishes; but he soon ascertained that the passage across the morass would be extremely dangerous, if not altogether impracticable.

While his lieutenant-general was, in consequence of this information, planning a different mode of attack, the Prince himself was moving with a great part of his army towards Dolphinston on Cope's right. Halting opposite Preston-tower he seemed to threaten that flank of the English general, who, thereupon, returned to his original position with his front to Preston, and his right towards the sea. Lord George Murray, considering that the only practicable mode of attacking Cope was by advancing from the east, now led-off part of the army through the village of Tranent, and sent notice to the Prince to follow him with the remainder as quickly as possible. After the Highland army had halted on the fields to the east of Tranent, a council

of war was held, at which Lord George Murray proposed to attack the enemy at break of day. Charles was highly pleased with the proposal of the lieutenant-general, which also received the unanimous approbation of the council. A few piquets were placed around the bivouac, and the Highlanders, having wrapped themselves up in their plaids, lay down upon the ground to repose for the night. Charles, taking a sheaf of pease for a pillow, stretched himself upon the stubble, surrounded by his principal officers. When Cope observed Charles returning towards Tranent, he resumed his former position with his front to the south, having thus, in the course of a few hours, been obliged, by the unrestrained evolutions of the Highlanders, to shift his ground no less than four times. He now began to perceive that his situation was not so favourable as he had imagined, and that while the insurgents could move about at discretion, select their ground, and choose their time and mode of attack, he was cramped in his own movements and could act only on the defensive. To secure his army from surprise during the night, Cope placed advanced piquets of horse and foot along the side of the morass, extending nearly as far east as the village of Seaton. He, at the same time, sent his baggage and military chest down to Cockenzie; and as the night—that of Friday the 20th of September—was very cold, Cope ordered fires to be kindled along the front of his line, to keep his men warm.

In point of numbers, the army of Cope was rather inferior to that of Charles; but many of the Highlanders were badly armed, and some of them were without arms. The royal forces amounted altogether to about 2,300 men; but the number in the field was diminished to 2,100 by the separation of the baggage-guard which was sent to Cockenzie. The order of battle finally formed by Cope along the north side of the morass was as follows:—He drew up his foot in one line, in the centre of which were eight companies of Lascelles's regiment, and two of Guise's. On the right were five companies of Lee's regiment, and on the left the regiment of Murray, with a number of recruits for different regiments at home and abroad. Two squadrons of Gardiner's dragoons formed the right wing, and a similar number of Hamilton's composed the left. The remaining squadron of each regiment was placed in the rear of its companions as a reserve. On the left of the army, near the waggon-road from Tranent to Cockenzie, were placed the artillery, consisting of six or seven pieces of cannon and four cohorts under the orders of Lieutenant-colonel Whiteford, and guarded by a company of Lee's regiment, commanded by Captain Cochrane. Besides the regular troops there were some volunteers, consisting principally of small parties of the neighbouring tenantry, headed by their respective landlords. Some Seceders, actuated by religious zeal, had also placed themselves under the royal standard. Pursuant to the orders he had received, Lord Nairne left the position he had occupied during the night at the appointed hour, and re-joined the main body about three o'clock in the morning. Instead of continuing the order of march of the preceding night, it had been determined by the council of war to reverse it. The charge of this movement was intrusted to Colonel Ker. The Duke of Perth, who was to command the right wing, was at the head of the inverted column. He was attended by Hephurn of Keith, and by Robert Anderson, son of Anderson of Whitburgh, who, from his intimate knowledge of the morass, was sent forward to lead the way. A little in advance of the van, was a select party of 60 men doubly armed, under the command of Macdonald of Glenalladale, ma-

jor of the regiment of Clanranald, whose appointed duty it was to seize the enemy's baggage. The army proceeded in an easterly direction till near the farm of Ringan-head, when, turning to the left, they marched in a northerly direction through a small valley which intersects the farm. During the march the utmost silence was observed, not even a whisper being heard; and lest the trampling of horses might discover their advance, the few that were in the army were left behind. The ford or path across the morass was so narrow that the column—which marched three men abreast—had scarcely sufficient standing room; and the ground along it was so soft that many of the men were almost at every step up to the knees in mud. The path in question—which was about 200 paces to the west of the stone-bridge afterwards built across Seaton mill-dam—led to a small wooden-bridge thrown over the large ditch which ran through the morass from east to west. This bridge, and the continuation of the path on the north of it, were a little to the east of Cope's left. From ignorance of the existence of this bridge,—from oversight, or from a supposition that the marsh was not passable in that quarter,—Cope had placed no guards in that direction, and the consequence was, that the Highland army, whose march across could here have been effectually stopped by a handful of men, passed the bridge and cleared the marsh without interruption. The Prince's army was divided into two columns or lines, with an interval between them. After the first line had got out of the marsh, Lord George Murray sent the Chevalier Johnstone to hasten the march of the second, which was conducted by the Prince in person. At the remote end of the marsh there was a deep ditch, three or four feet broad, over which the men had to leap. In jumping across this ditch, Charles fell upon his knees on the other side, and was immediately raised by the Chevalier Johnstone, who says, that Charles looked as if he considered the accident a had omen. As the column cleared the marsh, it continued its course towards the sea; but after the whole army had passed, it was ascertained that the Duke of Perth had inadvertently—not being able, from the darkness, to see the whole line—advanced too far with the front, and that a considerable gap had, in consequence, been left in the centre. The Duke being informed of this error, halted his men till joined by the rear. Hitherto the darkness had concealed the march of the Highlanders; but the morning was now about to dawn, and at the time the order to halt was given, some of Cope's piquets stationed on his left, for the first time heard the tramp of the Highlanders. The Highlanders heard distinctly these advanced guards repeatedly call out, "Who is there?" No answer having been returned, the piquets gave the alarm, and the cry of "Cannons, cannons! Get ready the cannons, cannoniers!" resounded on Cope's left wing. Charles instantly gave directions for attacking Cope before he should have time to change his position by opposing his front to that of the Highland army. It was not in compliance with any rule in military science that the order of march of the Highland army had been reversed; but in accordance with an established punctilio among the clans, which, for upwards of seven centuries had assigned the right wing, regarded as the post of honour, to the Macdonalds. As arranged at the council-of-war on the preceding evening, the army was drawn up in two lines. The first consisted of the regiments of Clanranald, Keppoch, Glengary, and Glencoe, under their respective chiefs. These regiments formed the right wing, which was commanded by the Duke of Perth. The Duke of Perth's men and the Macgregors composed the centre; while

the left wing, commanded by Lord George Murray, was formed of the Camerons under Lochiel, their chief, and the Stewarts of Appin commanded by Stewart of Ardschiel. The second line, which was to serve as a reserve, consisted of the Athole-men, the Robertsons of Strowan, and the Maclauchlans. This body was placed under the command of Lord Nairne. As soon as Cope received intelligence of the advance of the Highlanders, he gave orders to change his front to the east. Some confusion took place in carrying these orders into execution, from the advanced guards belonging to the foot not being able to find out the regiments to which they belonged, and who, in consequence, stationed themselves on the right of Lee's five companies, and thereby prevented the two squadrons of Gardiner's dragoons, which had been posted on the right of the line, from forming properly. For want of room, the squadron under Colonel Gardiner drew up behind that commanded by Lieutenant-colonel Whitney. In all other respects the disposition of each regiment was the same; but the artillery, which before the change had been on the left, and close to that wing, was now on the right somewhat farther from the line, and in front of Whitney's squadron.

There was now no longer any impediment to prevent the armies from coming into collision; and if Cope had had the choice, he could not have selected ground more favourable for the operations of cavalry than that which lay between the two armies. It was a level cultivated field of considerable extent without hush or tree, and had just been cleared of its crop of grain. But unfortunately for the English general, the celerity with which the Highlanders commenced the attack prevented him from availing himself of this local advantage. The beams of the rising sun were just beginning to illuminate the horizon; but the mist which still hovered over the corn-fields prevented the two armies from seeing each other. Every thing being in readiness for advancing, the Highlanders took off their bonnets, and, placing themselves in an attitude of devotion, with upraised eyes uttered a short prayer. As the Highlanders had advanced considerably beyond the main ditch, Lord George Murray was apprehensive that Cope might turn the left flank, and to guard against such a contingency, he desired Lochiel, who was on the extreme left, to order his men in advancing to incline to the left. Lord George then ordered the left wing to advance, and sent an aide-camp to the Duke of Perth to request him to put the right in motion. The Highlanders moved with such rapidity that their ranks broke; to recover which, they halted once or twice before closing with the enemy. When Cope, at day-break, observed the first line of the Highland army formed in order of battle, at the distance of 200 paces from his position, he mistook it for bushes; but before it had advanced half-way, the rays of the rising sun hursting through the retiring mist showed the armies to each other.

"Day opened in the orient sky

With wintry aspect, dull and drear;

On every leaf, white glittering

The firmy hoar-frost did appear.

The ocean was unseem, though near;

And hazy shadows seem'd to draw,

In azure, with their mimic floods,

A line above the Seaton wood,

And round North Berwick Law."

The army of Cope at this time made a formidable appearance; and some of Charles's officers were heard afterwards to declare, that when they first saw it, and compared the gallant appearance of the horse and foot, with their well-polished arms glittering in the sunbeams, with their own line broken into irregular clusters; they expected that

the Highland army would be instantly defeated, and swept from the field.

The Highlanders continued to advance in profound silence. As the right wing marched straight forward without attending to the oblique movement of the Camerons to the left, a gap took place in the centre of the line. An attempt was made to fill it up with the second line, which was about fifty paces behind the first, but before this could be accomplished, the left wing, being the first to move, had advanced beyond the right of the line, and was now engaged with the enemy. By inclining to the left, the Camerons gained half the ground originally between them and the main ditch; but this movement brought them up directly opposite to Cope's cannon. On approaching the cannon the Highlanders fired a few shots at the artillery guard, which alarmed an old gunner who had charge of the cannon, and his assistants, to such a degree that they fled, carrying the powder-flasks along with them. To check the advance of the Highlanders, Colonel Whiteford fired off five of the field-pieces with his own hand; but though their left seemed to recoil, they instantly resumed the rapid pace they had set out with. The artillery guard next fired a volley with as little effect. Observing the squadron of dragoons under Lieutenant-colonel Whitney advancing to charge them, the Camerons set up a loud shout, rushed past the cannon, and, after discharged a few shots at the dragoons, which killed several men, and wounded the lieutenant-colonel, flew upon them sword in hand. When assailed, the squadron was reeling to and fro from the fire; and the Highlanders following an order they had received, to strike at the noses of the horses without minding the riders, completed the disorder. In a moment the dragoons wheeled about, rode over the artillery guard, and fled followed by the guard. The Highlanders continuing to push forward without stopping to take prisoners, Colonel Gardiner was ordered to advance with his squadron, and charge the enemy. He accordingly went forward, encouraging his men to stand firm; but this squadron, before it had advanced many paces, experienced a similar reception with its companion, and followed the example which the other had just set. After the flight of the dragoons, the Highlanders advanced upon the infantry, who opened a fire from right to left, which went down the line as far as Murray's regiment. They received this volley with a loud huzza, and throwing away their muskets, drew their swords and rushed upon the foot before they had time to reload their pieces. Confounded by the flight of the dragoons, and the furious onset of the Highlanders, the astonished infantry threw down their arms and took to their heels. Hamilton's dragoons, who were stationed on Cope's left, displayed even greater pusillanimity than their companions; for no sooner did they observe the squadrons on the right give way, than they turned their backs and fled without firing a single shot or drawing a sword. Murray's regiment being thus left alone on the field, fired upon the Macdonalds who were advancing, and also fled. Thus, within a very few minutes after the action had commenced, the whole army of Cope was put to flight. With the exception of their fire, not the slightest resistance was made by horse or foot, and not a single bayonet was stained with blood. Such were the impetuosity and rapidity with which the first line of the Highlanders broke through Cope's ranks, that they left numbers of his men in their rear, who attempted to rally behind them; but on seeing the second line coming up, they endeavoured to make their escape. Though the second line was not more than 50 paces behind the first,

and was always running as fast as it could to overtake the first line, and near enough never to lose sight of it, yet such was the rapidity with which the battle was gained, that, according to the Chevalier Johnstone, who stood by the side of the Prince in the second line, he could see no other enemy on the field of battle than those who were lying on the ground killed and wounded. Unfortunately for the royal infantry, the walls of the enclosures about the village of Preston, which, from the position they took up on the preceding evening, formed their great security on their right, now that these park-walls were in their rear, operated as a barrier to their flight. Having disencumbered themselves of their arms to facilitate their escape, they had deprived themselves of their only means of defence, and driven as they were upon the walls of the enclosures, they would have all perished under the swords of the Highlanders, had not Charles and his officers strenuously exerted themselves to preserve the lives of their discomfited foes. The impetuosity of the attack, however, and the sudden flight of the royal army, allowed little leisure for the exercise of humanity; and before the carnage ceased several hundreds had fallen under the claymores of the Highlanders, and the ruthless scythes of the Macgregors. Armed with these deadly weapons, which were sharpened and fixed to poles from seven to eight feet long, to supply the place of other arms, this party mowed down the affrighted enemy, cut off the legs of the horses, and severed, it is said, the bodies of their riders in twain. Of the infantry of the royal army, about 170 only escaped. From a report made by their own sergeants and corporals, by order of Lord George Murray, between 1,600 and 1,700 prisoners, foot and cavalry, fell into the hands of the Highlanders, including about 70 officers. In this number were comprehended the haggage-guard stationed at Cockenzie, which amounted to 300 men, who, on learning the fate of the main body and the loss of their cannon, surrendered to the Camerons. The cannon and all the haggage of the royal army, together with the military chest, containing £4,000, fell into the hands of the victors. The greater part of the dragoons escaped by the two roads at the extremities of the park-wall, one of which passed by Colonel Gardiner's house in the rear of their right, and the other on their left, to the north of Preston-house. In retiring towards these outlets, the dragoons, at the entreaties of their officers, halted once or twice, and faced about to meet the enemy; but as soon as the Highlanders came up and fired at them, they wheeled about and fled. Cope, who was by no means deficient in personal courage, assisted by the Earls of Home and Loudon, collected about 450 of the panic-struck dragoons on the west side of the village of Preston, and attempted to lead them back to the charge; but no entreaties could induce these cowards to advance, and the whistling of a few bullets discharged by some Highlanders near the village, so alarmed them that they instantly scampered off in a southerly direction, screening their beads behind their horses' necks to avoid the bullets of the Highlanders. The general had no alternative but to gallop off with his men. He reached Coldstream, a town about 40 miles from the field of battle, that night; and entered Berwick next day.

Among six of Cope's officers who were killed was Colonel Gardiner, a veteran soldier who had served under the Duke of Marlborough, and whose character combined a strong religious feeling with the most undaunted courage. He had been decidedly opposed to the defensive system of Cope on the preceding evening, and had counselled the general not to lose a moment in attacking the Highlanders; but his ad-

vice was disregarded. Anticipating the fate which awaited him, he spent the greater part of the night in devotion, and resolved at all hazards to perform his duty. He was wounded at the first onset at the head of his dragoons; but disdaining to follow them in their retreat, he joined a small body of foot, which attempted to rally near the wall of his own garden, and while fighting at their head was cut down by the murderous Lochaber axe of a Macgregor, within a few yards of his own house. He was carried to the manse of Tranent in almost a lifeless state, where he expired within a few hours, and was interred in the north-west corner of the church of Tranent.\* Captain Brymer of Lee's regiment, who appears to have participated in Gardiner's opinion as to attacking the Highlanders, met a similar fate. Having been at the battle of Sheriffmuir, he was satisfied of the capability of the Highlanders to contend with regular troops, and dreaded the result of an encounter if assailed by the Highlanders. When encamped at Haddington his brother-officers were in high spirits, and making light of the enemy; but Brymer viewed matters in a very different light. While reading one night in his tent he was accosted by Mr. Congalton of Congalton, his brother-in-law, who, observing him look pensive and grave, when all the other officers appeared so cheerful, inquired the reason. Brymer answered that the Highlanders were not to be despised, and that he was afraid his brother-officers would soon find that they had mistaken the character of the Highlanders, who would, to a certainty, attack the royal army, with a boldness which those only who had witnessed their prowess could have any idea of. These gloomy forebodings were not the result of an innate cowardice—for this officer was, as he showed, a brave man—but from a well-founded conviction that Cope's men could not stand the onset of such a body of Highlanders as Charles had assembled. Brymer was killed, with his face to the enemy, disdaining to turn his back when that part of the line where he was stationed was broke in upon by the Highlanders. The loss on the side of the Highlanders was trifling. Four officers, and between 30 and 40 privates, were killed; and 5 or 6 officers, and between 70 and 80 privates, wounded. After the termination of the fight, the field of battle presented an appalling spectacle, rarely exhibited in the most bloody conflicts. As almost all the slain were cut down by the broadsword and the scythe, the ground was strewn with legs, arms, hands, noses, and mutilated bodies, while, from the deep gashes inflicted by these dreadful weapons, the field was literally soaked with gore.

"Alas! that British might should wield  
Destruction o'er a British plain,  
That hands, ordain'd to bear the shield,  
Should bring the poison'd lance, to drain  
The life-blood from a brother's vein,  
And steep paternal fields in gore!—  
Yet, Preston, such thy fray began;  
Thy marsh-collected waters ran  
Empurpled to the shore."

Prestonpans is in the presbytery of Haddington, and synod of Lothian and Tweeddale. Patron, Sir G. G. Suttie, Bart. Stipend £287 18s.; glebe £25 4s. Unappropriated tithes £104 10s. The parish-church was built in 1774. Sitings 750. According to a census taken by the elders, in 1835, the population was then 2,467; of whom 2,276 were churchmen, 153 were dissenters, and 38 were nondescripts.

\* The church has been rebuilt; and the grave of Colonel Gardiner is now without the walls of the edifice. An American tourist—who, with an enthusiasm unknown to Scotsmen, recently made a pilgrimage to the grave of Gardiner—exclaims: "Most true it is, that no monument, not even a stone, marks the ground where sleeps this extraordinary man,—a man whom Caledonia may well be proud to have enrolled among her best and bravest sons!"

A district, with about 50 or 60 inhabitants, is included in the *quoad sacra* parish of Cockenzie. There is in the parish a small Wesleyan Methodist place of worship; and there are Sabbath schools, attended by about 280 children. There are five schools; one parochial and four private: one of the latter conducted by a female. Parochial schoolmaster's salary £34 4s. 4½d., with £50 fees. Education is at a low ebb.—The original but very ancient name of the parish was Aldhammer; this early gave way to Priests-toun, which was gradually abbreviated into Preston; and that, after the erection of salt-works, and some changes in the parochial tenure, was, in its turn, superseded by successively Salt-Preston and Prestonpans. The ancient church was situated at Preston, and was a vicarage of the monks of Holyrood; and, in 1544, it was burned, in common with the town and castle of Preston, by the Earl of Hertford, and not afterwards repaired. The inhabitants of the two baronies, the east and the west, or Preston and Preston-Grange, into which the parish was distributed, seem to have tacitly attached themselves to Tranent; but were quite unduly provided for, and could obtain access, in but limited numbers, to the interior of the church. Mr. John Davidson, the confessor, at length built, at his own expense, a church and a manse in the village of Prestonpans, to which a glebe, garden, and stipends were attached, by George Hamilton of Preston; and the same worthy minister founded there a school for the teaching of the Latin, Greek, and Hebrew languages, and endowed it with all his property, free, moveable, and heritable. In consideration of what was thus done, the General Assembly, in 1595, declared Prestonpans to be a parish *quoad sacra*, and the parliament of Perth, in 1606, "erected the said newly built kirk into a parish-kirk, which was to be called the parish-kirk of Preston."

PRESTONPANS, a large village and a burgh-of-barony, lies along the shore of the frith on the Edinburgh and North Berwick road, 2½ miles east of Musselburgh, 8 east of Edinburgh, 9½ west of Haddington, and 14 south-west of North Berwick. Salt pans are supposed to have been erected on its site, and to have occasioned it to become a seat of population, so early as the 12th century. The monks of Newbattle, who pushed out their trading enterprises in all directions from their property of Preston-Grange, appear to have adopted and cherished Prestonpans as the scene of their salt-making operations; and they probably secured it a rude but abounding prosperity so long as it was under their influence. Even for generations after the Reformation it continued to thrive, and to be a flourishing seat of various sorts of the bardier orders of manufacture. Its present character and appearance are such as might indicate that Romish monks, sinking away into degeneracy, had continued, to a large degree, to direct its destiny. It is considerably more like a Spanish or an Irish village than a Scottish one, being chiefly a straggling single street, drawn out to about a mile in length,—narrow, ill-paved, filthy, and broken in its roadway, and utterly irregular, generally dull and somewhat antiquated, and often mean and almost hut-like in its houses,—the hulky amorphous mass of a salt-pan or some kindred work squatting among the other tenements at intervals, and producing a tout-ensemble peculiarly rude and rueful. A rill runs across the roadway, and cuts off from the west end of the continuous street an ugly suburb called Cuittle or Cuthill. Not a building, either public or private, of any intrinsic interest, exists. Even the parish-church pleases only by its associations, and has a thing doing service as a steeple, which is too much in keeping with the prevailing architecture of

the village. The salt-pans were formerly ten in number; but they have been nearly all abandoned. They at one time produced between 800 and 900 bushels of salt per week; and, along with those of Cockenzie, yielded government a revenue of £17,000 or £18,000 per annum. A race of females known as salt-wives and second in notoriety only to the fish-wives of Fisher-row and Newhaven, used to carry the salt in 'creels' to Edinburgh, and dispose of it in the city and its suburbs; but they were robbed of their occupation by the reduction of the duty. One set of salt-pans are still at work, and possess repute for the excellence of their produce. A manufactory of sulphuric, nitric, and muriatic acid, and of sulphate of soda, or Glauber's salts, once employed upwards of 50 men, but is now extinct. Extensive potteries, which were commenced about the middle of last century, and long employed about 40 men and upwards of 30 boys, dwindled down a few years ago to a small manufactory of brown and white ware, of five kilns, which, in 1840, was shut up. Two brick and tile works, which employed about ten men, and long sent forth a steady produce over the country, are now represented by one small manufactory of drain-tiles, and figure in reminiscence chiefly on account of having coated nearly the whole village with roofing-tiles, and contributed lastingly to its dinginess. A brewery—which has long been famous for the good quality of its ales—continues to enjoy its repute. A soap-manufactory, of recent establishment, seems to be prosperous. A chief employment and traffic are the fishing and exportation of oysters. Those which lie off the village, particularly such as are nearest the shore, have long been in high esteem among oyster-eaters, and are well-known under the name of Pan-door or Pandore oysters,—a name whimsically given them from the oyster-bed lying off the doors of the salt-pans. So far back as 70 years ago, and till the end of the century, the fishery employed 10 boats, each of which dredged from 400 to 6,000 in a day; and it sent the produce not only to Scottish markets, but to Newcastle, Hull, and London. Even yet, though the bed has probably been much over-dredged, large boats which can carry each from 25,000 to 30,000 oysters maintain a constant traffic with Shields, Newcastle, and Hartlepool. The fishermen may, in all seasons of the year, be heard over the waters singing their dredging-song long before dawn; and were they temperate and prudent in the proportion of their industry and resources, they might be one of the most comparatively opulent communities of operatives in Scotland. The commerce of the town, through its port of Morison's haven, a little west of Cutbill, was great in the days of its manufacturing prosperity and the extensive working of the neighbouring collieries; but it has grievously declined. The harbour was once a custom-house port, whose range included all creeks and landing-places between the mouth of the Figgateburn at Portohello, and the mouth of the Tyne near Dunbar; and it had the right of levying customs and the various sorts of dues to the same extent as those exigible at Leith. The charter of erection into a burgh-of-barony was given, in 1617, in favour of Sir John Hamilton of Preston; but it had reference, not strictly to the village of Prestonpan, but to the whole of the east or Preston barony of the parish; and it is visible in probably no other result than the officership of two baron bailies. Population, in 1833, conjecturally stated at 2,000.

**PRESTWICK**, an ancient village and burgh-of-barony on the coast of Kyle, Ayrshire. It stands on the road between Ayr and Irvine,  $2\frac{1}{2}$  miles north of Ayr, 1 south of Monkton,  $8\frac{1}{2}$  south of Irvine,

and 9 south-west of Kilmarnock. Its age, and especially its constitution as a burgh, are remarkable, and strongly resemble those of the curious neighbouring burgh of Newton-upon-Ayr. A charter, confirming and renewing its privileges, was granted by James VI. as administrator in law for his eldest son, then a minor; Henry, Duke of Rothesay, Earl of Kyle, Carrick, and Cunningham, Lord of the Isles, and Prince Stewart of Scotland. The charter is dated 19th June, 1600, and expressly says that it was known to have been a free burgh-of-barony beyond the memory of man, for the space of 617 years before the date of renewal. The burgh has power to elect annually a provost, 2 bailies, and councillors, to grant franchises for several trades, and to hold a market weekly, and a fair on the 6th of November. The freemen, or barons as they are called, are 36 in number. The burgh-lands belonging to them as an incorporation extend in a broad stripe along the Pow-burn to a line  $1\frac{1}{2}$  mile nearer Ayr, and comprehend about 1,000 acres. The lands are distributed into lots among the freemen, and do not remain in perpetuity, but are drawn for in a new distribution every 19 years. Part of them long existed as a common, on which each of the freemen had a right of pasturing a certain number of sheep and cattle; but this was, several years ago, divided and appropriated in the manner of the rest of the barony. Freemen cannot sell their lots or shares, or the baronial rights which belong to them, without the consent of the corporation; and females succeed equally with males to the inheritance of the freeholds. A freeman may, for an offence, be sent to prison, but not locked up; and, if he come out without being liberated by the judicial sentence of the magistrates, he forfeits all his corporation privileges and property. Some of these strange peculiarities, however, have fallen wholly into disuse. The town has a market-cross, apparently of great antiquity; and it has also a jail and council-house. Population, in 1793, 260; in 1838, 760. Prestwick, as an ancient parish, is now united to **MONKTON**: which see.

**PRESTWICK-TOLL**, a village  $\frac{1}{4}$  of a mile south of Prestwick, partly beyond and partly within the boundary of the Prestwick baronial lands. Population, in 1833, 330.

**PRIESTHILL**, a hamlet in the parish of Muirkirk, Ayrshire, a few miles north-east of the village of Muirkirk. It is in the midst of a wild solitude, environed by hills covered with heath, which give it the appearance of a spacious amphitheatre. A green sloping bank faces the south, with a mountain-stream silently winding along its bottom. Here, to the east, stood the hospitable mansion of the celebrated John Brown, which was ever open to the benighted stranger, and often a happy asylum to the persecuted saint. Nothing but its vestiges now remain. The grave of this good man is about forty yards to the west. It is covered with a large massy stone. Around its margin there is a prose description, which encloses an acrostic in the centre. A little farther onward to the west, tradition points to the hallowed spot where this good man calmly uttered his departing prayer, fondly embraced his wife and children, and with holy resignation breathed his last on the 1st of May, 1683, shot by the bloody Grabam of Claverhouse—a man whose name cannot be held in too great detestation by every true-hearted Scot.

**PRIEST-ISLAND**, an islet off the coast of Cromarty, constituting part of the parish of Loch-Broom. It is at the entrance of Loch-Broom.

**PRIESTWICK**, an ancient parish, now united to the parish of Monkton in Ayrshire. The church still remains, and serves as a landmark for vessels

navigating the frith of Clyde. This is a very ancient burgh-of-barony, and by its charter—which was renewed and confirmed by James VI. at Holyrood, on the 19th of June, 1600—it is empowered to elect annually a provost, and two bailies, with councillors; to grant franchises for several trades; and to hold a weekly market, and a fair on the 6th of November; but most of these privileges are fallen into disuse. It was the head burgh-of-barony of the bailiery of Kyle-Stewart.

PRIMROSE. See CARRINGTON.

PRINLAWS. See LESLIE, Fifeshire.

PROSEN (THE), a small river, a tributary of the South Esk, in Forfarshire. It rises between the heights of Mair and South Craig, at the north-west extremity of the Grampian section of the parish of Kirriemuir, and traverses that district 11 miles south-eastward; and it then, running in the same direction, divides, for 4½ miles, Cortachie on its right bank from Kingoldrum, and the Strathmore section of Kirriemuir on its left, and falls into the South Esk a mile above the mouth of the Carity at Inverquhar. It is fed by many rills and rivulets, the chief of which are Glenoig, Lednathy, and Glenlogy burns. Till it debouches not far above its mouth into the open country of Strathmore, it is pent deeply up among the Binchinnan mountains, and, along with its numerous small tributaries, drains a narrow mountain-basin to which it gives the name of Glenprosen, and the rim of which, all round, except where the Prosen makes its exit, forms a lofty water-shed.

PULTENEYTOWN, a modern, large, and thriving suburb of the royal burgh of Wick, Caithnessshire. In every respect except antiquity, chartered rights, and local associations of idea, it is now entitled to be regarded as the town, and Wick as the suburb. The harbour of the parliamentary burgh, the seat of most of its manufactures, the centre of its fisheries and its trade, the finest arrangements of its street architecture, and the homes of much the larger section of its population, are all in Pulteneytown; yet as usage and prescription still popularly assign the whole to Wick, they will be most appropriately

noticed in the article on the royal burgh. See Wick. In 1808, the Society in London for extending the British fisheries, purchased, out of the entailed estate of Hempriggs, a large space of barren and heathy ground on the south side of the bay and river of Wick, and feued it on a regular plan, of subordination to neatness of appearance, and to the purposes of the herring-fishery. A defined number of buildings were erected solely in adaptation to the fishery; and all buildings whatever were required to be substantial, and in keeping with prescribed street-arrangements. Two harbours, which communicate with each other, were constructed; and various other measures were adopted both to promote the direct object of the society, and to fling over their grounds the aspects of village comfort and embellishment. The result is, that a town of considerable extent, of great regularity, of some beauty, and of much prosperity, has sprung up; that all the circumjacent lands are enclosed and cultivated; and that an example of well-directed and energetic public-spirit has been given, the influence of which is beneficially, and very sensibly felt over all the extreme north-east of Scotland. Population of Pulteneytown, jointly with Louisburgh and Bankhead, in 1811, 755; of Pulteneytown alone, in 1840, 2,959.

PYKED-STANE, or HELL'S CLEUGH, a mountain in Peeblesshire, situated at a point in which the three parishes of Kirkurd, Broughton, and Stobo meet, and possessing an altitude, according to Armstrong, of 2,100 feet above sea-level. The name Pyked-Stane belongs strictly to the summit, and is derived from a small cairn with which it is crowned; and the name Hell's cleugh seems to belong to the northern or Kirkurd declivity, which is furrowed by a torrent, a tiny tributary of the Tarth. The summit of the mountain commands one of the most extensive views in Scotland, though one which is marred and broken by a surgy sea of heights which compose the fore-ground; and it lifts the eye, in one direction, to the hills around Loch-Lomond,—in another, to the Eildon hills, behind Melrose,—and, in a third, to the blue, dome-like summits of the Cheviots in Northumberland.

MONK'S TOWER, PERTH.

## Q

**QUAIR**, a rivulet of between 6 and 7 miles in length of course, from the south-western extremity of the parish of Traquair to the Tweed at the northern boundary of that parish, Peebles-shire. The source is on the east side of Blackcleugh-head; and the embouchure is immediately below Traquair-house, and directly opposite the village of Innerleithen. The direction for about a mile a short way above the village of Traquair is east-south-easterly; but everywhere else, excepting windings, it is north-eastward or north-north-eastward. The chief tributaries are the united waters of Newhall and Shilling-law burns, a little below the village, and the stream of Glengaber or Finland burn at Traquair mill,—each of them nearly equal to itself in length and volume. Though the Quair is short, it pays a considerable tribute to the Tweed; and, as a trout-ing-stream, and an enliverer of landscape, it has strong attractions for “the wellars” at Innerleithen.

**QUARFF**, a *quoad sacra* parish in Shetland. It comprises the district of Quarff on the mainland, lying  $4\frac{1}{2}$  miles south-west of Lerwick; and the islands of Burra, Papa, House, and Halvery, lying off the west coast. Its greatest length is about  $8\frac{1}{2}$  miles, over land and sea; and its greatest breadth is about  $5\frac{1}{4}$  miles. It was separated from the united parish of Bressay, Burra, and Quarff, on the 25th of May, 1833, by act of the General Assembly; and comprehends the ancient parochial districts of Quarff and Burra. Population, in 1835, 790; of whom 240 were in Quarff, 490 in Burra and House, and 60 in Papa and Halvery; and in ecclesiastical distribution, 728 were churchmen, and 62 were dissenters. All are of the poor and working classes, chiefly dependent on agriculture and fishing, and, in no instance, paying more than £5 of rent. There are two parish-churches. Quarff church was built in 1828-9, off the parliamentary grant to the Highlands and Islands, at an expense of about £750. Sittings 360. Burra church belongs to the original parish of Burra, and was built by the heritors, and completed in 1804. Sittings 280. The parish is in the presbytery of Lerwick, and synod of Shetland. Patron, the Crown. Stipend £120, with a manse and glebe.—A Wesleyan Methodist chapel in the parish was built 14 or 16 years ago, at a cost of £150. Sittings 100. A Baptist and Independent place of worship in Burra was taken down about 5 years ago, and replaced by a new one which was estimated to cost from £50 to £60.

**QUARRELTON**, a village in the Abbey parish of Paisley, nearly a mile south of Johnstone, on the side of the great road to Beith. Here one of the most extraordinary masses of coal in the kingdom has long been wrought. It consists of five contiguous strata. The thickness of the whole, measured at right angles to the surface of the strata, is upwards of 50 feet; but as in some places the seam forms a considerable angle with the horizon, the thickness of the whole in those places, measured vertically, is about 15 fathoms. In consequence of the great depth, it is wrought in floors or stories. It is difficult to convey a clear idea of the manner in which this singular mass of coal lies. In a field of about 15 acres, it is found to dip in several different directions. At least, conceiving a nearly circular area of these contents, the coal from the north, the east, and the south quarters of that circle dips pretty

uniformly towards the centre. This, however, is in some measure interrupted by several hitches, at one of which the mass of coal is suddenly thrown up about 50 feet, at another about 30. These hitches interrupt not only the direction but also the degree of dip. On one side of the first-mentioned hitch, it is about one foot in three; on the other, only one in six. The concomitant strata are chiefly whinstone; whereas, at the other coal-works in this county, the accompanying minerals are freestone, ironstone, limestone, &c.; but never whinstone. The Quarrelton coal is of excellent quality. Some of it is of the burning kind, but the great part is of the close burning nature, similar to Newcastle coal, and breaks into small pieces. It abounds with inflammable air, and is liable to spontaneous ignition. Some time before the year 1776, it caught fire below, and burnt for several years; and part of the roof having given way, the ground sunk, for nearly an acre, about 2 feet lower. [Semple, Part III. p. 256.] Appearances indicative of the sinking of the ground still exist. In May 1818, one of the mines was overflowed with water, and five of the workmen perished. Two of the others were rescued alive, after having been immured in the gloomy dungeon for ten days. The village of Quarrelton is pleasantly situated, and is well-supplied with good water. The inhabitants are almost entirely colliers. The population of it and the adjacent village of Thorn, is about 900.

**QUARTER**. See HAMILTON.

**QUEENISH**, a small village, built about 40 years ago, on the estate of Mr. Maclean of Cadbole, in the island of Mull.

**QUEENSBERRY**, a mountain in the parish of Closeburn, Dumfries-shire. It sends down its east base into the parish of Kirkpatrick-Juxta, and lifts its summit but a brief distance south of the extreme angle of the deep indentation which is made into Dumfries-shire by Lanarkshire. Its altitude is 2,140 feet above sea-level. Its fine, majestic, sombre form constitutes a hold feature in many of the rich scenic views of the county. It has its name from the Anglo-Saxon *berg*, ‘a hill,’ softened into ‘berry;’ and, situated amid a congeries of noble heights, but queening it over them like a sovereign among courtiers, it is prosaically as well as poetically the ‘queen-hill’ of a large and superb district. It gave the titles successively of Earl, Marqu’s, and Duke, to the noble family of Douglas, which became extinct, in the direct line, in 1810, at the death of William, the 4th Duke. At that period, the noble family of Scott, dukes of Buccleuch, succeeded to the dukedom and the principal part of the estates; and Sir Charles Douglas, Bart. of Kelhead, succeeded as Marquis and Earl of Queensberry, Viscount of Drumlanrig, and Baron Douglas of Hawick and Tibberis, in the peerage of Scotland.

**QUEENSBERRY**. See POWFOOT.

**QUEENSFERRY**, a very small parish on the coast of the frith of Forth, Linlithgowshire; bounded on the north by the frith, and on all other sides by Dalmeny. Even the parliamentary boundaries of the burgh enclose a mere stripe along the beach, extending from an old quarry on the east to Echland-burn on the west; an area of only a mile in extreme length, and not more than about 250 yards in mean breadth. But the parochial territory compre-

hends not above one-half of this area; it is co-extensive with the royalty; and excludes parts of both ends of the town. As a territory it is in no part landward; and, in description, it becomes identified with the burgh. A chapel-of-ease was anciently built here by Dundas of Dundas, and still figures as an antiquity of the town. But the little district was separated from Dalmeny, and erected into a parish, only in 1636. It is in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. Patron, the Town-council. Stipend £171 8s. 6d.; glebe £25, with an allowance for a manse. The church was lately repaired, partly by a voluntary assessment, and partly by subscription from the burgh funds. There is here a meeting-house of the United Secession. In 1834, the parish-school was attended by 82 scholars; and three private schools by 58. Parochial schoolmaster's salary £22 4s. 6d., with about £40 fees and £4 other emoluments.

QUEENSFERRY, a small town and port, a royal burgh, and an important ferry-station on the south coast of the frith of Forth, Linlithgowshire. It stands 9 miles east by south of Bo'ness, 9 east by north of Linlithgow, and 9 west-north-west of Edinburgh. Its site is a belt of low ground at a point opposite the peninsula of North Queensferry, and the intermediate island of Inchgarvey, where the frith is suddenly and briefly, but very greatly, contracted in breadth. The ground behind the town rises abruptly; and immediately at the summit, or even on the slope of the steep bank, becomes open agricultural country. It is a place of considerable antiquity; it comes into notice as the station at which Margaret, Queen of Malcolm Canmore, passed the Forth in her numerous excursions between Edinburgh and Dunfermline; and it received, in honour of that active and well-meaning but priest-led princess, whose Saxon connexions and influence remotely worked so vast a moral revolution on the country, both its present name, and some early Latin designations of similar import. Malcolm IV., the great-grandson of Margaret, made the monks of Dunfermline a grant of the right of ferry at the place, and of a small piece of ground within the limits of the present royalty,—a grant which probably led almost immediately to the erection of the town; and, in 1164, he granted also to the monks of Scone a free passage at 'Portum Reginae,' for the abbot, the monks, and their men. In 1294, Pope Gregory confirmed to the abbey of Dunfermline "*dimidium passagii sanctæ Margaritæ Reginae.*" In a charter of general confirmation of regality jurisdictions by David II. to the monks of Dunfermline, "*Passagium*" figures as a burgh-of-regality along with "*Dunfermlyne, Kirkaldy, and Musselburgh.*" The place, as a burgh-of-regality, was again granted to the monks by Robert I., regranted by Robert III., and confirmed in 1450 by James IV. A new charter—mistakenly quoted by the Commissioners of Inquiry on Municipal Corporations as the governing one—was granted, in 1636, by Charles I., confirming the preceding royal grants, but at the same time confirming a charter by Robert, commendator of Dunfermline, which granted "*Ballivis, consuliis, et inhabitantibus nostri burgi regalitatis, fundum ejusdem et terras eidem spectantes, una cum lie mure burgi, una cum privilegiis, libertatibus, anchoragiis annuis-reditibus, firmis et devoriis burgalibus.*" As this is the latest extant charter, and the record of the Great seal, for the period is defective, no evidence exists as to the precise year when the town was erected into a royal burgh. Yet proof is decisive that the erection took place between 1638 and 1642, that it was violently opposed by the corporation of Linlithgow, and that it was not effected without degrading concessions to

that body. See LINLITHGOW. In 1639, a commissioner from it appears for the first time to have sat in parliament, and, in the parliament of the following year, he recorded a protest that he had produced his commission for Queensferry as a royal burgh, and that "he had ridden, sitten, and voyced in this parliament as the rest of commissioners of burghs;" and he was confronted by a counter-protest on the part of the burgh of Linlithgow, that he "had neither ridden, sittin, nor voyced in parliament for the Queensferry." In 1641, the same act of parliament which erected the place into a separate parish, freed it from the galling opposition of Linlithgow, and definitively recognised it as a royal burgh.

Queensferry, in spite of its antiquity and seemingly historical importance, has always been of small extent, and has a mean appearance; nor has it ever been enriched by much commerce, or dignified by great events. Its principal street is very irregularly curved, and of various and generally contracted breadth, and wends between 600 and 700 yards partly along the shore, and partly a little into the interior. A street of about 200 yards goes off from it at right angles, and straggles along the road leading to Kirkliston; and four brief alleys lead, in the case of three, to the harbour, and, in the case of the other, to the parish schoolhouse. These compose the whole town; and they form a mean tout ensemble. The old chapel, with a stone roof, stands at the west end, not very greatly dilapidated; the modern church stands behind the main street; and the humble town-house is wedged up into a nook near the centre of the town. The harbour is formed by two piers of different dates, which are so constructed as to enclose a pentagonal dock or basin, with an opening between their extremities toward the south. The work was constructed at a cost of £1,551, furnished chiefly by subscription, and was completed in 1818; but it has the disadvantage that it cannot be entered during any one of a large range of westerly winds. About the year 1640, about 20 vessels, most of them large brigs, belonged to the place, and were generally employed in the carrying trade; and toward the close of last century several vessels were built here, one of them a Greenland whaler of upwards of 500 tons. But now not a vessel is either built or owned; nor is one even seen, except passing along the frith, or making a detour for shelter.—Nearly the whole importance of the town is derived from the celebrity and the greatness of the thoroughfare at its ferry across the frith, which is 2 miles in length. Yet this belongs not to the burgh, but to the little village of Newhall, situated from 300 to 600 yards distant from its east end, and within its parliamentary boundaries. The pier of Newhall, provided with a lighthouse, is that with which the ferry-vessels communicate; and Newhall-inn, or 'the Ha's'—which figures so prominently in the opening scenes of Sir Walter Scott's '*Antiquary*'—is the central point of transit and bustle. The ferry is under the direction of trustees, who, in terms of parliamentary enactment, regulate fares, hours of sailing, and kindred matters; and it is, in all respects, on a very efficient footing. Between the 1st of April and the 1st of October a large hoat leaves both Newhall and North Queensferry, bourly, every day except Sabbath, from 6 in the morning till sunset, and, during the rest of the year, from 8 till sunset; a pinnace sails from each side half-an-hour after the large boat; and a steam-boat is always on the station, and, in a calm or during baffling or contrary winds, plies instead of the large boat or the pinnace. Passengers, horses, and carriages are not, without their consent, conveyed in the same boat with cattle, a stallion, or carts;

yet they have a right to be taken in the alternate boat which may ply for the latter's conveyance. The fare of passengers by the large boat is 3d. ; and by the pinnace or the steamer is 6d. The freight of a boat specially employed, if during the day, is 4s. ; of a pinnace or yawl, is 2s. 6d. ; and of the steamer is 7s. 6d. ; and, if during the night, of a boat, is 6s. ; and of a pinnace or yawl is 4s. Porters are salaried by the trustees, and not allowed to accept any gratuity. The boats, besides being used in all the ordinary traffic, regularly carry across the great northern line of mail from Edinburgh. The time allowed for conveying the Royal mail across is 30 minutes; and £300 is annually paid on account of the Post-office to the Ferry trustees for the conveyance of the four daily mails across the ferry here.

Queensferry is governed by a provost, a land bailie, two sea bailies, a dean-of-guild, and 16 councillors. By a singular interpretation of the Reform act, the inhabitants considered themselves at liberty to elect councillors resident without the royalty, but within the parliamentary boundaries, and actually chose several members thus not legally qualified. Municipal constituency, in 1833, 21,—just the number of the council; in 1840, 39. The Ferrymuir, the site of the town, and a right of common called the Loanings, were all at one time burgh property; but the first was sold, in 1814, for £1,610, to defray a debt of £500. The permanent revenue is about £100, of which one-half arises from customs, anchorages, and shore dues; and the permanent expenditure amounts to about £70, of which £42 is paid in salaries to the schoolmaster and the town-clerk. The magistrates have jurisdiction only within the royalty,—not in the extremities of the town; they hold their courts in person; they try civil causes to any amount; and they have, on the average, annually before them, 8 civil, and probably 12 or 13 petty criminal cases. The resident burghesses are 34. There are three incorporated trades, the wrights, the tailors, and the weavers, numbering respectively 4, 3, and 1, and all stoutly maintaining their exclusive privileges against unfreemen! There is no special police act; 6 constables assist the town's officer to maintain the peace; a supply of water has been obtained by voluntary assessment; the lighting of the streets at night is unknown. Queensferry unites with Stirling, Culross, Dunfermline, and Inverkeithing, in sending a member to parliament. Parliamentary constituency, in 1838, 42. Population in the burgh and parish—exclusive of the ends of the town of Newhall, and of scattered houses within the parliamentary boundaries—in 1801, 454; in 1831, 684. Houses 73. Assessed property, in 1815, £784. The Earl of Roseberry having given the inhabitants a pendicle of land for a bleaching-green, and materially aided them in obtaining the town's supply of water, as well as in other matters affecting their welfare and comfort, a tablet with a suitable inscription in his honour was, by order of the town-council, placed over the fount. An annual fair is held on the 5th of August, or, if that day be a Saturday, a Sabbath, or a Monday, on the preceding Friday or the following Tuesday.

QUEENSFERRY (NORTH), a small village in the shire of Fife, and parish of Dunfermline, but annexed, *quoad sacra*, to that of Inverkeithing. It is 10 miles north-west by west from Edinburgh, opposite to the royal burgh of South Queensferry, above described. "There is a traditional report," says Mercer in his 'History of Dunfermline,' "that the boatmen here formerly resided in a little square of cottages on the margin of what was once the Ferry-loch, on the top of the Ferry-hills. The remains of this ancient village were lately removed, to assist in

building a march-dyke through the loch, which has been drained. The inhabitants of North Queensferry consisted, from time immemorial, of operative boatmen, without any admixture of strangers. They hold their feu under the Marquis of Tweeddale, as successor of the abbots of Dunfermline; and they have always held, from generation to generation, the ferry as a sort of property or inheritance. On the evening of every Saturday, the earnings of the week were collected into a mass; one-fortieth part of the whole was set apart for the proprietors of the passage; and the remainder was divided into shares, called *deals*, according to the number of persons entitled to a share of it. One full deal was allotted to every man of mature age who had laboured during that week as a boatman, whether he acted as master or mariner, or in a great boat, or in a yawl. Next the aged boatmen, who had become unfit for labour, received half-a-deal, or half the sum allotted to an acting boatman. Boys employed in the boats received shares proportioned to their age. A small sum was also set aside for a schoolmaster, and for the widows of decayed boatmen. Nobody became a boatman in this ferry unless by succession, and that right was always understood to be limited to the first generation. The children of those who had emigrated, and were born elsewhere, had no connection with this ferry; but, on the other hand, if the son of a boatman found himself unfortunate in the world, he was always entitled to return, to enter into one of the boats, and to take a share of the provision which formed the estate of the community in which he was born. That community always consisted of nearly the same number of persons. About 40 men acted in the boats, and received the full deal, as sailors of mature age. The whole community, including these and the old men and boys, and the women of every age, amounted to about 200 individuals. It was kept down to this number by emigration; because a man of mature age usually received no more, and sometimes less, for acting as a boatman here than he could obtain by acting as a seaman in the public service, or in that of a merchant. He was, moreover, excluded from all chance of rising in the world,—a circumstance which is of itself sufficient to keep the number stationary. The community accordingly existed for ages destitute of riches; but none of its members were ever reduced to absolute poverty, or became a burden on the public."

QUEENSIDE (LOCH). See LOCHWINNOCH.

QUEICH (NORTH), a rivulet of Kinross-shire, which rises among the Ochils in the north-west corner of the parish of Orwell, and runs south-eastward to Loch-Leven, a little below Milnathort: See ORWELL.

QUEICH (SOUTH), a rivulet partly of Perthshire, but chiefly of Kinross-shire. It rises among the Ochils,  $1\frac{1}{2}$  mile north-west of the source of the North Queich, and within the limits of Perthshire; it begins a little below its origin to trace for nearly 4 miles the boundary-line between the two counties; and it then runs  $4\frac{1}{2}$  miles south-eastward, chiefly through Kinross parish, to Loch-Leven, at the town of Kinross.

QUENDAL VOE, a bay in the parish of Dunrossness, Shetland. It opens near the southern extremity of the mainland,  $2\frac{1}{4}$  miles west-north-west of Sumhurgh-head, and penetrates about 2 miles north-eastward into the land, with a mean breadth of about 1 mile. It is partially covered in the offing by an islet called Cross-island, and is esteemed a good natural harbour. At its head stands a mansion called Quendal-house.

QUIVOX (ST.), a parish in Kyle, Ayrshire;

bounded on the north by Monkton and Tarbolton; on the east by Tarhilton; on the south by the river Ayr, which divides it from Ayr parish; and on the west by Newton-upon-Ayr and Prestwick. Its greatest length from east to west is 5 miles; its greatest breadth is 3 miles; and its area is about 4,000 acres. The surface in the west and centre is level, and in the east is somewhat swollen and tumulated. Some parts of the bank of the river Ayr are steep, and covered with natural wood and plantation. The soil in the west is sandy, in the centre is light and gravelly on an irretentive subsoil, and, in the east border, is a stiff clay. The whole area, except what is covered by town and detached houses, and about 250 acres covered with wood, is arable, and well-enclosed with ditches and hedge-rows. Husbandry and the dairy flourish, and are conducted with skill. A five years' rotation, comprehending two of grain, one of esculent roots, one of artificial grass, and one of pasture, is common; and the Ayrshire breed of cattle is preferred, not only for the dairy, but for the shambles. The coal-field of Ayrshire, with its characteristic interior and superincumbent strata, underlies the whole area. Three coal-mines and several quarries of prime building-sandstone are worked. Craigie, in the vicinity of Ayr, and the seat of Mr. Campbell, and Auchencruive, in the eastern district, and now the seat of Mr. Oswald, the representative of Glasgow in the present and in former parliaments, are both situated on the picturesque banks of the Ayr, and are spacious and elegant mansions. The gardens and grounds of Auchencruive, in particular, are highly embellished and ornate, and form a powerful attraction to tourists and to the citizens of Ayr. Wallacetown and Content [see WALLACETOWN] form jointly a large suburb of Ayr, and lie compactly or continuously with the burgh of Newton-upon-Ayr. The only other village is WHITELETS: which see. The parish is traversed by the roads from Ayr to respectively Galston and Mauchline; and has a complement of other roads. Population, in 1801, 2,070; in 1831, 5,289. Houses 692. Assessed property, in 1815, £7,832.—St. Quivox is in the presbytery of Ayr, and synod of Glasgow and Ayr. Patron, Oswald of Auchencruive. Stipend £276 1s. 9d.; glebe £8. Unappropriated tithes £334 18s. 8d. The parish-church—situated in the centre of the parish—was built before the Reformation, and altered and somewhat enlarged in 1834. Sittings 450. The town-district of Wallacetown, with then 4,199 inhabitants, and 7 places of worship, was, in 1836, erected into a separate *quoad sacra* parish. The population of St. Quivox, *quoad civilia*, in 1836, was, according to

the statement of the minister, 5,407, leaving to it, *quoad sacra*, or after the deduction of the Wallacetown population, only 1,208,—of whom 999 were churchmen, and 209 dissenters. There are two Sabbath-schools respectively at the church and at Whitelets. Parochial-schoolmaster's salary £30, with 8 holls of meal, £15 fees, and from £10 to £15 other emoluments. In 1834 there were 7 non-parochial schools, conducted by 8 teachers, and attended by 551 scholars.—The ancient church was originally, and for centuries, called Sanchar, the antique form of the modernized Sanquhar, from the Gaelic *sean caer*, 'the old fort.' In 1212 it was a rectory; between 1229 and 1238 it belonged to the short-lived Gilbertine convent, which the second Walter, the Stewart, established at Dalmulin; and from 1238, till the Reformation, it belonged to the monks of Paisley. Though Sanchar continued to be the name of the several estates which were portions of the ancient territory or manor, the church, at the Reformation, looks out under the designation of St. Kevoc. This name, which is quite unknown in hagiology, and looks very like a quiz of the un-housed and splenetic monks, has undergone the successive transmutations of St. Kevocke's, St. Keevox, St. Queevox, and St. Quivox.

QUOICH (LOCH), a lake in the centre of the western half of Inverness-shire. The vale which it occupies receives from it the name of Glenlochquoich, but really is the upper part of Glengarry. The lake is about 6 miles in length, and probably not quite half-a-mile in mean breadth; it extends from west to east, and sends off its superfluous waters eastward to Loch-Garry, at a distance from it of 9 or 10 miles. Though altogether Highland, and not remarkable in its scenery, it is yet a fine sheet of water. The public road from Invergarry, in the Great Glen to Loch-Hourn and Glenelg, winds along its north bank.

QUOICH. See COICH.

QUOTHQUAN, or COUTH-BOAN, i. e. 'The beautiful hill,' in the Upper ward and shire of Lanark, an ancient parish, united in 1660 to the parish of Liberton. The church is demolished. Quothquan-law, from whence the parish is supposed to derive its name, is a beautiful little hill, which is elevated about 600 feet above the level of the Clyde, and is green to its very summit: upon it, the common people still point out a large rough stone, called Wallace's chair, where, it is said, Sir William Wallace held conferences with his followers, before the battle of Biggar. Here is a school, the salary of which arises from school-fees, and a mortification of about £2 10s. per annum.

## R

RAASAY. See RASAY.

RAEBERRY-CASTLE. See KIRKCUDBRIGHT.

RAFFORD, a parish in the west of Morayshire. It is bounded on the north by Kinloss; on the east by Alves and Elgin; on the south by Dallas and Edinkillie; and on the west by the Findhorn and by Forres. Its length, from north-east to south-west, is upwards of 8 miles; and its breadth varies from 3 to 5 miles. Its surface is partly low, flat, and fertile; partly elevated, moorish, and rocky; and everywhere much diversified in tone of landscape. The hills attain no commanding or remarkable altitudes, and are chiefly dressed in heath, furze, and juniper; yet they produce abundance of fallen fir, excellent peat, and other fuel, and afford extensive pasturage for sheep and black cattle. The soil is variously a light and shifting sand, a black and shallow mould lying upon rock, a deep and rich clay, and a rough brown gravel on an almost impenetrable subsoil. Sandstone and grey slate are quarried. The chief mansions are Blervie, Altyre, and Burgee. "Our next step," says Miss Sinclair, "was through a scene of almost unearthly beauty to Altyre, the most lovely and loveable place you can conceive, belonging to Sir William Cumming Gordon, chief of the clan Cumming, and representative of the old Lords of Badenoch. The house is a perfect cluster of arhours and green houses, apparently meant for the muses and graces, for pleasure, gaiety, and romance, but never intended for the mere vulgar, ordinary purposes of life. Within, without, and around, you see nothing but flowers rushing in at every window, and besetting all the doors. This is the court of Flora herself; and you would suppose we had come for a horticultural show." Burgee-castle is a large and beautiful fabric, consisting of a square tower of six stories, built in 1602, and an adjoining mansion founded about a century later. Its gardens occupy several acres, and are skirted with double rows of fine spreading heeches. The parish is bisected by the road from Forres to Grantown. Population, in 1801, 1,030; in 1831, 992. Houses 203. Assessed property, in 1815, £887.—Rafford is in the presbytery of Forres, and synod of Moray. Patron, Brodie of Lethen. Stipend £222 19s. 3d.; glebe £6. Unappropriated teinds £68 7s. 9d. The present parish comprehends the ancient parishes of Rafford and Altyre. See ALTYRE. Parish-schoolmaster's salary £27 16s., with £10 fees, and £4 other emoluments. Two private schools are conducted by females.

RAILWAY. See articles ARBROATH, ARDROSSAN, BALLOCHNEY, DALKEITH, DUNDEE, EDINBURGH, GARNKIRK, GLASGOW, KILMARNOCK, MONKLAND, PAISLEY, PERTHSHIRE, POLLOCK, SLAMANNAN, TROON, and WISHAW.

RAIT, a small village in the parish of KILSPINDIE: which see.

RANKLE-BURN (THE), a rivulet, a tributary of the Ettrick in Selkirkshire. It rises within  $\frac{1}{4}$  of a mile of Moodlaw-loch, where the counties of Selkirk, Roxburgh, and Dumfries meet, and flows 7 miles northward and north-north-westward to the Ettrick opposite Tushielaw-tower. For 2 miles near its source it divides Ettrick parish from Rotherton; and for half-a-mile about the middle of its course, it divides Ettrick from Yarrow. It is throughout a deeply sequestered and wildly pastoral stream. The

glen which it traverses is one of the most still and savage in the Lowlands, yet is not devoid of interesting associations, nor wants the power of appealing strongly to the imagination and the taste: See articles BUCCLEUCH and ETRICK.

RANNOCH, a *quoad sacra* parish, and an extensive Highland district, in the north-west extremity of Perthshire. The whole extent is 28 miles from east to west, by 16 from north to south; but the inhabited portion is only a stripe from east to west of 16 miles by 2. The parish comprehends the larger and northern part of the enormous *quoad civilia* parish of Fortingal, and the large detached part of Logierait which lies in the centre of Fortingal; and it was erected by authority of the General Assembly in 1829. The church is situated at the east end of Loch-Rannoch, and was built in 1829 by the heritors, at an expense of £750. Sittings 560. A chapel-of-ease, or second parochial church, is situated at the west end of Loch-Rannoch. Sittings nearly 300. The minister officiates on three successive Sabbaths in the church, and on the 4th Sabbath in the chapel. Stipend £120 paid by Government; glebe about £2 10s., and a manse. The minister stated to the Commissioners of Religious Instruction, that formerly there were three stations at which a resident missionary alternately officiated, and "that now, there being no obligation on the minister of Rannoch" to preach at one of the stations, "the inhabitants of that district are in a worse situation than when they were under the pastoral superintendence of a missionary!" Population, in 1836, according to ecclesiastical survey, 1,415; of whom 1,400 were churchmen, and 15 were dissenters.—The district has Lochaber on the north-west, Badenoch on the north, Blair-Athole on the east, Breadalbane or the Glenlyon and Fortingal sections of that district on the south, and Glenorchy and Appin on the west. All the northern part is filled with a section of the broad and towering range of the central Grampians,—that range which runs from sea to sea between Ben-Nevis and the coast of Kincairdineshire; all the western part is filled with the hoggly wilderness of the Moor of Rannoch, which intervenes between the great central mountain-range of Scotland and the commencement of the range which runs down at right angles from it to the Clyde at the Kyles of Bute; and a stripe along the border of the southern part consists of the northern declivities and spurs of the water-shedding range, which forms the left screen of the long, pent-up, romantic vale of Glenlyon. Not a pass or point of egress exists round the far-stretching sweep of the stupendously hulwarped north-west and north; and even into Glenlyon direct access is practicable only by one difficult mountain-road, about the middle of the south. All the upland region is wild and indomitable, towering hulkily up in sable nakedness, or in dresses of heath, or stretching abroad in table-expanses of moor and deep bog, or occasionally cloven down, in the lower declivities, into narrow and sequestered glens, or small verdant openings, the site of solitary shielings, and the scene of the summer pasturings of the migratory flock, and the summer seclusion of the grazier and the herd. The moor on the west is the largest and the dreariest tract of its class in Scotland, and probably one of the most desolate in the world, an open, monotonous, silent,

black expanse of desert, a vast region of bog and morass, with a few dreary pools, and one long dreary lake, some ditchy naked lines of dark water-course, and a far-distant environing mountain-screen, whose frowns and coarse dark features are in rueful sympathy with the humours of the sable sea of moss. "Pray imagine the moor of Rannoch," says Dr. M'Culloch; "for who can describe it? A great level (I hope the word will pardon this abuse of it) 1,000 feet above the sea, 16 or 20 miles long, and nearly as much wide, bounded by mountains so distant as scarcely to form an apprehensible boundary; open, silent, solitary; an ocean of blackness and hogs, a world before chaos; not so good as chaos, since its elements are only rocks and hogs, with a few pools of water, hogs of the Styx and waters of Cocytus, with one great, long, sinuous, flat, dreary, black, Acheron-like lake, Loch-Lydoch, near which arose 3 fir-trees, just enough to remind one of the vacuity of all the rest. Not a sheep nor a cow; even the crow shunned it, and wheeled his croaking flight far off to better regions. If there was a blade of grass any where, it was concealed by the dark stems of the black, black muddy sedges, and by the yellow, melancholy rush of the bogs." But the long inhabited stripe, though much inferior in scenery to other and similar Highland glens, largely compensates by its beauty and picturesqueness for the repulsive wildness of the moor. At the west end it is entered from the moor by the closing in of the hills upon the course of the river Gamhair; and from the mouth of that river to a point 12 miles eastward, it has gentle, or at least rapid slopes coming down upon the watery pavement of Loch-Rannoch; and from the east end of the lake onward, it consists of the vale or glen of the Tummel, overhung and shut up by the vast solitary mountain-mass of Shichallion. Most of it is thus the frame-work of Loch-Rannoch, and, with a large forest of native fir which runs far up the height along the south, and is broken with glades and curiously gemmed with mansions and farm-villages,—with some decrepit yet picturesque remains of a native birch-forest straggling upon the declivities along the south,—with the side background of the bold mountain-heights climbing tier upon tier till they become wreathed in clouds,—and with the snowy peaks of Glencoe and Glenetive looking up in the far west at the distance of 40 miles, and suggesting what an ocean of wilderness lies between, the landscape is at once interesting and impressive. Two hamlets, called Kinloch-Rannoch and George-town, stand respectively at the east and at the west end of the lake, and are the sites of the two places of worship. Roads go up both sides of the Tummel and the lake, keeping close upon the water; but they unite and become one at George-town, before setting out on the moor toward Glencoe. See FORTINGAL.

RANNOCH (LOCH), a lake in that district of Perthshire called Rannoch, to the east of the moor of Rannoch, and within a few miles of the northern boundary of the county. It is distant from Dunkeld upwards of 40 miles, and about 25 from Blair-Athole. To this district there is an excellent carriage-road along the banks of the Tummel, which here presents a continued succession of falls and rapids, and thunders down a channel within lofty banks shaded with woods. Loch-Rannoch occupies about 10 miles of a narrow valley, nearly 20 miles in length, and from 2 to 2½ miles in breadth. Its shores are beautifully indented by descending sweeps of the adjoining mountains, and by points of land richly wooded, which run far into the lake. The mountains on the north side are very high; and their steep sides, wherever the crags will permit it, pre-

sent some beautifully wild cultivation, and several upland farms of a singular character. The ride up the south side of the loch, however, is by much the most delightful. The mountains here form another lofty range, covered far up their sides with an ancient forest of natural pines. In many places this forest is now falling into decay; but it still presents much scenery magnificently picturesque. In proceeding from the foot of the loch—rather anomalously called *Kinloch-Rannoch*, or 'the head of Loch-Rannoch'—towards what is really the head of the lake, the distant mountains of Breadalhan and Lorn, crowned with the clouds constantly arising from the Atlantic ocean, form a splendid termination in almost every view; while, in descending, the lofty Shichallion, and other mountains in its neighbourhood, closes the scene towards the east. At the foot of the loch is the village of Kinloch-Rannoch, and at the head the village of George's-town, at both which places there are inns. About a mile from George's-town is Barracks, the property of Robertson of Struan, a place used by Government as barracks for a considerable time after the Rebellion. Here troops were kept for preserving the peace of this portion of the Highlands; and hence its present name, which has rather an odd sound, as the residence of a Highland gentleman. It was to Rannoch barracks that the notorious Serjeant Mhor was conveyed after his capture, previous to his being taken to Inverness, where he was condemned and executed. The uppermost farm in Rannoch, before entering on the moor, is still pointed out as the place where this almost the last of the Highland freebooters was taken. Rannoch-lodge, the hunting-seat of Sir Neil Menzies, Bart., of Castle-Menzies, is situated a short way beyond the head of the lake.—There are two islands in the lake, on one of which a M'Dougal of Lorn was confined by Robertson of Struan, the chief of the Clan Donachie, during the struggle of Robert Bruce for the throne. The opposition of M'Dougal to Bruce is well known; but the Clan Donachie had adopted the cause of the royal fugitive. In some battle between these clans, M'Dougal was taken prisoner, and, for greater security, was imprisoned on one of the islands of this lake. Two of his followers came from Lorn to Rannoch with a sack of apples for their chief, and wished to be allowed to visit the island. The chief of the Clan Donachie refused this request, but sent the apples to the island with two of his own followers. These worthies having fastened their boat to a rock, carried the apples to M'Dougal. The chief opened the sack, took out some handfuls of the apples, and threw them on the floor for the two children of Donachie to pick up. They began to scramble for them, and in their eagerness forgot the prisoner. The opportunity was tempting; the door stood open,—the distance to the beach was short,—the boat ready,—and no other at the island by which he could be pursued. Leaving his two enemies to fight at their leisure for the apples, M'Dougal sprung out at the door, and before the sons of Donachie recovered from their astonishment at the suddenness of his exit, was in the boat, and had pushed it from the island. He made quickly to the opposite shore,—landed at a point which still bears his name,—and took to the mountains. Pursuit was vain, and the Lord of Lorn was soon in safety among the sons of his own clan. Tradition has not told us the punishment inflicted by the angry chief of the Clan Donachie on his two apple-loving clansmen; but we may be certain, that if they fell into his hands, their heads would be made to answer for their folly.—The other island is much smaller than that on which M'Dougal was imprisoned, and is said to have been

erected of wood and stone in ancient times, by one of the Robertsons of Struan, who, upon it, imprisoned his wife for a number of years. While she was confined here, the laird went north, and wooed the daughter of another chief. Suspicious as to his first wife being still alive having been excited, he laid his hand on his dirk, and swore that he had no wife living on Scottish ground. As his wife lived in the prison he had built in the middle of the lake, the laird considered she did not live on the land; but whether this savage piece of casuistry availed him or not, Tradition—which is as confused and contradictory on this as it is on many other points—has not very distinctly handed down.—The Clan Donachie, who inhabited this district, are alleged to have sprung from the great sept of the M'Donalds. Their remote ancestor was one Duncan Croisda, or 'Duncan the Cross-grained,' a son of M'Donald, Lord of the Isles, in the reign of William the Lyon. From him they are called Clan Donachie, or Duncanson; but their name of Robertson they derive from a chief named Robert, who signalized himself in the reign of James I, and apprehended Robert Graham, one of the king's murderers. In memory of this act, they bear, in addition to their original arms, which are three wolves' heads erased gules, a naked man manacled. The surname of Skene is said to have been derived from one of this family, who, hunting with the king in Stochel forest in Athole, killed a large fierce wolf with his skene or dagger. This is alluded to in the arms and motto of that name. From the Robertsons are also derived the surname of Collier; among whom Collier, Earl of Portmore, was the most important. The residence of the chiefs of the clan was at Mount Alexander, or as it is called in Gaelic, Dun-Alister, near the eastern extremity of Loch-Rannoch.—This place derives some interest from its connexion with the well-known poet, Robertson of Struan, the head of the Clan Donachie, during the rebellions of 1715 and 1745. This singular character was out in 1715, and his estates were, in consequence, forfeited. These were afterwards restored; but on his joining the Rebellion of 1745 they were again forfeited and annexed to the Crown. Notwithstanding this, however, he again returned, and lived upon his property, as Dr. McCulloch says, 'a poet and a sot.'

RANNOCH (THE), that part of the northern great head-water of the Tay, or of what, in a large sense, is called the Tummel, which runs between the foot of Loch-Rannoch and the head of Loch-Tummel, Perthshire. The stream is 9½ miles in length; has some bold, though not large sinuosities; runs prevailingly due east; and has, on its right bank, Fortingal and Dull, and on its left a detached part of Logierait, Fortingal, Blair-Athole, and a wing of Dull. As it contains all the waters of the Gaur and of minor streams drained into Loch-Rannoch, it possesses the volume of a second-rate Scottish river. Its course is rapid and occasionally impetuous: and its scenery, though considerably inferior to that of the Tummel, possesses much Highland and bosky picturesqueness and romance. Its banks, for some distance below Loch-Rannoch, while greatly more open than those of the southern Teith between Lochs Katrine and Achray, have confused aggregations of little rocky eminences, overhung with shrub and tree, which, with bold and lofty mountains overlooking them, present some similarity to the Tro-sachs. At Mount Alexander, 4 miles below Loch-Rannoch, it forces its way through a narrow and romantic pass under the north side of Shichallion, and has on each side climbing forests, which go boldly and rollingly and with picturesque sweeps up the broken base of the acclivities. "The whole of

this species," says Dr. McCulloch, "is exceedingly rich in that mixture of wood and rock which is so characteristic of this skirt of Shichallion; and the various wider landscapes which are found about this place, yield to few in extent of scope, and in splendour of romantic and ornamented mountain character." "As you follow down the banks of the river," says another writer,\* "as it flows from the Rannoch to the Tummel, you see such an assemblage of wildness and rude grandeur, as beggars all description, and fills the mind with the most sublime conceptions."

RANZA (LOCH), a hay and hamlet on the north-west coast of Arran, 1½ mile from the northern extremity of the island, 5 miles south-south-east of Skipness-point in Kintyre, and 7½ miles south-west of Inch-Marnoch, off Bute. The bay is about a mile in length, and 3 furlongs in mean breadth. On the south side, near its head, a commodious natural harbour of great security and much depth is formed by the projection of a small low peninsula. During the season of the herring-fishery, 200 or 300 boats frequent the bay, and may be seen now lying at anchor, while their nets are drying on the beach, and now shooting away in a consentaneous fleet, and opening out in array to drop their nets on the fishing-ground. On the small peninsula of the bay stands Loch-Ranza castle, once a royal hunting-seat, but now a ruin, though otherwise undilapidated. The structure consists of two castellated square towers, united by connecting walls, and more ornamented than the majority of old Highland strongholds. There is a chapel-of-ease here. See ARRAN.

RAPLOCH, a village in the parish of Stirling, Stirlingshire. It is overhung immediately on the south-west by Stirling-castle, or stretches from the base of the rock to within a few yards of the Forth; it is distant ¾ of a mile from Stirling bridge; and it is comprehended within the parliamentary boundaries of the burgh. Dougald Graham, long town-bellman of Glasgow, and the author of nearly all the chapbooks which circulated among the lower classes during the past century, was born about the year 1724, at Raploch, and died in the year 1789. According to an account of him given by the late Mr. Motherwell in 'the Paisley Magazine,' he joined the Pretender in 1745; and the most extensive of all Dougald's works was a metrical 'History of the Rebellion,' which was a great favourite with Sir Walter Scott, and which seems to have been an early production, having on the title-page,—

"Composed by the poet D. Graham;  
In Stirlingshire he lives at home."

He was also author of two well-known songs of considerable merit,—'Turninspike,' and 'John Hielandman's Remarks on Glasgow.' An old bookseller, who remembered him personally, told Motherwell, that "Dougald was an unco glib body at the pen, and could screed-aff a bit penny-history in less than nae time. A' his works took weel. I never kent a history o' Dougald's that stack in the sale yet." Strange it is to reflect, that the task of providing food for the popular mind, which the Broughams and other great ones of the day do not now disdain to devote themselves to, should have rested, so short a time ago, solely in the hands of this half-witted and illiterate mortal, Dougald Graham, bellman of Glasgow!

RASAY (THE), or BLACK WATER, a river of the central district of Ross-shire. It rises in various head-waters on the east side of Dirry More, on the boundary between Loch-Broom and Contin, and traverses the latter vast parish along Strath Vaich and

\* Dr. James Howie.

Strath Garve, to the Conan, 2 miles above the church of Urray, and 7 miles above the head of the Cromarty frith. Its length of course, exclusive of sinuosities, is about 20 miles; its prevailing direction is toward the south-east; and its chief tributaries are the Dirry and the Rannoch,—both inconsiderable streams.

RASAY, or RAASAY, a considerable island of the Hebrides, belonging to Inverness-shire, and lying between the island of Skye and the Ross-shire district of Applecross. It forms a long belt of land stretching due north and south; and separated by the sound of Rasay, from the Skye district of Trotternish, or sub-districts of Snizort or Portree. Its distance from Skye varies between a mile and nearly 5 miles; and its distance from Ross-shire varies between  $6\frac{1}{2}$  and  $9\frac{1}{2}$  miles. On a line with it due northward extends Rona, distant at the nearest point about a mile; and at its north-west corner lies Fladda, separated from it only during flood-half tide, and by a very narrow channel. Rasay measures about 14 miles in length, about 2 miles in mean breadth, and about 28 square miles in superficial extent. It may be viewed as consisting of two continuous hilly ridges; the one on the north composed principally of gneiss, and the one on the south composed of porphyritic rocks superincumbent on red and white sandstone. The northern division extends to the vicinity of Brochel-castle, or occupies all the area for about  $5\frac{1}{2}$  miles from the northern extremity; and it presents those naked, rounded, evenly-disposed, and cheerless rocky eminences which characterize so many of the dull low islands of the outer Hebridean archipelago. The southern division possesses a mean elevation of probably 1,000 feet; and as seen from the south-east, it presents the outline of a high table-land, sending up the single flat-topped eminence of Duncan-hill to about 1,500 feet above sea-level; but, in reality, it descends by a general slope toward low shores on the west, and, for the most part, breaks sheer down on the east in a long range of mural cliffs picturesquely intermixed with fine slopes which are swarded in verdure. In the interior, narrow though the district be, are many irregular eminences, and long narrow ridges parallel to the sides of the island, so divided by deep valleys, that a tourist's path in traversing them resembles that of a vessel alternately descending and surmounting the long ridgy waves of a deeply-rolling sea. All the west and the north of the island have a most uninteresting aspect, and exhibit dreary amassments of grey rock which are ill diversified by the brown hue of the heath, and the arid yellow of the scirpus cespitosus. But the east side of the southern district is powdered over with farm-steads, and chequered with tracts of cultivated land, and patches of brush-wood; and it shoots up in towering rocks and formidable cliffs, which now nestle the human dwellings in the hollows at their base, and now perch them aloft in giddy and hurlesque mimicry of the eyries of the eagle. "On this side," says Dr. McCulloch, "scenes of considerable grandeur occur, generally marked by great breadth and simplicity of manner, and by powerful effect; at times, however, verging to an artificial character, in the architectural regularity of the flat sandstone cliffs, which are frequently split into columnar and conical forms, rising like towers above the deep dark sea that washes their bases. The houses perched on these summits seem more like the retreats of the birds that hover round them than the habitations of human beings; the eye from below scarcely distinguishing them, far less their inhabitants. The grandeur of these long-

extended walls of rock is often varied by the enormous fractures and dislocations which have at different times taken place; masses of immense bulk having been occasionally separated so as to form a second ridge below them; while, in other places, huge piles of ruin cover their slopes with fragments advancing far into the sea, and strewing the shore with rocks." Dr. Johnson, then, had he given more scope to his intellectual taste, and less to his physical, would have found something better to say of Rasay than:—"It has little that can detain the traveller, except the laird and his family; but their power wants no auxiliaries. Such a seat of hospitality amidst the winds and waters, fills the imagination with a delightful contrariety of images." A man who, in the vicinity of such splendid cliff-scenery as fills the eye with some of the choicest images of poetry, could think only or chiefly of the roast and the decanter, of "plenty and elegance, beauty and gaiety, the song and the dance," could hardly do otherwise than produce a hideous daub when he attempted a picture of Scotland.—The chief antiquity of the island is Brochel-castle; a curiosity whose attractions draw from many a tourist the expenditure of a day's excursion. It stands in a little bay, on the east coast, at a point where the cliffs have diminished to a moderate altitude. Its site is a conglomerate rock of two ledges or stages, whose upper part is quite isolated from the neighbouring heights, and whose composition a not very scientific writer describes as "different kinds of burnt stone, lime, and shell, that have all the appearance of being jumbled together, some time or other, by a volcanic eruption." On the lower ledge of the rock, and rising from its very edge, stands a small building of two low stories, and a narrow interior court; and on the summit of the rock, and occupying all its area, stand another small building, and two triangular and loop-holed recesses,—the building disposed in two low stories, of each a single apartment, and in surmounting battlements, and a warden's room. The only access is up an approach which has been cut on the side next to the sea, and which is so steep that it can be climbed only on all-fours, or at least with the aid of the hands; the entrance is by a narrow steep-roofed passage between the lower building and the base of the upper stage of the rock; and, altogether, the combination of strong natural position and artificial fortalice is so complete as to exhibit the very beau-ideal of adaptation to security and defence in the ages preceding the invention of gunpowder. The last occupant of the castle is said to have been a person of extraordinary personal strength and valour, who was one of the predecessors of the present laird of Rasay, and lived in the times of James VI., and who, on account of his remarkable powerful appearance, was called Eoin Garbh,—'John the athletic.' At the Kirktown of the island stand the ruins of an ancient Roman Catholic chapel, surrounded with a plantation of trees. The mansion of Macleod of Rasay, the landowner of the island, is a splendid edifice, in modern style of architecture, with a superb front; and was built by the late proprietor, with the native sandstone of the southern district. Some very scanty remains exist of some natural woods which, up to a few years ago, were of noticeable and embellishing extent. Plantation covers a considerable space, and consists of pine, ash, mountain-ash, hirsch, and oak. Two freshwater lakes in the island are fringed with coppie, and command views of a very large expanse of the picturesque hill-landscape of Skye. The sound of Rasay, and all the encircling sea abound in cod, ling, herrings, haddocks, whittings, flounders, skate,

cuddies, and lythe. For the population and ecclesiastical statistics of the island, see **PORTREE**; to which parish it helongs.

**RATHEN**, a parish on the coast of Bucban, Aberdeenshire. It is bounded on the north by the main body of Fraserburgh and hy Fraserburgh-hay; on the east hy the German ocean; on the south hy Lonmay; on the south-west by Strichen; and on the west hy the detached part of Fraserburgh and hy Tyrie. Its greatest length, in a direction south-westward from the coast, is about 7 miles; its breadth, for about  $1\frac{1}{2}$  mile near the interior end, expands to 4 miles, but elsewhere averages about  $1\frac{1}{2}$ ; and its area is about 6,310 acres. The coast, partly flat and sandy and partly consisting of low rocks, commences 2 miles south of Fraserburgh, runs out into a headland called Cairnhulg-point, and altogether has an extent of  $2\frac{3}{4}$  miles. The rivulet of Rathen or Philorth drains nearly the whole parish; and, herefore falling into the sea, runs nearly 3 miles on the houndary with Fraserburgh. **MORMOND-HILL** [which see] is partly within the south-west limits; and both its declivities, and the summits and sides of other high grounds in its vicinity, are bleak and barren; but the lands along the Philorth are low, and, in general, tolerably productive. The woodlands, the hill-pastures, and the arable grounds, are, in the proportion to each other, of 2, 27, and 94. Limestone is plentiful; and, on the estate of Auchirus, it is worked, and is of excellent quality. Cairnhulg-castle, now in ruins, has walls of great thickness, and appears to have been a place of considerable strength. It was the family seat of the predecessors of Lord Saltoun; and till sold, in 1613, by Sir Alexander Fraser to Fraser of Durris, it bore the name of Pbilorth, which was then transferred to another mansion in the family which still hears it, and is the seat of Lord Saltoun. Inverallochy-castle, also a ruin, formerly had above its entrance a stone sculptured with the Comyn's arms, and inscribed: "I, Jordan Cumming, gat this house and land for higgng the ahhey of Deer." Colles-house is a modern mansion, emhosomed in wood. Two contiguous fishing-villages on the coast, Cairnhulg and Inverallochy, jointly possessed, in 1837, a population of about 900. During the herring-fishing at Fraserburgh they are almost wholly deserted; and, at other seasons, they partake the prosperity which has so long distinguished the adjacent fishing-grounds. The parish is hised by the road from Fraserburgh to Aherdeen, and partly cut hy that which diverges toward Peterhead. Population, in 1801, 1,588; in 1831, 2,100. Houses 434. Assessed property, in 1815, £4,154.—Rathen is in the preshytery of Deer, and synd of Aherdeen. Patron, Lord Saltoun. Stipend, £169 14s. 4d.; glehe £9. The church is old, and was repaired in 1767. Sittings 684. Schoolmaster's salary £25 13s. 3 $\frac{1}{2}$ d., with £16 4s. 6d. fees, and a share of Dick's hequest. Two private schools were, in 1834, attended by 144 scholars.

**RATHILLET**. See **KILMANY**.

**RATHO**, a parish in the north-west division of Edinurghshire; hounded on the north hy Kirkliston and Corstorphine; on the east by Corstorphine and Currie; on the south hy Currie and Kirknewton; and on the west by Kirknewton and Kirkliston. A slender oval, stretching east-north-eastward, and measuring at the axes  $4\frac{3}{4}$  and  $2\frac{1}{2}$  miles, constitutes the body of the parish; and a projection,  $2\frac{1}{2}$  miles in length and about a mile in mean breadth, goes off south-south-westward from near its middle. The area is about 10 square miles, or 5,800 acres. The surface of the eastern half of the main body is a slightly variegated level; and, of the western half, is a congeries of broad-based billocks, or low tahleland, with gentle swells, rising from 300 to 400 feet

above sea-level. As the position is midway between the Pentland hills and the frith of Forth, and about 8 or 9 miles west of Edinurgh, magnificent views are obtained, from the little heights, of the scenery of the Lothians, the Forth, and the southern slopes of Fife, with the romantic perspective of the far-extending Grampians. The surface of the projecting or southward district rises slowly from a low line of connexion with the main body to near the southern extremity; and it there shoots abruptly up in the bold forms of the Dalmahoy crags, or Dalmahoy and Kaimes bills, 660 and 680 feet above sea-level. These two isolated heights form a conspicuous and picturesque feature of the general Lothian landscape; and, like Salisbury crags, the rocks of Edinurgh and Stirling castle, and various eminences at the north-east end of the Lennox hills, they break down in cliffs, or stoop precipitously to the west. As the arable grounds are enclosed with hedge-rows and waved over by files of trees, and large pendicles of the area are emheshed into garden-ground and demesne, and the swells and summits of the low tahleland in the west are striped and crowned with helts and clumps of plantation, the parish possesses, within itself, not a few materials and groupings of beauty. About five-sixths of the whole area is either in tillage or in an arable condition; and the remaining sixth is distributed, in not very unequal parts, into plantation-ground and pasture. The soil is, in general, a light loam, with a preponderance of sand; but, toward the eastern border, it passes, in a great degree, into clay. Trappean rocks lie beneath all the northern district; in many places they come near the surface; and, in four quarries, they are worked. Sandstone occurs in the south, and is quarried. Coal is said to have been found, and even mined in the sandstone district; yet it has eluded comparatively recent search. Gogar-hurn, the only stream of the parish, except the merest rills, forms the houndary of the main body along all the east and part of the north. Water for culinary uses is, in general, obtainable only in artificial wells or hy borings. The only antiquities are vestiges of camps, both probably Danish, the one on Kaimes-hill and the other on South Platt-hill, the most commanding of the little summits on the west. The principal mansions are Dalmahoy-house, the seat of the Earl of Morton, huilt in the early part of last century, and subsequently augmented with several additions; Hatton-house, the seat of William Davidson, Esq., a haronial mansion, partly of great antiquity; Rathohouse, built hy the late John Bonar, Esq., and now the property of his heirs; Bonnington-house, the seat of William Wilkie, Esq., huilt in 1622; Norton-house, the seat of Alexander Berwick, Esq., very recently erected; Milhurn-tower, the property of Mrs. Liston, and huilt hy the late Sir R. Liston; Gogar-hank, the seat of Mr. Ramsay; and Rathohall, the seat of William Hill, Esq. All these, and two or three other mansions, are elegant residences. But Rathohouse arrests special attention by the splendour and Grecian elegance of its architecture,—Hatton, hy its venerableness of aspect, its extensiveness of gardens and pleasure-grounds, and its associations as an ancient seat of the Earls of Lauderdale,—and Dalmahoy-house, hy its general pre-eminence, and by its containing some curious beir-looms of the noble family who possess it, such as the only known extant complete copy of the original Scottish parliamentary Bible, enhanced hy having been the property of the Regent Morton, an original portrait of the Regent, an original portrait of Mary, taken while she was in Loch-Leven, and the original warrant for the Queen's incarceration, with the signatures of the nine noblemen who assumed its responsi-

bility.—The village of Ratho stands in the centre of the main body of the parish, 8 miles west by south of Edinburgh, 4 east-north-east of Mid-Calder, and 2½ south-south-east of Kirkliston. Its site is on the slope or eastern declivity of the gentle uplands of the west. It consists of a single two-sided street, coming down the declivity from west to east, and bending northward, near the end, to terminate upon the Union canal. Most of its houses are neat and recently erected cottages, walled with whinstone, lintelled with sandstone, and roofed either with tiles or with slate; and wearing, in common with the roadway, a tidy appearance. The village has a small library, a savings' bank, three friendly societies, a masonic lodge, and seven or eight drinking-houses. Population of the village 550.—Bonnington, a hamlet or small village, consists of about twenty thatched cottages, and is situated 1½ mile to the south-west. Population 100.—Norton figured 50 years ago as a village, but, in that capacity, is now nearly extinct. The parish is traversed westward by the Union canal, the Edinburgh and Glasgow railway, and the Edinburgh and Glasgow turnpike by way of Mid-Calder; and it has ample number and extent of other means of communication. Population, in 1801, 987; in 1831, 1,313. Houses 222. Assessed property, in 1815, £11,746.—Ratho is in the presbytery of Edinburgh, and synod of Lothian and Tweeddale. Patron, the Trustees of Dr. Davidson. Stipend £264 15s. 2d.; glebe £16. Unappropriated tithes £54 1s. 8d. Schoolmaster's salary £34 4s. 4½d., with £45 fees, and £6 2s. 6d. other emoluments. The ancient church of Ratho—the British *Rath-au*, 'a cleared spot,' 'a bare place,' 'a plain'—was dedicated to the Virgin Mary; and in the immediate neighbourhood of the present church there is a fountain still called the Lady's well. The parish was a rectory till 1429, and it then became a prebend of the collegiate church of Corstorphine. In 1315 the barony and patronage of Ratho were, along with much other property, granted by Robert I. to the Steward of Scotland, as the dowry of the Princess Marjory; on the accession of Robert II. to the throne, they became part of the property of the King's eldest son, as Prince of Scotland; and, in 1404, they were, with the other estates, erected into a principality for the Prince, with regal jurisdiction. Among eminent persons connected with the parish were Dr. William Wilkie, 'the Scottish Homer,' one of its ministers in the last century; Sir William Liston, the British ambassador at seven foreign courts, the proprietor of Milburn-tower; and Sir William Fettes, a resident and heritor, whose vast property was bequeathed for the establishment in Edinburgh, of the great Fettes institution.

RATHVEN, a parish on the coast of Banffshire; bounded on the north by the Moray firth; on the east by Cullen and Deskford; on the south by Keith; and on the west by Belly. Its length from east to west is 10 miles; its breadth varies from 3 to 5 miles; and its superficial extent is estimated at 27,000 Scottish acres. The surface is variegated with hills and eminences, streams of water, and fertile plains. The Binhill, in the south-east, is nearly all mantled with wood, and lifts its summit sufficiently high to be a landmark visible at 15 leagues distance from the coast.—Maud and Adie bills, contiguous to it, are clothed in russet, and of less elevation, and stretch away westward to the confines of the parish. Most of the parochial surface declines to the north-west, and suffers from the frequent and bitter north-westerly storms. Yet the climate is tempered by the vicinity of the sea, and the windings along its margin of 12 miles of coast-line; and, on the whole, is favourable to vegetation, and eminently

promotive of health. The soil is very various; in one corner a light and extremely rich loam superincumbent on clay; in another corner, a thin yet fertile loam on a red soft earth; in some places, a light sand; in other places, a stiff clay; and almost everywhere, except in the sandy districts, a soil powdered all over, and profusely intermixed with small water-worn stones. The distribution of the lands, at the date of the Old Statistical Account, was into 16,200 acres of hills, moors, and mosses; 4,700 of arable grounds; 4,500 of woodlands; and 1,600 of meadow and artificial pasture. Limestone, sandstone, and slate abound, and are quarried. A beautiful whitish sand, affirmed to be almost equal in fineness to any in Holland, occurs in great quantity near Litchieston. Three medicinal wells formerly attracted some notice. A large heap of stones, called the King's Cairn, and crowning an eminence near Woodside, is pointed out by tradition as the grave of King Indulphus of Scotland, who is said to have been slain in the vicinity after obtaining a complete victory over the Danes. Abercromby places this victory in the year 961; Buchanan, in 967. Not far distant is a great number of small cairns, alleged to be the burial-places of the Danes who fell in the engagement. Numerous cairns occur also on the farm of Westerside. Two ruins, called Green and Tronach castles, crown two hills which screen the sides of the harbour of Portnockie. The villages of the parish—all upon the coast, and upheld chiefly by fisheries—are BUCKIE, PORTEASY, FINDOCHTIE, PORTNOCKIE, and PORT-GORDON. See these articles. The parish is traversed near the coast by the road from Fraserburgh to Fochabers. Population, in 1801, 3,901; in 1831, 6,484. Houses 1,352. Assessed property, in 1815, £7,336.—Rathven is in the presbytery of Forfyce, and synod of Aberdeen. Patron, Hay of Rannes and Leithball. Stipend £206 12s. 7d.; glebe £12. Unappropriated tithes £1,082 4s. 6d. The parish-church was built in 1794. Sittings 1,000. A portion of the parish at its eastern extremity, and containing the village of Portnockie, has long been united *quoad sacra* to CULLEN: which see. Another portion, at the middle of the coast district, was recently erected into the *quoad sacra* parish of BUCKIE: which also see. Another portion, at the eastern extremity, and containing the village of Port-Gordon, forms part of the *quoad sacra* parish of Enzie. That parish was erected out of Rathven and Bellie, in 1836, and measures between its extreme points nearly 6 miles by about 4. Its church was built in 1785, and enlarged in 1815 and 1822. Sittings 400. Stipend £62, derived from a fund set apart by a private individual, and placed under the charge of the committee for managing the royal bounty. Population, in 1836, 1,814; of whom 1,060 were churchmen, 673 Roman Catholics, and 81 Episcopalians.—Rathven, after deducting the Cullen and Enzie portions, but including the whole *quoad sacra* parish of Buckie, measures, between its extreme points, 5 miles by 4, and was estimated, in 1837, to have then a population of nearly 4,000.—A Scottish Episcopalian chapel was built, about 54 years ago, at Arradoul. Sittings 210. Stipend £150. A Roman Catholic chapel, with 800 sittings, was built, in 1788, at Presholm; and the congregation who use it assemble also in a hall at Buckie, which has 400 sittings, and is rented at £5.—In 1834, the parish-school was attended by 56 scholars; and 15 other schools were attended by 633. Parochial schoolmaster's salary £32 1s. 7d.; with £10 3s. 6d. fees, and £37 5s. 6d. other emoluments. The property of a lazar-house, founded about the year 1226, by John Bisset, still yields each of 6 bedesmen half an

acre of land, a boll of oatmeal, and 9s. 6d. yearly, and is under the administration of the proprietor of Rannes.

**RATTRAY**, the name of various localities in the maritime parish of Crimond, Buchan, Aberdeenshire. An extinct town of the name is said to have been a hurgh: see **CRIMOND**. A fishing-village of the name is situated 10 miles north by west of Peterhead, and about the same distance south-east of Fraserburgh. Rattray-house stands embosomed in wood  $1\frac{1}{2}$  mile south of the village. Rattray-head is a low dangerous promontory, running about  $1\frac{1}{2}$  mile out from the prevailing line of the coast, and situated about 10 miles south-east of Kinnaid-head. Rattray-bridges are peculiarly dangerous marine ground about  $\frac{3}{4}$  of a mile east-north-east of the extreme point of the promontory.

**RATTRAY**, a parish in the extreme west of Strathmore proper, marching with the district of Stormont, Perthshire. It is bounded on the north by Alyth; on the north-east by the detached part of Blairgowrie; on the east by Bendochie; and on the south and west by the river Ericht, which divides it from the main body of Blairgowrie. Its extreme length, from north to south, is  $5\frac{1}{2}$  miles; and its mean breadth is about  $1\frac{3}{4}$  mile. A detached portion, called Easter Bleaton, lies  $3\frac{1}{2}$  miles to the north-north-west; measures 1 mile by  $1\frac{1}{2}$ ; and is bounded on the north by Forfarshire,—on the east and the south by Alyth,—and on the west by the river Loebie, which divides it from a detached part of Caputh and from Kirkmichael. Easter Bleaton forms part of the ascending ranges of the frontier Grampians. The main body of the parish, for  $1\frac{1}{2}$  mile from the southern boundary, is flat, or very gently ascending; and, over the rest of the area, consists of the lowest and slowly graduated heights which, several miles beyond the northern boundary, attain a Grampian elevation. The fine southern exposure, combined with the field afforded by the vast mountain-rampart in the comparatively near distance, renders the situation pleasant, and the climate very healthy. The lands in the south have a dry and pretty fertile soil, and are all arable; and those in the north are disposed chiefly in pasture. A common moor of 300 acres lies in the uplands, and though improveable, is neglected. The Ericht, over most of its  $6\frac{1}{2}$  miles' connexion with the parish, is alternately a picturesque and a romantic stream; it is overhung by a profusion of copsewood, chiefly small oaks, which are periodically cut for sale; and above Craighall, its banks are sheer precipices of rock, upwards of 200 feet high, crowned with plantation, and parapeted with wall, to warn strangers and cattle of danger. Its floods occasionally invade the low grounds in the south, and carry off much booty. At Keith, about  $\frac{3}{4}$  of a mile from the village of Rattray, where the stream rushes over a rugged rock about 10 feet high, and forms a pool, fishers, who pay a considerable rent for the fishery, practise a peculiar method in catching salmon: they make what they call a "drimuck," resembling thin wrought mortar, and throw it into the pool to disturb the clearness of the water; and, being provided with long poles to the end of which bag-nets are affixed, they then stand upon the point of the rock, rake the pool, and bring up the fish. The Ericht is esteemed by sportsmen one of the finest rivers for rod-fishing, both for trout and for salmon. A curious and elegant iron-bridge has recently been thrown across the stream below Glen-Ericht-house: it consists of one direct or straight-lined span, resting at the ends upon stone pillars; and it has a separate carriage-way and foot-track, and is floored or carpeted with gravel. On the farm of Standing-stanes, which has

its name from the circumstance, are the remains of a Druidical temple. South-east of the village is an oblong moundish height, called the Castle-hill, surmounted by vestiges of the ancient castle of Rattray, a very large building, and the original residence of the far-descended family of Rattray. About 2 miles north-north-west of the village stands Craighall, the more modern but still ancient seat of the family. It crowns a peninsulated rock whose sides go sheer down 200 feet or upwards to the Ericht, and has, from the drawing-room windows, a balcony whence, as from an aerial elevation, a close and thrilling view is obtained of the surrounding romantic scenery. The house is accessible only in front, or from the south; and, on that side, it was anciently defended by a ditch, and two round towers, with openings for archery or missiles. The towers still exist; and the house has recently been modernized in the interior, and embellished at the exterior angles with turrets. The parish is traversed eastward through the village by the road between Dunkeld and Kirriemuir, and is within easy distance of the western terminus of the Dundee and Newtyle railway. Population, in 1801, 880; in 1831, 1,362. Houses 261. Assessed property, in 1815, £2,433. — Rattray is in the presbytery of Dunkeld, and synod of Perth and Stirling. Patron, the Earl of Kinnoul. Stipend £157 9s. 2d.; glebe £25. The parish-church is modern and neat. The inhabitants of Easter Bleaton attend the chapel of Persie in Bendochie. See **PERSIE**. A meeting-house belonging to the United Secession is situated in the village. In 1831, the parish-school was attended by 69 scholars; and three private schools—two of them conducted by females—were attended by 116. Parochial schoolmaster's salary £34 4s. with £15 fees, and about £4 10s. other emoluments.

**RATTRAY**, a manufacturing and thriving village in the above parish, is situated  $\frac{3}{4}$  of a mile east of Blairgowrie,  $4\frac{1}{2}$  miles south-west of Alyth,  $4\frac{1}{2}$  north-west of Coupar-Angus, and  $10\frac{1}{2}$  east-north-east of Dunkeld. It is, in a strict sense, two villages, Old and New Rattray, almost contiguous. Old Rattray is situated on the southern declivity of a hill, and built in a straggling manner; and New Rattray occupies both sides of the road toward Blairgowrie, and extends almost to the Ericht. The former has much increased during the last half century; the latter has entirely sprung into existence within that period; and both owe their prosperity, in a great degree, to the water-power of the Ericht, and the erection upon it of flax-spinning-mills. The mills in the vicinity, and within the parish, are 7 in number; they vary in mechanical force from 6 to 20 horse-power; and they employ about 240 persons. The inhabitants not employed by the mills are, in general, weavers of coarse linen fabrics for the manufacturers of Dundee. Population of Old Rattray, about 400; of New Rattray, about 320.

**RAVENS CRAIG**. See **PETERHEAD**.

**RAVENS CRAIG**. See **DYSART**.

**RAVENS WORTH**. See **CARSTAIRS**.

**RAYNE**, a parish in the district of Garioch, Aberdeenshire. It is bounded on the north by Auchterless; on the north-east by Fyvie; on the east by Daviot; on the south-east by Chapel-of-Garioch; on the south and south-west by the Urie, which divides it from Oyne; and on the west by Culsalmond. Its length and breadth are each about  $3\frac{1}{2}$  miles; and its area is about 11 square miles. The bill of Rotbmaise, situated on the northern frontier, and covered with beath and hard weeds, lifts its summit about 850 feet above sea-level. Not far from this height a large tract of peat-moss stretches quite across the parish from east to west. The rest of the

surface is slightly undulated, or occasionally rises into gentle eminences. The soil of the best arable grounds is a rich loam on a bottom of clay; and, of inferior ground, is a shallower and more gravelly loam, on a rocky or tilly subsoil. About four-fifths of the whole parochial area are regularly subject to the plough; and upwards of 350 acres are covered with wood, principally planted larch and Scottish fir. The chief antiquities of the parish are a supposed Roman iter, two Druidical temples, and some cairns. The mansions are Freefield, Rothmaise, and Warthill. The decayed village of Rayne stands in the centre of the parish; and has an annual fair for cattle and horses on the 4th Tuesday of November, old style. The village of Meiklewarthill, possessing about 150 inhabitants, stands on the north; and has an annual fair on the Thursday before the 26th of May. The village or tiny post-town of Old Rayne, possessing about 100 inhabitants, stands on the Urie, 9 miles north-west of Inverury, 12 south-east of Huntly, and 24 north-west of Aberdeen. It has annual fairs on the Wednesday after the first Tuesday of August, old style; on the Thursday and Friday preceding the former; and on the day after Tarriff in October. The only manufacture is the knitting of seamen's vests and under-jackets of worsted for employers in Aberdeen. Old Rayne was anciently a residence of the bishop of Aberdeen; and, not long ago, possessed the remains of his bouse. The road from Aberdeen to Huntly, though not entering the parish, runs close along the Urie. Population, in 1801, 1,228; in 1831, 1,484. Houses 306. Assessed property, in 1815, £2,734. — Rayne is in the presbytery of Garioch, and synod of Aberdeen. Patron, the Crown. Stipend £225 2s.; glebe £12. Schoolmaster's salary £25 13s. 3½d., with £32 10s. fees, a share of Dick's bequest, and £5 15s. other emoluments.

REAY, a parish on the north coast of the counties of Caithness and Sutherland, lying quite compactly, but cut lengthwise into two nearly equal parts by the boundary-line between the counties. It is bounded on the north by the North sea; on the east by Thurso and Halkirk; on the south by Halkirk and Kildonan; and on the west by Farr. Its length, from north to south, is about 17 miles; and its breadth is between 8 and 9. The Sutherland district is watered from end to end, along the centre, by the river HALLADALE [see that article]; it takes from that stream the name of Strath-Halladale; and it presents, over all its length, the appearance of a narrow valley screened by heights which vary in bulk from mountain to hill, and are not amassed into continuous ranges. A water-shedding line divides the whole of Strath-Halladale from the eastern or Caithness district. Heights, variously mountainous and billy, occupy all the latter district, except along the coast; but they possess no scenic interest or distinctive character. Ben-Radb, whose steepest side is computed to be upwards of a mile from base to summit, and which is probably the most considerable elevation, lifts its summit within 2¼ miles of the sea, and 1½ mile within the frontier-line of Caithness; and it is perforated by a large cave, to which cattle run for shelter in a storm, and which figures in traditional story as the retreat of a gang of bandits. A band of territory along the coast, and a narrow belt along the Halladale, are almost the only low or flat grounds. The coast is, in general, bold and rocky; and, at Borrowston, it has several small caves, and a beautiful turf-clad natural arch, spanning a chasm of nearly 50 feet deep, and washed by the tide. Its principal bays are Port-Skerry, at the mouth of the Halladale, and Sandside-bay, about 1¼ mile long and ¾ of a mile broad, situ-

ated 2½ miles east of the boundary-line between the counties: See PORT-SKERRY. A large extent of sandy links, abounding in sea-shells, stretches round Sandside-bay, and is carpeted with excellent pasture. The principal headland is Fresgo-head, near Sand-side. Sea-ware is thrown by storms in great heaps into the bays and creeks; and occasionally bushes of sponge springing from one stem, and often broken pieces of sponge, are deposited on the beach. The fish caught on the coast are cod, ling, turbot, haddock, skate, whiting, mackerel, flounders, horn-back, sand-eels, and dog-fish. The river Forss has a course of 12 miles northward in the east, the first half of the distance in the interior, and the second half on the boundary; and, in common with the Halladale, it abounds in trout and salmon. Loch-Cailm, upwards of 3 miles in circumference, feeds one of this river's tributaries; and Loch-Sburery, 1¼ mile long, is formed by an expansion of the Forss. Lochs Seirach and Tormaid, each about ¾ of a mile long, send off a streamlet of 5 miles' length of northerly run to the head of Sandside-bay. Loch-Sleitill, in Strath-Halladale, is noted for its large red trouts. Of several mineral springs, all seemingly chalybeate, one at Hellsbetter claims to be little inferior to the celebrated wells of Strathpeffer. The mountain-rocks of the parish are massive and schistose sandstones, limestone, gneiss, granite, syenite, and hornblende and quartz rocks. Both the sandstone and the limestone are extensively quarried. Shell-marl is dug up in large quantities at Durecay and Brawbin. Iron-ore is found in different places; and a vein of lead-ore occurs near Reay, but not in circumstances and quantity to encourage mining. The soil of the arable lands in the Caithness district is generally fertile; but that of Strath-Halladale is, to a great extent, shallow, barren, and fitter for pasture than for cultivation, yet, by the skilful application of manure, produces good crops. The aggregate amount of land in tillage does not exceed 2,200 acres. Some small birch coppices in Strath-Halladale, and a few trees around Sandside-bay, are the only woods. The principal mansions are Bighouse, formerly the seat of an ancient and respectable branch of the family of Mackay, but now the property of the Duke of Sutherland; Isaldhouse, the seat of Captain Macdonald; and Sandside-house, the seat of Major Innes. Some rude but extensive fortifications occur on the hills of Sebster and Benfrechan. Dorn-Reay-house, the ancient seat of the Mackays of Reay, exists in ruin, 2 miles north-north-east of Sandside-bay. The ancient owners of this mansion and of the estates around it derived from them, in 1628, the title of Barons Reay in the peerage of Scotland; and, in consequence, gave the name of Lord Reay's country to their extensive possessions in the west: see next article. The village of Reay, or New Reay, containing about 110 inhabitants, stands at the head of Sandside-bay, 12 miles west-south-west of Thurso, and the same distance east of Strathly. The parish-church crowns a green rising ground a little detached from the village. Old Reay is traceable only by a far-descending tradition; and it is said to have been a burgh-of-regality, and to have accidentally proved its quondam existence by the discovery, about the middle of last century, of parts of several houses which had been overwhelmed and inbumed. A market cross at the present village claims to have belonged to the traditional burgh. The parish is traversed along the coast by the road from Thurso to Tongue, which is daily travelled by a mail-coach; and down the vale of the Halladale, by the road from the Dornoch frith and from Helmsdale to MELVICH; which see. Population in the Sutherland district, in 1801, 861;

in 1831, 1,013. Houses 171. Assessed property, in 1815, £1,076.—Population in the Caithness district, in 1801, 1,545; in 1831, 1,868. Houses 316. Assessed property, in 1815, £2,275.—Reay is in the presbytery of Caithness, and synod of Sutherland and Caithness. Patron, the Crown. Stipend £182 11s. 5d.; glebe £8. Unappropriated teinds £75 7s. 6d. The parish-church was built in 1739. Sittings 632. Strath-Halladale, jointly with two districts in the parishes of Watten and Halkirk, has a mission on the scheme of the Committee of the Royal bounty. The mission-chapel—a thatched house in bad repair—is situated near Congill, on the estate of Bighouse, about 4 miles from the foot of the Halladale. Sittings 550. Stipend £50 from the Royal bounty, and £15 from each of the three districts. A catechist is employed for the whole parish, and paid by voluntary subscription. In 1834 the parish-school was attended by 88 scholars; and a school belonging to the General Assembly by 90. Parochial schoolmaster's salary £34 4s. 4d., with £12 fcs and £4 4s. other emoluments. Ruins of ancient chapels exist at Lyhster and at Shehster.

**REAY'S COUNTRY (LORD)**, a large district in the north-west of Sutherlandshire. It extends from the sea on the west to Torrisdale or Borgia river on the east; comprehends the parishes of Durness, Tongue, and Edderachillis; and has a superficial extent of about 800 square miles. It acquired its name from being the property of the Lords Reay, the noble family of Mackay; and is called in Gaelic 'the Land of the Mackays,'—*Duthaich Mhio Aoi*.

**REDCASTLE.** See **INVERKEILOR**.

**REDDING**, a populous colliers' village, in the parish of Polmont, Stirlingshire. It stands in the centre of a very productive coal-district, between the line of the mail-road and that of the Union canal,  $\frac{1}{4}$  mile south-west of Polmont, and  $\frac{2}{2}$  miles east-south-east of Falkirk.

**REDGORTON**, a parish occupying the peninsula of the Tay and the Almond, and extending northward and west-north-westward, up the course of the respective rivers, in the Strathmore district of Perthshire. It is bounded on the north by Auchtergaven and Kinclaven; on the east by St. Martin's and Scone; on the south by Tippermuir; on the south-west by Methven; and on the west by Monedie and Auchtergaven. Its outline is proximately that of two triangles, or rather of the extended wings of a butterfly; and would become nearly rectangular by compacting with it the whole of Monedie, and the southern projection of Auchtergaven. Its length, from the point of the peninsula northward and west-north-westward, or in straight lines up the course of the Tay and of the Almond, is respectively  $4\frac{1}{2}$  and  $4\frac{3}{4}$  miles; its breadth, in both directions, varies from half-a-mile to  $1\frac{3}{4}$  mile; and its area is 10,125 square miles. A detached portion, not included in this estimated area, lies  $2\frac{1}{2}$  miles north-west of the most westerly point. It forms a stripe of  $3\frac{1}{2}$  miles by 6 furlongs, stretching from the south-east to the north-west; and is surrounded by Auchtergaven and the district of Monedie, which formerly belonged to Monzie. This detached part consists of the barony of Mullion; it has an area of probably 1,875 square mile; it is situated on the lowest tier of the Grampians, and runs up their acclivity; it is, for the most part, pasture, moorland, or heathy waste, and contains but few and small penicles of arable ground; and it is drained along the boundary, on the Auchtergaven side, by the Shochie, and, on the Monzie side, by Crachie-burn, which, jointly with the Shochie into which it falls, peninsulates the lower end of the barony. The main body of the parish is richly

diversified in surface; hilly, but nowhere lofty or abrupt; low, and but slightly above river-level along the streams, yet speedily passing into hanging plains, undulations, or hilly swells; everywhere soft and pleasing in outline, and, at almost every step, disclosing some agreeable variation. The lands of Lord Lynedoch, which comprehend two-thirds of the whole area, are improved in agricultural capacity, and embellished with hedge-row and variously disposed wood, beyond those of most estates in Scotland; and they, as well as other lands within the area, form many delightful limited pictures, and, at the same time, contribute charming features to a general landscape of uncommon power and wealth of beauty. Around some of the high grounds is hung one of those panoramas for which the county is so famed; on the east, the palace, and park, and pleasant lands of Scone; on the south-east, the fertile and luscious strath of Tay, with its bounding and majestic stream, now seen among openings of wood, and now hid by its gay body-guard of forest; in the same direction, the bridge and city of Perth, and a semicircular sweep of jointly the Sidlaw and the Ochil hills, cloven down at Kinnoul and Moncrieff, and overlooked in the distance by the Fifeshire Lomonds. The running waters, besides the Tay and the Almond, are the Ordie, the Shochie, and the Coldrochie. All divide the parish from Monedie; the Coldrochie, a mere rill, falling into the Shochie, and the latter meeting the Ordie, and then debouching with it across a narrow part of the interior to the Tay. The prevailing rocks are greywacke, the old red sandstone, and the lowest members of the secondary formation. The soil is, in some places, a mixture of clay and of black earth; but, in general, it is light and fertile. If the whole area, including the barony of Mullion, were distributed into 100 parts, 75 would be found arable, 12 covered with wood,  $7\frac{1}{2}$  in grass, and  $5\frac{1}{2}$  occupied with roads or waste. The principal villages are STANLEY, PITCAIRN, and LUNCARTY; which see. Bridgeton-of-Almond, situated, as its name implies, upon the Almond, has about 100 inhabitants, and Craighead about 70. At Cromwell Park on the Almond, at a place where the river affords three waterfalls, there are a cotton spinning-mill, a flax spinning-mill, two power-loom establishments, and a bleachfield. The works belong to two different proprietors, and aggregately employ about 200 persons. Other extensive manufactories exist at the three principal villages. On the point of the peninsula of the Tay and the Almond, anciently stood Old Perth or BERTHA [which see], and also, as the author of Caledonia thinks, the Roman station Orrea. At Pitcairn on the Almond are vestiges of a British camp; where probably the native Horestii took post to watch the motions of the Romans. The parish is traversed northward by the great Highland road from Perth to Inverness; and, in various directions, by four statute-labour roads. Across the Almond are three bridges; one, of a single arch, resting on two rocks, and built in 1619, by an ancestor of Lord Lynedoch,—another, a neat structure of three arches, built in 1827,—and another, of singular elegance, and of one semicircular arch of 80 feet span, built in 1832—6, at a cost of £4,000, by Lord Lynedoch. Over the Tay, while it touches the parish, or even between Perth and Dunkeld, there is no bridge; nor is there at the parish any better means of crossing it than one large oar-impelled boat. Population, in 1801, 2,009; in 1831, 1,866. Houses 267. Assessed property, in 1815, £1,218.—Redgorton is in the presbytery of Perth, and synod of Perth and Stirling. Patron, the Crown. Stipend £189 5s. 8d.; glebe £18 6s.

6d. The parish-church was built in 1776; and though substantial, is not floored. Sittings 415. A portion of the parish is connected *quoad sacra* with the church of Stanley. The inhabitants of the district of Mullion, amounting to about 100, attend the church of Logie-Almond. An United Secession place of worship was built in 1797 at Pitcairn; and cost, including the session-house and the manse, £1,000. Sittings 450. Stipend not stated; the minister has a house and garden. According to a census taken by the parish minister, in 1834-5, the population then was 1,912; of whom 1,617 were churchmen, 280 were dissenters, and 15 were non-descrip. — The present parish comprehends the three ancient parishes of Luncarty, which was an independent parsonage, — St. Scrifs, or St. Servanus, which belonged to the diocese of Dunkeld, — and Redgorton, which belonged to the monks of Scone. The three were united, it is believed, at the Reformation. Popular tradition and belief refer the origin of the name Redgorton, quasi “Red-gore-town,” to the battle of Luncarty, a notice of which will be found in our account of that village; and, though not in their own rough mode of etymology, they may possibly be correct, the words *ruach garton*, in Gaelic, signifying ‘the red little field,’ or poetically, ‘the field of blood.’ In 1834 the parish-school was attended by 89 scholars. Salary £34 4s. 4½d., with £25 fees and £18 other emoluments. There are two non-parochial schools; but both are situated in the *quoad sacra* parish of Stanley.

RED-HEAD, a promontory, or hold abutting headland, on the south side of Lunan-bay, in the parish of Inverkeilor, Forfarshire. It descends almost sheer down in a precipitous rock to the sea of 270 feet; and it is but a nodular projection of a stretch, several miles in extent, of bold rocky and high coast. As the highest ground on that sea-bulwark, the loftiest point of terminating uplands which there stoop bluffly down to the ocean, it is usually noted as the north-east end of the Sidlaw-hills, forming the last head of the string of which Kinnoull-hill at Perth forms the first. The headland abounds with various species of sea-fowls; it makes a fine display of the porphyritic formation of rock; it is distinctly seen at a great distance at sea; and it is remarkable as the point northward which, before the year 1793, coal was not permitted to be carried without paying a very heavy duty.

REEKING LINN (THE). See THE SOUTH CALDER.

REEKY LINN (THE). See GLENISLA.

RENFREW,\* a parish in the county of the same name, bounded on the north by the parishes of West and East Kilpatrick in Dumhartonshire; on the east chiefly by Govan in Lanarkshire; on the south by the Abbey parish of Paisley; and on the west by the rivers Black Cart and Gryfe, which separate it from Kilmarchan and Inchinnan. Its greatest length is about 6 miles; greatest breadth 2½ miles; contents 3,776 imperial acres. Its figure is very irregular, and is farther broken by the intersection of the rivers Clyde and White Cart, and — for a short distance — of a canal which runs alongside of the latter. Fully one-third of the parish is on the north

\* The derivation of this name from the ancient language of the country seems liable to little doubt. In the British, *Ahyn* means a point of land, and *Frew* or *Frann*, a flow of water. These words are strikingly applicable to the site of the town of Renfrew, on a point of land between the rivers Clyde and Cart, which unite their waters about a mile below. The angular piece of ground formed by their junction, is called *Renfield*, affording an instance of the ancient and modern languages in combination. Vulgarly, the word is pronounced *Arenthrow*, and in conformity, in some measure, to this, we find Principal Bailie in his ‘Letters,’ written in the 17th century, spelling it *Baranthrow* and *Baranfrow*.

side of the Clyde, with which portion communication is maintained by row-boats for foot-passengers, and by a large vessel, open at both ends, and moved along a chain by a hand-windlass, for cattle, carts, and carriages. The canal is crossed by a strong swing-bridge, and the White and Black Carts by a handsome stone-bridge at their confluence at Inchinnan. On the south of the Clyde, the surface is almost perfectly level, there being only one noticeable acclivity, which is dignified with the appellation of *Knock*, — ‘a little hill.’ North of that river, the ground rises into low conical eminences, with flat land between and around them. The soil on both sides is, for the most part, deep, fertile, and alluvial. The parish wears a pleasing and cheerful aspect, nearly the whole being in a state of cultivation, while the landscape is beautified by several mansion-houses with plantations, and enlivened by the many vessels, impelled by wind and steam, that hourly float along the brimming waters of the Clyde. In the lands of Scotston and Jordanhill, on the north side of that river, coal has long been wrought. At Yokcr, on the same side, but lower down, there is an extensive distillery manufacturing whisky from malt; and near it the trustees for the improvement of the river have their chief establishment of artificers and labourers. The parish is traversed by no less than six public roads which are of obvious utility. — The population, including the burgh, was, in 1801, 2,031; in 1821, 2,646; and, in 1841, 3,076. Families, in 1841, 633; giving an average of 4.86 to each. The annual value of real property for which the parish was assessed, in 1815, exclusive of the burgh, was £7,128. — The parish is in the presbytery of Paisley, and synod of Glasgow and Ayr. Patron, the Crown. The date of erection of the church is unknown. It was enlarged and repaired in 1726, at an expense of £225 12s. 1d.; and was refitted with seats in 1820, at an expense of £865. Sittings 750, exclusive of the family gallery of the principal heritor. Stipend £277 18s. 3d.; glebe £54. Unappropriated teinds £171 7s. 11d. There is no regular place of worship in the parish, except the Established church, to which the unusual proportion of 8-9ths of the population professed to adhere, in 1836. — Besides five private schools, there is a considerable seminary, which originated under the following circumstances: — In 1833, soon after the death of Archibald Campbell, Esq., of Blythswood, Lord-lieutenant and Convener of Renfrewshire, a meeting of the nobility and gentry, and other friends of the deceased, was held, at which it was resolved “to transmit to posterity some lasting mark of the high and grateful sense which the county at large entertained of the public services and private worth of Mr. Campbell.” Subscriptions were entered into, and a committee was appointed for the purpose of carrying this resolution into effect. The committee having determined that the monument should be a building combining some institution of public utility with the preservation of Mr. Campbell’s memory, they entered into an agreement with the town-council of Renfrew, by which an institution for the education of youth was to be erected out of the money subscribed, and the council — besides giving a site — were to endow and support the institution. A handsome edifice, called “The Blythswood Testimonial,” was accordingly finished in 1842. It stands on the west of the burgh, near the domains of the estimable gentleman of whom it forms so appropriate a memorial. This seminary may be considered as coming in the place of the parochial or grammar-school, for which provision was made by a charter of James VI. in 1614.

In the parish, as we have already intimated, there

are some handsome mansions. Blythswood-house is finely situated upon the point of land where the united streams of the Carls and the Gryfe mingle their waters with those of the Clyde. The prospect here was pronounced by Pennant—"the most elegant and the softest of any in North Britain." The house is constructed of the finest white freestone,—the east front presenting a portico of four columns in the Ionic order. It was built, in 1821, by the above-mentioned Archibald Campbell, Esq., who died in 1838, and was succeeded by his relative, Archibald Douglas, Esq. of Mains, who now holds the name and title of 'Campbell of Blythswood.' The original name of this property was Renfield,—and it had an old house upon it so called. When the present mansion was built, it received the name of Blythswood, in honour of a small but now very valuable estate belonging to the family, on which a great part of the north-western portion of Glasgow is built.—At the confluence of the Black Cart and the Gryfe are the house and lands of Walkinshaw, long the seat of an ancient family of that name, but now belonging to William Maxwell Alexander, Esq., and others. The house is modern, and stands among full-grown wood.—Jordanhill, the seat of James Smith, Esq., F. R. S., occupies an eminence on the north of the Clyde, about a mile from the river, and commands an extensive and agreeable prospect. It was built about the year 1782, but has since been much improved. The estate of Jordanhill anciently belonged to the Crawfords, one of whom was that Captain Thomas Crawford who surprised, and took by escalade, the castle of Dumharton, in the year 1571.—Near the river, on the same side, is Scotston, an ancient inheritance of a branch of the Montgomeries, which, after being held by several families, was purchased in the 18th century by Richard and Alexander Oswald, merchants in Glasgow. It now belongs to Miss Oswald. The house is modern.—Elderslie-house, the seat of Mr. Speirs, has been noticed under the article **ELDERSLIE**.

This parish is distinguished for its connexion with the illustrious house of Stewart. The lands of Renfrew are the first-mentioned of the estates specified in the charter granted by King Malcolm IV. in 1157, in favour of Walter, the founder of that family, whereby he confirmed a grant which had been made by King David, who reigned from 1124 to 1153. The office of high steward of Scotland was also conferred on Walter and his successors, who from thence took the surname of Stewart, often, but incorrectly, spelt Stuart. At Renfrew they had their earliest and usual residence; and from this corner of the land, therefore, there issued a race which successively ascended the thrones of Scotland and England. Their mansion stood on a slightly elevated piece of ground, on the west side of the road leading from the town to the ferry. It no longer exists, but the site is still called Castlehill. Within the recollection of many living, there was a deep fosse partially round the site, strengthened with stone on the inner side, and having a small rivulet passing through it. Part of the foundations having been lately dug up, several rings and a key were found. Adjacent are lands which still bear the names of 'The Orchard' and 'The King's Meadow'; also a small street, called 'The Dog-row,' meaning the place where the kennel was. This street we have seen mentioned as a boundary in a deed dated in the early part of the 15th century.—Somercled, Lord of the Isles, who had risen in rebellion against King Malcolm IV., was defeated and slain at Renfrew in 1164. The mound, with a stone on the top, noticed by Pennant (vol. iii. p. 151), as traditionally reported to be the memorial of Somercled's fall, and the place of his interment,

no longer exists.—The lands of Knock—so called from the hill already mentioned—at one time belonged to the Knoxes of Ranfurly, from whom the Reformer was descended; and from this place the surname of Knox may be derived. Semple says (p. 30) that in 1782 there was dug up here a part of an urn, with some human bones, and that about 36 years previously, what was supposed to be a Roman urn was found at this place. In the New Statistical Account (p. 17) it is said that, in 1778, two urns, containing human ashes, and believed to be Roman, were dug up here; but this is probably Semple's account in a different form. The spot is little more than a mile from the site of the Roman station at Paisley. The lower edge of the hill is, to this day, called 'the Butts,'—most probably because it was a place for the practice of archery. But the Knock is chiefly remarkable on account of an accident which tradition tells befell Lady Marjory Bruce, daughter of King Robert Bruce, and wife of Walter the Steward, in the year 1316. It is said that the Princess, when far advanced in pregnancy, was thrown from her horse and killed at this place, but that the life of the child was saved, which child, long afterwards, ascended the throne as Robert II. Till the year 1779, there stood here an octagonal column, about 10 feet in height, inserted in a pedestal also eight-sided, and about 6 feet in diameter. It had neither inscription nor sculpture, but went by the name of 'Queen Blearly's Cross,' or 'Stane,' and, according to unvarying tradition, supported by Crawford (p. 61), was commemorative of the above unhappy accident.—Another occurrence, much more recent and better authenticated, is commemorated by a large stone which stands on the estate of Renfield or Blythswood, close to the high road leading from Renfrew to Inchinnan-bridge. At this spot the Earl of Argyle was wounded and taken prisoner after the failure of his ill-conducted enterprise in 1685. It consists of a fragment of rock, weighing probably a couple of tons, and contains some reddish veins, which (as the Earl leant upon it after being wounded) were long believed to be the stains of his blood.

RENFREW, a royal burgh, and the capital of Renfrewshire, is situated within half-a-mile of the south bank of the Clyde, nearly 3 miles north of Paisley, and 6 miles west of Glasgow. It is certainly the most ancient town in the county, being traceable as far back as the reign of David I. It was constituted a royal burgh by Robert III. in 1396. The town is very small, consisting only of a single street, about half-a-mile in length, with some lanes. At the cross, near the west end, stand the town-house and jail, with a spire and clock. North of this is an excellent gas-work, erected by the community in 1841. The town maintains an almost stationary state, and has a neat and comfortable look. The inhabitants are chiefly occupied in the weaving of silks and muslins; and there is a bleachfield, and a starch manufactory. The community have long enjoyed the exclusive privilege of fishing salmon in the Clyde, within certain extensive limits. In the 16th century, according to Bishop Lesley, they often had 60 boats so employed during the whole of the spring and summer (not 'all the year round,' as his language has been erroneously translated). Crawford says that Renfrew had once a little foreign trade; but that when he wrote in 1710, the chief traffic was with Ireland. The burgh must of old have plumed itself on account of its occupation on the waters; for its arms represent a ship, with the motto, 'Deus gubernat naven.' At present there are no vessels belonging to Renfrew, except such as carry coals, manure, &c., on the river. The salmon-fishery is still prosecuted; but the fish have greatly decreased in quantity. A

branch of the Clyde at one time ran close to the town, on the north; but the river deserted this channel in the 17th century, or perhaps more recently; and the town now communicates with the Clyde by a small canal, formed about the year 1785, partly in the old bed of the river. A commodious quay was built in 1835, at an expense of £800; and about 100 yards below it, is the terminus of a railway to Paisley, opened in 1837. No place, perhaps, in the west of Scotland, is so peculiarly healthy as Renfrew. Epidemical distempers are hardly ever known. For this, two reasons have been assigned. The one is, that the town stands upon a bed of sand of great depth, so that the rain is soon absorbed, and damps and fogs are hardly ever felt. The other reason is the peculiar excellence of the water. The royalty of the burgh is very extensive. It stretches down the Clyde as far as the river Cart, in the direction of the Greenock road, as far as Inchinnan-bridge, about a mile from the cross, and in the direction of Paisley about a mile-and-a-half. The parliamentary boundary is much more limited, but appears to afford room for any probable extension of the town. There is a portion of ground within the parliamentary boundary, but excluded from the royalty, though entirely surrounded by it. This ground, which is now partly built upon, is that called the Orchard and Castlehill, which has been noticed in the account of the parish, as having formed the residence of the Stewarts. The property of the burgh, in reference to its size and population, is large and valuable. It consists of farms, pasture-lands, fishings in the Clyde, the ferry across that river, houses and gardens, canal and harbour dues, seats in the church, feu-duties, &c. The Commissioners on Municipal Corporations, in 1833, reported that no valuation of this property had been made, but that the total annual revenue at that time was £1,448 12s. 7d. In 1841 it had increased to £1,683 7s. 9½d. Before the burgh reform act of 1833, the mode of election in Renfrew was one of pure self-nomination. The last provost under the old system, Mr. Robert King, was constantly re-elected, and filled the office for 24 years continuously. It must be acknowledged, however, that although tenacious of office, the worthy functionary bore his faculties meekly; and notwithstanding the extravagant tavern-bills, for which this petty burgh was long noted, his administration must, upon the whole, have been prudent and judicious,—for it appears by the Commissioners' Report, that, during the last 16 years of his sway, the debt due by the corporation was reduced to the extent of one-half. The council consists of a provost, 2 bailies, a treasurer, and 15 ordinary members. The provost is *ex officio* a deputy-lieutenant of the county. The only incorporated trade is that of the tailors. Renfrew was formerly associated with Glasgow, Dumbarton, and Rutherglen, in returning a member to parliament;—by the Reform act it is united with Kilmarnock, Dumbarton, Port-Glasgow, and Rutherglen. In 1841, the parliamentary constituency of Renfrew was 95, the municipal 88,—and the population, within the parliamentary boundaries, 2,013. The assessed value of real property within the burgh, in 1815, was £2,955. There are three fairs annually, chiefly for the sale of cattle. The magistrates hold a court weekly on Saturday, which is also the market-day. The meetings of quarter-sessions, commissioners of supply, and freeholders, are held at Renfrew as the county-town. This was also the seat of the sheriff-court till 1705, when it was transferred to Paisley.

RENFREWSHIRE, a small but important manufacturing and commercial county; bounded on the east and north-east by Lanarkshire; on the south

by Ayrshire; on the west by the frith of Clyde, which separates it from Argyleshire; and on the north by the frith and river of Clyde, which separate it from Dumbartonshire, except 1,294 acres belonging to the parish of Renfrew, which lie on the opposite side of the river. The greatest length of the county from Drumduff, in the parish of Eaglesham, in a north-west direction to Cloch-point, in the parish of Innerkip, is 31½ miles; and its greatest breadth from Maich-bridge, near Kilbirnie-loch, to Erskine-house, in a north-east direction, is 13½ miles. Its area is 241 square miles, or 154,240 acres, of which about 100,000 are cultivated, 20,000 uncultivated, and 34,240 unprofitable. In 1755 the population was only 26,645; in 1801 it had increased to 79,891; in 1821 it was 111,796; in 1831, 133,443; and, in 1841, 154,755, of whom 72,725 were males, and 82,030 were females. The rapid increase in the number of inhabitants is attributable to the extension of manufactures and commerce. The greater part are gathered round the towns of Paisley, Greenock, and Port-Glasgow. The increase in the 10 years preceding 1841, was 15·9 per cent. The inhabited houses, in 1841, were 24,626. The valued rent, in 1674, was £69,172 Scots; the annual value of real property, as assessed in 1815, £265,534. The county returns one member to parliament. Constituency, in 1841, 2,336.

In ancient times the greater part, if not the whole, of the district, which now forms the county of Renfrew, was denominated, from one of its rivers, Strath-gryfe,—the valley of the Gryfe,—and was included in the shire of Lanark. It was the chief patrimony of the Stewards of Scotland, and, after the 12th century, was called the barony of Renfrew, from the burgh where the Stewards had their principal residence. In 1404, 33 years after their accession to the throne, King Robert III. granted to his son and heir, James, this barony and the other portions of his ancient patrimonial inheritance; since which time the eldest son of the reigning monarch has, besides his other titles, been styled Prince and Steward of Scotland, and Baron of Renfrew. When there is no heir-apparent, these titles are merged in the Crown. Crawford, in his History of this county, says (p. 10) that “the barony of Renfrew was dissolved from the shire of Lanark, and erected into a distinct sheriffdom” by King Robert when he executed the grant in favour of his son; but the charter to which Crawford refers as proving this statement does not contain one word of a sheriff or sheriffdom of Renfrew, or any allusion to its establishment as a shire. The barony must, however, have been formed into a sheriffdom about that time, or soon after; for in a deed dated 12th August, 1414, there appears as a witness one ‘Dominus Finlayus Buntyn,’ who is styled ‘Vicecomes de Renfrew,’ sheriff of Renfrew [Caledonia, vol. iii. p. 772]; and about the middle of the same century the sheriffdom is recognised in several records.

In describing Renfrewshire, it is usual to separate it into three districts, which differ greatly in soil, surface, and mode of cultivation; namely, the hilly, the gently rising, and the flat. 1. The hilly or more elevated district is by far the most extensive, and, if properly cultivated, perhaps the most important of the three. It forms the south and west parts of the county, and comprehends the parishes of Mearns, Eaglesham, Kilmacolm, Innerkip, Greenock, and Port-Glasgow, the greatest part of Neilston and Lochwinnoch, with large portions of other parishes which are chiefly situated in the lower districts. The soil which generally pervades this district is a free light earth on a dry bottom of gravel on whinstone, or what is called rotten-rock. The grounds

are often barren, producing only ling or heath, and many parts are covered with deep moss. 2. The gently rising or middle district comprehends the parishes of Cathcart and Eastwood, with parts of the parishes of Paisley, Inchinnan, Erskine, Houstoun, Kilbarchan, and Renfrew. In no part of Britain, perhaps, has nature formed a more beautiful surface than in this district. Little hills, swelling in endless variety, interspersed with many-coloured copses, often watered at the bottom by winding rivulets, in different and changing forms, meet every turning of the eye. In a small compass there is a striking diversity of landscape. The hills do not rise in ridges, but are altogether separate, and present those alternate risings and falls which constitute so material a part of picturesque beauty. In this district the soil is a thin earth, sometimes on a gravel and sometimes on a till bottom. The land is nearly all arable, and there are many flat holms of small extent, the soil of which is of a loamy mellow nature and of great fertility. 3. The flat division, called, in the language of the country, 'the laigh-lands,' forms the last and smallest division. It consists chiefly of that beautiful level tract which is situated to the north of the town of Paisley, and comprehends the parish of Renfrew and parts of Inchinnan, Erskine, Houstoun, Kilbarchan, and Paisley. Here the soil is, generally, a deep rich loam of a dark brown colour, and seems to be a deposition of vegetable mould from the higher and less fertile parts of the county. In this district, especially along the banks of the Black Cart, moss prevails. The cultivated part of the county is in the centre, and on the north and north-east. The billy parts on the west and south are chiefly devoted to pasture.—The railways, turnpike roads, and canals, which traverse the county, have been noticed under separate articles, and otherwise.

The principal rivers are the White Cart, the Black Cart, the Gryfe, the Levern, and the Calder, which have been separately described, as has the chief sheet of water, Castle-Semple-loch. The Clyde must also be regarded as connected with Renfrewshire, as it forms the boundary, to a great extent, and at once beautifies the district and affords facilities for commerce.

The south-eastern part of the county is included in the coal-district of the west of Scotland, and in this part coal has been long and extensively wrought. Limestone, freestone, and whinstone abound throughout the county. Ironstone is also found in profusion, and it has been partially wrought. The geology of the county has been well described by an intelligent inhabitant, William Montgomery, Esq. of Cloak, in a prize essay published in the Quarterly Journal of Agriculture for December, 1838 (No. 43), and by the Rev. William Patrick, in General Observations on Renfrewshire, contained in the New Statistical Account.

Since the period of the Union with England, Renfrewshire has become distinguished for the extent of its manufactures and commerce, as may be seen from our accounts of Paisley, Greenock, Port-Glasgow, and other places within its bounds.

The number of parochial schools within the county, in 1834, was 19, and of schools not parochial 169. Between Lady-day and Michaelmas 1833, the greatest number of scholars attending the former were 925, and the latter 9,142; but when a due proportion is added for defective returns, the former number should be 1,102, and the latter 11,721.

RENTON, a large manufacturing village, in the parish of Cardross, Dumbartonshire. It is pleasantly situated in the vale of the Leven, on the right bank of that pure and lovely stream,  $2\frac{1}{2}$  miles north of Dumbarton,  $1\frac{1}{4}$  south of Alexandria,  $8\frac{1}{2}$  east by south

of Helensburgh, and 17 north-west by west of Glasgow. It was founded, in 1782, by Mrs. Smollett of Bonhill, and named in honour of her daughter-in-law, Miss Renton of Lammerton. Extensive calico printing and bleaching establishments have already urged its prosperity to the bulk of a small town; and, either directly or remotely, employ almost the whole of its population. The village has a United Secession meeting-house, regular missionary-station-work connected with the Establishment, several schools, a Bible and Missionary society, a respectably large subscription-library, and quite an undue number of public-houses. Population 1,900.

RENTON, a decayed village upon the Eye, in the parish of Coldingham, Berwickshire, which, judging from the extent of the foundations of its houses which, till lately, remained to impede the progress of the plough, must, at one period, have been of considerable size.—A little to the south-east of these ruins, upon the northern bank of the Eye, was situated the tower of Renton, which figured a good deal in the wars of the 15th and 16th centuries, but of which only the foundations can now be traced.

RENTON-INN, a stage on the western one of the Cockburnspath and Coldingham parts of the great coast-line of road between Edinburgh and Newcastle. It stands in the parish of Coldingham, 14 miles from Berwick, and 43 from Edinburgh.

RERRICK, or RERWICK, a parish on the coast of Kirkcudbrightshire; bounded on the north by Kelton; on the east by Buittle; on the south-east and south by the Solway frith; and on the west by Kirkcudbright and Kelton. It is, in a general view, triangular; and measured in straight lines, which fall more within than beyond the real boundary, it extends 7 miles along the north-east,  $8\frac{3}{4}$  along the south-east, and  $8\frac{1}{2}$  along the west. Its area is about 32 square miles. The surface is, in part, boldly hilly, and coarsely tumulated; and, in part, undulated or champaign. Bencairn, Forrest, Kendum, and other hilly heights, fill the whole north angle, or between a fourth and a third of the entire area, and are clad in heath and altogether pastoral or waste. The grounds elsewhere have two lochlets and a number of mosses,—three of the latter comprehending respectively 30, 40, and 300 acres; but, with these exceptions, they are all arable, the plough maintaining dominion up to the summit of every swell and eminence. The soil, in most places, is naturally wet and spongy; but, having been well-drained and cultivated, it has become a good mould, and produces excellent crops. At the head of Auchencairn-bay is a flat expanse reaching about half-a-mile inland, which apparently was, at no very ancient date, a marsh overflown by the tide, but is now a scene of agricultural industry, and a seat of population,—disposed in fine fields, in the pleasure-grounds of a gentleman's mansion, and in the site of the village of Auchencairn. The bay of AUCHENCAIRN [which see] is one of the prettiest little inlets of the sea in Scotland. Along its edges is a little rising ground or bank, skirted with natural wood; at its entrance, exactly in the middle, rises the beautiful green, smooth island of Heston,  $1\frac{3}{4}$  mile in circumference, towering high above the billows, and offering herbage to a flock of sheep and a brigade of rabbits; and, from its west side, near its north-west corner, Heston-bay goes off in form of a horn, measuring  $1\frac{1}{2}$  mile in length, and half-a-mile in breadth, and overlooked by the mansions of Torr and Orchardton. These bays, with a streamlet, called Orchard-lane, flowing into the latter, form the whole of the boundary with Buittle. The coast, from Balcarry-point, at the entrance of Auchencairn-bay, to a creek, called Mullock-bay, at the western boundary, is  $8\frac{3}{4}$  miles in

extent. In the shore-line it is bluff, bold, and broken, and has some strong dashes of romance; along the sea-board, it exhibits a charming variety of creeks, green fields, simple woods, and twisted vales; and, from numerous swells, or nearly all its higher surface, it commands a rich and far-extending prospect, both inland and especially toward the sea. The view inland embraces a large part of Galloway and a portion of Dumfries-shire, and is closed at the distance of about 50 miles, by Cairnmoor, the bills of Carsphairn, and the noble dome of Queensberry. Seaward the frith, which is here 10 leagues broad, is seen to stretch away on the right till it is lost in the Irish sea, and on the left about 30 miles, in narrowing limits, dotted along the English coast with no fewer than five towns fringed along the margin with distinctly seen fields and hedges, and overhung on the Scottish side by the majestic Criffell, and on the English side by the gallery or receding ranges of the Cumberland mountains, terminating in the lofty Skiddaw. The heights have the effect of flinging a kind of shade upon the frith, or of aiding the distinctiveness of its objects, and enhancing the impression of its general beauty. From several parts of the parish a curve of about 90 miles from the point of St. Beev, round the Isle of Man to the point of Whitehorn, can be distinctly seen in one view; and, as most of the vantage-grounds which command this great and gorgeous marine prospect are high, and lift the eye away to the mouth of St. George's channel, and towards the north of Ireland, the vessels which dot it—and which are rarely fewer than from 60 to 80 in number—appear, in consequence of a well-known law of optics, as if they were elevated one above another, according to their distance, till the farthest seems as if dropping out of the clouds; so that, in certain states of the atmosphere, the beautifully zoned sea looks like an immense canvass hung down from heaven, and depicted with ships. **PORT-MARY** [which see], Mullock-bay, and a creek in Auchencairn-bay, called Balcarray-bay, have all, by act of Parliament, been declared free ports; but they are mere landing-places, and witness very little traffic. Five or six streamlets rise among the uplands in the north, and flow divergently to the sea; the most noticeable being Kendlum and Abbey burns, which wash respectively the two villages of the parish, and are pleasing for their utility and their scenery. Excellent freestone abounds along the coast, and has been extensively quarried for exportation into a considerable circumjacent district. A rich iron-mine was worked for some time by an English company, and was abandoned on account only of the expense and inconvenience of exporting the produce.\* The principal village is Auchencairn, with, in 1836, 325 inhabitants. See **AUCHENCAIRN**. The village of Dundrennan stands on the Abbey-burn,  $5\frac{1}{2}$  miles east-south-

east of Kirkcudbright; and had, in 1836, a population of 199. Near it stands **DUNDRENNAN ABBEY**: which see. In various localities there are vestiges of two Druidical temples, and twelve British, Roman, and Saxon, or Danish camps; and on the summit of Bencairn, 1,200 feet above sea-level, is a cairn which has given name to the mountain, and appears to have been amassed by the laborious portage of its stones from the plain. The principal mansions, additional to those already named, are Dundrennan-house and Balcarray. The parish, though sufficiently veined with roads, is not traversed by any great turnpike lines. Population, in 1801, 1,166; in 1831, 1,635. Houses 262. Assessed property, in 1815, £11,986. —Rerrick is in the presbytery of Kirkcudbright, and synod of Galloway. Patron, the Crown. Stipend £232 19s. 2d.; glebe £30. The parish-church was built about the end of the 17th century, and was altered and enlarged in 1743 and 1793, and received the addition of an aisle in 1828. Sittings 565. A Baptist meeting-house in Auchencairn was built in 1822, at the cost of £112, and has attached to it one of the parish school-rooms.—The parish was anciently called Dundrennan,—a name which means 'the hill of thorns,' and which was given by the parish to the abbey, not borrowed from the abbey by the parish. The original church stood on the east of 'the bill of thorns,' alluded to in its name, or by the side of the Abbey-burn; and, from 1142 till the Reformation, it belonged to the abbey. The church still remained in the reign of Charles I.; and, when it became ruinous, the abbey was used in its stead. On the abbey, in its turn, falling into disrepair, the present church was built on the lands of Rerrick, and thence derived for itself and the parish their modern name. A chapel anciently stood at an extinct village, to which it gave the appellation of Chapeltown. There are two parochial and two non-parochial schools; the former attended, in 1834, by 175 scholars, and the latter by 103. United salaries of the parish schoolmasters £51 6s. 6 $\frac{1}{2}$ d., with £44 fees.

**RESCOBIE**, a parish a little south-east of the centre of Forfarshire. It consists of two connected sections, both of which are elongated, and stretch from east to west, but which are not strictly continuous, and jointly form a very irregular outline. Rescobie-loch—a sheet of water which stretches from west to east, measures  $1\frac{1}{4}$  mile in length by  $\frac{1}{2}$  of a mile in extreme breadth—forms, along with very small parts of Lunan-water at its ends, the line of connection between the two sections. The western section lies on the north side of the loch, and extends westward from its east end; and the eastern section lies on its south side, and extends eastward from its west end. The western section measures  $5\frac{1}{2}$  miles in length, and from  $\frac{2}{3}$  of a mile to  $1\frac{3}{4}$  mile in breadth; and is bounded on the north by Oatblaw and Aberlemno; on the east by Aberlemno; on the south by the loch and by Forfar; and on the west by Kirricmuir. The eastern section measures  $4\frac{1}{2}$  miles in length, and from  $\frac{3}{4}$  of a mile to  $1\frac{1}{2}$  mile in breadth; and is bounded on the north by the loch and by Aberlemno and the northern section of Guthrie; on the east by Kirken; on the south by Kirken and Dumichen; and on the west by Forfar. The superficial extent of the whole parish is about 12 square miles. The surface is much diversified, and nowhere lies lower than about 200 feet above sea-level. The hills of Turin and Pitscandle, on the north side of Rescobie-loch, are about 600 feet in elevation above the level of the lake, and rise rapidly from their base. The face of the former is an impregnable wall of rock, similar to that of Salisbury-crag at Edinburgh; and its summit is crowned by the vestiges of an ancient

\* Some small but beautiful rock crystals, found in this district, are curiously described by the Old Statistical Reporter:—"On the march, in the northern corner of the parish," says he, "there is a small stream, which comes gurgling down from the mountains, in which are found a certain kind of little stones, of a very striking figure and quality, quite transparent, with a faint colour of purple, and so hard, that they will cut glass like a diamond. They grow on the rocks that overhang the rivulet in large clusters, about the size of pin heads, where they continue to vegetate—as may be collected from the different stages of their progress, evidently there to be seen—till they are near an inch long and three-eighths diameter; when dropping out of their sockets, they fall into the water, and mix with the gravel at the bottom of the rill. The end that sat in the socket, very much resembles that part of a tooth which sticks in the jaw; the other end of most of them is tapered: and—which is the great and inexplicable phenomenon—are cut into triangular, quadrangular, and various other figures, as neatly and distinctly, as if they had come through the hands of the best lapidary in the kingdom. How frequently these rocks bring to maturity, and cast off their singular form, whether in 50, 100, or 1 000 years, cannot be so much as guessed at."

stronghold, now called Kemp or Camp-castle, and consisting of various extensive contiguous buildings, with a circular citadel about 120 feet in diameter. Concerning this antiquity, remarks the dull but occasionally sarcastic Webster, "even tradition does not tell a lie." The most remarkable feature in the Turin-hill quarries is a stratum of conglomerate or pudding stone, 20 or 30 feet in thickness, overlaying the old red sandstone which forms the body of the hill. The latter affords perhaps the best building-stone in the county, and varies from a laminar to a conchoidal fracture, or, in the language of the quarriers here, from slate to liver rock. An abundant supply of rich shell marl from the lakes of the parish and its boundaries incited and secured success in georgical enterprise. Lemno-water circles  $3\frac{1}{2}$  miles round the south, the west, and the north sides of the western section. Lunan-water, coming in from near its source, in Forfar, traces for a mile the western boundary of the eastern division; and dehouching eastward, expands into Rescobie-loch, and afterwards traces for  $2\frac{1}{4}$  miles the northern boundary-line, and, during its progress, expands into the Loch of Balgavies, a sheet of water  $1\frac{1}{4}$  mile in circumference. The vallicular funnel between the ridgy hill of Dunnicheon on the south, and the connected hills of Turin and Pitscanhie on the north, frequently occasions in the atmosphere a strong and purifying current, which carries off the humid exhalations from the lakes, and renders the air of the parish peculiarly salubrious. When the Old Statistical Account was written, some parishioners were upwards of 80 and 90, and one had just died at the advanced age of 104. The minerals, especially the sandstones of the two chief hills, appear to be richly workable, and so situated and amassed as to command the attention of taste. The hills, says the old statist, "contain inexhaustible stores of stone of various kinds, and of every dimension fit for use; and quarries are now working which are astonishing to look at, and afford ample subject of contemplation and amusement to the naturalist and the virtuoso. Gentlemen of this cast would sometimes deign to come and see, if they knew what is to be seen. Besides the discoveries to be made in the bowels of these hills, the stupendous rocks that rise upon them, in proud contempt of human productions, may well be viewed as natural prodigies, and must strike with amazement the eye of the stranger." The principal mansion is Turin-house. The parish is traversed by the Arthroath and Forfar railway, and the turnpikes between Arthroath and Forfar, between Montrose and Forfar, and between Dundee and Aberdeen by way of Brechin. Population, in 1801, 870; in 1831, 808. Houses 164. Assessed property, in 1815, £5,277.—Rescobie is in the presbytery of Forfar, and synd of Angus and Mearns. Patron, the Earl of Strathmore. Stipend £213 19s. 3d.; glebe £13. Schoolmaster's salary £31, with £10 12s. 6d. fees, and £6 other emoluments. A chapel anciently stood a little east of the loch of Balgavies. In its hurrying-ground, which still remains, no grave seems to have been opened a second time, and the tomb-stones are so deposited that, while their inscriptions were legible, a family history might have been collected from them through a series of generations.

**RESORT (LOCH)**, a long narrow bay, on the west coast of Lewis and Harris, and forming over all its length the boundary between them in Long island. It penetrates about 7 or 8 miles into the country; but, 3 miles inward from its entrance, is only about a mile broad; and thence to its head it tapers gradually to a point.

**RESTALRIG**, a village in the parish of South Leith, Edinburghshire. It stands on low ground in

the midst of the plain which extends from the beach of Leith to the hills of the metropolis; and it is  $1\frac{1}{4}$  mile east-north-east of the Calton-hill of Edinburgh,  $1\frac{1}{2}$  mile south-east of the centre of the town of Leith, and  $1\frac{1}{2}$  mile west-north-west of the Figgateburn at Portobello. During the period of the papacy, it was the capital of the parish, and the site of the parish-church. When or whence it had its name and its parochial origin, is not known. At the demise of William the Lion, the district of Restalrig—or, as it was anciently called, Restalric—was possessed by a family who wore its name as their own. At the demise of Alexander III., it acknowledged John de Restalric as its baron, and had undoubtedly become a parish and a parsonage. In 1291, Adam of St. Edmund's was its parson, and had a writ to the sheriff of Edinburgh to deliver him his lands and rights; and, in 1296, in the church of Restalric, he swore fealty to Edward I. During the reign of Robert I. the barony passed by marriage into the possession of the Logans; and it continued to be their property till they became forfeited for their participation in Gowrie's conspiracy. In 1435, the patronage of the church was confirmed to Thomas Logan, by William, bishop of St. Andrews. At various dates, transactions—some of them of a very venial kind—were effected by the Logans which remotely enthralled the port of Leith to the domineering tyranny of Edinburgh: See LEITH. A collegiate establishment was set up at Restalrig by James III., improved by James IV., and completed by James V.; but it seems not to have interfered with the parsonage, which remained entire till the Reformation. In 1560, the first General Assembly ordained that the church, on account apparently of its abounding with statues and images which were the insensate objects of brutalized religious worship, to be destroyed "as a monument of idolatry," and that the parishioners should in future adopt as their parish-church, St. Mary's chapel in Leith,—that which continues to the present day to be the South Leith parochial church. In 1609, the legal rights of the church and parish of Restalrig, with all their revenues and pertinents, were formally alienated from them by parliament, and conferred upon the chapel, then legally declared to be the parish-church of South Leith. Robert Logan of Restalrig, who, in 1600, was concerned in Gowrie's conspiracy, and who seems, about the year 1607, to have died a bankrupt, sold, in 1596, his estate of Nether Gogar to Andrew Logan of Coalfield,—in 1602, his lands of Fast-castle, to Archibald Douglas,—in 1604, his barony of Restalrig, to Lord Balmerino,—and in 1605, his lands of Quarrel-holes to some party whom our authorities do not name. The Lords Balmerino held the lands of Restalrig till their forfeiture in 1746; and during the whole period of their possession appropriated the vaults of the forsaken and dilapidated church as the burying-place of themselves and their immediate relations. Lady Balmerino, the wife of Arthur, the 6th and the attainted Lord, resided in the village during the years of her widowhood, and died there in 1765. The Earls of Moray succeeded the forfeited family in the possession of the lands; and they now claim the spacious vaulted aisle of the church as their sepulchre. The Episcopalians, whether those of the Scottish deposed church, or those in communion with the Church of England, have always, from the Revolution downward, had a peculiar attachment to Restalrig. They were for many years prohibited from performing the ritual of their funeral service in any of the burying-grounds of the city or immediate suburbs of Edinburgh, yet were allowed to use their freedom with that of Restalrig; and they, in consequence, adopted

it as their cemetery, and, in 1720, interred in it the body of Alexander Rose, the last legal or more than titular bishop of Edinburgh. In 1837, the eastern wall and part of the side-walls of the old church were still standing; and, at that date, the building was renovated, and reconverted into a place of worship.—The village consists of only a few houses, and has a decayed appearance. All around it are fruit and vegetable gardens, which send large supplies to the market of Edinburgh, and, in summer, attract numerous parties of the citizens in quest of strawberries and other fruits. On the west are meadows irrigated by putrescent water from the metropolis, and highly productive of crops of herbage. In the direction of the meadows, about a furlong from the church, on the side of an ancient road which probably communicated between the collegiate church of Restalrig and the abbey of Holyrood, is St. Margaret's well, a spring of the purest and softest water, the source apparently of supply to the ancient ecclesiastics of the village, and now spanned by an arch, which seems a solitary remnant of some old and handsome edifice. Opposite the west end of the church, and forming the lower walls of a plain modern house, is part of the ancient castle of the barons of Restalrig.

RESTENET, an interesting hut very altered locality,  $1\frac{1}{2}$  mile north of the town, and on the northern frontier of the parish of Forfar, Forfarshire. A sheet of water which formed the parochial boundary-line, bore the name of Loch-Restenet; and, in the latter part of last century, was, at great expense, drained for sake of obtaining a rich supply of shell-marl in its bed. The draining of it was thought by many a hazardously bold enterprise; but it afforded speedy indemnification by its conquest of a tract of rich land, and, in addition, led to a long-continued and handsome revenue in the produce of marl.—On a picturesque eminence, once a peninsula projecting from a very narrow isthmus into the lake, stand the walls and spire of an ancient church, the ruinous memorials of an attached priory. The monks of Jedburgh selected the peninsula in this lake as a suitable retreat for a detachment of their body, and a desirable place of safety for their records and more valuable effects. The priory was thus instituted that it might "protect their affairs," and was aptly called, in Latin phrase, "*Res tenet*." The buildings appear to have been wholly surrounded with water, and to have been accessible only by a drawbridge. The church is said to have been the place of worship for the townsmen and parishioners of Forfar before they were in a condition to build a church for themselves; and in all presentations and other legal documents, it still intrudes its name in company with that of the town to make "Forfar-Restenet" the legal name of the parish. The area of the church is now used as the burying-places of the families of Dempster of Dunninghame\* and Hunter of Burnside.

RESTON, an agricultural village in the parish of Coldingham, Berwickshire. It stands a little south of the great east road between Edinburgh and Newcastle,  $3\frac{1}{2}$  miles west of Aytoun, and the same distance south-west of Coldingham. Population 230.

RHINNS, RHYNs, or RINNS, of GALLOWAY, a large, double elongated peninsula, lying

west of Loch-Ryan and Luccabay in Wigtonshire. It stretches north-north-west and south-south-east; and contains at its south end the most southerly land in Scotland. Its name, whether in British or in Gaelic, 'Rhinn' or 'Rinn,' signifies points or promontories, and appropriately designates its figure and appearance. An isthmus of about  $6\frac{1}{2}$  miles connects it with the rest of Galloway; and is throughout low, and replete with evidence of having been under marine water. The Rhinns must thus, though probably at a very remote period, have formed an island. They stretch away respectively 9 miles north and 14 miles south of the isthmus; they vary in breadth from 2 to nearly 6 miles,—the northern one being the broader; and they comprehend an area of about 116 square miles. The parishes included in the Rhinns are Kirkmaiden, Stoneykirk, Portpatrick, Leswalt, Kirkcolm, and a small part of Inch. The district was called by Ptolemy and the ancient geographers Chersonesum Novantum.

RHOE (LITTLE), an islet in the vicinity of Mickle Rhoe, and separated from the mainland by a sound about a mile broad. Population, in 1837, 12.

RHOE (MICKLE), an island belonging to the parochial district of Delting, in Shetland. It lies near the head of St. Magnus-bay, on the west coast of the mainland, and is separated from a peninsular part of the mainland only by a very narrow sound which is dry at low-water. Its extent is probably about  $2\frac{1}{2}$  by 2 miles. A century ago it was wholly waste or pastoral; and even yet it consists, to a large extent, of heath clad and rugged land, fit only for grazing and sheep-walk. Population, in 1837, 210.

RHONHOUSE, or RONHOUSE, a small village in the parish of Kelton, Kirkcudbrightshire;  $1\frac{1}{2}$  mile south-west of Castle-Douglas. It owed its origin to the great fairs or cattle-markets of Kelton-hill, and since these have been transferred to Castle-Douglas it has lost its importance.

RHYND, or RYND, a parish at the eastern extremity of Strathearn, Perthshire; bounded on the north and north-east by the Tay, which divides it from Kinnoull and Kinfauns; on the east by the incipient estuary of the Tay; on the south by the Earn, which divides it from Abernethy; on the south-west by Dumharney; and on the west by Perth. A belt of about 3 miles in length, and from 6 to 12 furlongs in breadth, lies along the Tay in the form of the small segment of a circle, the convexity resting on the river. From the south end of this belt project two slender peninsulæ, called the East and the West Rhynd, each about a mile long, the former eastward between the Tay and the Earn at their confluence, and the latter south-south-eastward into a sweeping fold of the Earn. The eastern one of these peninsulæ is, at its isthmus, the site of the parish-church, and, in consequence, has won the parish its name—*Rhynd*, or more properly, *Rhinn* or *Rinn*, signifying, in the Celtic language, "a point or promontory." Of three islets in the Tay which belong to the parish, two have recently been so ingeniously connected with the mainland that considerable peninsulæ of very valuable land have been won from the waters, while, as a collateral though incidental advantage to the town of Perth and the whole country around it, the navigable channel of the river has been materially deepened. The parochial area, in common with the operations at the islets, is still undergoing enlargements; and, at present, may be stated as amounting to 1,900 acres. The scenery of the parish comports well with its being part of the gorgeous environs of Perth. The climate is remarkably healthy, and has long been noted for its salubrity; instances of great longevity being numerous, and the citizens of Perth

\* This family became extinct by the death of George Dempster, Esq. of Dunninghame, many years Member of Parliament for the Forfar district of boroughs. His attention to the progress of the agriculture, manufactures, and commerce of Scotland were unremitting. His individual enterprise is shown in the draining of the locality just described, and in the planning of the village of Letham. From an incidental remark of an East India captain, that he had seen fish brought to Canton enclosed in snow, he first suggested the practicability of carrying salmon fresh to the London market by packing with ice, which is now universally adopted by the Scots fishers.

having in large numbers flocked to it during the desolation of their city, in old times, by the plague.—Elcho-castle, the property of the Earl of Wemyss, stands on the Tay, due north-east of Moncrieff-hill, and 4 miles below Perth. Though in a ruinous condition, it is still entire, and was recently re-roofed. It is of considerable extent, strong and thick in its walls, very hard and durable in its materials, and must anciently have been a place of note. The battlement which crowns it, and which is accessible by several well-preserved winding stairs, commands splendid prospects along the river.—The ruins of a nunnery remain at Orcharlnook on the Tay, about a mile above Elcho-castle. The establishment is said to have been founded by David Lindsay of Glenesk, and to have been a dependency of the monastery of Dunfermline. The ruins are situated in the midst of a large orchard; and, along with vestiges in the grounds around them, indicate that the original buildings were pretty extensive.—The landowners are the Earl of Wemyss and Mr. McGill of Kemhach. The parish has only one-eyed or strictly parochial roads, yet enjoys ample facilities of communication, chiefly from its vicinity to Perth. Population, in 1801, 403; in 1831, 400. Houses 74. Assessed property, in 1815, £5,854.—Rhynd is in the presbytery of Perth, and synod of Perth and Stirling. Patron, the Earl of Wemyss. Stipend £225 10s. 3d.; glebe £17. Unappropriated tithes £451 19s. 6d. Schoolmaster's salary £34 4s. 4½d., with £25 fees.

**RHYNIE AND ESSIE**, an united parish in the district of Strathbogie, Aberdeenshire. It is bounded on the north by Gartly; on the east by Kinnethmont; on the south by Kern and Cahrach; and on the west by Cahrach. It is nearly a square 5 miles deep. The hill of **NOTH** [which see] is a commanding feature in the parish. Other heights exist; but are of inconsiderable altitude. The general parochial surface lies about 400 feet above sea-level. The soil in the vale, or Strathbogie proper, is loamy; near the foot of the hills is stony and gravelly, yet very fertile; and, on some low grounds, now a clay and now moss. The Bogie circles round the south-east and east of the parish. The ruins of Lesmore-castle and of Essie-kirk occur near the west base of Noth. The hamlet or kirktown of Rhyne stands on the Bogie, 8 miles south by west of Huntly. Population of the parish, in 1801, 676; in 1831, 1,018. Houses 197. Assessed property, in 1815, £1,502.—This parish is in the presbytery of Strathbogie, and synod of Moray. Patrons, the Duke of Richmond and the Earl of Fife. Stipend £158 7s.; glebe not stated. Schoolmaster's salary £24 7s. 8½d., and eight holls of meal, with fees. There are two private schools. Though the two parishes were united at a remote period, the church of Essie continued in use till the middle of last century.

**RICCARTON**, a hamlet, a hilly ridge, and a streamlet, in the parish of Linnlithgow,—the first 2 miles south-east of the hurgh, and the others in the hamlet's vicinity.

**RICCARTON**, a parish near the middle of the northern verge of Kyle, Ayrshire. It is bounded on the north by the river Irvine, which divides it from Kilmarnock in Cunningham; on the east by Galston; on the south by Craigie and Symington; and on the west by Dundonald. Its length, from east to west, is 6 miles; and its mean breadth is 2 miles. Excepting a moss of about 250 acres, the lands are all arable and well-enclosed; and, in general, are carpeted with a deep clay soil. Limestone abounds; and coal is extensively mined for exportation. Cessnock-water drains the eastern district, partly along the boundary and partly in the interior; and, as well as the Irvine, affords good trouting. The only

antiquity is a moat, the seat of the judicial executive in feudal times, situated in the immediate vicinity of the village. The principal landowner is the Duke of Portland. The mansions are Caprington and Skerrington on the Irvine, and Bellfield a little east of the village. The parish is traversed by three roads which diverge southward from Kilmarnock, and enjoys all the facilities of communication afforded by its suburban relation to that town. The name of the parish, in its original or uncorrupted state, was Richardstown, or Ricardston, and seems to have been derived from a Richard Wallace, whom tradition declares to have been the uncle of the celebrated Sir William, the patriot, but who probably lived too early to claim the distinguished honour. In the 13th and 14th centuries the lands of Ricardston belonged to a family of the name of Wallace, or, as the word was anciently written, Waleys. During the reign of Alexander II., and under the second Walter the Steward, Richard Waleys held considerable estates in other parts of Kyle-Stewart, and appears to have been one of the most considerable of the Steward's vassals; and he, very probably, was the ancestor of the Ricardston Wallaces, the first of their property, and the person from whom it derived its manorial and parochial designation. Sir Ronald Crawford, the maternal uncle of Sir William Wallace, had, in this parish, a residence to which his illustrious nephew often resorted, and whence he sallied to perform many of the exploits which fame assigns him in the tales of tradition. The residence is said to have been a tower on the site of the farm-house of Yardsides, immediately west of the village; but it has entirely disappeared, and has left, even in its vicinity, very doubtful memorials. A very ruinous and very humble edifice at the west end of a little row of cottages beside the farm-house is pointed out as the barn which belonged to the tower; and, respectively in the garden and at the entrance to the farm-yard are a pear-tree which Wallace is said to have personally planted, and a very old tree perforated with an iron staple to which he fastened his horse when he visited the tower.—The village of Riccarton is strictly a suburb of Kilmarnock; and, though nominally a mile from it, or really a mile from the centre of the burgh, is almost uninterruptedly connected with it by a long street, and is included within its parliamentary boundaries: see **KILMARNOCK**. Its site is a rising ground or swell immediately overlooking the Irvine. It is a place of antiquated appearance; and, since the date of Kilmarnock becoming a seat of manufacture, it has been inhabited chiefly by weavers of woollen fabrics. Its history, as to employment and prosperity, is very nearly a duplicate of that of Kilmarnock, or rather is a subordinate and dependent chapter of the same narrative. In 1638, the village was made a hurgh-of-barony. The church of Riccarton crowns the moat at the end of the village; and as it is a modern edifice, and has a fine spire, it contributes a conspicuous and pleasing feature to an extensive field of circumjacent landscape. Population of the parish, in 1801, 1,364; in 1831, 2,499. Houses 356. Assessed property, in 1815, £10,178.—Riccarton is in the presbytery of Ayr, and synod of Glasgow and Ayr. Patron, Cunningham of Caprington. Stipend £241 3s. 9d.; glebe £30. Unappropriated tithes £557 15s. 3d. In 1834, the parochial school was attended by 109 scholars; and two non-parochial schools by 167. Parochial schoolmaster's salary £34 4s. 4d., with £50 fees.—Riccarton was anciently a chapelry, subordinate to the parish-church of Dundonald; and it followed the fortunes of that church in annexation, from 1229 till 1238, to the short-lived convent of Dalnulin, and in subsequent annexation to the mon-

astery of Paisley. At some period of the Paisley monks' possession, it was made a parish-church, and treated by them as a vicarage. After the Reformation, it was incorporated with Craigie; but, in 1648, it was disunited from that parish, and honoured with independence.

**RIDDELL.** See **LILLIESLEAF.**

**RIGG-BAY,** a small bay in the parish of Sorbie, Wigtonshire. It measures 4 furlongs across at the entrance, and 3 thence to the head. Its situation is in the immediate vicinity of Galloway-house, and a mile south of Garlieston. Its depth of water is from 20 to 30 feet; and its shore is flat and sandy.

**RINGLY-HALL.** See **MAXTON.**

**RINK FAIRS (THE).** These fairs are very important—are held on the estate of Edgerston, 7 miles from Jedburgh, and 15 from Kelso and Hawick. The first fair is held on the 12th of July for Cheviots and wool; the second sheep fair is held on the day before Pennymoor October tryst.

**ROAG (LOCH),** a large and intricate inlet of the sea, on the west coast of the island of Lewis. The extreme length to which it intrudes upon the land is about 11 or 12 miles. Over 6½ miles from its entrance it has a breadth of from 6 to 8 miles; but it is sectioned lengthwise, by a series of islands, into two main channels, called Loch-Roag proper, and Loch-Bernera. Its further penetrations into the land consist of four quite separate and widely detached narrow bays, two of which bear the names respectively of Little Loch-Roag, and Loch-Carloway. So many islands and islets occur in all parts of the inlet, that 30 or 30 are of consequence enough to figure in a map of half-an-inch to a mile; while the largest, called Great Bernera, itself has a length of about 6 miles. The entire loch is hollowed into bays, and interrupted by passages of such variety and intricacy, as to demand no ordinary degree of attention and skill for its navigation. The entrance of Loch-Roag proper, too, is so obscure, that it might escape the observation of a boat's crew passing within a hundred yards' distance. All the land of the islands, and of the immediate coasts, are either low and tame, or terminate in such cliffs of gneiss as have little elevation, much ruggedness, and no beauty.

**ROAN or ROON (LOCH),** a small lake in the north of the parish of Crossmichael, Kirkcudbrightshire. It covers about 40 acres; is from 10 to 22 fathoms deep; and seldom freezes.

**ROBERTON,** a parish partly in Roxburghshire, and partly in Selkirkshire, lying on that district of their border which marches with Dumfries-shire. It is bounded on the north by Yarrow, by a detached part of Selkirk, and by Ashkirk; on the east by Wilton and Hawick; on the south-east by Hawick; on the south and south-west by Dumfries-shire; and on the west by Ettrick. Its length from north to south is about 13 miles; and its breadth is on the average between 4 and 5 miles. A water-shedding line of heights forms the boundary for 12 miles with Hawick and Dumfries-shire. The range is hooked, extending partly from north-west to south-east, and chiefly from south-west to north-east. Its sides, in some places, are steep and precipitous; but, in most, are accessible, and, in some, are of gentle ascent; and its summits are, in general, dome-shaped or flat. Three of its peaks, Craikmoor, Culm or Coon, and Crihlaw of Craik, are the highest in the parish, yet do not rise more than 1,300 feet above sea-level. Two other hilly ranges, or rather chains of hills, extend north-eastward through the parish, and occupy much the larger part of its area. But they are lower, and of softer outline, than even the heights on the boundary; and are cleft by the ravines or cleuchs of numerous little streams opening into the central val-

leys. The district, though situated not far from the centre of the Southern Highlands, and walled in by one of the middle stretches of their water-sheds, is thus not strictly mountainous, and possesses both lowness of surface and softness of feature compared with either Ettrick on its one side, or Liddesdale on its other. Two vales which, to a certain extent, traverse it lengthwise, are narrow along the bottom, or are the merest glens; but they have gently sloping screens, and, except where beautified with wood, are in a state of cultivation. Borthwick-water, rising in several head-streams at the southern extremity of the parish, drains the longer and larger of the vales; runs 10 miles north-eastward, and 2 eastward; and divides the parish into two nearly equal parts. Ale-water, rising 3½ miles from the southern extremity, drains the other vale, and runs nearly parallel to the Borthwick, at a distance from it of from 1½ mile to 2¼ miles. Rankle-hurn, rising in the south-west corner, begins, a little below its source, to trace, for 2¼ miles, the boundary with Ettrick. The Borthwick and the Ale, augmented in their course by a great number of rivulets, abound with trouts of the best quality, and, in the spawning season, are visited by salmon. Hellmoor, Kingsmoor, Crooked, Windy, and Alemoor lochs, occur as expansions or remote sources of the Ale,—each of three of them 2 miles or upwards in circumference; and two or three lochlets occur, as sources or expansions of tributaries of the Borthwick. All abound in fine perch and pike, and one has an excellent red trout, much resembling that of Loch-Leven. Moodlaw-loch, situated at a considerable altitude, but of small extent, is remarkable only for belonging equally to the three counties of Roxburgh, Selkirk, and Dumfries. All the common kinds of game abound as much on the land as the finny tribes in the water, and combine with them to render the district an attractive one for the sportsman. Though heath stretches out in patches, and almost every farm has its particular moss, the lands of the parish may, in general, be viewed as an assemblage of green hills, pleasantly and richly pastoral. About 11 parts in 12 of the whole area are sheep-walk, or cattle-pasture, and maintain about 19,000 sheep, chiefly of the Cheviot breed, and a proportionate number of short-horned cattle, and of kyloes. Between 500 and 600 acres are under plantation. About 2,000 acres are either regularly or occasionally in tillage. The chief antiquity is the old mansion-house of **HARDEN:** which see. There are six or seven camps, some British and some Roman; but all absurdly called, in the district, Picts' works. The only good road leads from Hawick, 3 miles distant from the nearest boundary, up the vale of the Borthwick, toward Eskdalemuir; but a branch-road goes westward, to pass down Rankle-burn to the vale of the Ettrick. Population, in 1801, 618; in 1831, 730. Houses 121. Assessed property, in 1815, £4,214.—Roberton is in the presbytery of Selkirk, and synod of Merse and Teviotdale. Patron, the Crown. Stipend £205 12s. 9d.; glebe £18. Unappropriated tithes £633 11s. 8d. Schoolmaster's salary £34 4s. 4½d., with £24 fees.—The ancient parish was called Borthwick; and its church stood at a place formerly named Kirk-Borthwick, but now named Borthwick-brae. In 1682, there were annexed to it part of the suppressed parish of **HASSEDEAN,** [which see,] a small detached portion of the distant parish of Selkirk, and some specific sections of the adjoining parishes of Hawick and Wilton; and, in 1695, a church for the united districts, the same edifice which continues to be in use, was built at Roberton, 1½ mile north-east of Kirk-Borthwick, and imposed the name of its site upon the extended parish. A chapel an-

ciently stood on the right bank of the Borthwick, in the Hassendean district, and belonged, like its parent church, to the monks of Melrose, and was served by a chaplain from their establishment.

**ROBROYSTONE.** See **CADDER.**

**ROGART**, a parish in Sutherlandshire, bounded on the north by Farr; on the north-east and east by Clyne; on the south-east by Golspie; on the south by Dornoch and Crieich; and on the west by Lairg. Its extreme length from north to south is 17 miles; its breadth, for  $6\frac{1}{2}$  miles from the north, is uniformly about 3 miles, and thence gradually expands to an extreme of 9 miles; and its superficial extent is about 63,000 acres. The river Brora, rising in the extreme north, comes 13 miles south-south-eastward down the interior, and then debouches to the east, and passes into Clyne; and the river Fleet, issuing from a lake considerably south-west of the centre of the parish, runs  $5\frac{1}{2}$  miles south-south-eastward into Dornoch. The vales of these streams—called from them Strathbrora and Strathfleet, and extending parallel to each other in direction—occupy, with their hill-screens, the greater part of the parochial area. Both straths vary in breadth from a few yards to  $\frac{3}{4}$  of a mile, and are occasionally abrupt, but, for the most part, gentle and sloping in their screens, contracting at long intervals into ravines and hold passes, but more generally expanding into prolonged haughs and hanging plains. Strathbrora is overlooked by heights of from 800 to nearly 1,000, and Strathfleet by heights of from 500 to 700 feet above sea-level; and in its upper part, the former is more frequently contracted, and becomes at times a mere rocky chasm. Very few contiguous aeres in the straths are not either patched with brushwood growing from old stocks of trees, or intersected by very rapid and destructive burns, coursing down the hills to the central streams. A band of country,  $8\frac{1}{2}$  miles long, and 3 broad, which lies between the straths, is an irregular and dreary grouping of low rocky hills, flat heathy moors, small lakes, morassy meadows, and cold bleak ruts of moorland burns. Some wretched vestiges of very considerable birch woods are to be seen in different parts; and a pitiful pendicle of the stunted coppice has been enclosed, and turned partly into plantation. Several lochlets are celebrated for the size and quality of their trouts; and two of them bear the name of the Lake of Blessing. The moors abound in blaek game, moorfowl, and the mountain hare; and they are occasionally scoured by the red mountain deer, and always trodden by a few roes. The chief rock is a large-grained and very micaceous gneiss, easily worked by the chisel, and well-adapted to the masonry of fences and cottages. Almost every sub-district exhibits traces of encampments, tumuli, and Pictish or Scandinavian buildings. The parish has a cross-road between the south-east ends of its two straths, and is traversed up Strathfleet by the road from Golspie to Tonguc. Population, in 1801, 2,022; in 1831, 1,805. Houses 386. Assessed property, in 1815, £2,040.—Rogart is in the presbytery of Dornoch, and synod of Sutherland and Caithness. Patron, the Duchess-Countess of Sutherland. Stipend £155 14s.; glebe £9 10s. In 1834, the parish-school was attended by 92 scholars, and three other schools by 228. Parochial schoolmaster's salary £36 7s. 1 $\frac{1}{4}$ d. with £18 fees, and £6 other emoluments.

**ROLLOX (St.)** See **GLASGOW.**

**ROMAN ROADS.**—The Romans have left many remarkable monuments of their power and greatness, of which the most prominent are their highways, which, commencing at the gates of Rome itself, traversed the whole extent of their mighty empire. These highways, by facilitating the communication

between the capital and the most distant provinces, were of the utmost importance, in many respects, to the maintenance of the Roman authority in places remote from the seat of government.—The whole of Britain was intersected by these roads; and one of them may be traced into the very interior of Vespasiana, where it afforded a passage to the Roman armies, kept up the communication between the stations, and thereby checked the Caledonian clans.

This road issued from the wall of Antoninus, and passed through **CAMELON**, [which see,] the Roman port on the Carron, and pushing straight forward, according to the Roman custom, across the Carron, it pursued its course by Torwood-house, Pleanmuir, Bannockburn, St. Ninian's, and by the west side of the Castlehill of Stirling, to the Forth, on the south side of which, near Kildean, there are traces of its remains. It here passed the Forth, and stretched forward to Alaua, which was situated on the river Allan, about a mile above its confluence with the Forth, and which, as it is 12 miles from the opening in the Roman wall, agrees with the distance in the Itinerary. From thence the road went along Strathallan, and at the end of 10 miles came to the Lindum of Richard's Itinerary, the well-known station at **ARDOCH**: which see. The road, after passing on the east side of Ardoch, ascends the moor of Orchil to the post at Kemp's-castle, which it passes within a few yards on the east. The road from Kemp's-hill descends the moor to the station of Hierna, at Strageth, from which it immediately crosses the river Earn. After the passage of the Earn, the road turns to the right, and passes on the north side of Innerpefferay, in an easterly direction, and proceeds nearly in a straight line across the moor of Gask, and, continuing its course through the plantations of Gask, it passes the Roman camp on the right. At the distance of 2 miles farther on, where the plantations of Gask terminate, this great road passes another small post on the left. From this position the road proceeded forward in a north-east direction to the station at Orrea, which is situated on the west bank of the Tay, at the present confluence of the Almond with that noble river. Having crossed the Tay, by means of the wooden-bridge, the Roman road proceeded up the east side of the river, and passed through the centre of the camp at Grassy-walls. From this position the remains of the road are distinctly visible for a mile up to Gellyhead, on the west of which it passed, and went on by Innerhuist, to Nether-Collin, where it again becomes apparent, and continues distinct to the eye for  $2\frac{1}{2}$  miles, passing on to Drichmuir and Byres. From thence, the road stretched forward in a north-east direction, passing between Blairhead and Gilwell to Woodhead; and thence pushing on by Newbigging and Gallowhill on the right, it descends Leyston-moor; and passing that village, it proceeds forward to the Roman camp at Cupar-Augus, about  $11\frac{1}{2}$  miles from Orrea. From Cupar the road took a north-east direction towards Reddie, in the parish of Airly. On the south of this hamlet the vestiges of the road again appear, and for more than half-a-mile the ancient road forms the modern way. The Roman road now points towards Kirriemuir, by which it appears to have passed in its course to the Roman camp at Battledikes. After traversing this camp, the road continued its course in an east-north-east direction for several miles along the valley on the south side of the river South Esk, which it probably passed near the site of Black-mill, below Esk-mount. From this passage it went across the moor of Brechin, where vestiges of it appear pointing to Keithock; and at this place there are the remains of a Roman camp which are now known by the name of Wardikes. Beyond this camp on the

north, the Roman road has been seldom or never seen. In the popular tradition, this road is called the Lang Causeway, and is supposed to have extended northward through Perthshire and Forfarshire, and even through Kincardineshire to Stonehaven. About 2 miles north-east from the Roman station at Fordun, and between it and the well-known camp at Urie, there are the traces, as it crosses a small hill, of an artificial road, popularly called the Piet's road.

As the Romans had other stations in the north besides those noticed, they did not always in returning to the south follow the course of the Iter just described. They had another Iter, the first station of which from the Burgh-head was the Varis of Richard, now Forres, a distance of 8 statute miles. From Forres the Iter proceeds to the Spey at Cromdale, a distance of 19 statute miles. Proceeding southward, along Strathaven by Loch-Bulg, to the junction of the Dee and Cluny, the Roman troops arrived at the commodious ford in that vicinity, a distance of 28 statute miles from the Spey. Richard does not mention the names of the two next stations, the first of which is supposed to have been at the height which separates the waters that flow in opposite directions to the Dee and the Tay, and which consequently divides Aberdeenshire from Perthshire; and the next, it is conjectured, was at the confluence of the Shee with the Lornly-water, the Iter taking its course along Glen-heg and Glen-shee. The whole extent of this route amounts to nearly 40 statute miles. A variety of circumstances indicate the middle station to have been at Inchtuthel, which still exhibits a remarkable camp of Roman construction, on a height that forms the northern bank of the Tay. From the last-mentioned station to Orrea the distance is 9 itinerary miles, and the real and corresponding distance from Inchtuthel along the banks of the Tay to ancient Bertha is about 10 miles. At this central station—which has always been a military position of great importance—the Iter joined the one already described, and proceeded southward by the former route to the wall of Antoninus.

It would appear that there are traces of Roman roads even farther north. Between the rivers Don and Urie, in Aberdeenshire, on the eastern side of Bennachie, there exists an ancient road known in the country by the name of the Maiden Causeway, a name by which some of the Roman roads in the north of England are distinguished. This proceeds from Bennachie, whereon there was a hill-fort, more than the distance of a mile into the woods of Pitodrie, when it disappears: it is paved with stones, and is about 14 feet wide. Still farther north, in the track of the Iter, as it crosses between the two stations of Varis and Tuessis, from Forres to the ford of Cromdale on the Spey, there has been long known a road of very ancient construction, leading along the course of the Iter for several miles through the hills, and pointing to Cromdale, where the Romans must have forded the Spey. Various traces of very ancient roads are still to be seen along the track of the Iter, between the distant station of Tuessis and Tamea, by Corgarf and through Braemar: the tradition of the people in Strathdee and Braemar, supports the idea that there are remains of Roman roads which traverse the country between the Don and the Dee. Certain it is, that there are obvious traces of ancient roads which cross the wild districts between Strathdon and Strathdee, though it is impossible to ascertain where or by whom such ancient roads were constructed, in such directions, throughout such a country.

RONA, a small inhabited island of the northern ocean, situated "far amid the melancholy main," and possessing the repute of being the most north-

westerly land in Europe. According to the common tables, it is situated in north latitude  $58^{\circ} 55'$ , and in longitude  $5^{\circ} 51'$  west of Greenwich; but, according to an observation taken by Dr. Macculloch from its surface, it lies about 13 miles farther north, or in latitude  $59^{\circ} 10'$ . Its distance north-west of the Butt of Lewis is thus about 16 leagues. The island has been the subject of various fanciful descriptions; and, to the inhabitants of continental Britain, it possesses associations but a degree less romantic than those of the island retreat of Robinson Crusoe. In its true features, it is known to few except mariners who navigate the North sea, and the islanders of the Barvas, part of Lewis, with which it is politically and parochially connected. Such of the western and northern islanders as are acquainted with it regard it as the Thule of their own hyperborean regions, and as placed "far from the sun and summer gale," and beyond the limits of the habitable world; and they to a man who has visited it, award a degree of distinction scarcely less than if he had explored the sources of the Nile or the Niger. Dr. Macculloch made it the object of one of his Hebridean voyages; and has given us, in his *Work on the Western Islands*, a very interesting description of it.

RONA, an island of the Skye Hebridean group. It lies about a mile north of Raasay; 6 miles west of Applecross in Ross-shire; and from  $5\frac{1}{2}$  to  $8\frac{1}{2}$  miles east of Kilmuir and Smizort in Skye. It measures about 5 miles in length, and less than one in breadth; and forms a ridge extending nearly due northward on a line with Raasay. Its greatest elevation does not seem to exceed 500 feet. Its surface is prevailingly tame and cheerless; and is separated by deep irregular valleys into a series of rocky hills. It is appropriated chiefly to the rearing of black cattle; and, in proportion to its area, is among the most barren of the western uplands. To an ordinary observer, its aspect is quite repulsive; presenting no picturesque features, and but little verdure to chequer its grey and sterile surface, and hiding most of even its patches of brown mountain-pasture amid a profusion of dull and naked rocks. Nearly all its arable ground lies round a scattered village which is situated at the head of a bay, and contains most of the population. Of four small harbours which occur on the west side, one, called Archasig-hirm, has a double entrance, and offers a convenient refuge for coasting vessels; but, except to the natives and the neighbouring islanders, it is very little known. The island belongs ecclesiastically to PORTREE; which see.

RONA, an island in the Outer Hebrides, ecclesiastically belonging to the parish of North Uist. It lies less than a mile south of the south-west point of the island of North Uist, and about  $2\frac{1}{2}$  miles east of Benbecula. Its length is about 2 miles, and its breadth about  $1\frac{1}{2}$ . It rises 600 feet above sea-level, presents a rocky aspect in its higher grounds, and exhibits a broken surface down its eastern declivity. It is much indented by the sea, and possesses a belt of low productive land around its coast. The island was at one time regarded as of little or no value; but it has been improved by culture, and is now considered one of the best grazing-grounds in the parish of North Uist.

RONA'S HILL. See NORTHMAVEN.

RONALDSHAY (NORTH), one of the Orkney islands, and the most northerly of the group. It lies  $2\frac{1}{2}$  miles north of Taftness in Sanday; and 15 miles east-north-east of the nearest part of Papa Westray. Its length from north to south is  $3\frac{1}{2}$  miles; its mean breadth is a little upwards of one mile; and its superficial extent is about 4 square miles. The sound which divides it from Sanday is very dangerous in navigation. The shores of the

island are flat and rocky; and they afford a large quantity of sea-weed for the manufacture of kelp. The surface of the interior is low and flat; and possesses a sandy soil, mixed in some places with clay, and generally very fertile. At its north end are found some coarse slates. Of several ancient tumuli, one was opened not many years ago, and disclosed a small building externally circular, but internally square, and containing a human skeleton in an upright posture. The island is the property of Mr. Traill of Woodwick; and is believed to retain Scandinavian usages, or at least a primitive condition of social manners, more than any other part of Orkney. A beacon-post, built by the Northern Lighthouse board, and consisting of a tall stone-tower, surmounted by a hollow ball of stone-work, 8 feet in diameter, rises from the point of the southern promontory. It stands in north latitude  $59^{\circ} 40'$ , and in longitude  $2^{\circ} 15'$  west of London; and is distant 8 miles north-north-east, one-half east, by compass, from the revolving light on the start-point of Sanday. The population of the island, at the date of the Old Statistical Account, was 420, giving a much higher average for the surface than the aggregate of Britain, or 105 to a square mile. Population, in 1811, 384; in 1821, 420,—213 of whom were males; in 1831, 522. The island, in *quoad civilia* ecclesiastical distribution, belongs to the united parish of Cross and Burness; but, in 1831, it was disjoined, *quoad sacra*, and erected into a parliamentary parish. Patron, the Crown. Stipend £120. A school, supported by the Society for propagating Christian knowledge, was attended, in 1834, by 52 scholars.

RONALDSHAY (SOUTH), one of the Orkney islands, and, excepting Pentland Skerries, the most southerly of the group. It lies 6 miles north by east of Duncansby-head, and occupies the south-east corner of the Orcadian archipelago. It is washed on the north by the Ferry of Water-sound, about a mile broad, which divides it from Burray; on the east by the uninterrupted surges of the German main, on the south by the eastern entrance of the Pentland frith, which divides it from Caithness; and on the west by the northern expansion of that frith, or the entrance of Scalpa Flow, which divides it from Walls and Flota. Its length from north to south is 8 miles; its breadth, except at one point near the north end, where it suddenly but briefly expands to  $5\frac{1}{2}$  miles, is prevailingly about  $2\frac{1}{2}$  miles; and its superficial extent is estimated at 13 square miles. Its surface is, on the whole, low and level; and aggregately presents a much richer and more generally cultivated appearance than perhaps any equal extent of Orcadian ground. Three head-lands present a bold, rocky front to the ocean, Barsick-head on the west, and Ilalero and Stores-heads on the east, each about 250 feet perpendicular above sea-level. Widewall-bay, on the west coast, has a good opening to the Pentland frith and to Stromness, and offers safe anchoring-ground to either small vessels or ships of 500 or 600 tons burden. St. Margaret's Hope, on the north coast, is one of the safest and best harbours for small vessels in the kingdom. The excellence of these harbours, combined with a great plenteousness of cod and other fish, in the furious currents which sweep along the shores of the island, has long given the inhabitants a pre-eminence of prosperity over the other Orcadians. A fishery at St. Margaret's Hope, which drew regular visits from London lobster smacks, and engaged the capital of different English companies, was, for many years, the only regular fishery in Orkney. South Ronaldshay is still the great station for the herring-fishing in the southern Orcadian islands; and the scene also of an extensive fishery for supplying London, by means of

welled smacks of each about 70 tons burden, with live lobsters and cod.—A standing stone occurs at Sandwich, another near Stores, and another near the manse,—the last about 14 feet high, 2 feet broad, and 8 inches thick, but all unstoried by either document or tradition. Some remains of Piets' houses and of watch-towers occur in various places. A fortalice, situated on the peninsula of Hoxa, and called Hoxa How, is very ancient, and seems to have possessed considerable consequence. In south Ronaldshay, Olave of Norway offered the pagan Earl of Orkney and his followers the alternative of nominal Christianity or death, and thus pinned his creed upon the Orcadians with the point of his sword. The island, as long as popery continued, maintained the pre-eminence which it won by being the scene of such an exploit; and was the grand Orcadian roosting-place of all the raven fraternity of the missal and the cowl. Small as its area is, it still shows the ruins of no fewer than seven Romish chapels; and it claimed for its principal minister, or secular priest, the offices of dean of Orkney, and provost of the cathedral. At the head of St. Margaret's Hope is a village of the same name, the site of Allan's inn, the best establishment of its class at any of the southern Orcadian ferries. From this place a road leads southward, over the whole length of the island to Burwick, and is regularly traversed by the mail between Kirkwall and Caithness. The ferry from Burray to St. Margaret's Hope costs only twopence with the mail; and that from Burwick to Houna in Caithness, a distance of 12 miles, costs only one shilling. Though the Pentland frith is reckoned peculiarly dangerous at the part which is abreast of the island, only one post-boat on the ferry at the place has been lost during the last 100 years, and that one was run down. Population, in 1821, 1,949; in 1831, 2,265.

RONALDSHAY (SOUTH), and BARRAY, a parish in the south-east of Orkney. It consists of the two islands whence it has its name, of the inhabited islands of Swona, Hunda, and Pentland Skerries, and of the uninhabited island of Glimsholm. So scattered and irregular are its constituent parts, that its extent is not accurately known; but it lies within limits of about 16 or 17 miles in length, and 9 in breadth. Three parishes are comprehended in the present parish, and are all believed to be original. South Ronaldshay, or St. Mary's parish, includes Swona, the Pentland Skerries, and the south end of South Ronaldshay; the North, or St. Peter's parish, includes the north end of South Ronaldshay; and Barray parish includes Barray, Hunda, and Glimsholm. Population, in 1801, 1,881; in 1831, 2,711,—of whom 2,265 were in South Ronaldshay, 357 in Barray, 89 in Swona and the Pentland Skerries, and 2 families in Hunda. Houses 423. Assessed property, in 1815, £225.—The united parish is in the presbytery of Kirkwall, and synod of Orkney. Patron, the Earl of Zetland. Stipend £202 1s. 3d., besides £7 8s. 10d. vicarage teinds; glebe £12 6s. 8d. There are two parish-churches, the one in St. Mary's, and the other in St. Peter's; the latter built in the 13th century; and both repaired in 1802. Sittings in St. Mary's 413; in St. Peter's 273. A church, which formerly existed in Barray, has been in ruins for about 40 years. An United Secession place of worship was built in the parish, in 1826, at a cost of £451. Sittings 342. Stipend £85, with £5 for communion expenses, fuel worth £3, and a house which cost £467 18s. In 1834, there were in the parish 1 parochial school, attended by 124 scholars, and 8 other schools attended by 232. Parochial schoolmaster's salary £26, with £15 fees, and £2 10s. other emoluments. One of the non-parochial schools is a well-endowed establishment on the

island of South Ronaldshay, erected and maintained from a munificent donation by Governor Thomson of the Hudson's Bay company.

ROOME. See CRAIL.

ROSE-FENWICK. See FENWICK.

ROSEHALL, a mission district in the counties of Sutherland, Ross, and Cromarty. It is composed of parts of the parishes of Criech and Kincardine; and was assigned its limits jointly by the presbytery of Dornoch and by the presbytery of Tain,—the former in the synod of Sutherland and Caithness, and the latter in the synod of Ross. The Kincardine portion measures 23 miles by 3 or 4; and is separated from the rest of the district by the Dornoch frith and the river Oickel. The greatest length of the whole district is 25 miles; its greatest breadth is 15 miles; and its superficial extent is 250 square miles. The missionary station was established at least 55 or 65 years ago; and is under the superintendence of a missionary on the royal bounty. The church was built, in 1808, by the late Lord Ashburton, at a cost of £500; and it was repaired about 7 years ago, and is the property of the present owner of the Rosehall estate. Sittings 260. Stipend £60. In 1835, the population of the Criech section was about 640; and of the Kincardine portion about 434. Rosehall-bouse is situated amidst beautiful grounds, extensive woods, and a fine landscape, near the confluence of Castle-water with the river Oickel. See OICKEL.

ROSEHEARTY, a fishing-village and hurgh-of-larony, in the parish of Pitsligo, Aberdeenshire. It stands on the coast of the Moray frith, 4 miles west of Fraserburgh, 16 east by north of Banff, and 19 north-north-west of Peterhead. The herring-fishery, beginning about the middle of July, and ending about the last of August, employs at least 40 boats, each worked by 5 persons; and competes in prosperity with the best of the flourishing fisheries in the frith. The harbour of the village, in consequence of its being situated on an exposed part of the coast, and having so considerable a depth of water as 9 feet in neap and 14 in spring tides, may eventually become important; and, since 1810, when a discovery was made that the shore-dues belong, not to the superior, but to the feuars, it has been the principal occasion of the prosperity of the village. The revenue from the shore-dues, previous to 1810, never exceeded £3; but it afterwards gradually increased, and amounted, in 1819, to £52, and, in 1833, to £96. Some important improvements, either recent or contemplated, will add much to the harbour's value. The exports are fish and grain; and the chief imports are coals, salt, and timber. A weekly market is held on Saturday. The village has a United Secession meeting-house. Roseheartly was erected into a burgh-of-barony in 1681; and possesses by charter the right of creating burgesses, of annually electing bailies, a dean-of-guild, a treasurer, and all other magistrates and officers necessary for its government, and even of deposing these magistrates "for reasonable causes, as shall seem expedient." Yet it is *de facto* no burgh; has no police, no magistracy, not one public officer; and succumbs, in its pecuniary affairs, to the voluntary management of a few individuals who have the concurrence of the feuars. Even a tolbooth belonging to it has—nobody can tell how or when—become private property! Some mosses, 30 acres of links, 2 acres of ground at the harbour, and the harbour itself, constitute the burgh-property; but are burdened with a debt of £200. Population, in 1833, between 700 and 800. Houses of upwards of £10 yearly value, 23.

ROSEMARKIE, a parish on the east coast of Ross-shire; bounded on the north-east and north

by Kirkmichael and Cromarty; on the east and south-east by the Moray frith; and on the south and west by Avoch. Its length, from north-east to south-west, is about 6 miles; its breadth is 3 miles; and its superficial extent is about 15 square miles. The inner boundary is skirted from end to end by the long flat hill called the MULLNUY: which see. The surface from the coast up to this acclivity is, in general, a slow and gradual ascent; and, being for the most part cultivated or covered with wood and verdure, has a very fine and pleasant appearance. The coast, all along the north-eastern section, is bold, rocky, and romantic; and abounds in frightful precipices, where

"Low-brow'd rocks hang nodding o'er the deep,"

and in ragged cliffs, overgrown with ivy, and haunted by the wild pigeon and the hawk. Some natural caves, both curious and deep, perforate the bold shore; and one of them runs quite through the rock for about 150 feet. Otters have been shot upon the rocks; seals are often seen upon them, and crabs and lobsters are dragged from crevices and holes by the most primitive contrivances. A narrow promontory called Fortrose-point or Chanorony-ness runs  $1\frac{1}{2}$  mile into the frith; and forms the Ross-shire side of a ferry which usually takes the name of Ardersier from its Inverness-shire side. Immediately north of this promontory lies the fine bay of Rosemarkie, fringed with a beach of fine smooth sand, and alluring sea-bathers to visit its shores, and vessels to seek anchorage and shelter from westerly winds in its centre. In the neighbourhood of Rosemarkie is a large and beautiful flat, covered with a fine black mould upon light gravel, and in a high state of cultivation; and in the immediate vicinity of Fortrose is a belt of 'links,' about a mile in length, smooth as a carpet, and choice ground for the game of golf. The royal hurgh of Fortrose is in the parish: See FORTROSE.—The town of Rosemarkie, though not large, is of considerable antiquity. In the reign of Alexander II., it was erected into a royal hurgh; and, in 1444, it and Chanorony were constituted a joint or united burgh under the common name of Fortross or Fortrose. Rosemarkie stands half-a-mile north-east of Fortrose or Chanorony; and, in 1793, had 296 inhabitants,—in 1821, 314. Such of the colonnades and arches of the ancient cathedral of Rosemarkie as are yet standing display great taste in design and skill in execution. The roofless little area which they enclose contains the ashes of some of the ancient Earls and Bishops of Ross, and is still the burying-ground of several of the chief branches of the clan Mackenzie. The church and the manse of Rosemarkie, at a little distance to the east, are two beautiful objects, in very beautiful situations. The whole town, and all the face of the parish, as they look down, in the warmth and elegance of their own dress, upon the frith at their feet, and the low grounds and Higblands of Inverness-shire and Nairnshire in the back-ground, have a sunny and cheerful and almost a romantic aspect. Above Rosemarkie is a circular artificial hill, level on the top, called the Court-hill; anciently the seat of the feudal courts of justice; but now hurlesqued in its antiquarian associations by the erection upon it of some small cottages. At the west end of the town stands an ancient shaft of stone, surmounted by the rude resemblance of a ducal crown, and serving as the burgh cross; and on Chanorony-ness stands another, but of inferior appearance, which tradition assigns as the site of the last incremation in Scotland for the alleged crime of sorcery. The parish has a fair provision of good roads; and though not touched by any mail or stage coach, enjoys, from

the point of Chanonry-ness, all the advantages of the steam-navigation between Inverness on the one side, and London, Leith, and intermediate ports on the other. Population, in 1801, 1,289; in 1831, 1,799. Houses 331. Assessed property, in 1815, £2,430.—Rosemarkie is in the presbytery of Chanonry, and synod of Ross. Patron, the Crown. Stipend £249 9s. 6d.; glebe £9. Unappropriated teinds £77 13s. 11d. From a mortification of £100 in 1811, a fund has arisen out of which a salary of £70 per annum is paid to a preacher and catechist in Fortrose. Measures were adopted in 1840 for erecting Fortrose into a *quoad sacra* parish. An Episcopalian chapel, erected a few years ago, in the Gothic style, and situated on a rising ground overlooking the sea, vies, in beauty of workmanship, and in simplicity and elegance of design, with the fine remains of the old cathedral. In 1834, there were 5 schools, conducted by 6 teachers, and attended by 212 scholars. One of the schools is the Fortrose academy—the oldest seminary of its class in the north of Scotland—remotely founded, in 1699, by Thomas Forhes, hallic of Fortrose, and affording tuition in all the branches usually taught in town academies; another is the grammar or burgh school; and a third is a school for females, maintained chiefly by subscription. The salary for a parochial school was attached first to the grammar-school, and next to the academy, and then was withdrawn from both. At the date of the Education Commission inquiry, therefore, a parochial school did not exist; but measures were in progress for establishing one with the least possible delay.

ROSENEATH, a peninsulated parish in the extreme west of Dumbartonshire; bounded on the north by Row; on the east by Gairloch, which divides it from Row; on the south-east and south by the frith of Clyde, which divides it from Cardross and Renfrewshire; and on the west by Loch-Long, which divides it from Argyleshire. It is a curved oblong, hending from a southerly to a south-south-easterly direction, and measuring 8 miles in length, and from  $1\frac{1}{4}$  to  $2\frac{1}{2}$  in breadth. Its superficial extent is 6,140 acres. Its connexion with the main land is by an isthmus of only  $1\frac{1}{2}$  mile. The surface, in a beautiful small point which runs south-eastward into the Clyde, and in some adjacent grounds along Gairloch, is very slightly, and with a gentle rise, elevated above sea-level; and elsewhere—or over nine-tenths of the whole area—it is a table-land, whose sides slope easily and in pleasant and varied curvatures down to the encincturing sea, and whose expansive summit of between 300 and 400 feet above sea-level, forms a rolling and striated upland plain, swollen and knobbed with rising grounds and little hills. The highest ground is Tamnabara hill, 800 feet in altitude, and within  $1\frac{1}{2}$  mile of the northern boundary. The summit of the table-land and the surface of its swells, is nearly all heath and morass, unhealthy in its climate, and uninhabited by man. But the slopes, and mimic ravines, and undulating descents which come down to the low grounds and the environing waters, are nearly all verdant, or arable, or planted; and on the side whence the point projects—or that which looks east-south-eastward up the Clyde—they, in common with the low ground of the point itself, are, to a large extent, sheeted over with plantation, and exhibit, in the curvatures of their surface, and the many-tinted green, or mellowing of their woods, and the interspersion of field, and glade, and lawn, with their prevailing forest, a richness of fringe which flutters beautifully aside from the skirts of the joyous frith.—At the edge of one of the expanses of wood, and at the head of the point, on ground which lingers at an elevation about one-fifth of that of the

table-land, stands Roseneath-castle, a seat of the Duke of Argyle, and a conspicuous and arresting feature in the landscape. The edifice was built in 1803, from a design by J. Bononi of London; and is one of the most chaste and splendid specimens of modern architecture which Scotland has yet produced. Its style combines the castellated Gothic and the Greek; and, though hastily blamed by some critics, is not more incongruous than the approved combination of the Greek and the Ecclesiastical Gothic, and is executed with such harmony in its parts, and such unity and justness in its lines and masses, as to produce on a near view, as well as at a distance, an unmingledly pleasing and very graceful effect. One principal front looks to the north, and is adorned with a magnificent portico, which resembles in its style the Roman Ionic, and projects so far as to admit the transit of a carriage-way. Another principal front looks to the south, but is less marked in feature. A circular tower rises from the centre of the edifice, and is crowned by a halustrade. But though the summit of the tower commands much of the gorgeous scenery of the district, the site of the castle and the whole home demesne forfeit all the luxuries of a rich mountain and marine landscape, and shut up the eye among such mere ranges of prettiness as resemble those of an ordinary English park.—Easter-house, the predecessor of the castle, and the seat of the ancestors of the present ducal family, is much more advantageously situated, about  $1\frac{1}{2}$  mile to the north-west near the margin of Gairloch. Its position has a grandly panoramic background; and its access has an avenue of yews, flanked by parallel lines of lofty limes, whence a powerful appeal is made to the taste and admiration of a stranger. The skirts of the slopes along Gairloch are so studded with villas and cottages, and gently embellished with wood and enclosure, as to have a warm and agreeable appearance. But the table-land, the moorish and repulsive elevated expanse of swells—which itself is happily unseen from any of the usual points of observation on the Clyde—commands a complete circle of some of the most gorgeous scenery in Scotland. On the north-east, a regular ascent of from 1,000 to 1,800 feet from nearly the edge of the opposite side of Gairloch, begins with a region of woods and villas as luscious as if all were orchard and garden, and recedes in a region of enclosed fields and expanses of firs, and climbs to the summit in a moorish stripe between heath and grass, and is overlooked in the near distance by a several-peaked mountain-range cutting against the horizon a sharp and exquisitely curved sky-line; on the east, beyond the waters, extends the long smiling little town of Helensburgh, and behind it a slowly-receding, depressed, hill-range of agricultural beauty, overlooked at 12 miles' distance by the rugged mountain-screen of the further side o. Lochlomond; on the south-east comes down the new-born and exulting frith of Clyde, from a mere point between the soft sylvan grounds of Erskine, and the picturesquely featured hills of Kilpatrick, in the clearly-seen distance, to a breadth and power which enable it to fling its sea-arms in an embrace round the parish; and projecting into it is the low warmly-wooded point of Ardmore, while, from its shores rise the gladly beautiful and charmingly variegated hills of Renfrewshire and Cardross, the former broadly spotted at their base with the towns of Greenock and Port-Glasgow; on the south, the frith, with the pleasant hay and village of Gourrock on its foreground, dchouches between ridgy heights which press down upon it in a struggle between wildness and embellishment; and, in the west and the north-west, and the north gigantic mountain-

masses and towering peaks, singularly rugged in contour and harshly athletic in feature, appear huddled together in a mob a rude assemblage of wild Highland strength, and—to adopt the hurried phrase of some man of taste who, not long ago, looked on them with wonder—exhibit the noblest “specimens of the statuary of nature.” If the area of the parish be distributed into 100 parts, 49 will be found uncultivated moorland, 32 arable grounds or artificial pasture, and 19 lands covered with natural or with planted wood.—Conglomerate, or coarse red sandstone, occurs to a small extent on the south-east, and appears to be the further edge of the great sandstone formation of Renfrewshire, Ayrshire, and the Clyde islands. Clay slate is the prevailing rock. The soil had long a factitious fame for fatality to rats; and though it is now overrun by the vermin quite as rudely as less sacred soil, even the writer of the Old Statistical Account had to say: “Here rats cannot exist. Many of these have, at different times, been accidentally imported from vessels lying upon the shore; but were never known to live twelve months in the place. From a prevailing opinion, that the soil of this parish is hostile to that animal, some years ago, a West India planter actually carried out to Jamaica several casks of Roseneath earth, with a view to kill the rats that were destroying his sugar-canes. It is said this had not the desired effect; so we lost a very valuable export. Had the experiment succeeded, this would have been a new and profitable trade for the proprietors; but perhaps, by this time, the parish of Roseneath might have been no more.” The coast is partly sandy, partly rocky; and overlooks waters which swarm with fish. Of two small bays, Calvattie and Campsaile, the latter, situated in Gairloch, is beautiful in its shores, and affords in its hosom probably the best-sheltered anchorage in the western seas and friths of Scotland. At an early period, it was frequently a station of the Scottish royal navies; during the last war, it for some time was the sea-ground of a line-of-battle ship; at present it is the adopted retreat of the cutters of the royal yacht club; and, at any period, it might, jointly with the adjacent parts of Gairloch, give safe shelter and anchorage to all the navy of Britain. A lochlet near Tamahara abounds in perch. The numerous rills of the parish are, in summer, occasionally swollen into foaming torrents and cataracts, and in winter, congealed into fantastic and many-tinted colonnades and shelvings of icicles. Blind Harry and tradition associate the name of the patriot Wallace with Roseneath, but in tales too legendary to admit of discrimination between fiction and fact. A precipitous rock north of the castle bears the name of Wallace’ leap. Many of the persecuted Covenanters, in the days of the tyrant Stuarts, found shelter in the parish under the protection of the friendly Argyle. Respecting even the noted Balfour of Burley, the amiable parochial minister who writes the New Statistical Account, thinks that “there are strong presumptions that he found an asylum in the same peninsula, and that, having assumed the name of Salter, his descendants continued here for several generations.” The village of Roseneath is finely situated opposite the point and ferry of Row,  $3\frac{1}{2}$  miles from Helensburgh; but contains not quite 100 inhabitants. Though the parish has no turnpike, it possesses good roads round all its coast, and in three lines across its interior. Steam-boats communicating either directly with Glasgow, or with the western terminus of the Glasgow and Greenock railway, call off the village—which has a small quay—several times a-day. A row-boat maintains constant ferry-communication with Row-point in Row; and one can at any time be had from the south-west of

the peninsula to Gourrock. Population, in 1801, 632; in 1831, 825. Houses 159. Assessed property, in 1815, £1,851.—Roseneath is in the presbytery of Dumharton, and synod of Glasgow and Ayr. Patron, the Duke of Argyle. Stipend £190 16s. 5d.; glebe £10. Schoolmaster’s salary £34 4s. 4½d., with £35 fees, and £4 4s. other emoluments. There is a non-parochial school. The ancient parish comprehended, in addition to the peninsula, all the territory which now constitutes Row,—the latter having been disjoined and separately erected in 1635. Its appearance from the Clyde was formerly naked, and may have occasioned its being called in the British language, *Rhos-noeth*, ‘the hare peninsula.’ In the 12th century, the church was a free parsonage, under the patronage of the Earl of Lennox; but, in 1225, it was given, with its pertinents, in perpetual alms to the monks of Paisley; and it continued to be maintained by them as a curacy till the Reformation. The peninsula, and the adjacent but disjoined district of the ancient parish, together with a portion of land beyond, formed the country of Nevyd, which was granted at a very early date to the noble family of Lennox, and continued in their possession till the latter part of the 15th century. Part of Nevyd, including most of the peninsula, was, in 1489, bestowed as a royal gift upon Colin, the 1st Earl of Argyle, and introduced his powerful family by territorial connexion to an influence upon the western Lowlands.—Matthew Stewart, the mathematician, and the father of the celebrated Dugald Stewart, was for some time minister of Roseneath; Dr. Anderson, the founder of the Andersonian university of Glasgow, was the son of a minister, and born in the manse.

ROSLIN, a *quoad sacra* parish and a village, a little south of the centre of Edinburghshire. The parish was disjoined, in 1835, from Lasswade by the presbytery of Dalkeith. Its greatest length is  $5\frac{1}{2}$  miles; its greatest breadth is  $3\frac{1}{2}$  miles; and its superficial extent is about 10 square miles. The parishioners are for the most part agricultural labourers, handiworkmen, and operatives at coal-works, paper-mills, a gunpowder manufactory, and a bleachfield; and are, to a considerable amount, congregated into villages. Population, according to ecclesiastical survey, in 1835, 1,611; of whom 964 were churchmen, 534 were dissenters, and 113 were nondescripts. The parish-church was built as a chapel-of-ease, in 1827, at a cost of £978 15s. 5½d. Sittings 444. Stipend £150.—A United Secession chapel at Bridge-end, in the vicinity of Penicuik, but within the parish of Roslin, was built in 1782. Sittings 481. Stipend not known; but there are a manse and a small glebe.—The parish has four Sabbath-schools.

ROSLIN, or ROSSLYN, a village  $2\frac{1}{2}$  miles south-west of Lasswade;  $3\frac{1}{2}$  north-east of Penicuik; and 7 south of Edinburgh. It stands on a bank about  $1\frac{1}{4}$  furlong west of the North Esk, and about a mile east of the turnpike from Edinburgh to Peebles and Dumfries. Roslin-castle is replete with historical reminiscence, and possesses some interesting features in its site, and vestiges; Roslin-chapel is one of the most elegantly designed, the most elaborately and exquisitely adorned, and the least damaged, the most proximately entire specimens of Gothic ecclesiastical architecture in Scotland; the vale of Roslin constitutes one of the richest links in the concatenation of scenic beauty and romance which lies along the North Esk, and which was briefly noticed in our article on LASSWADE;—and these three attractions, singly great and aggregately conquering, draw, during all the sunny parts of the year, numerous visitors from the brilliant and tasteful metropolis. About the year 1440, the village or town was next in im-

portance in the east to Edinburgh and Haddington; and enjoying the fostering protection of William St. Clair, who lived in its castle in the style of a prince, and threw over it an importance second only to that of the seat of a royal court, it became very populous by the great concourse to it of all ranks and degrees of visitors. In 1456 it received, from James II., a charter erecting it into a burgh-of-harony, with the rights of a market-cross, a weekly market on Saturday, and an annual fair on the feast of St. Simon and St. Jude; and respectively in 1622 and 1630, it obtained confirmations of its charter from James VI. and Charles I. In modern times it has subsided into the retreat of rural and unpretending quietness,—the home of cultivators of the soil, and of workmen in establishments for bleaching linen and manufacturing gunpowder. An inn at the village—in rather close and inappropriate juxtaposition with the chapel—receives visitors, and furnishes them with a cicerone to point out the admired or the storied features of castle, chapel, and landscape.—The battle of Roslin, in 1303, which gave to Scottish arms ‘Three triumphs in a day,’ has been noticed in our article on the parish: see *LASSWADE*.

Roslin-castle stands on an almost insulated rock, overhanging the picturesque glen of the Esk. A path winds down to it from the village, and speedily conducts the visitor among deep thickets and precipitous rocks, tangling or walling up the margin of the river. The original and only access to the castle was along a one-arched bridge, across a deep gully—now nearly filled up—which quite insulated the rocky site. The entrance was defended by a gate of great strength. The site, though in the highest degree pleasant and romantic, is very ill chosen for a fortalice; and while it finely overlooks the playful meanderings of the sylvan stream below, is itself commanded by heights which press closely on its precincts, and look almost right down upon the tops of its chimneys. The structure must, in early times, have been large and massive; but it has lost nearly all its antique appearance and more ancient parts; and it now consists principally of a tremendous triple tier of vaults, some huge fragments of walls and battlements, and a comparatively modern mansion reared on the under-vaulted stories of extinct parts of the ancient edifice. A descent of a great number of stone-stairs conducts through part of the existing structure to the bottom, and leads into a large kitchen, whence a door opens into a once famous garden. The comparatively modern part seems to have been erected in 1563; and in its lower apartments it is ill-lighted and confined, and possesses far more of the coldness and inconvenience and dungeon-properties of a prison than the cheering and comfortable characteristics of a modern residence. Such fragments of the more ancient castle as remain stand opposite this erection on the right hand of the entrance to the rock, and consist of some arches, hut-tresses, and pieces of walls. A view of the whole, as they appeared in 1788, is given by Grose;—haggard, and utterly dilapidated,—the mere wreck of a great pile riding on a little sea of forest, and not far from contact with commanding rocks,—a rueful apology for the once grand fabric, whose name of ‘Roslin-castle’ is so intimately associated with melody and song.—When or by whom the original castle was built is not known. About the year 1100, William de St. Clair, son of Waldernus, comte de St. Clair, who came from Normandy to England with William the Conqueror, obtained from Malcolm Canmore a great part of the lands of the barony of Roslin; and as the building of castles by barons or land-owners was the fashion of the age, he probably erected some fortalice on his possessions, and pos-

sibly was the constructor of the oldest fragments of the surviving ruins. He was called, in allusion to his fair department, the seemly St. Clair. His descendants—indifferently named St. Clair and Sinclair—received from the liberality of successive monarchs such accessions to the original demesne as made them masters of all the baronies of Roslin, Cousland, Pentland, Cardaine, and other lands. The early barons lived at their castle in the splendour and sumptuousness of a rude age, and acquired personal importance and increase of their possessions by methods which would be little dreamed of in modern times.\* The St.\*Clairs stood at the head of the baronage of Mid-Lothian; and about the middle of the 13th century, they acquired, in addition to their vast territories and honours in Lothian, the inheritance of the wealth and power of the earldom of Orkney. The 8th chief of the family, a Sir William St. Clair, having married Isabel, one of the daughters and co-heiresses of Malise, Earl of Strathearn, Caithness, and Orkney, Henry, his son, succeeded to the earldom of Orkney, and, in 1379, obtained a recognition of his title from Haco VI., king of Norway. In 1470, however, William St. Clair, the 3d Earl of Orkney of his family, resigned his earldom to the Scottish Crown; received, in compensation, the castle of Ravenscraig in Fife, and the lands of Wilstown, Dubbo, and Carberry; and soon after was created Earl of Caithness and Baron Berriedale. Three sons of this nobleman conveyed the concentrated honours

\* A story is told of a hunting-match between King Robert Bruce and Sir William St. Clair, which throws some interesting light upon both the practices of the age, and the proprietorial history of the family. The king had been repeatedly balked by a fleet white deer which he had started in his hunts among the Pentlands; and having asked an assembled body of his nobles whether any dogs in their possession could seize the game which had escaped the royal hounds, Sir William St. Clair promptly offered to pledge his head that two favourite dogs of his, called ‘Help and Hold,’ would kill the deer before she crossed the March-burn. The king instantly accepted the knight’s bold and reckless offer, and pledged himself to give the forest of Pentland-moor in guerdon of success. A few slow hounds having been let loose to beat up the deer, and the king having taken post on the best vantage-ground he could command a view of the chase, Sir William stationed himself in the finest position for dipping his dogs, and—in the true style of a Romanist, who asks a blessing upon a sin, and supposes the giver of a blessing to be a creature—earnestly prayed to St. Katherine to give the life of the deer to his dogs. Away now came the raised deer, and away in full chase went Sir William on a fleet-footed steed; and hind and hunter arrived neck and neck at the critical ‘March-burn,’ Sir William threw himself in a desperate fling from his horse into the stream; ‘Hold,’ just at the crisis of fate, stopped the deer in the hook; and ‘Help’ the next instant came up, drove back the chase, and killed her on the winning side of the stream. The king, who had witnessed the nicely-posed result, came speedily down from his vantage-ground, embraced Sir William, and granted him in free forestry the lands of Logan-house, Kirkton, and Carneraig. Sir William, in gratitude for the fancied interference of St. Katherine in his favour, built the chapel of St. Katherine in the Hopes: see *PENICUICK*. The tomb of the wildly adventurous knight, who was so ruined in his nature as to reckon his life not too high a pledge for the fleetness and treachery of a pair of dogs, is still to be seen in the chapel; and it very appropriately represents the sculpture of his armed person to be attended by a greyhound, as a joint claimant of the honour and the fame of his exploits.—A descendant of this knight, another Sir William St. Clair, became not a little distinguished by the baronial magnificence of his festivities, and the rude princeliness of his mode of life. Father Hay, a member of the St. Clair family, speaks of him as a ‘prince,’ who maintained his state ‘at his palace of the castle of Roslin;’ and he says, “He kept a great court, and was royally served at his own table in vessels of gold and silver; Lord Dribton being his master-household, Lord Borthwick his cup-bearer, and Lord Fleming his carver; in whose absence they had deputies to attend,—viz., Stewart, laird of Drumlanrig; Tweede, laird of Drumferline; and Sandilands, laird of Calder. He had his halls and other apartments richly adorned with embroidered hangings. He flourished in the reigns of James I. and II. His princess, Elizabeth Douglas, was served by 75 gentlewomen, whereof 53 were daughters of noblemen, all clothed in velvet and silks, with their chains of gold and other ornaments, and was attended by 200 riding gentlemen in all journeys; and if it happened to be dark when she went to Edinburgh, where her judgments were at the foot of Back-Fryar’s-wyid, 80 lighted torches were carried before her.”

ROSSINI CHAPEL

of the house into three divergent channels, and poured them along in separate streams of family dignity and descent. William, the eldest, whose mother was the Lady Margaret Douglas, eldest daughter of Archibald, 4th Earl of Douglas, inherited the title of Baron Sinclair, which was created in 1489, and was the ancestor of the St. Clairs, Lords Sinclair, whose seats are Herdmanstone in Haddingtonshire, and Nesbitt-house in Berwickshire. The second son, also called William, whose mother was Marjory, daughter of Alexander Sutherland of Dunbeath, continued the line of the Earls of Caithness. The third son, Oliver, the full brother of the second, founded the modern respectable family, and connected it with the ancient one of St. Clair of Roslin. William St. Clair, the last heir in the direct male-line, died in 1778. A collateral branch, the family of St. Clair Erskine, were, in 1795, created Barons Loughborough of Loughborough, and were, in 1801, raised to the dignity of Earls of Rosslyn, in the peerage of the United Kingdom. James Alexander, the 2d Earl, succeeded to the title in 1837, and has his Scottish seat at Dysart-house in Fifeshire. The St. Clairs of Roslin, from the time of James II., till they resigned the office in last century, were grand-masters of masonry in Scotland. See KILWINNING.—In 1455, Sir James Hamilton was confined in Roslin-castle, under the ward of the Earl of Orkney, by order of James II.; but, after some time, he was released, and taken into favour. In 1554, the castle, with that of Craigmillar and the town of Leith, was burnt by the English army sent by Henry VIII. to castigate Scotland for refusing a matrimonial alliance between Prince Edward of England and the Scottish Queen. In 1650 it was besieged and taken by General Monk; and, in 1681, it was plundered by a furious mob, chiefly tenants of the barony.

Roslin chapel is situated in an enclosed ground on the brow of an eminence between the castle and the village; and occupies physical vantage-ground which would have been as suitable for the site of a fortalice, as the site of the actual castle is unsuitable. The rising ground which it crowns is named the college-hill, and is beautifully decorated, in its environs, with wood and water,—the river Esk running in a deep rocky bed on its west and south fronts; and it is said to have been originally called *Roskelyn*, a Gaelic or Erse word which signifies ‘a hill in a glen,’ exactly describes its position, and is easily recognisable in the modern Rosslyn or Roslin. The chapel was founded in 1446, by William St. Clair, the 7th of his name, Lord of Roslin, and Earl of Orkney; and though called a chapel, was really, even from the outset, a collegiate church. It was dedicated to St. Matthew the apostle, and founded for a provost, six prebendaries, and two choristers, or singing boys. Sir William, the founder, was the 3d Earl of Orkney of his name; he had the foreign title of Duke of Oldenburg; he was admiral of the fleet in 1436, and, in that capacity, conveyed the princess Margaret to France; and he was chancellor of Scotland from 1454 to 1458. Tradition says, that he procured the architectural design of the church from artists at Rome, that he built houses for the workmen to be employed in constructing it, that he gave to each mason ten pounds a-year, to each master-mason twenty pounds, to both an extent of land, proportionate to the reward of the ability which they displayed, and to other artificers a commensurate extent of compensation and encouragement, and that, in consequence, he attracted all the best architects and sculptors from various parts of Scotland, and of neighbouring kingdoms. He endowed it with various lands and revenues, and saw it rising in profuse magnificence

of architecture; yet, after vast efforts and great expense, he left it unfinished. A crypt at the east end, which shall be noticed in the description of the pile, was founded by the Earl's first lady, the daughter of the Earl of Douglas. Such parts of the whole fabric as were in an advanced state toward completion, Sir Oliver St. Clair of Roslin, the third son of the Earl of Orkney, carried on and completed. But the originally designed edifice was, in many of its parts, never commenced; and what was finished, and now in nearly an entire state, remains to refresh the eye of taste, is a comparatively small building, and consists only of the nave. Various barons of Roslin made additions to the church's endowments. In 1523, Sir William St. Clair granted some lands in the vicinity for dwelling-houses and gardens, and other accommodations, to the provost and prebendaries; and, in his charter, he speaks of four altars as existing in the church, and as dedicated respectively to St. Matthew, the Virgin Mary, St. Andrew, and St. Peter. At the Reformation, the provost and prebendaries felt the effects of the movement spirit which was abroad against their craft; and, in 1572, after having been virtually denuded of their possessions for a series of years, they were obliged to relinquish, by a formal deed of resignation, the whole of their revenues and property. At the Revolution, a mob, partly raised in Edinburgh, but consisting chiefly of the tenants of the barony, and the same that attacked the castle, and robbed it of its furniture, did some damage to the chapel, and carried away some of its ornaments. The edifice was in great danger, during the early part of last century, of becoming quite ruinous; but it was repaired at much expense by General St. Clair, who put wooden casements with glass into all the windows, new laid the floor with flag-stones, placed new flag-stones all over the roof, and built a high wall round the cemetery; and it was again repaired by the 1st Earl of Rosslyn, who roofed it with blue slate, and partially renovated its architecture, without impairing any of its antique or distinctive features.—The chapel is entered by two doors, respectively on the north and on the south. Its height within, from the floor to the top of the high arched roof, is 40 feet 8 inches; its breadth is 34 feet 8 inches; and its length is 68 feet. A descent from the south-east corner, leads, by a flight of 20 steps, to a crypt or chapel, which is supposed to have served also as a sacristy and vestry. This appendage measures 15 feet in height, 14 in breadth, and 36 in length; it is partly subterranean, but, owing to the sudden declivity of the hill, looks out from the surface at the east end; and it is lighted by a single window. The whole chapel is profusely decorated with sculpture, both within and without; nor is it less interesting from the mouldings in the exterior being worn and rounded by the weather. A number of niches for statues appear on the outside; but whether they were ever tenanted by these embellished resemblances of men is not known. The interior is divided into a central, and two side aisles, by 14 clustered pillars, disposed in two rows, and supporting Saxo-Gothic arches. The pillars are only 8 feet high; but they are exquisitely rich in workmanship, and have capitals adorned with foliage and curiously wrought figures, and produce a very imposing effect. The central aisle is higher than the side aisles, and has along its middle, and over its arches, a row of windows; and, owing to the breadth and exuberance of its adornings, after springing from the pillars, it looks to be one continued arch. The roof, the key-stones, the capitals, the architraves, of the whole interior, are all covered with sculptures representing flowers, foliage, passages of sacred history, texts of scripture, and grotesque figures, all executed

with astonishing neatness. Like other celebrated structures, such as Melrose abbey, with some of its finest sculpturing, and Rouen cathedral, with its famous rose window, Roslin chapel has a chef-d'œuvre, which wonder-making tradition asserts to have been the work of an apprentice during the absence of his master, and the occasion of the master's killing the apprentice through jealousy. Legend even gossips so lustily as to point out among the sculptures the heads of the slain, the slayer, and the former's mother weeping for his fate; and, quite in the characteristic style of monkish fiction, it appeals to a daub with ochre as a memento of the apprentice's wound, and blunderingly identifies his whole figure with that of a bearded old man. But, apart from this stupid romancing, "the Prentice's pillar" is a mass of superb sculpturing, and justly excites general admiration. "This pillar," says the author of a pamphlet which minutely describes the chapel, "has on the base of it several dragons in the strongest or first kind of basso relievo; as one can easily thrust a finger or two between some parts of the dragon and the base. The dragons are chained by the heads, and twisted into one another. This beautiful pillar has round it, from base to capital, waving in the spiral way, four wreaths of the most curious sculpture of flower-work and foliage; the workmanship of each being different, and the centre of each wreath distant from that of the neighbouring one a foot and a-half. So exquisitely fine are these wreathings, that I can resemble them to nothing else but Brussels lace. The ornaments upon the capital of this pillar are the story of Abraham offering up Isaac; a man blowing on a Highland bagpipe, with another man lying by him; and on the architrave joining it to the smaller one on the south wall, with your face to the east, and to the entry of the sacristy, you read the following inscription in old Gothic characters: 'Porto est vinum, fortior est rex, fortiores sunt mulieres, super omnia vincet veritas.'" Britton, in his 'Architectural Antiquities' of Great Britain, says respecting Roslin chapel:—"This building, I believe, may be pronounced unique, and I am confident it will be found curious, elaborate, and singularly interesting. The chapels of King's College, St. George, and Henry the Seventh, are all conformable to the styles of the respective ages when they were erected; and these styles display a gradual advancement in lightness and profusion of ornament; but the chapel at Roslyn combines the solidity of the Norman with the minute decoration of the latest species of the Tudor age. It is impossible to designate the architecture of this building by any given or familiar term; for the variety and eccentricity of its parts are not to be defined by any words of common acceptation. I ask some of our obstinate antiquaries, how they would apply either the term Roman, Saxon, Norman, Gothic, Saracenic, English, or Grecian, to this building." There were formerly in the chapel several monuments; and two which remain are remarkable, that of the hunting knight, who won the match against King Robert Bruce, and that of George, Earl of Caithness, who died in 1582. The family vault lies beneath the pavement of the chapel; and is entered by an aperture at the front of the third and fourth pillars, between them and the north wall, where a large flag-stone covers the ingress. This vault contained before the Revolution the remains of ten barons of Roslin, and is so dry that the hodies were found entire after 80 years, and as fresh as immediately after entombment. The barons were anciently hurried in their armour, without any coffin. The first who was buried in the modern style was he who died a little before the demise of Charles II., and, contrary to the advice of the Duke

of York, the subsequent James VII., who was then in Scotland, and of several other persons well versed in antiquities, he was assigned a coffin by his widow, Archbishop Spottiswood's grand-niece, who thought it beggarly to be hurried without one. The vastness of the expense which she threw away upon the obsequies of her husband, occasioned the sumptuary acts which were passed in the following parliaments. The hurrying vault was damaged in 1688, by the same mob who rioted against the chapel and the castle. Various persons collaterally connected with the barons were interred in the vault. A superstitious helief prevailed, amid the dark ages, that on the night before the death of any of the barons, the chapel, by supernatural means, appeared to be in flames. Sir Walter Scott makes a fine poetical use of this belief, and at the same time graphically alludes to the ancient manner of the barons' sepulture, in his hallad of Rosabelle:—

"O'er Roslin all that dreary night,  
A wondrous blaze was seen to gleam;  
'Twas broader than the water-fire's light,  
And redder than the bright moonbeam.

It glared on Roslin's castled rock,  
It ruddled all the copsewood glen;  
'Twas seen from Dryden's groves of oak,  
And seen from eaver'd Hawthornden.

Seen'd all on fire that chapel proud,  
Where Roslin's chiefs unc coffin'd lie;  
Each baron, for a sable shroud,  
Sheathed in his iron panoply.

Seen'd all on fire, within, around,  
Deep sacristy and altar's pale;  
Shone every pillar foliage-bound,  
And glimmer'd all the dead men's mail.

Blazed battlement and pinnet high,  
Blazed every rose-carved buttress fair,—  
So still they blaze, when fate is high  
The lordly line of high St. Clair.

There are twenty of Roslin's barons hold  
Lie buried within that proud chapel;  
Each one the holy vault doth hold—  
But the sea holds lovely Rosabelle!

And each St. Clair was buried there,  
With candle, with book, and with knell;  
But the sea-eyes roing, and the wild waves sung,  
The dirge of lovely Rosabelle!

ROSS-SHIRE, a large county in the north of Scotland, extending westward from the Moray frith to the Atlantic ocean, and southward from Sutherlandshire to the Beaully frith, Inverness-shire, and Loch-Aish, and comprehending Lewis and some of the minor Hebridean islands. It embosoms the Ferintosh district of Nairnshire, has numerous and minute interspersions of Cromartyshire, and is ruggedly dovetailed into sections of the latter county along the east coast; and in order, therefore, to avoid such a multitudinous tracing of petty boundaries, and constant staking of trivial exceptions, as would be insufferably irksome and even scarcely intelligible, we must describe it as including Cromartyshire and Ferintosh, and refer to our articles on these districts for a view of their separate position and character. The continental part of Ross-shire, thus understood, lies between 57° 7' 40" and 58° 7' 20" north latitude, and between 3° 45' 30" and 5° 46' 20" longitude west of Greenwich; and the Hebridean part, exclusive of the small islands of Rona and Barra, extends to 58° 31' 30" north latitude, and 7° 5' 20" west longitude. Its houndary with Sutherlandshire, except for a few miles at the central water-shed, is all formed by the river Oikell and the Dornoch frith, and by Locbs Vathie and Fin, and the stream which carries off the superfluent waters of the latter to the ocean; and its houndary with Inverness-shire is formed chiefly by the inner Moray frith, the Beaully frith, and a very tortuous series of mountain water-sheds along the north edge of the hugely rugged

basin of the Glass, and along the south edge of the basin of the Shiel. Exclusive of the Hebridean part, its greatest length, in a straight line, from the mouth of the Fin, on the north, to a point  $2\frac{1}{2}$  miles south of the Bridge of Shiel, on the south, is 69 miles; and its greatest breadth, in a straight line due west from Old Shandwick, in the parish of Nigg, to a small headland near Malveg, in the district of Gairloch, is 67 miles. But, in consequence of its east side somewhat gradually contracting till it tapers to a point at Tarbatness, and of its west side running far southward and considerably northward in two cuneiform projections, its real length is from east-north-east to west-south-west, and extends 83 miles; its mean breadth, in the opposite direction, is only about 39 or 40 miles; and its general form is proximately that of a triangle, whose sides, along Sutherlandshire and the German ocean, measure respectively 55 and 64 miles. The area of the whole district is 3,799 square miles, or 2,431,359 English acres; of which  $562\frac{1}{2}$  square miles, or 359,893 acres, are in the Hebrides;  $344\frac{3}{4}$  square miles, or 220,586 acres, belong to Cromartyshire; and  $9\frac{1}{2}$  square miles, or 5,973 acres, belong to Nairnshire. The area of Ross alone is thus 3,445 square miles, or 2,204,800 acres. These computations of area are those of Sir George S. Mackenzie, in his General Survey of the Counties of Ross and Cromarty. Oliver and Boyd's Almanac—referring, probably, to the continental district alone, and making a low computation of even it—states the area of the county to be 2,774 square miles, or 1,775,830 acres,—of which 301,000 are cultivated, 545,000 uncultivated, and 929,830 unprofitable.

LEWIS, RONA, and BARRA, the only Hebridean divisions of any importance, are separately described. The continental district is popularly divided into Easter Ross, extending from Tarbatness to the river Alness; the Black Isle, lying between the frith of Cromarty and the frith of Beaul; Fearndonald, extending from the river Alness to the burn of Cline; Wester Ross, comprehending all the low country from Cline to Contin, on the north side of the rivers Conan and Orron; and the Highlands, comprehending all the central, western, and south-western area, or all north of Strathpeffer and west and south-west of Contin;—and the last of these divisions may be subdivided into Strathoikel, Strathcarron, Coigach, Loch-broom, Greinord, Gairloch, Applecross, Lochalsb, Glenshiel, Strathbran, Strathgarve, Strathdirry, Glenelchaig, and some other subdivisions. All the vast Highland division is wild, lofty, and confusedly mountainous; it lies on a basis averaging about 1,500 feet above sea-level; and, though cut through or tessellated in all directions by glens, gorges, and the deep beds of streams, it possesses hardly an expanse which can be called a valley. Its mountains are occasionally isolated, but, for the most part, grouped, yet not so disposed in ranges that they can be methodically described; and, though numerous all but unexplored, and rarely of accurately or even proximately ascertained altitude, they are believed to rise, in many instances, to nearly as great a height as the monarch summits of Scotland. But, often broad-based and slow ascent, or so agglomerated and amassed as to form stretches of tumulated table-land, and rising from so lofty an average level of water-course as we have named, those in the interior, or at more than a brief distance from the coast, aggregately possess none of the force and grand character of scenic feature which distinguish a large proportion of the Scottish alps. Ben-Wyvis, situated on the south-east frontier of the Highland district, overlooking Wester Ross, and variously stated at 3,426 and 3,722 feet of altitude, is the most imposing of

the mountains, and is usually represented as the highest, but may possibly owe its fame to the comparative lowness of its base, the wideness of its range of vision, and the great scenic power of its configuration. The uplands, while prevailing bleak and desolate, are aggregately covered with much excellent herbage; and the interior glens, though narrow, offer some pleasant retreats to population, and occasionally show fine dashes of the beautiful, the picturesque, and the grand, in landscape. The long extent of western coast, over a mean breadth of 3 or 4 miles, is almost everywhere magnificent, and, in several places, sublime, in scenery; and, in the stupendous bulwarks which it presents to the sea, or the soaring elevations which it lifts up to the clouds, or the numerous cleavings which it receives from rivers and marine lochs, it transfixes attention and looks defiance to the efforts of the pencil.—The eastern districts of the county differ widely in character from the vast Highland division; and, over much of their area, present the striking contrast to it of soft woodlands and rich champaign expanses of arable ground. The Highlands come out upon these districts with such abruptness of wild and rocky glen and mountain, that the contrast is instantly felt deeply impressive; the streamlet of Aultgrand, in particular, presents, close upon the low country, as sublime a series of tremendous cliffs and waterfalls as any in Scotland; and, from every point of view in the champaign division, the enormous mass of Ben-Wyvis looms stupendously in the eye, and suggests crowding fancies of the tempestuated ocean of alps which stretches away westward from its base. Much of the Black Isle district is occupied by the broad, low, cheerless height of the MILLBUX [which see]; and most of Wester Ross, as popularly understood, is geographically included in the Highland division, and has, in consequence, been anticipated in our description. With these exceptions, and some minor ones, all the country on the east is rich, well-wooded, remarkably fruitful in agricultural produce, beautifully embellished in the artificial arrangements of its surface, and splendidly foiled in its landscape, not only with the long sweep of mountain-rampart round its edge, but with the far-stretching gulf of the outer Moray frith, and the deep and curving intersections of the friths of Dornoch, Cromarty, and Beaul.

The climate of Ross-shire, particularly of the western districts, is moist. The west coast is subject to very heavy rains. Snow falls in greatest quantity in the month of February; but severe storms are sometimes experienced at earlier periods. The average annual temperature of the whole county is about  $46^{\circ}$ . The heat in the months of July and August often equals, and sometimes considerably exceeds, the greatest heat experienced in England. Actual spring can hardly be said to commence till nominal spring has passed away. The winter is colder and the summer warmer on the eastern coast than on the western. A much greater difference than occurs in England or the south of Scotland is usual between the temperature of day and that of night. Changes of temperature are so frequent and sudden in spring and autumn as to be severely felt; and are so common in winter as to render its weather very variable. Winds, from between the north-west and the south-west, blow during three-fourths of the year; winds from the south of west bring the heaviest rains; winds from the north-west bring most of the snow-storms, and, from the north-east, snow-storms of great severity; and winds from the south and south-west, in summer, are sometimes accompanied by thunder. "It has been remarked," says Sir George Mackenzie, in 1810, "that the climate has been becoming worse for many years. I

can answer for the truth of this since the year 1796; and I judge from the ripening of certain garden fruits."

The east coast, besides being cloven with the long marine inlets of Dornoch, Cromarty, and Beauliefriths, is indented with the bays of Tain and Shandwick, and offers many situations where safe and excellent harbours might be constructed. The west coast is cut into numerous fragments by a rapid series of sea-lochs, and worn into constant jaggedness or curvature by creeks and tiny bays. The lochs, named in an order from north to south, are Loch-Enard, Loch-Broom, Little Loch-Broom, Loch-Greinnord, Loch-Ewe, Gair-loch, Loch-Torridon, including Lochs Ardheslag and Shieldag, Loch-Carron, sending off Loch-Keeshorn and Upper Loch-Carron, and Loch-Alsh, ramified by Loch-Ling and Loch-Duibh. The fresh water lakes, of the first class, are Lochs Maree and Tainich; of the second class, are Lochs Skinaskink, Vattie, Lurgan, Na-Shallag, Fuir, Monar, Luichart, Glass, and Moir; and of minor classes, are too numerous to be here separately mentioned. They are aggregately fine trout waters; and, in most instances, are frequented by a great variety of wild fowl. The chief streams, flowing eastward, are the Oikell and the Carron, to the head of the Dornoch frith; and the Balnagowan, the Alness, the Aultgrand, and the Conan, to the Cromarty frith; and the chief flowing westward, are the Broom, the Ewe, and the Carron, to the head of their cognominal lochs, and the Sbiel to the head of Loch-Duibh. All these streams have very productive salmon-fishings; and the Ewe, in particular, is frequented by prodigious numbers of salmon, and is perhaps the best angling stream in Britain. Several medicinal springs occur; but the only one known to fame is that of Strathpeffer.

Granite, or granitic gneiss, forms the ridgy height of the Black Isle, which terminates in the Sutors of Cromarty. Gneiss constitutes the central mountain masses of the county, from Ben-Nevis on the east, and Loch-Carron on the west, away to the boundary with Sutherland. Mica-schist forms the highly picturesque three-topped mountain of Scur-Vuitin, and thence diverges, as from a centre, to form the heights of Strath-Conan; and it constitutes also the greater part of the rugged but picturesque district of Gairloch. Primary granular limestone occurs in the vicinity of Loch-Keeshorn, and in other places in the west. Quartz-rock, displaying its curious isolations, its characteristic sterility of covering, and its puzzling connections with gneiss, granite, mica-schist, and old red sandstone, occurs along both sides of Loch-Maree, and in the district thence to the boundary with Sutherland. A red conglomerate sandstone, now called primary, and now the old red, extends along the whole western coast in a belt of from 1 to 4 miles broad, resting unconformably on the sides of the primitive mountains, often rising into altitudes of not less than 3,000 feet, and generally exhibiting long picturesque ridges, here and there broken into distinct truncated and somewhat pyramidal masses. The same formation, but in an attenuated shape, and looking out from the bosom of an expanse of secondary deposits, forms two interrupted ridges in the champaign country of the east, nearly parallel to the general direction of the Cromarty frith, and seeming, when beheld from a distance, to be embossed upon the sides of the loftier heights which radiate from Ben-Wyvis; and it also projects in two other spurs, the one of which runs eastward from Coul, and forms a chain of rounded and tabular heights, with bold and bare escarpments towards the south and west, while the other traverses Black Isle from Redcastle to the

vicinity of Avoch. Secondary rocks, chiefly sandstone, occupy the greater part of Easter Ross, and a considerable part of the other eastern districts. Strata of lias on the outer side of the granitic ridge of Black Isle have been upheaved to a very high angle, and display their ammonites and helminthes in bold protrusion. A hard granitoid conglomerate occurs at the junction of these rocks and the granitic gneiss in the vicinity of the western Sutor. The following succession of rocks occurs in an ascending order between the eastern Sutor and Tarbatness; granitic gneiss; coarse sandstone conglomerate; highly inclined strata of sandstone, very various in colour and texture; lias shales and limestone, with their characteristic fossils; strata of sandstone, red, greenish-grey, grey and brown, exceedingly variable in hardness and thickness; micaceous, laminated beds of dark grey impure limestone; and alternating beds of calciferous sandstone and bituminous and calcareous shales, one of them with fossilized fish-scales, and fragments resembling the trionyx of the Caithness schist. Superincumbent on the old red sandstone of the glens of Alness and Aultgrand, appear grit, argillaceous and calcareous beds, and bituminous shale; and extending westward thence through Fearn-donald, they largely expand between the first and second ridges of the old sandstone or conglomerate heights, pass over the smooth hills above mount Gerald and Tulloch-castle, and after having been associated with micaceous sandstone, they dip into Strathpeffer, and there assume the character of a dark-coloured calcareo-bituminous schist, foliated, and occasionally much contorted, and mixed with pyritous shale.

The useful and fancy minerals of the county, and the general character of the soils, may, in a great measure, be inferred from the details of its geognostic structure. Actynolite, tremolite, shorl, tourmaline, garnet, and simple hornblende, as well as portions of actynolite, chlorite, and hornblende schists, are not uncommon. Pure bitumen occurs among the shales of Strathpeffer. Copper has been wrought in the primary limestone near Keeshorn. Lead-ore was searched for on the north side of Loch-Maree, but seems to have been indicated by nothing better than a large vein of calcareous spar. Ironstone abounds in the west; and was at one time worked. Shell-marl is very abundant, and quite accessible at Culrain; and occurs in large quantities in various other parts of the east. Limestone, such as might be used for economical purposes, is either so coarse and unproductive, or occurs in such inaccessible regions of the west, that supplies of lime for the farmers have to be obtained by importation.—The soil of the greater part of the low lands of Easter Ross, Fearn-donald, and Wester Ross, is either clay or a sharp sandy loam; and, in part of Strathpeffer, and about Dingwall, the clay is deep and heavy. A moorish soil covers most of the remaining area of these districts; but is generally such as draining and manuring would render productively arable. The soil of much of the Black Isle is very poor; but, in the cultivated parts, is either clay or a good black sandy mould; and, on Auchterflow, though lying high, it is so rich as to be best adapted to wheat. The soil of the uplands in the great Highland division is, for the most part, peaty; and of the narrow intersecting glens, is chiefly sand, varied in its character by the nature of the prevailing rocks.

Natural forests appear to have anciently covered almost the entire county; but they are now represented by only an inconsiderable aggregate extent of copses. A few patches of natural oak occur at intervals, but receive no nurturing or protecting attention, and are cut down at every dictation of

either caprice or pecuniary need. Such natural woods as exist consist principally of fir and birch. Plantations are very extensive, and have, for about half-a-century, been constantly receiving great augmentations. Lord Seaforth alone planted, in the early part of last century, about 5,000,000 of various sorts of trees; and other proprietors so numerously and spiritedly imitated, or vied with this noble example, that individual notices of their exertions would be too tedious. The chief plantations are at Brahan, Red-Castle, Tulloch, Novar, and various places in the east; and venerable trees of different sorts,—oak, ash, heech, elm, &c., may be seen around the seat of almost every proprietor.

The arable lands occupy most of the eastern or champaign districts, and occur in small pendicles in the glens of the west. So great have been georgical and agricultural improvements of all sorts during the last 40 years, that the appearance and dress of all the eastern territory have been totally changed; and that district can now, as a farming-ground, bear comparison with almost any in Great Britain. The great majority of the farms display a neatness in the style of enclosing and dressing the land, which is superior to the modes of most districts in England, and scarcely surpassed by those of the best in Scotland. The crops are always clean, often luxuriant, and generally so good, that Ross-shire wheat has repeatedly sold as the best in the London markets. Twenty thousand quarters are now annually produced; and not less than 10,000 quarters of grain are exported.—Sheep-farming prevails over all the Highlands; and long ago produced the necessary effect of depopulating the country. The great sheep-farmers keep considerable numbers of black cattle on such parts of their farms as are not well-adapted for sheep; and they, in consequence, contrive to earn all the lucrative results of giving preference to the fleecy tribe, and at the same time secure to themselves and the county the peculiar advantages of maintaining the grazing system.

Manufactures of any kind, except those of local artisanship, and strictly domestic industry, are very inconsiderable, and exist chiefly at Cromarty, Invergordon, and Port-Mahomack.—The salmon-fishery is extensive and spirited in the rivers and estuaries; the herring-fishery is large and remunerating along the east coast; but the fisheries of the west, especially that of herrings, have in general declined.—The principal exports are black cattle, sheep, wool, grain, and fish. Fairs, markets, and trysts for cattle, some established by custom, and some by act of parliament, are sufficiently numerous and dispersed to afford every facility to internal commercial intercourse. Steam-vessels have begun to open up the bays, and sea-lochs, and friths; and afford the farmer the important advantage of a direct and swift conveyance of his sheep and cattle to the London market. The roads of the county have been rapidly multiplied, extended, and improved since the commencement of the enlightened scheme of laying open the Highlands as a measure of national importance: and they are made and maintained at the joint cost of the proprietors and of the kingdom. The chief are a line northward from Inverness through the Black Isle, and Easter Ross, by way of Cromarty; a line northward from Beaully, through Wester Ross, Fearndonald and the western part of Easter Ross to the Dornoch frith opposite Cricheh, by way of Dingwall and Ainess; connecting lines between these, forming a sweep by way of Tain; a line westward up Strath-Oikell, and ramified toward Assynt in Sutherland, and Ullapool; a line north-westward from Dingwall or Strathpeffer to Ullapool; a line westward along a chain of straths, somewhat akin

in character to that of the Glen-more-nan-Albin, from Strathpeffer, to a point in the west whence lines diverge to Gairloch, Loch-Torridon, and Loch-carron, and a line connecting Glensbiel, and the county around Lochs Alsb and Duieb, with the great glen of Inverness-shire.

The principal mansions are Castle-Brahan, the quondam seat of the Barons Mackenzie of Kintail, and the Earls of Seaforth; Tulloch-castle, Davidson, Esq.; Mountgerald, Mackenzie, Esq.; Fowlis-castle, Sir Hugh Munro, Bart.; Balcony, Fraser, Esq.; Novar-house, Sir T. Munro, Bart.; Invergordon-castle, Macleod, Esq.; Fairburn, General Sir Alexander Mackenzie, Bart.; Kilcoy-castle, Belmaduthy-house and Fore-house, Sir Colin Mackenzie, Bart.; Gairloch-castle, Sir Francis Mackenzie, Bart.; Coul, Sir George Stuart Mackenzie, Bart.; Scatwell, Sir James Wemyss Mackenzie, Bart.; Balnagowan-castle, Sir Charles Ross, Bart.; Geanies-house, Macleod, Esq.; Red-castle, Grant, Esq.; and Sbandwick-house, Ross, Esq.—In Ross-shire are the royal burghs of Dingwall, Tain, and Fortrose; and the towns, or considerable villages of Invergordon, Portmahomack, Rosemarkie, Ullapool, Poolewe, and Stornoway. Smaller villages or hamlets are numerous; and occur almost wholly on the coasts of sea, or frith or bay.—Ross and Cromarty shires are divided into 33 *quoad civilia* parishes; of which 22 are in the east, 7 in the west, and 4 in Lewis. Those in the east are distributed into the three presbyteries of Chanonry, Dingwall, and Tain, which constitute the synod of Ross; and those in the west and in Lewis form, respectively, the presbyteries of Lochcarron and Lewis, which belong to the synod of Glenelg. In 1834, there were, in the two counties, 33 parochial schools, conducted by 33 teachers, and attended by a maximum of 2,007 scholars, and a minimum of 1,120; and 124 non-parochial schools, conducted by 129 teachers, and attended by a maximum of 6,579 scholars, and a minimum of 3,494. The two counties jointly send a member to parliament. Constituency, in 1839, 710. The valued rent, in 1674, was £75,043 Scottish; and the value of real property, as assessed in 1845, was £121,557. Population, in 1801, 33,525; in 1811, 60,853; in 1821, 68,828; in 1831, 74,820; in 1841, 78,980. Houses, in 1841, 16,377.

ROSS. See KILFINICHEN.

ROSSIE. See INCHTURE.

ROSSKEEN, a parish in the eastern division of Ross-shire, bounded on the north by Kincardine and Edderton; on the east by Kilmuir; on the south by the frith of Cromarty; and on the west by Ainess. Its inhabited part extends northward from the frith about 10 miles, and has a mean breadth of about 6 miles; but the entire parish, according to the New Statistical Account, "is supposed to extend in length from south-east to north-west, from 25 to 30 miles," and has an extreme breadth of about 12 miles. A district of 2 miles in breadth along the frith rises with a very slow and gentle ascent from the shore; and, in physical complexion, is very strictly lowland. A district immediately behind this, and of about equal breadth, rises into moderate and arable uplands; and occupies a medium place between plain and hill-pasture. A little interior from the latter district, lies an extensive upland vale, called Strathusdale, and disposed for the most part into sheep-walk. Beyond the higher arable ground and inhabited glens expands a very large tract of mountains, which either are altogether waste, or are used for sheep-pasture, or for the summer grazing of a few black cattle. The highest ground is Cairn-Coinneag, situated on the boundary with Kincardine and with Ainess, and raising its summit about

3,000 feet above sea-level. The soil, in the low district, is partly gravelly and light, partly loam, and partly a deep and strong clay; and in the middle district, or higher arable land, it is wet, light, and spongy, and fitter for pasturage than for the plough. An extensive and rich bed of shell-marl, amounting to upwards of 70 acres, gave an early incitement to improve the soil; but its supplies, though still vast and all but inexhaustible, have been superseded by cheap and good lime. Nearly 4,000 acres of the parochial area are under cultivation. About a century ago, the parish had no plantations whatever; and no natural woods except about the place of Ardross; but, during the latter half of last century, and since planting has been so extensively conducted at Invergordon, at Milncraig, and on other properties, that now there are about 3,000 acres of woodlands. The old red sandstone is the prevailing rock of the lowlands of the parish; and, occurring of excellent quality as a building material, it is quarried on the banks of the river Alness. That stream traces all the lower part of the western boundary; it abounds in wildness and romance; and at Tolloch it presents some scenes of great power and beauty. Bahagowan river rises in the parish, but soon passes away from it, and eventually falls into the hay of Nigg in Logie-Easter. A small lake, called Achnacloich, situated in a small and sequestered glen, is encompassed with rich landscape. Other three lakes, Pataviog, Charnac, and Coinneag, command attention by neither their size nor their scenery. The frith of Cromarty touches the parish over a distance of nearly 6 miles; supplies it with salmon, cod, flounders, skate, and coal-fish, but no longer, as formerly, with haddocks and whittings, and brings up vessels of very large burden to its port of Invergordon. A spectator commands, from the ness, or little headland of Invergordon, magnificent views eastward of the lower frith, the sutors of Cromarty, and the clearly-defined coast of Nairn and Elgin; southward and northward, of rich and fertile bands of country superbly screened with well-feathered hills; westward, of the upper frith, reposing between belts of level and richly-wooded ground, and overlooked in the distance by the huge mountain-mass and snowy summit of Ben-Wyvis; and south-westward, of the stupendous and many-peaked Ben-Vaichard. The principal landowners are Macleod of Cadholl, Macleay of Newmore, H. R. Ross of Glastullich, and the Duke of Sutherland. Invergordon-castle, the property of the first of these, was, several years ago, destroyed by fire, and is now inhabited and in repair only in one of its wings. There are three villages.—INVERGORDON, which is separately noticed, and has a population of 1,000,—Bridgend, with a population of 280,—and Saltburn, with a population of 300. Invergordon has branch offices of the North banking company and the Commercial bank of Scotland; an excellent inn in Main-street, called the Macleods' Arms; a subscription-library, commenced in 1835; a parochial library; a friendly society; and annual fairs on the third Tuesday of February, the second Tuesday, old style, of April and December, the first Tuesday of August, and the second Tuesday of October. The manufacturing establishments of the parish are two hemp factories at Invergordon; and a new and very capacious mill at Dalmore, having no fewer than five departments, for respectively wheat-flour, barley, oats, thrashing, and timber; and a saw-mill on the river Alness. A fine pier at Invergordon, erected in 1823, and recently enlarged by the addition of a wooden jetty, gives facility for the shipment of a considerable quantity of grain for London and Leith, and shares with the harbour of In-

verness the luxury and importance of regular communication by large steamers with Aberdeen, Leith, and London. A harbour at Dalmore is a place for the shipment of considerable quantities of fir and other timber for Shields and Newcastle. Within the parish are several extensive lines of excellent road. Population, in 1801, 2,074; in 1831, 2,916. Houses 630. Assessed property, in 1815, £10,492.—Rosskeen is in the presbytery of Tain, and synod of Ross. Patron, Mackenzie of Cromarty. Stipend £156 ls. 1d.; glebe £10 10s. Unappropriated teinds £260 19s. 11d. In 1834, the parish-school was attended by 104 scholars; and five other schools, —two of them supported or aided by the Education societies of Glasgow and Inverness,—were attended by 306. Parochial schoolmaster's salary £34 4s. 4d., with about £12 fees, and about the same sum other emoluments.

ROSYTH-CASTLE. See INVERKEITHING.

ROTHES, a parish in the Strathspey district of Morayshire; bounded on the north by Speymouth; on the east by the Spey, which separates it from Banffshire; on the south by Edenkeillie; and on the west by Birnie and Urquhart. Heath-clad hills environ the district; and, in a great measure, limit its practicable grounds to the glen, or narrow valley of the Spey. The Cairngorm mountains look sublimely down upon it from the distance; and Benrinnes, the most northerly of the Grampian alps, towers aloft immediately beyond the south-eastern boundary, and invites a tourist to survey, as upon a map, a large part of the nine surrounding counties. The valley of Rothes is beautiful and fertile; but bears marks of having been wildly sported with by the Spey, and tracked by former but now quite forsaken channels of the stream. In the great flood of 1829, the Spey overspread the valley, overtopped many of its lofty trees, strewed it over with disaster and catastrophe, and left such large and lofty monuments of its power that, three years afterwards, masses of reeds and roots still lay lodged upon the branches of the trees. From the village of Rothes, in the valley, to Craigellachie-bridge, 3 miles to the south, the road leads through a picturesque pass, and has the finely wooded seat of Arndilly, on the Banffshire side of the Spey, on the left. At Craigellachie is an iron bridge, erected in 1814, with an arch of 150 feet span, and four Gothic turrets forming the abutments; and over this bridge frowns a precipitous rock, while below it darkly careers the Spey, with that impetuous velocity which everywhere characterizes the noble river's motion. The soil of the parish is, in general, dry and sandy, but degenerates into moor in the north. The crops raised are principally barley and oats. On the side of a hill, near the church, is a quantity of fine white and red agate, hard, heavy, uniformly smooth, finely shaded in its colours, and capable of very high polish.—The village of Rothes stands near the Spey, at the junction of the road south-south-eastward from Elgin, and that up Strathspey southward from Garmouth; and is 3 miles north of Aberlour,  $6\frac{1}{2}$  north-north-west of Dufftown in Mortlach,  $8\frac{1}{2}$  south-south-west of Fochabers, and 11 south-south-east of Elgin. It consists of about 250 straw-thatched cottages, arranged in four streets, which diverge at various angles from a common centre. Annual fairs are held here on the third Tuesday of April, and the third Wednesday of July and October. On the summit of a round and precipitously-faccd hill, in the vicinity of the village, stands Rothes-castle, the ancient seat of the noble family of Leslie, Earls of Rothes. This castle was one of the most ancient fortalices in the country; but now survives in only a small portion of one of its walls. In 1233 Eva de Mortach, daughter of Muriel de Polloc,

and grand-daughter of Petrus de Polloc, was Domina de Rothés; and, in that capacity, she, in 1263, bestowed, by charter, the lands of Inverlochtn on the cathedral of Moray. The Leslies are believed to have come from Hungary, with Atheling the wife of Malcolm Canmore; and, in 1457, they were created Earls of Rothés by James II. They seem to have resided at Rothés so late as 1620; but immediately afterwards they removed to Fifeshire; and, about 1700, they sold their remaining possessions in Moray to Grant of Elchies. The chief mansion is Orton. Population, in 1801, 1,521; in 1831, 1,709. Houses 363. Assessed property, in 1815, £5,131.—Rothés is in the presbytery of Aberlour, and synod of Moray. Patron, the Crown and the Earl of Seafield. Stipend £159 6s. 6d.; glebe not known. Schoolmaster's salary £34 4s. 4d., with £26 5s. fees, and £7 3s. other emoluments. The late Dr. Simpson of Worcester was a native of this parish, and bequeathed a sum of £500 to it, the interest of which is to be enjoyed by the parish-schoolmaster.

ROTHESAY, a parish in the island and county of Bute. It occupies all the northern and larger part of the island; and is bounded on the south-east by Kingarth; and, on all other sides, by the Kyles of Bute and the frith of Clyde. Its greatest length, in a direct line, is nearly 10 miles, and, by the road, is 13 miles; its greatest breadth is 5 miles; and its superficial extent is 45 square miles. INCHMARNOCK [which see] belongs to the parish. The coast-line, including that island, and measuring along sinuities, is about 35 miles in extent. The coast is neither flat nor bold, and consists, for the most part, of gravelly slopes and shelving rocks. The chief bays on the west, are Scalpsie, at the boundary with Kingarth; St. Ninian's, opposite Inchmarnock; and Etterick, 2½ miles north of St. Ninian's; and, on the east, are Kames and Rothésay bays, both distinguished for their beauty, and the former noted for its fine safe anchorage. Two delightful valleys extend across the island between the bays of Scalpsie and Rothésay, and those of Etterick and Kames; and are supposed to have once been submarine, and to have cut what is now one island into three. The rest of the parochial area is nearly all filled with low and soft-featured hills, many of which command from their gentle summits charming views of the confined but rich scenery of the Kyles, and of the more expanded and brilliant scenery of the frith and its very diversified coasts. Common-hill, Baron-hill, and Kames-hill, three of the most remarkable heights, have altitudes, above sea-level, of respectively 430, 532, and 875 feet. Of six fresh-water lakes LOCH-FAD is much the largest, and is separately described; Lochs Ascog and Quien lie on the boundary with Kingarth, and cover respectively 70 and 54 acres; and Lochs Greenan, Dhu, and Bull, are situated in the interior, and measure respectively 11½, 7, and 5 acres. A medicinal spring was discovered, in 1831, at Bogany-point, about a mile east-north-east of Rothésay; and has acquired much reputation as a remedy for cutaneous and glandular diseases, and for rheumatisms. According to an analysis by Professor Thomson of Glasgow, an imperial gallon of water contains 1860.73 grains of muriate of soda, 12.25 grains of sulphate of lime, 129.77 grains of soda, 32.8 grains of chloride of magnesium, 14.59 grains of silica, and 17.4 cubic inches of sulphuretted hydrogen gas. The rocks, south of Rothésay-bay and Loch-Fad, are all red sandstone and conglomerate; and, north, are mica, clay, and chlorite slates, variously intersected by veins of trap and quartz. Greenstone is quarried in the vicinity of Rothésay, and supplies the burgh with building material; and clay-slate is quarried, on a small scale, near Kames-bay. A deep

and rich bed of shell-marl occurs at St. Ninian's-bay. The soil, in the valley between Kames and Etterick bays, is a strong fructiferous alluvial loam; that of other low grounds is variously sand, gravel, clay, and moss; and that of the hillocks and acclivities is, in general, light and shallow. Agriculture, chiefly from enlightened encouragement by the Marquis of Bute, has made singularly great progress since the commencement of the present century. The woods cover upwards of 700 acres, and consist, principally, of pines, oak, beech, ash, and elm. Plants, elsewhere rare in Scotland, are numerous, and render the parish a fine field for the study of the Scottish flora. A salmon-fishery was recently established along the shores by the Marquis of Bute; a regular fishery of haddocks and other species supplies the Rothésay market; and a herring-fishery is carried on to a large extent in both the kyles and the frith. The roads of the parish are convenient, in good repair, and free from tolls. The only noticeable landowner, besides Lord Bute, is Hamilton of Kames; and the only noticeable mansion, not in the immediate vicinity of Rothésay, is KAMES-CASTLE: which see. PORT-BANNATYNE, the only village, is separately described. Kilmorie-castle, the ancient seat of the Jamiesons of Kilmorie, and originally quite a congeries of towers and edifices, is now an utter ruin. Tumuli, standing-stones, and ancient hill-forts, are numerous. A Druidical circle occurs near Etterick-bay. Population, in 1801, 5,231; in 1831, 6,084. Houses 757. Assessed property, in 1815, £3,457.—Rothésay is in the presbytery of Dunoon, and synod of Argyre. Patron, the Marquis of Bute. Stipend £276 1s. 3d.; glebe £20. Unappropriated tithes £170 3s. 2d. The parish-church was built in 1796. Sittings 955. Three other places of worship exist in connexion with the Establishment,—a Gaelic chapel-of-ease, and two *quoad sacra* parish-churches. The chapel-of-ease is situated in the town of Rothésay, and was built in 1837, at a cost of £600. Sittings 600. Stipend £70.—New Rothésay *quoad sacra* parish-church was erected in 1798 as a chapel-of-ease, and cost £1,300. Sittings 830. Stipend £180, with about £8 8s. for expenses connected with the Lord's supper, and a manse and garden worth annually about £20. The attached parochial district measures about 2½ miles in length, 2½ in breadth, and 10 square miles in area. Its population reside chiefly in the town, and, in 1835, amounted to 2,074; of whom 1,813 were churchmen, 253 were dissenters, and 8 were nondescripts.—North Bute *quoad sacra* parish-church stands about a mile from Port-Bannatyne and 3½ miles from Rothésay, in the valley which extends between Kames and Etterick bays. It was built in 1836, at the expense of the Marquis of Bute; and it is of handsome architecture, and cost about £1,000. Sittings about 700. Stipend £150, with a manse, and £10 in lieu of glebe. The attached parochial district comprehends all the northern part of the *quoad civilia* parish, and contains a population of between 900 and 1,000. The Marquis of Bute has adopted measures for obtaining its civil parochial independence by a deed of the court of tithes; and has expended, in various ways, upon the erection not less than about £8,000.—There are 4 dissenting places of worship. The Reformed Presbyterian meeting-house was built in 1829, for a congregation which was established in the same year; and, along with session-house, &c., it cost about £400. Sittings 450. Stipend £80.—The United Secession congregation dates back to the year 1770. Their meeting-house, in 1836, was valued in that year at about £300, and was supposed to have been built in 1782. Sittings 434. A new place of worship has since been erected at a cost of between £900 and

£1,000. Stipend £135, with about £4 for expenses in attending church courts.—The Independent congregation was established in 1835. As some members resided in Rothesay and others in Port-Bannatyne, the projectors of a place of worship perspicaciously reasoned that a site at Ardheg, mid-way between them, would draw the people of both towns; and they, accordingly, adopted that site, but found it utterly unsuitable. The chapel was built in 1836, at a cost of from £550 to £600, and has 430 sittings; but, after strenuous exertions to drag it from its solitude into connexion with the neighbouring seats of population, it was virtually abandoned in favour of a hall in Rothesay. Stipend about £60.—The Episcopalian chapel is the quondam meeting-house of the United Secession congregation.—In 1836, the population of Rothesay parish, *quoad sacra*, or of the district which remained after the disjunction of New Rothesay and North Bute, was, exclusive of summer-visitors for sea-heathing, 3,422; of whom 3,105 were churchmen, 295 were dissenters, and 22 were nondescripts.—In 1834, the parochial school was attended by 11 scholars; and 15 non-parochial schools were conducted by 18 teachers, and attended by 946 scholars. Twelve of the non-parochial schools are situated in the hurgh, and take a very wide range among the departments of tuition. Parochial schoolmaster's salary £35, with between £10 and £15 fees, and between £9 and £11 other emoluments.—The ancient church of Rothesay was dedicated to the Virgin Mary; and was originally a chapel, subordinate to Kingarth, and possessed for a short time by the monks of Paisley. At the close of the 13th century, it appears on record as an independent parsonage; and afterwards it became one of the cathedral churches, of the diocese of the Isles, and was the only one during the period of Protestant episcopacy. In 1515, its temporalities were given by James VI. to the collegiate church of Restalrig near Leith; and, at the Reformation, they were transferred to the chapel royal of Stirling. In 1617, the parson of Rothesay was, by act of parliament, made sudean of the Isles. In the early periods of Presbyterianism, the parish was in the presbytery of Irvine or Cunningham; and in 1639, it was annexed to the presbytery of Dunoon.—A large number of small chapels were anciently dispersed throughout the parish; Kildavanan and Kilmichael chapels in the extreme north; St. Calmag's chapel, still commemorated by a large stone-cross; chapels at St. Ninian's point, Kilmorie M'Neil, and Nether Ardroscaedale; St. Bride's chapel on Chapel-hill, in the immediate vicinity of the burgh, and a chapel in the court of Rothesay-castle.

ROTHESAY, a town of considerable antiquity, a royal hurgh, and the capital of Buteshire, stands at the head of Rothesay-bay, on the east side of the island of Bute, 9 miles west-north-west of Largs, 11 miles north-west of Millport, 22 miles north-north-east of Brodick, 19 miles south-west of Greenock, and 40 miles west by north of Glasgow. The bay opens immediately within the east entrance of the Kyles of Bute; it commences between Bogany and Ardheg points, which are  $\frac{1}{2}$  mile asunder; and, measured from the middle of a straight line across its entrance, it extends 9 furlongs into the interior, and has the form very nearly of a semi-ellipsoid. The breadth of the Kyles opposite the bay is, at Ardheg-point, 9 furlongs; and at Bogany-point  $\frac{1}{2}$  mile. The bay is screened all round with a gentle and variegated slope, coming down, in one place, from a finely-featured but inconsiderable hill; it has the town and harbour at its head, and very extended lines of mansions and villas along its sides; it is

kissed by sward and bush and flower-plot, and shaded or set-off by numerous trees; and, almost in any weather and in any mood, but especially when hurried by a vernal sun, and skimmed by one or two gaily crowded steamers, it both presents within itself and commands from without scenes of stirring interest and highly picturesque beauty. "The deep, intensely blue ocean, is here framed in a circle of noble, solemn-looking mountains, among which you would admire that curious museum of hills, with ragged tops, jocularly named Argyle's howling-green. On the opposite coast stands the ruined old castle of Toward, which once had the honour of Queen Mary's company at dinner; and also, conspicuously placed, is its lineal descendant, that handsome new mansion, looking like the king of all the villas, recently built by Mr. Kirkman Finlay, a stately well-grown edifice, surrounded by a young colony of trees, tastefully sprinkled all over the pleasure-grounds, which look so low and insignificant, that the place might be very appropriately called Bushy Park." The villas which form the edified line along the east side of Rothesay-bay are not fewer than forty in number; and they are so uniform or akin in structure, and are set down at such brief and regular intervals, as to look like a sumptuous one-sided street, luxuriously airing itself amid the mingled halm of land and wood and sea. The villas, on the west side, present a much less pleasing aggregate appearance; some lie low and crouching on the beach, some straddle holdly up the slope, and keep an ambitious outlook upon town and sea, most are comparatively tasteless and very various from one another in outward form, and nearly all have steep-slated roofs, and swollen lumpish proportions. The houses in the body of the town date, in hardly any instances, higher than 1791, and have very numerous been built since 1813. All are constructed of greenstone, and necessarily want the polish and the lightness of aspect imparted by most sandstones; but they possess a stability, a tidiness, and an aggregate regularity which quite compensate for the absence of more showy properties. The streets, though somewhat narrow and confined, are clean and proximately regular; and, irrespectively of some lanes, they are 13 or 14 in number, and bear the names of High, King, Prince's, Bishop, Argyle, Montague, Castle, Castle-hill, Bridge, Bridge-end, Mill, Guildford, and Tareth streets.

The principal modern public edifice is the county buildings and prison. This structure was built in 1832, at the cost of about £4,000; and is in the castellated style, and very spacious. Both its size and its costliness appear to a stranger quite out of proportion with the uses of so small a county; and its air of neatness, comfort, and opulence seems utterly out of keeping with the notion of a prison. The jailer, says Miss Sinclair, "led us with much professional zeal to inspect the remnant of a dark dungeon, formerly used for confining prisoners, measuring only 10 feet by 15, a dismal hole with only an aperture above, not the semblance of a window, and containing a crevice in the roof, which served as a door, but was so narrow that captives must all have been starved for some time, till they were thin enough to get in, and afterwards kept on spare diet, if they were ever intended to come forth again. Here our friend the jailer expatiated very fully on the superior advantages enjoyed under his jurisdiction; and certainly that necessary evil, the county jail, which we saw, looks like Cardiff-castle, or any other nobleman's residence. No wonder that when his guests have once conquered their natural horror of disgrace, they frequently return to the jailer's careful guardianship, where these poor creatures, who knew not

formerly where to gain a dinner, are here at once transported into a comfortable hotel, where they meet with kind treatment, fires in every room, excellent sleeping accommodation, regular hours, plenty of food, and nothing to pay. Some of the old women consider it a perfect home; and would feel more alarmed at the threat of being turned out than of being shut in." This picture is doubtless over-coloured; yet it has quite sufficient correctness of tint to suggest that benign refinement upon prison-discipline may be overdone, and that if ever it offers more amenities and comforts to the criminal than are, in the same circumstances, provided for the honest poor, it is substantially offering a premium on crime. The court-hall is adorned with a splendid portrait of the Marquis of Bute.—The places of worship are the only other modern public buildings; but while creditable, and in one or two instances neat, they are all of such common-place character as does not admit remark.—The walls of the choir of the ancient cathedral of Rothesay still stand close to the present parish-church. The nave was taken down in 1692, and used as a quarry for the building of the present church's predecessor. The windows of the surviving part of the ruin are in the style which prevailed in the 13th century, and seem to claim that date for the whole edifice. A monument, with the figure of a recumbent knight in the style of armour which belonged to the period of Robert III., appears from the coat-of-arms to rest on the ashes of some member of the royal family; and another monument, which bears marks of being a century more recent, is ruder in execution, and has the figures of a lady and child.

The grand antiquity, and chief architectural object of Rothesay, is its castle. The tall ruin of this structure stands close upon the town; and has the historical associations mingledly of a royal palace and a military fortalice. The building consists of a circular court, about 140 feet in diameter, formed by high and thick walls; four round towers upon the flanks; and an erection which is ascribed to King Robert II., and which projects, on the north-east side, between two of the towers. Round the outside is a wide and deep ditch; and between this and the wall is a terraced walk. The walls are very richly overgrown with ivy; and have been noted for their similarity to some "rifted rocks" among the romantic cascade scenes of the Highlands, in producing remarkable trees. "Here," says the lively writer already quoted, "an ash tree recently contrived to grow on the summit of a stone arch, till the trunk attained to a circumference of nine feet, when it fell to the ground; and, after so long setting an example of frugality in living without nourishment, it became a means of overfeeding others, having been cut into a dining-table for George the Fourth. Within the castle, we admired a fine old thorn, six feet in circumference, and forty-five feet high, which fell prostrate on the ground last November, but still [in 1840] puts out a mass of leaves, as if the roots yet had nourishment from the ground, instead of the empty air in which they are upraised, preserving its foliage 'green and fresh without, but worn and bare within.'" About 24 years ago, the Marquis of Bute, at considerable expense, caused to be cleared away, from within and around the castle, the accumulated rubbish of ages,—consisting, to a large amount, of beef and mutton bones! and, in consequence, the presumed royal apartments, the reputed additional palace of Robert II., the towers, the terraces, the chapel, and the dungeon, are now all easily accessible by even the feeblest and most fastidious. Yet the building, with all the accompaniments proper to itself, and whatever additional aids it may derive from the fanciful embel-

ishments of a cicerone, will grievously disappoint every visitor who expects to see either beauty or picturesqueness in its ruin, or indications of military strength in its structure or position. In spite of the very fine and imposing embellishment of some tall ash trees, which still rise up among the ruins, the edifice strikes the eye as only a ponderous, lumpish, dull mass of masonry, quite doleful in the dingy red colour of its stones, and destitute to shcer nakedness of every attribute which the fancy associates with the ideas of either castle or palace. "As a piece of fortification, even on the ancient principles," says a contemporary, "it is wretchedly deficient, and argues very little in favour of the military knowledge that erected it. Even the gate is neither flanked nor machicolated; and it might have been mined or assaulted at almost any point." Yet it figures in history quite as conspicuously as many a place of great strength, and possesses a very fair proportion of antiquarian interest. The original structure—for the aggregate building is evidently of various dates—was probably one of the fortalices erected in 1093, by Magnus Barefoot, King of Norway, to secure his conquest of the western islands of Scotland. It may have been raised, however, in greatly more obscure circumstances; and it is said to have belonged, before the time of Alexander III., to a family of the name of M'Roderick. It first comes into historical notice in 1223; when it was attacked by Olave, King of Man, and Husbac, a Norwegian chieftain, with eighty ships, and, after a siege, was taken by a sap and assault, with the loss of 390 men. After the battle of Largs, it was retaken by the Scots. During the inglorious reign of John Baliol, it was occupied by the English; but, it 1311, it submitted to Robert Bruce. In 1334, it was again seized in the unpatriotic cause of a dependent crown, and was fortified by Edward Baliol; but, not long afterwards, it was captured by Bruce, the Steward of Scotland. Robert II. visited the castle in 1376, and again in 1381; Robert III. died in it from grief on account of his son, afterwards James I., having been captured. Oliver Cromwell's troops burst rudely against it, like the surges of a desolating flood; and, in 1685, the brother of the Earl of Argyle seized it, set fire to it, and irretrievably converted it into an utter ruin.—The castle of Rothesay gave title to the first dukedom which existed in the Scottish peerage, and continues the title to the king's eldest son as a collateral for Scotland to that of Prince of Wales for England. The dukedom of Rothesay was created in a solemn council held at Scone in 1398, and conferred on David, Earl of Carrick, Prince and Steward of Scotland, and eldest son of Robert III.; and when David, in 1402, fell a victim to the ambition of his uncle, the Duke of Albany, it was transferred to his brother James, afterwards James I. of Scotland. An act of parliament, passed in 1409, declared "that the lordship of Bute, with the castle of Rothesay, the lordship of Cowal, with the castle of Dunoon, the earldom of Carrick, the lands of Dundonald, with the castle of the same, the barony of Renfrew, with the lands and tenandries of the same, the lordship of Stewarton, the lordship of Kilmarnock, with the castle of the same, the lordship of Dalry; the lands of Nodisòale, Kilbryde, Narristoun, and Cairtoun; alsu the lauds of Frarynzan, Drumcall, Trebrauch, with the fortalice of the same, 'principibus primogenitis Regum Scotiæ successorum nostrorum, perpetuis futuris temporibus, uniantur, incorporentur, et annexantur.'" Since that period, the dukedom of Rothesay, in common with the principality and stewardry of Scotland, the earldom of Carrick, the lordship of the Isles, and the barony of Renfrew, has been vested in the eldest son and heir-apparent of the sovereign. In the event

of the first-born dying without an heir, the right passes to the king's eldest surviving son; and when the king has no son or heir-apparent, it reverts to himself, as the representative of an expected prince.

The town of Rothesay was originally a village in connection with the castle; and in its more matured, as well as in its infant state, it necessarily shared the castle's fortunes,—at times basking in the favour of the powerful, and eventually royal family who owned it, and at other times suffering capture and plunder from the Norwegians, the Islesmen, the English, and the conflicting parties in civil wars. At an early period, it was made a burgh-of-barony; and in 1400, it received from Robert III. a charter erecting it into a royal burgh, and conferring upon it a considerable quantity of landed property. In 1584, a charter of confirmation and novodamus was given by James VI. The town seems to have grown slowly but steadily in prosperity; and it gradually became so great and commanding a mart for the Lowlanders exchanging commodities with the Highlanders and Islesmen, as occasioned the island of Bute to be regarded as a sort of neutral territory, neither Highland nor Lowland. About the year 1700, the erection of Campbeltown into a royal burgh, and the very advantageous terms which were offered to settlers, drew away to it from Rothesay a considerable number of traders, and a large proportion of trade. Rothesay now fell rapidly into decay, and seemed even to be menaced with extinction. Against 1760, its population became lessened to one-half of its former amount; and its houses, in a vast number of instances, and to the amount, probably, of a moiety of the whole, stood mouldering in ruin, or lay amassed in heaps of rubbish. At this date, only one or two half-decked vessels, of each about 15 tons, and a few open boats, belonged to the port. In 1765, while laws were in force which required all produce of the colonies to be landed in Britain before it could be imported into Ireland, Rothesay was made a custom-house station for the accommodation of the Irish colonial trade; and a few years later, a berring-fishery, which still continues to be a staple trade of the place, was successfully introduced, and cheerily engaged the attention of a large number of the inhabitants. The town now rose from ruin, and began to put on the appearances of renovation and prosperity which have since so eminently characterized it. In 1778, a cotton manufactory, the earliest establishment of its class in Scotland, was commenced here by an English company, and soon afterwards it became the property of the excellent and celebrated David Dale, and largely contributed to increase and perpetuate the town's favourable circumstances. Against 1791, all ruinous houses were re-edified, many new ones were erected, and between 80 and 100 vessels, of from 15 to 100 tons burden, besides a proportionate number of open boats, belonged to shipowners in the town and parish.

The cotton-mill of Rothesay is moved by water collected in reservoirs, and ingeniously economized and applied according to a plan by Mr. Thom, engineer; and it contains 23,448 spindles, and employs about 360 persons. A factory for weaving by power-looms was established about 16 years ago, is well managed, and employs between 80 and 90 workmen. Men's wages in the spinning-mill vary from 17s. to 24s. a-week, and, in the power-loom factory, range between 21s. and 30s. The number of hand-loom, in 1828, was 250, and, in 1838, was 35. Several cooperages employ between 30 and 40 persons, and annually produce about 15,000 herring barrels. Two small yards for boat-building employ about 20 ship-carpenters; and a tanyard of considerable extent employs a few persons.—In 1822, an excellent harbour

was erected, at the cost of £6,000; and, in 1840, a slip and a building-dock were added. In 1837, there belonged to the port 58 vessels, each from 15 to 300 tons, and aggregately 2,950 tons, navigated by 255 men, and variously employed in the coasting, the foreign, and the fishing trades. The largest imports are about 30,000 bushels of salt, and 6,000 tons of coals; and the largest export, about 19,000 barrels of salt herrings. Other imports are cotton, hides, bone-dust, grain, lime, sandstone, barrel-staves, and colonial produce; and other exports are cotton-yarn, cotton-cloth, fresh fish, leather, barley, potatoes, and turnips. Four steam-vessels in summer, and two in winter, ply daily between Rothesay and Glasgow; a steam-boat plies three times a-day between Rothesay and Greenock, to communicate with the terminus of the Glasgow and Greenock railway; two steam-boats daily touch at Rothesay in transit between Glasgow and Loch-Fyne, affording communication with Tarbet, Lochgilphead, Inverary, and the western coasts and islands; and a steam-vessel, during two or three months in summer, maintains communication with the island of Arran.

Rothesay has long been distinguished as a retreat of consumptive invalids and of sea-bathers. Common fame and accurate delineation unite in describing it as "the Montpellier of Scotland, where consumptive patients, unable to endure any other air, find it possible to breathe with comfort." "I shall never forget," says Miss Sinclair, "the fervour with which a sick young friend of my own once exclaimed, when suffering severely from the sharp arrow-like winds of Edinburgh, 'Oh! what would I not give for one single gasp of Rothesay air!'" The range of the thermometer is less than in probably any other town in Scotland; snow is rarely known to lie more than two days on the ground; perennial plants thrive singularly well, and are seldom or never injured by frosts; the Kyles and Loch-Strevin act as natural funnels to carry off impurities of air; and a fine sheltering hill-screen, surrounding the town at an agreeable distance, mellows the atmosphere, and attempers every breeze.—As sea-bathing quarters, Rothesay was in repute long before steam-navigation was dreamed of; and it naturally became a select spot when that remarkable invention began, in 1814, to bring down the citizens of Glasgow in summer-shoals to the coasts of the frith of Clyde. But, in proportion to the number of bathers who resort to it, there is around the bay such an utter absence of bathing-apparatus, combined with natural want of facilities for privacy and due decorum, as would quite amaze any person accustomed to the bathing-places of England, or of the east coast of Scotland. "In this little marine city, which is like Venus rising out of the sea," says the rattling writer already twice or thrice quoted, "nothing surprised me more than to find neither baths nor bathing machines. Rothesay has no right to call itself a sea-bathing quarter. Never was salt-water so thrown away on any place. The little crisp, clear, crystal waves, curl up on the beach most invitingly, sparkling and dancing in the sun; but when you ask, 'Where are the machines?' echo answers 'Where?' No facility is afforded for enjoying what the Americans call 'this privilege of water,' either hot or cold, and the shore all round the bay seems as public as the Serpentine in London; therefore, the inhabitants must dip into the ocean as you dip into a novel, merely giving it 'a supercilious glance.' One very enterprising talker has talked for some years of trying, as a speculation, to establish baths here, on a scale worthy of Constantinople or Cheltenham; but his good intentions have ebbed and flowed so long, that I fear the sea will cease to be salt before he finally makes up his mind." Except

that Helensburgh and Largs have splendid suites of baths, and Dunoon has a few fixed bathing-boxes, all the many watering-places on the Clyde are, we believe, in the same predicament as Rothesay. The citizens of Glasgow, Paisley, and Greenock, who frequent them, display marvellously little niceness of feeling on the subject of bathing-machines, and seem, to a degree which is quite astonishing, to be cool and indifferent as to the publicity of bathing-grounds.

Rothesay is the seat, every Tuesday during session, of the sheriff and commissary courts of Bute here, and once a fortnight or oftener during session, as well as occasionally during vacation, of the sheriff's small-debt-court. The town has branch-offices of the Royal bank of Scotland, the Renfrewshire bank, and the Greenock bank; offices of five insurance companies; customs, excise, stamp, and post-offices; a Rothesay subscription-library, instituted in 1792; a Rothesay youths' library, begun in 1818; a mechanics' library, instituted in 1833; three congregational or school libraries; two public reading-rooms; a savings' bank, instituted in 1821, under the patronage of the Marquis of Bute; and five friendly societies, called respectively the Rothesay, the Rothesay marine, the Rothesay cotton-mill, the Bute, and the coopers' societies. A weekly market is held on Wednesday; and ill-attended and unimportant annual fairs are held on the first Wednesday of May, the third Wednesday of July, and the last Wednesday of October. Two annual shows take place,—the one for cattle, and the other for seeds, roots, and dairy produce; and both excite much interest, are attended with the awarding of prizes for the best specimens, and exert a beneficial interest on all the connexions of the town with the county. There are no fewer than about 50 inns and public houses, equal to one for every 20 families!

The burgh-lands are very extensive, and consist technically of territories on the land, and territories on the sea. Those 'on the land' measure 4½ miles in extreme length from the point of Ardbeg to the south end of Loch-Fad, and 2½ miles in extreme breadth, either in a line due west across the bay from Bogany point, or in 1 west-north-westward from the mouth of Ascog-burn; and they are technically described as "all the lands on the west side of the lands of Ascog and Kerryerucoch, the east boundary to the burn of Barnald, the south boundary,—along the loch or lake called Loch-Fad or Longloich, the lands of Chapelton, Ballieloan, Meikle-Barrone, Eskechranggan-Acholter, Cranslagmorie, and Easter Kames, on the west and north-west, and the sea on the north." The territories 'on the sea' are described as "beginning from the island of Pladda on the south, turning from thence to the west by the Kyles and straits between Arran and Kintyre, Argyle and Bute, and Loch-Kiddan to Clockstane, comprehending therein all the Kyles of Bute and Locastryn on the north; and from the foresaid Clockstane to the foresaid island of Pladda, comprehending therein the station of Cumbray, the station of Fairleg, the station of Hallijo, the island in Roranie, otherwise called Hemolathe Dan." But the burgh, as to all matters connected with the parliamentary franchise, having been thrown, by the reform statute, into the county of Bute, the extent of its territory has to be considered only in its municipal connections. The council consists of a provost, two bailies, a dean-of-guild, a treasurer, and 14 councillors. Constituency, in 1839, 249. After its own completion at Michaelmas, the council annually appoints the town-clerk, the procurator-fiscal, three town-officers, the jailer, and the collector of cess and other taxes. The town-officers, each of whom receives £5, and the jailer, who receives £15, are the only persons

who receive salaries. There are no corporations of guildry or craftsmen; but the magistrates have power to create burgesses, and have been in the practice of exacting the fees of burgh-ship as the condition of leave to carry on trade or manufacture. A stranger, if a merchant, must pay £3 3s.; if an artificer, £2 2s.; the eldest son of a burgher must, if a merchant, pay £1 11s. 6d.; if an artificer, £1 1s.; and a younger son, or a son-in-law of a burgher, pays three-fourths of what is exigible from a stranger. An itinerant merchant, before he opens sale-rooms, except on fairs and market-days, and for every time he re-opens sale-rooms, after having temporarily left the town, must pay £5 5s. for a license; but if he resides for a year, and satisfies the council that he intends to remain as an inhabitant, he receives back £2 2s. of what he paid, and is regarded as a burgher. The number of burghers, in 1833, was about 80. The property of the burgh consists of lands, feu-duties, the town-house, jail, and council-chambers, five church-pews, and a weighing-machine. Debts due to the burgh, in 1832, amounted to £2,594 18s. 5½d.; and debts due by the burgh, at the same date, amounted to £105 18s. 2d. The entire revenue for the year ending 1st October, 1832, was £353 7s. 11d.; and the expenditure, for the same year, was £211 3s. 3d. Right of harbour, with shore-dues and other dues, belonged to the burgh by charter; but they have been transferred to trustees appointed by an act of parliament "for improving, repairing, and maintaining the harbours of the burgh of Rothesay, in the county of Bute." These trustees are the magistrates and council, along with four persons elected in October by the Rothesay ship-owners. The council have been used, for time immemorial, to levy customs, great and small, on all goods brought within burgh, according to a table which has remained unchanged for time immemorial. The annual amount levied, as ascertained by the average of three years, ending in 1833, is £69 6s. 5d.; and burghers pay only one-half of the ordinary rates. The land-tax or cess amounts to about £42. An assessment to the amount of £16 10s. 5d. on the whole rental of the burgh is made for the schoolmaster's salary. No paupers' rates are levied.—The jurisdiction of the magistrates extends over the whole land-territory of the burgh as fixed by the charters; and previous to the emission of a decree by the court-of-session in 1820, it was also exercised maritimately over the whole coast of the shire of Bute and the adjacent lochs, as identified with the burgh's possessions 'on the sea.' Civil causes tried by the magistrates embrace actions for debts to any amount; but since the special statutes under George IV., the sheriff-court has, in cases of small debts, been resorted to in preference to the burgh-court. The criminal causes of late years have occurred chiefly in mere matters of police; and during 14 years, ending in 1833, they averaged not quite three in the year. The police of the burgh is wholly under the management of the magistrates and council. The three town's officers generally constitute the whole police force; and when necessary, they are aided by some constables. At fairs or markets the officers, and one or more constables, patrol the streets. When the jail needs to be watched, the inhabitants, to the number of two or more in turn each night, perform the duty either personally, or by paid substitute. The cleaning and the repairing of the burgh streets and roads are paid for from the statute-labour, from contributions by the inhabitants, and from the burgh-funds. Public wells, whence the town is supplied with water, are maintained by occasional grants from the burgh-funds, and by annual voluntary contributions of 6d. or 1s.

A gas-work was commenced in 1840 to light the town at night with gas.—On the north-east side of the entrance to Rothsay-hay stands a lighthouse, with a revolving and intermitting light. On the same side of the bay, inward from the lighthouse, is a battery, mounted with several pieces of cannon. The principal attractions in the vicinity of the burgh are MOUNT-STEWART, KAMES-CASTLE, and LOCHFAD, overlooked by Kean's cottage: See these articles. Population, in 1821, 4,107; in 1831, 4,817.

ROTHIEMAY, a parish in Banffshire; bounded on the north-west by Grange; on the north and north-east by Marnoch; on the east by Inverkeithnic; on the south by Forgue and Huntly; and on the south-west and west by Cairney. Its greatest length, from east to west, is between 7 and 8 miles; its greatest breadth is between 5 and 6; and its mean breadth is probably less than 2½. The burn of Knock traces the north-western boundary to the Isla; the Isla runs along the western and south-western boundary to the Deveron; and the Deveron moves in mazy folds now on the southern boundary, now across the interior, and now along the northern boundary. The last of these streams, the monarch-river of the county, flows here between richly wooded banks; and abounds with salmon, eel, and common trout. At the point where it leaves the southern boundary for the interior, and where its margin is pressed by the village of Rothiemay, occurs a happy mixture of well-enclosed fields and woods, which, with woods and corn-fields on the opposite side of the river, rising by a gradual ascent to a great height, form a beautiful rural scenery, equalled by few and perhaps excelled by none, of equal extent, in the kingdom. The northern district consists of a large, low, and partially tumulated table-land; part of which is an extensive moss, which supplies a wide circumjacent district with fuel, while the remainder is disposed in fir-plantations, pasture-grounds, and arable lands. From this platform a gentle declivity, of upwards of a mile, descends to the Isla and the Deveron. The plantations and natural woods occupy a considerable proportion of the whole area; and consist chiefly of fir, birch, ash, elm, and alder, besides larch, oak, beech, and other species. The pasture-lands bear but a small proportion to those which are in tillage; yet are such as to render the rearing of a few sheep and black cattle, for the market, prudent and remunerating economy. The soil of the arable grounds is, in general, rich and fertile. A little east of the village is Rothiemay-house, a seat of the Earl of Fife, and traditionally said to have afforded a night's lodging to Queen Mary; and on the estate of Mayer is an elegant residence.—The village of Rothiemay stands 6 miles north by east of Huntly, 12 south by west of Portsoy, and 15 south-west of Banff. Annual fairs are held here on the 3d Tuesday of May, the 1st Thursday of October, the Thursday before the 23d of November, and the 2d Tuesday of December,—all old style, except that in November. A Druidical temple occurs a little north of the village; and a supposed Roman iter runs north-westward through the western district. The chief road is that northward from Huntly to Portsoy and Banff. Population, in 1801, 1,061; in 1831, 1,228. Houses 278. Assessed property, in 1815, £2,651.—Rothiemay is in the presbytery of Strathbogie, and synod of Moray. Patron, the Earl of Fife. Stipend £175 3s. 6d.; glebe £10 10s. Unappropriated tithes £204 2s. 1d. Schoolmaster's salary £30 10s., with £18 4s. 9d. fees, £25 from the Dick bequest, and from £4 to £5 other emoluments. There is a non-parochial school. The parish boasts as a native the distinguished astronomer Fergussou.

ROTHIEMURCHUS, a parish in Inverness-

shire, united to the parish of Duthil in Morayshire. See DUTHIL and ROTHIEMURCHUS.

ROUCAN, a village in the parish of Torthorwald; 4½ miles south-west of Lochmaben; 3½ east-north-east of Dumfries; and 1½ north of Collin, Dumfries-shire. It stands on the face of a descent overlooking Lochar-Moss, on the road between Dumfries and Lochmaben, and is, for the most part, an irregular assemblage of cottages. Population 250.

ROUSAY, one of the Orkney islands. It lies parallel to the district of Evie, in the extreme north-east of Pomona, and is separated from it by a sound of from half a-mile to 1¼ mile broad; it has Eglishay along its east side, at the distance of a mile, and Weir along part of its south-east side, at the distance of ¾ of a mile; and it is distant 5½ miles due south from the headland of Skea in Westray. The island measures about 4 miles from east to west, and about 3 from north to south; and, but for being indented on the north by a broad but short bay, would be nearly circular, upon a diameter of 4 miles. On every side, almost from the very shore, the surface rises in hilly acclivity, and forms an upland mass of the general shape of a flattened cone; and this, being several miles around the shoulder, has a strong and imposing aspect. The ascent is in general steep; and, at intervals, it admits abrupt ridges and terraces, as if formed by the action and subsidence of billows that have now far receded. From a sward which is beautifully thick, smooth, and green, grey, foggy, and rugged rocks frequently look out, imparting to the whole surface a freckled and warted aspect. All the interior is fitted only for the rearing of sheep and black cattle, and exists in a state of commonage. A stripe of decidedly fertile land is carried round most of the island, between the base of the uplands and the beach; and is disposed in enclosures or 'touns,' most of which form pleasant little pictures. The shores on the west are rocky and precipitous; but those on the other sides are low or sloping, and clad with soil. In various parts are safe harbours for shipping; and the inhabitants industriously prosecute the fisheries. Horses and black cattle, large numbers of sheep, and a huge multitude of hogs, are maintained on the commons. Several small lakes send some rivulets to the sea; and the banks of the burn of Trumbland are rich in botanical specimens. A tolerable inn on the south side of the island invites all persons in search of the picturesque and the scientific, to include Rousay in a tour of the Orkneys. The principal mansions are Westness, and Westside, on the south-west coast. The chief antiquity is an ancient Norwegian encampment or Law Ting. Monumental stones, Priests' houses, and tumuli, are frequent. Population, in 1811, 795; in 1821, 834; in 1831, 921.

ROUSAY AND EGLISHAY, an united parish in Orkney. It comprehends the inhabited islands of Rousay, Eglishay, Weir, and Enhallow, and two holms in small pasture islands. So mutually adjacent are its various parts that the parish, measured across land and sea, has an extreme length from east to west of only 6½ miles, and an extreme breadth of only 5. Population, in 1801, 1,061; in 1831, 1,262. Houses 244. Assessed property, in 1815, £136.—The parish is in the presbytery of North Isles, and synod of Orkney. Patron, the Earl of Zetland. Stipend £157 18s. 1d.; glebe £9. One parish-church is situated in Eglishay, and another is situated on the south-east side of Rousay, within ¾ of a mile of Weir. A meeting-house of the United Secession stands in Rousay. In 1834, the parish-school was attended by 60 scholars, and three other schools by 113. Parochial schoolmaster's salary £26, with about £5 fees. Two of the non-parochial schools

are situated respectively in Eglisbay and Weir, and are open only during winter: the third is a General Assembly's school; and this and the parochial school are situated in Rousay.

ROUTER-BURN. See KILBIRNIE.

ROUTING-BRIDGE. See KIRKPATRICK-IRON-GRAY.

ROW, a parish in the western extremity of Dumbartonshire; bounded on the north and north-east by Luss; on the east by Luss and Cardross; on the south by the frith of Clyde, which divide it from Renfrewshire; on the south-west by Gairloch, and an artificial line of  $1\frac{1}{2}$  mile, which divides it from Roseneath; and on the west by Loch-Long, which divides it from Argyleshire. It consists of an irregular oblong, stretching north-westward and south-eastward, parallel to Gairloch, and measuring 9 miles in length, and from  $2\frac{1}{2}$  to 5 in breadth; and of a stripe, running up from the north-east corner along Loch-Long, and measuring  $2\frac{1}{2}$  miles by 6 furlongs. Its superficial extent is about 64 square miles. The surface consists principally of two mountain-ranges, and an intervening valley. The loftier and greater range forms, along its water-shed, the boundary with Luss; it is an elongated or continuous mountain, beautifully waved or curved into a series of summits; it is broad-based, soft-featured, and verdant; and, in several of its nodular and gently traced eminences, it attains an altitude of from 2,000 to 2,500 feet above sea-level. Glenfruin, which extends between it and the other range, is remarkable for wild, lonely beauty, and for doleful historical association: See GLENFRUIN. It has little wood, and is a natural funnel for the passage and the whirling sweep of high winds; yet it has much good soil, and is partly under cultivation. The ridge between it and Gairloch is properly a single elongated hill, broad in its base, straight-lined along its summit, but broad and marshy, gentle in descent at the ends, and, as to general outline, shaped not unlike an upturned row-boat. Its altitude, for about 4 miles, is quite or nearly 1,800 feet. On the side of Glenfruin, it is naked and heathy; but on the side of Gairloch, it has, up two-thirds of its acclivity, received from the hand of cultivation that highly ornate appearance which is noticed in our article on Roseneath. At its south-east end, for about  $1\frac{1}{2}$  mile inward from the boundary with Cardross, it softens down into land which is very gently upland, and nearly all cultivated and enclosed, and which might be not a little beautiful were it duly embellished with wood. The opposite shore and uplands of Roseneath are strikingly picturesque, and the general landscape seen from many points of the acclivity above Gairloch, has many of the same elements, and in some points nearly the same groupings, as those of the panorama beheld from Roseneath: See ROSENEATH. Finnard-hill, at the west end of the inner mountain-range, sends off spurs which fill all the parts of the parish bordering on Loch-Long, and which go down to the margin of the water in generally rapid declivities. The soil of the arable grounds is, for the most part, light and fertile. Husbandry is in a highly improved condition, and has reclaimed and enriched land as extensively, perhaps, as is yet possible for the art. Considerable attention is given to the rearing of black cattle, and to the dairy. Transition limestone and clay-slate abound, and have been worked, but both are of inferior quality, and scarcely compensate labour. Some apparently unmeaning, and certainly useless searches, have been made for coal. Ardincaple-castle, a beautiful seat of the Duke of Argyle, Ardenconnel-house, and many extremely elegant modern mansions built on perpetual lease from the lands of Sir James Col-

quhoun, press upon the shore of the Gairloch, and fling along the margin of the water, and up the lower ascent of the hill, a profusion of horticultural and forest embellishment. A part of Ardincaple-castle is of very ancient date. Ancient castles at Shandon and Faslane, are traceable only in the low grass-grown mounds of their mouldered ruins. The two prettily situated hamlets of Row and Gairloch-head,—the former the site of the parish-church, and the latter of a neat extension church,—are situated respectively  $2\frac{1}{2}$  miles up Gairloch, and at its head. The large village of HELENSBURGH [which see] stands at the entrance of the loch. The turnpike between Glasgow and Arroquhar creeps closely along the whole coast-line of the parish; and a road from Helensburgh to Luss and Balloch runs very near and parallel to the eastern boundary. Population, in 1801, 970; in 1831, 2,037. Houses 274. Assessed property, in 1815, £5,891.—Row is in the presbytery of Dumbarton, and synod of Glasgow and Ayr. Patron, the Duke of Argyle. Stipend £241 1s.; glebe £20. The amount of unappropriated tithes is debated. The parish-church was built in 1763, and was last altered in 1835. Sittings 700. A place of worship, above noticed, in connection with the Established church was, in 1837, built at Gairloch-head, and cost £800. Sittings 300.—An Original Burgher chapel—now connected with the Establishment, and made a *quoad sacra* parish-church—was built at Helensburgh in 1824, and cost £1,000. Sittings 700. Stipend £100.—An Independent chapel in Helensburgh was built in 1801, at a cost of £350 or £400. Sittings 550. Stipend £70.—A Baptist place of worship in Helensburgh, is the rented wing of a dwelling-house. Sittings 80. No stipend.—According to ecclesiastical survey in 1835, the population, exclusive of the very numerous class of summer-residents and visitors, consisted then of 1,500 churchmen, 300 dissenters, and 100 non-descripts, above 12 years of age, amounting, with children, to about 2,500.—In 1834, there were 9 schools,—eight of them private. Parochial schoolmaster's salary £34 4s. 4½d., with £12 fees, and £5 other emoluments.—The parish was erected out of ancient Roseneath in 1635, and named Row from the point or little peninsula—in Gaelic *ru*—which projects into the Gairloch near the church.

ROWARDENNAN, a little hostelry at the foot of Benlomonnd, on the eastern side of Loch-Lomonnd. The steamer, while proceeding to the head of the loch, regularly calls here, and lands or receives tourists.

ROWDILL (Loch), a marine loch or arm of the sea, at the south-east corner of Harris, in the Outer Hebrides. It penetrates little more than a mile into the land, but forks into two parts, and is covered across the entrance by an islet called Vally. Rowdill church is a very ancient and curious structure, originally the church of a monastery or priory dedicated to St. Clement, afterwards one of the parish-churches of Harris, but now a neglected though not much dilapidated ruin. It is of ancient and tolerable architecture, and "presents," says Dr. Macculloch, "some peculiarities in sculpture which are well worth the notice of an antiquary, and, from their analogy to certain allusions in oriental worship, objects of much curiosity."

ROXBURGH, a parish in lower Teviotdale, Roxburghshire. It is bounded on the north-west and north by the Tweed, which divides it from Makerston and Kelso; on the north-east and east by Kelso; on the south-east by Eckford; on the south by Eckford and Crailing; on the south-west by Ancrum; and on the west by Maxton. It consists of an irregular four-sided figure, 4 miles in

length south-eastward, by from  $2\frac{1}{2}$  to  $3\frac{3}{4}$  miles in breadth; and of a stripe 3 miles long, and nearly 1 mile broad, running up between Crailling and Maxton to Lilliard's Edge. Its superficial extent is about 14 square miles. The Teviot cuts the large division northward into two not very unequal parts; and, jointly with the Tweed, to which it speedily becomes united, flings upon the district a profusion of natural ornament. The general surface declines gently toward the streams; yet is waving, low, and pleasant. The highest ground is Dunse-law, at the extremity of the projecting stripe, and about 500 feet in altitude. The western and southern borders are naturally moorish, but have been improved, enclosed, and profitably subjected to the plough. The soil elsewhere is, for the most part, a rich, fructiferous, wheat-hearing loam. Much of the land between the rivers is so stony as to have originated a tradition, but evidently a mistaken one, that it was once all covered with town.\* If the parochial area be distributed into 400 parts, 295 of them are in tillage, 92 in pasture, and 13 under wood. The chief rocks are of the trap and sandstone families, little suited, in the case of either, to the purposes of building. Two springs near the Tweed have a remarkable petrifying power, and are environed with very curious petrifications. Caves of considerable extent, of interesting configuration, and once used as places of concealment, occur on the banks of the Teviot.—An immense natural dam, called the Trow-Craigs, and consisting of the newest trap, lies across the Tweed, but has been worn by the river into four slits, which, when there is no flood, admit in divisions or separated currents, the whole volume of water. Two of the slits are about 34 feet deep, and so narrow that a person may bstride them; and they and the other gulleets have a length of about 450 feet, and a descent of 16 feet; and they form eddies and rapids, and offer to the current alternate accelerations and obstructions, which at all seasons occasion a loud grumbling noise, and, at the breaking-up of an ice-storm, cause a tremendous roar, resembling the cry of the tempest-lashed sea, and heard at a great distance.—In almost every corner of the parish, the eye is presented with objects which nature and art seem vying how best to adorn. Hedge-row enclosures, files of trees among the fields and thickets, clumps and groves upon unarrahie knolls and rocky hillocks, and curvatures of slope, render the general aspect of the surface rich and beautiful. A tourist travelling eastward along the highway, a little west of the ancient castle, moves along the summit of a precipice lined with trees, and sees, immediately on his left, through the little vistas of the wood, the majestic Tweed rolling far below him, “dark, drumhly, and deep;” and, at a little distance on the right, the Teviot, forced aside by a rocky wooded bank, and meandering round a large plain. Advancing a brief space, he loses sight of both rivers, and is engulfed among wood in a hollow of the way; speedily emerging from the gloom, he looks upon one of the most brilliant landscapes in the world,—the ducal castle and demesne of Fleurs,—the splendid mansion and embellished grounds of Springwood-Park,—the gay and glad and most beautiful rivers of Teviotdale, each spanned by an elegant bridge,—and, right before him, Kelso and its immediate environs in all their glory. From a particular spot in the village of Roxburgh, a spectator looks, on the one hand, along a valley 8 or 10 miles in length, apparently all covered with trees, or but thinly diversified with glade and dwelling; and, on the other hand, has an open and very diversified prospect of double the distance, away to the mountainous summits of Carter-fell and the adjacent

heights. From a rising ground near the southern houndary, the Teviot, after moving awhile in concealment behind overshadowing hanks, rolls romantically into view, and instantly passes again into concealment. The summit of Dunse-law, crowned with an observatory or summer-house, and anciently a station of authority and strength, commands by far the most extensive and interesting of the local prospects,—one so vast, so rich, and so crowded with objects, including all the elements of rural landscape, three renowned castles, and a peep at the German ocean, as to defy succinct description.—The great Roman road, called Watling-sireet, from Yorkshire to the frith of Forth, bisects the south-west corner of the parish, and till recently was used as a drove-road for cattle into England. The ground vestiges, or strongly-vaunted lower walls of a fortalice, variously called Roxburgh, Sullaws, and Wallace-tower, the subject of many legends, and seemingly one of a chain of strengths between Roxburgh-castle and Upper Teviotdale, exist between the village of Roxburgh and the Teviot. Vestiges of numerous camps and trenches appear in various localities. Vestiges of villages, malt steeps, and other memorials of inhabitation, are numerous, and indicate the population, irrespectively of that of the town, to have formerly been very considerable. Minor antiquities are multitudinous and very varied. The chief and higher antiquities will be afterwards noticed.—The villages are Roxburgh and Hightown; noticed, the former below, and the latter in its alphabetical place. The turnpikes from Kelso to respectively Hawick and Melrose, pass up the right hanks of the rivers. Population, in 1801, 949; in 1831, 962. Houses 196. Assessed property, in 1815, £9,564.—Roxburgh is in the presbytery of Kelso, and synod of Merse and Teviotdale. Patron, the Duke of Roxburgh. Stipend £225 2s. 7d.; glebe £20. Unappropriated teinds £1,346 4s. 4d. There are two parish schools. Salary of the first master £34 4s. 4½d., with from £12 to £15 fees; of the second £17 2s. 2½d., with £17 9s. fees. The parts of the ancient parish on which stood the burgh and the castle, are now united to KELSO: which see. A chapel, subordinate to the mother church of Old Roxburgh, anciently stood on the manor of Fairington.

ROXBURGH, a village, and anciently a town, in the centre of the cognominal parish, 2 miles south of the Castle of Roxburgh, and  $3\frac{1}{4}$  south-south-west of Kelso. It figures in early history just as distinctly as Old Roxburgh; but it never rivalled the importance, or imitated the grandeur, or shared the proud notice of the burgh, and it escaped the burgh's fate. Its fortunes, while obscure, have been fluctuating; and, even within the last century, have ebbed and flowed with the effect of greatly diminishing and then doubling the population. Unequivocal evidences exist, or have been dug up all round it, of its once having possessed the hulkiness of a town. It stands on a pleasant southerly slope, half-a-mile west of the Teviot; and is divided by a small rivulet into the Upper and the Nether Towns. In the midst of it stands the parish-church, an edifice of 1752. Population, in 1792, about 200; in 1840, about 400.—OLD ROXBURGH, now quite extinct, stood over against Kelso, on a rising ground at the west end of a fertile plain, peninsulated by the confluence of the Tweed and the Teviot. Brief but obscure notices by various historians indicate that it was a place of considerable note long previous to the 12th century, but fail to throw light on its condition, or furnish any certain facts in its history.\* While David I.,

\* No mention is made of Roxburgh till after the Norman conquest. The word, indeed, claims a Norman origin. In

who mounted the throne in 1124, was yet only Earl of Northumberland, the town, as well as the castle, belonged to him as an appanage of his earldom; and appears to have been so flourishing that it could not accommodate the crowds who pressed into it to enrol themselves its citizens. An overflow of its population was the occasion of the erection of the new town, the original of the present village, and the Easter Roxburgh of history. Whether the new town was built by David, or at a period prior to the date of his influence, is uncertain; but the fact of its being an offshoot at so early a period, strikingly evinces how great and attractive a seat of population the district at the embouchure of the Teviot was in even rude and semi-barbarous times. Among other elements of the old town's importance in the time of David, it possessed an enincincturing fortification of wall and ditch, and had, under the superintendence of the abbot of Kelso, schools which figured magnificently in the age's unpolished tales of fame. When David ascended the throne, it became, as a matter of course, a king's burgh, and possibly was the one which the monarch most favoured; and, in the loose phraseology of such general history as overlooks the fact that royal burghs were a commodity of later invention, it is said to have been one of the first royal burghs which David erected. It eventually wore all the forms of burgh honour; it was governed by a provost or alderman and bailies; it had a burgh or city seal; and it was the seat of a mint,—coins of William the Lion, and of James II., having been struck in it, the latter probably during the king's siege of the castle. So early as the reign of William, it enjoyed the privilege of a weekly market;

Kelham's Dictionary we have "*Rokeboruth*, Roxburgh;" from *roke*, a rack, and *boruth*—perhaps originally written *boruch*—evidently the same with the Anglo-Saxon *borh*, *burgh*, 'a borough.' In charters of David I. the orthography is *Rokesburg*. It also appears as *Roksburg*, *Rocesburg*, *Rochelburg*, *Rokesburck*, *Rosburg*, or *Rosburgh*—which is the vulgar pronunciation—and *Rousburge*. Some have urged that this is the proper appellation of the place, being most expressive of its beautiful situation; as in the supposed etymon of Montrose from *Mons roserum*. "Where Tweede and Teivy [Teviot] unite their streams," says Camden, "is Rosburgh or Roxburgh, anciently called *Marchidun*, because situate on the marches, where is a castle antiently very strong by nature and art." It has been objected to this derivation of the word, that Camden's intimation is not warranted by the fact; as it was not a town in the marches. But if by this is meant that Roxburgh was not included in the district commonly called the Merse, it should be observed, that, when Camden wrote, this name had been used with greater latitude; for he reckons Kelso a town belonging to it, from which Roxburgh is not a mile distant. As Northumberland extends up the river Tweed, within a few miles of Roxburgh, it might with great propriety be denominated a fort on the boundary. The anonymous Geographer of Ravenna, who wrote in the 7th or 8th century, having denominated a town in North Britain *Marcolaxon*, Baxter views this as a slight error for *Marcosaxon*; and as undoubtedly denoting Roxburgh, formerly denominated *Marchidun*, or 'the Town of the Boundary.' For here, he adds, "anciently was the boundary between the Saxons and Pictish Britons; *Mare* in both languages signifying 'a sign,' and also 'a limit.'" Both Johnstone and Finkerton, however, give the word in the form of *Marchidun*. "*Marchidun*, in the British poets," according to Chalmers, "would signify the towering fortress; and this name would be very descriptive of the position of Roxburgh, if we suppose, what is not improbable, that there was some fortress of the Gadeni upon this lofty knoll, when the Romans entered their diversified country." It affords a strong presumption that there was a Roman station in the neighbourhood, that, in the Advocates' Library of Edinburgh, there is an altar inscribed to the *Divi Campestres*, or *Faries*, which was found in the romantic vicinity of Roxburgh-castle. Chalmers refers to the Welsh *marc*, 'towering,' or 'of high or luxuriant growth,' and to *din*, 'a border or limit,' 'a fortified hill, or mount.' But, as this etymon is not supported by the height of the knoll, the term might be more naturally traced to the Anglo-Saxon *mare*, or *meorce*, 'a march,' and *dun*, 'a hill.' This derivation also more nearly corresponds with its subsequent designation of *Marchemond*, or *Marchimond*, latterly *Marchmont*. Sir James Dalrymple throws out a singular fancy in regard to the origin of the word: *Marchmont*, "a name," he says, "perhaps given it by the Romans, esteeming time as a part set upon the march or boundarie of the world." As if a part set upon the march or boundarie of the world." As if the last syllable had been from the Latin *mundus*, 'the world.' Boere has given it a new designation, *Marchenium*, which is more obscure than any of the rest.

and, at a very early period, it had the privilege also of an annual fair,—the original of the great fair of St. James, which continues to be held on its site, and now belongs to Kelso. In 1368, its magistrates having sworn fealty to Edward III., it received from that monarch a charter confirming to its burgesses all the privileges bestowed on them by the kings of Scotland; and, in 1460, in consequence of its having succeeded to the power of England, and forgotten alike its patriotism and its loyalty, it was erased from the list of Scottish burghs. The town is said to have been the fourth in Scotland, in point both of population and of general importance; both in the year 1369 and in that of 1460, it was captured and burned; and, owing to its building material having been principally timber, it sooner decayed, and went more deeply into extinction, than a much smaller defunct town of stone. But its history is in most particulars identified with that of its castle, and will better be told in connection with a notice of the celebrated pile.—Near the town, on the Teviot side, at the site of a little hamlet which still bears the name of Friars, anciently stood a convent, now quite untraceable, for Franciscan monks. In the vicinity stood also a *Maison Dieu*, or hospital, for the reception of pilgrims and of the diseased and the indigent.

Roxburgh gives the title of Duke to the noble family of Ker of Cessford; but, as used in the title, is in general capriciously spelt *Roxburghe*. The Kers of Cessford and of Ferniehurst, or the Duke of Roxburgh and the Marquises of Lothian, sprang from the same root; and are regarded as in common or jointly the head of the sept of Ker, Kerr, or Carr,—a name which abounds in the south of Scotland, particularly in the counties of Roxburgh and Berwick, and is derived from the British word *Car*, aortalice or strength. Walter Ker of Cessford, a powerful border baron, whose Anglo-Norman progenitors had settled in Teviotdale in the 13th century, received, in 1499, from James IV., a grant of the site of the ruined town and castle of Roxburgh. In 1599, his descendant, Sir Robert Ker, was ennobled by the title of Baron Roxburgh, and, in 1616, was advanced to the dignity of Earl of Roxburgh. Jean, the daughter of the 1st Earl, married the Honourable Sir William Drummond, fourth son of the 2d Earl of Perth. The new line introduced by this marriage retained the surname of Ker, and carried down the peerage as if the line had been direct. In 1707, John, the 3d Earl, was created Duke of Roxburgh, Marquis of Bowmont and Cessford, Earl of Kelso and Viscount of Broxmouth. John, the 3d Duke, and grandson of the 1st, lived in celibacy, and left behind him at his death a vast accumulation of wealth.\* William, 7th Lord Bellenden, and a descendant of the 2d Earl of Roxburgh, succeeded the unmarried Duke as heir of entail; but he enjoyed his new honours during only about a year, and, in his turn, died without any immediate heir. A sharp, intricate, and lengthened contest now arose respecting the inheritance of the titles and the estates. In 1812, Sir James Innes Ker was at

\* While travelling on the Continent, he and Christiana, eldest daughter of the Duke of Mecklenburg-Strelitz, formed a mutual attachment, and were on the eve of being married, when Charlotte, a younger sister of the bride-elect, became espoused to George III., and etiquette was proudly interpreted to forbid that the elder sister should assume a station which would render her subject to the younger. The Duke and the lady, in consequence, broke off their match, yet testified the warmth of their mutual affection and esteem by permanently remaining strangers to wedlock. His Grace was a distinguished book-collector and virtuoso; and instituted in London a club, which took from him its designation of Roxburgh, and has for its chief object the amassing of a museum of rare books and articles of vertu. It still survives, and has numbered many distinguished literati among its members.

length declared the successful competitor, the true heir and the 5th Duke; and even he was so remotely akin as to achieve success in the capacity of heir-male of Margaret, daughter of Harry, Lord Ker, who figured in the troubles of the reign of Charles I., and died in 1643. His son, James Henry, the present and 6th Duke, succeeded to the honours in 1823; and in 1837, was advanced to the peerage of the United Kingdom, by the title of Earl Innes. The chief seats of the family are Fleurs, in the vicinity of Kelso, and Broxmouth, near Dunbar.

**ROXBURGH CASTLE.** The situation of Roxburgh on the border of our ancient kingdom, in a district continually exposed to inroads from one side or another, rendered the occupation of it a matter of the greatest importance to the contending powers. Its very site seemed to mark it out as a rock of strife. It was, therefore, a continual eyecore to the party that were not the immediate occupants. The remains of this castle appear on a rocky eminence on the margin of Teviot, near the place of its confluence with Tweed, rising about 40 feet above the plain. The walls—part of which are still standing—have been of great strength. The south wall, as Pennant has observed, impeded over the Teviot, a part of whose waters were directed by a dam thrown obliquely across the stream at the west end of the castle, into a deep fosse, which defended the fortress on the west and north, emptying itself into the river at the east end thereof. Over this moat, at the gateway from the town, was thrown a drawbridge, the remains of which were but lately removed. David, preparing to invade Northumberland—which he claimed in the name of his son Prince Henry—Thurstin, the aged archbishop of York, repaired to Roxburgh, and persuaded the king of Scots to consent to a truce, until Stephen should return to England. This visit Lord Hailes assigns to the year 1136; the Chronicle of Mailros to the following year. When Stephen afterwards entered into the north of England, in order to rescue it from the Scottish invaders, A. D. 1138, David retired at his approach, and occupied a strong camp in the neighbourhood of Roxburgh. At this place, in 1152, the good old king was residing, when his nobles came to condole with him on the severe loss he had sustained in the death of his amiable and excellent son. William the Lion having been taken prisoner by the English, Henry II. would consent to liberate him solely on the ignominious condition, that he should become the liegeman of the King of England: and, as a pledge of the performance of this disgraceful treaty, William agreed to deliver up to the English the castles of Roxburgh, Berwick, Jedburgh, Edinburgh, and Stirling; and gave his brother David and many of his chief barons as hostages. This took place, A. D. 1174. Wyntoun mentions only three of these castles.

— To be kept, was there accord  
For the delyverans of our Lorde,  
The three castellis of Roxsburch,  
Of Berwyk, and Edynburch.

CRONYKIL, B. vii. c. 8, v. 149.

Bromton says that Richard I. restored Rokesburgh and Berwike to the Scottish king. This must refer to the year 1190, when William "gave to Richard 10,000 merks of gold and silver, for the dignities and liberties and honours which he had before the war;" that is, for releasing him from his ignominious bond of vassalage; "and for Berewie and Rokesburch, which King Henry violently held for sixteen years." At Roxburgh, in 1193, William gave his daughter Margaret to Eustace de Vesci. The same year, he sent from Roxburgh 2,000 merks of silver for the redemption of Richard, King of England.

Having proceeded, in 1197, to Moray, with an army, against the rebels who were led by Torphin, the son of Harold Earl of Orkney, he marched onward to the northern extremity of Scotland, seized Harold, and consigned him to imprisonment in the castle of Roxburgh, until his son Torphin delivered himself as an hostage for his father. Lord Hailes conjectures—with great appearance of truth—that this sum made part of the price he had engaged to pay for the independency of his crown. In the year 1207, a considerable part of Roxburgh was accidentally burnt; as it was intentionally subjected to this calamity nine years afterwards, in common with Werk, Alnwick, Mitford, and Morpeth, from the vengeance of John of England. It is asserted by Fordun, that it again met with the same fate, in common with almost all the burghs of Scotland, A. D. 1244. In the castle of 'Rokisburc,' on the day of Pentecost, 1227, did Alexander II. confer the honour of knighthood on his kinsman, John Earl of Huntingdon, known by the name of John the Scot, the son of Earl David, and many other noblemen. In this place also, in the year 1239, was Alexander married to Mary, the daughter of Ingelram de Couci; and here was his son, and successor, Alexander III., born in 1241. To this fortress, according to the Chronicle of Mailros, in the year 1255, did Alan Ostiarius, or Durward, with his rebellious associates, carry this king, while only fourteen years of age, from the castle of Edinburgh, and retain him under their power. This was also the place of refuge for Alexander and his young queen, who, "by the guardians of the kingdom, had been prohibited from consummating their marriage, she being kept by them in strict confinement." This obviously refers to their liberation, above mentioned, by the agency of Alan Durward. Here, too, in the same year, Henry III. of England had an interview with Alexander, who had married his daughter Margaret in 1251. Here also, in 1283, was celebrated the marriage of Alexander, Prince of Scotland, with Margaret, the daughter of Guy Earl of Flanders. Edward I. claiming right as lord-paramount of Scotland, directed a letter from Norham, June 13th, 1291, to William de Soules, commanding him to deliver the castle of Rokesburgh to William de Grantessoun. On the 4th August, same year, Grandison is ordered to deliver the said castle to Brian the son of Alan. At this time the town of Roxburgh must have been a place of considerable trade. For a safe conduct is, this year, granted by Edward to his beloved noble, Richard le Furbur, burgess and merchant of Rokesburgh in Scotland, for travelling with his goods, merchandise, and people, throughout his dominions. During the interregnum, the public writings and records had been transmitted from Edinburgh to Roxburgh, where the auditors, appointed, for Scottish affairs, by Edward I., held their assemblies. In the year 1295, the pusillanimous John Baliol consented that Roxburgh, with Berwick and Jedburgh, should be delivered to the Bishop of Carlisle, as a pledge of the adherence of Baliol to the interests of Edward. In 1292, Edward himself resided at Roxburgh during a considerable part of the month of December. This fortress was yielded to him, in 1296, by James, the steward of Scotland. In the following year, an unsuccessful attempt was made by the Scots to retake it; but on Shrove-Tuesday, 1313, it was surprised by James Lord Douglas, while the garrison were indulging in riot. Here Edward Baliol made a solemn surrender of the liberties of Scotland to Edward III., A. D. 1332, acknowledging him for his liege lord; at the same time, by letters-patent, alienating to Edward, as a recompense for his support, *inter alia*, the town, castle, and

county of Roxburgh, to be annexed to and incorporated with the crown of England for ever. In this castle was Mary de Bruce, the sister of King Robert, kept in an iron cage, from the year 1306 to 1310. Here Edward III. twice celebrated his birth-day. It continued in the hands of the English, till stormed and taken by Alexander Ramsay, in 1342, when the government of it was given to William Douglas. It was retaken by the English after the battle of Hexham or Durham; and Copland—who had made King David Bruce prisoner—was nominated governor of it. Here Edward Baliol, A. D. 1355-6. made an absolute surrender to Edward III., not only of all his private estates in Scotland, but of the kingdom of Scotland, by delivery of a portion of the soil, and also of his golden crown. "In 1372, George Dunbar, Earl of March, accompanied by his brother, the Earl of Murray, with a large body of their dependents, entered Roxburgh at the time of the annual fair, and, in revenge of the death of one of their followers, who was slain the preceding year in an affray, slew all the English they found in the town, plundered it of the great quantities of merchandise and goods which were collected there" for sale, "and reduced the town to ashes." As, from the disastrous battle of Durham, in the reign of David II., the castle of Roxburgh had still continued in the hands of the English, no further notice is taken of it till the year 1398, when, during the truce, the Earl of Douglas's son, with Sir William Stuart and others, taking advantage of the critical situation of Richard II., broke down the bridge at Roxburgh, plundered the town, and ravaged the adjacent lands. In the year 1411, Douglas of Drumlanrig, and Gavin Dunbar, adopted the same course of hostility; for they broke down the bridge of Roxburgh, and set fire to the town. James I. made a vain attempt to recover this fortress, in 1435, of which Bellenden gives the following *naive* account. "The king past with an army to sege the castell of Marchmond, that is to say Roxburgh. The Scottis war nowmerit in this army to II.C.M. men, hy [hesides] futmen and caragemen. At last quhen the kyng had lyne at the sege foresaid xv. dayis and waistit all his munitioun and powder, he returnit haim, hut ony nair felicité succeeding to his army."

In 1460, James II.—perhaps from the idea of its being a disgrace to the Scottish crown, that Berwick and Roxburgh should continue so long under the dominion of England—laid siege to the latter, with a numerous army, well-furnished with artillery and warlike machinery. He had taken the town, and levelled it to the ground; but, during the siege of the castle, while he was overseeing the discharge of one of his pieces of ordnance, so remarkable for its size that it was called 'the Lion,' it burst, and the king was almost instantaneously struck dead. A large holly, enclosed by a wall, marks the fatal spot. The queen, Mary of Guelder, who immediately on the mournful tidings arrived in the camp, bringing her eldest son with her, then a boy of about seven years of age, conducted herself with such heroism on this mournful occasion as to inspire the troops with redoubled spirit, and the garrison, finding themselves reduced to extremities, surrendered the fortress. "That the place," says Redpath, "which the English had held for more than a hundred years, might thenceforth cease to be a centre of rapine and violence, or a cause of future strife between the nations, the victors reduced it to a heap of ruins." In this dismantled state did it remain till the English army, in 1547, under the Protector Somerset, encamped on the plain between the ruins of the castle of Roxburgh and the confluence of Tweed and Teviot. Observing the strength

and convenience of the situation, he resolved to make the fortress tenable. This he did; leaving in it a garrison of 300 soldiers and 200 pioneers, under Sir Ralph Bulmer. While the English were at Roxburgh, a great number of the Scottish gentry in this district came into the camp, and made their submission to Somerset, swearing fealty to the King of England.\*

ROXBURGHSHIRE, a county in the middle of the border-district, or southern marches of Scotland. It is bounded on the north by Berwickshire; on the north-east and east by Northumberland; on the south-east by Northumberland and Cumberland; on the south-west by Dumfriesshire; and on the west and north-west by Selkirkshire, and the southerly projection of Mid-Lothian. It is situated between 55° 6' 40", and 55° 42' 52" north latitude; and between 2° 11" and 3° 7' 50" longitude west from Greenwich. Its greatest length, from the point where it is left by the Tweed in the north-east, to that at which it is left by the Liddel in the extreme south or south-west, is 41 miles; and its greatest breadth in a direction at right angles with the line between the above points, is 29 miles. Its medium length is about 30½ miles; and its medium breadth about 22½. Its superficial extent, as stated by Dr. Douglas, in his Agricultural Survey of the County, is 672 square miles, or 430,080 acres; and, as estimated by Chalmers from Arrowsmith's map of Scotland, is 696 square miles, or 445,440 acres. Its form is so irregular as not easily to be reducible to any one mathematical figure, either single or complex; but, in general, it is broad, protuberant, and of very ragged outline on the north, and narrower, more regular, and finally attenuated to a point in the south. The boundary-line for 29 miles on the south-west, or with Dumfriesshire, is strictly natural, consisting for a brief space of Mare-hurn, which flows into the Liddel, and, over all the remainder of a water-shedding range of mountain-summits; and over all the south-east and east, or with England, a distance of upwards of 60 miles, it is at least proximately geographical, consisting chiefly of mountain or gently upland water-sheds, and of the course of the Kershope and small part of the Liddel; but, on all other sides, it is utterly artificial, runs a tilt against all geographical landmarks, and repeatedly becomes so capricious and whimsical as thoroughly to tantalize. The Tweed—which actually at two points, one of 1½ mile in the east, and the other of 5 miles near the middle, forms the northern boundary-line—might have served as a very distinct natural frontier along the whole of the north; but it is overleaped by two sections of the county, which respectively belong in geographical though not political division, to Lauderdale and the Merse. A mountain-water-shed, though one of some sinuosity, and of invasion upon Selkirkshire, might have been found along the west

\* A circumstance has been mentioned, regarding the history of this castle, which, could we give it credit, would not be without considerable interest. It has been generally asserted, that the unfortunate James IV. wore an iron chain about his waist, as a voluntary penance for his unnatural rebellion against his royal father. In a manuscript history of Scotland, written by the Earl of Nithsdale, and preserved in the Scots college at Douay, it is said, "that, during the usurpation of Cromwell, a skeleton, girded with an iron chain, and enclosed in a bull's skin, was found among the ruins of the old castle of Roxburgh; and that the iron chain which King James IV. did at no time lay by, made people generally believe that it was the body of that prince which they had discovered; but that the nation being then in subjection, there was no way to make a further trial of the matter, so the skeleton was interred without any ceremony in the common burial-place." This story tallies in some degree with one account of the death of James, mentioned by Buchanan as current after the event; that he recrossed the Tweed, and was slain by some of Home's men, near the town of Kelso. There have, however, been such various accounts of his death, and of the disposal of his body, that the fact must be left as a matter of absolute uncertainty.

simply by following the hither rim of the basin of the Ettrick; but both it and other geographical lines have been so utterly disregarded, that considerable pieces of the two contiguous shires are mutually dovetailed, and a small part of Selkirkshire is even quite insulated. The county—owing, in two instances, to the defiance of natural boundary, and, in one, to a total difference of direction in the general declination of the surface—necessarily arranges itself into four very unequal divisions. The first division projects northward of the Tweed, between the rivers Gala and Leader; constitutes only part, though the larger one, of the parish of Melrose; and comprehends 28 square miles, or 17,920 acres. The second division projects northward of the Tweed into the Merse; includes the parishes of Smailholm, Makerston, Kelso, Stichel, and Ednam; and comprehends 27 square miles, or 17,280 acres. The third division forms the extreme south of the county; has its whole general declination southward, with the eventual direction of its streams through the Liddel and the Sark to the Solway frith; consists of the single parish of Castletown; bears, from its main draining-stream, the name of Liddesdale; and comprehends 120 square miles, or 76,800 acres. The fourth division amounts to between 14 and 15 twentieths of the whole area; it constitutes, as to both bulk and position, the great body of the county; it bears the general name of Teviotdale, and sometimes occasions that name to be a synonyme with Roxburghshire; but, on the one hand, it cedes to Selkirkshire some little districts which are drained by the upper courses of the tributaries of the Teviot; and, on the other, it includes a district on the Tweed, in the west, whence the Teviot draws no tribute, and two or three pendicles in the east, which are drained by the Bowmont and other streams into Northumberland; and it comprehends 521 square miles, or 333,440 acres. The measurements of these divisions are those of Chalmers, and give a total which corresponds with his estimate of the aggregate superficial extent of the county.

The surface of the two divisions north of the Tweed, and of the whole northern part of Teviotdale, jointly constituting what without impropriety might be called Lower Tweeddale, is, as compared to the rest of the county, decidedly champaign,—undulating, and even boldly variegated, but not upland, or anywhere markedly hilly,—flattened down in the Merse district into nearly a level,—fashioned, along the south side of the Tweed, into a sort of rolling plain,—heaved aloft nowhere into pastoral and commanding heights, except in the classical Eildon-hills behind Melrose, and in William-law on Gala-water,—and almost everywhere, but especially in the immediate vicinity of the Tweed, exquisitely rich in the adornings of arboriculture and husbandry. The country south of this united district is, in a general view, all hilly, and over a great extent mountainous. Vales and hanging plains follow the courses of the Teviot and its tributaries; and along with most of such acclivities as can be climbed by the plough, are generally in tillage, and often profusely embellished with wood. The country between these intersecting hollows is a constant series of hills, all beautiful, nearly all rounded, and, with hardly an exception, deeply and warmly green; and the country beyond, including Liddesdale and the eastern and south-western and western borders, is boldly mountainous or sequesteredly pastoral,—in most places verdant, and softly outlined, though alpine in its heights,—in a few, bleak, moorish, harsh, and barren,—and in most, cloven down at intervals into pretty glens, spotted over with tillage, and occasionally but sparingly adorned with wood.

A towering range, the commencement in Scotland of that which stretches from the Northumberland Cheviots quite across the island to the Western sea, in the south of Carrick, comes in, with its loftiest summit-line, at a point 7 miles south-south-east of where the Tweed leaves the county, and extends, in its water-shed, along or near the whole of the eastern and south-eastern border, till it strikes the division of the English Tyne and the Rule; and it thence runs westward between Teviotdale and Liddesdale, and finally passes off north-westward, forming the upper rim of the basin of the Teviot. This great range, particularly where it cuts off Liddesdale from the rest of the county, sends up as menacing summits, and has as alpine roads or passes as occur in most districts of even the Northern Highlands. But interior from it and its spurs, the only singular or arresting eminences are Ruberslaw, Dunian, and the heights of Minto; and even they, as they hang in one grouping over the opposite sides of the Teviot, only tend to fling an aspect of brilliance over a district which, without them, might have been tamely or but hoysedly hilly. In general, the uplands of the county are both ornamental and useful; and while they occupy much of the superficies, they contribute largely to landscape, and profusely to pasturage. Very few of the heights are cheerless; none are rugged or tremendous; and many both give and command prospects at once beautiful, variegated, and delightful. Crawford, in his lyric of the Cowdicknowes, fondly speaks of

“Teviot braes so green and gay;”

and Gilpin, in his Tour, talks of sheep covering the downy sides of the valleys of the Teviot, and, from the depth of the verdure and the suddenness of the slope, often appearing to hang upon immense green walls. The landscapes of the county are, in very many instances, beautiful, but in few romantic or sublime,—almost always agreeable, and occasionally thrilling, but seldom magnificent, or such as fill, or strongly exercise the imagination.

No county in Scotland, much less in the other sections of the United Kingdom, excels Roxburghshire in the number and beauty of its running waters. Those of Perthshire, indeed, are equal or superior in number and magnitude, and they bear no comparison for romance and grandeur; but they are far inferior in variety and in all the softer and more graceful and alluring elements of landscape. The streams of Roxburghshire are sacred to song; and far more than those of any other county, figure in the lyrics and the various outpourings of the sweetest poetry of Scotland. The Tweed is the chief of all, both in bulk and in beauty; and rolls in majestic sweeps along the north, in a direction principally eastward, but tending to the north-east. It comes in from Selkirkshire, finds itself twice, for a brief way, on the boundary with Berwickshire, and takes leave at the point of its beginning to divide Scotland for England. The Ettrick touches the county but for a mile or two before falling into the Tweed. The Gala, the Allan, the Leader, and the Eden, come in one instance from Edinburghshire, in one from the extremity of the north-west projecting district, and in two from Berwickshire, and all join the Tweed on its left bank. The Teviot, the other great river, belongs wholly to the county, and runs north-eastward, from its south-west extremity, nearly through its centre, to the Tweed at Kelso. Besides the rivulets which rush down upon it from their springs in the mountain-land near its origin, this ample and very beautiful river receives from the heights on its left side the Borthwick and the Ale, and from the many hills and vales of the Cheviot range, the Al-

lan, the Slitrig, the Rule, the Jed, the Oxnam, and the Kail. The Liddel, receiving on its right bank the Hermitage and the Tinnis, and on its left the Blackburn, the Kershope, and some smaller tributaries, runs south-south-westward through Liddesdale. The Bowmont, the Coquet, and some other hut smaller English streams, have a brief connection with the eastern border.—The lakes of the county are not very numerous; they are all small, and fit only for parochial notice; and they occur chiefly in the parishes of Roberton, Morebattle, Linton, Ashkirk, and Galashiels. Petrifying springs occur in the parishes of Roxburgh, Minto, and Castletown; chalybeate springs in Jedburgh, Oxnam, Crailing, St. Boswell's, and Castletown; and 'consecrated' wells, as St. Helen's, St. Robert's, and St. Dunstan's, in the neighbourhood of Melrose.

Trappean and porphyritic rocks, in all their varieties, and in nearly all their modes of occurrence, are found in the county. Felspar porphyry, for the most part a reddish brown, is most abundant, and composes nearly all the Cheviots in Yetholm, Morebattle, Hownam, and the larger portion of Oxnam. Greenstone, basalt, amygdaloid, trap tuff wacke, and other trappean varieties, occur in a large part of the county, at intervals of a mile and less, in nodules, in dikes, or otherwise, generally breaking and dislocating sandstone, and sometimes, though not often, lying undisturbedly beneath it. Red sandstone, of disputed age, generally possessing the characters of the new, but often occupying the position of the old, occupies the larger part of the central and northern districts of the county; and occurs elsewhere in detached or isolated sheets, indicative of its prevalence at one period over a much larger area. Transition rocks, consisting almost entirely of greywacke and greywacke slate occupy all the western district, and make a sweep round the south so as to shut out but not to enter Liddesdale; and they are separated from the sandstone district by a line from near the point where the Leader first strikes the county, past the base of the Eildon hills, and by Bowden and Hassendean curvingly to Southdean, Old Jedburgh, and Oxnam. But the region of these rocks in the latter or curving and southerly part of it, is greatly narrowed on the Cheviot side by the invasion of trap, and much overlaid on the other with the red sandstone, and in the interior is frequently dislodged and shivered up into vertical arrangement by towering and abrupt hills of porphyry and trap. The coal formation and superincumbent strata, consisting of red, grey, and micaceous sandstones, carboniferous limestone, clay-ironstone, shales, and thin seams of coal, come in from the Northumbrian coal-field, and, with local variations and some interruptions, more or less distinctly occupy Castletown or Liddesdale, and parts of Ednam, Sprouston, Kelso, Bedrule, Jedburgh, and Southdean. The coal is mineable only in Liddesdale; and limestone, whether carboniferous or of other formations, is but limitedly calcined for sale.

In the pastoral regions the soil is dry, wet, or heathy. The dry prevails all eastward of the Jed; and, with very slight interpatchings of heath, and but few and small and drained marshes, has a thick sward of rich and sweet grass. A large tract of stubborn clay, lying on a cold impenetrable till, stretches from the south-west skirt of Ruherlaw to the confines of Liddesdale. This and Liddesdale, or the districts south-west of the Jed, while almost wholly pastoral, are the wettest portion of the county, yet contain no small proportion of dry land, and many spongy fields which produce coarse grass, and are susceptible of great improvement by draining.—In the arable district the soil is partly light

and partly heavy. The light consists of rich loam, or mixtures of sand and loam, gravel and loam, and sand, gravel and clay, in every variety of proportion, —each species of very different qualities and degrees of excellence, and distinguishable also by the nature of its subsoil; and it is in general found on low and level lands in the vales of the streams, but occurs likewise on several eminences of considerable extent, especially in the parishes of Linton, Eckford, Crailing, Ancrum, Maxton, and Melrose. The heavy soil consists chiefly of clay of different depths and densities, or of mixtures in which clay predominates, lying on tilly or otherwise retentive subsoil; and it chiefly occupies the high grounds, and except where lying on a dry bottom, or strangely interpatched with light soil, almost never appears in valleys. It somewhat prevails in the parishes around Kelso, on both sides of the Tweed, and there, when in considerable quantity, is generally friable and fertile; and it covers an area of 10 miles by 4, or about 10,000 acres, stretching away southward from the Eildon hills, and including nearly the whole of Bowden, Lilliesleaf, and Minto, and parts of the parishes on their north flank, and is there over one-half the extent rich and fructiferous, and over the other half shallow, cold, churlish, resistant of tillage, uncertain in agricultural produce, and, in consequence, largely devoted to plantation.

The Saxons, who began to come in upon the Romanized Britons in the 5th century, commenced and carried on, during the long progress of their intrusion, a sort of incipient husbandry. Yet, so late as the close of the 11th century, the whole extent of Roxburghshire, in spite of the little clearings and improvements which they had effected, was sheltered by forests, overrun with copses, or disfigured by wastes. The expanses of woodland were aggregately and even individually vast; and they afforded retreat and covert to great tribes of the wild cat, the boar, and the wolf. Monks and barons now numerously claimed an interest in the soil, and commenced a contest, the former to destroy the wild beasts for their profit, and the latter to defend them for their sport; and the monks acquiring the ascendancy, pronounced lessons of profitable industry, pointed the way to georgical improvement, and showed the country an example of clearing woods, reclaiming wastes, and introducing cultivation. The many manors which existed in the county during the age of David I.—each, according to the custom of the period, provided with its church, its mill, its malt-kiln, and its brew-house, and containing a district of arable ground for cultivation, and a village for the residence of the proprietor's retainers—evince how great an epoch the reign of that monarch was in the county's agriculture. At the mill of Ednam alone, probably 1,000 quarters of malt were annually ground; and brew-houses were so numerous that ale must have been the common beverage of nearly the whole population. The monks propelled to a comparatively high state of advancement the agricultural system which they had mainly contributed to introduce; and they, at the same time, made Roxburghshire, in its vale of the Allan north of the Tweed, the earliest dairy-ground in Scotland, and, in various districts, gave practical lessons in horticulture which have not been forgotten till the present hour, and continue to render several of the county's localities notable for their fruit. The various arts and departments of working the soil were crushed at the demise of Alexander III., and remained in miserable neglect during the long period of three centuries. Agriculture did not revive, and start for the goal of fame, till about the same period as in the adjacent counties. Before 1743 the practices of draining, enclosing, and fallow-

ing, of raising cabbages and potatoes in the fields, and of growing flax, hemp, rape, and grass-seeds, were generally introduced. In 1747 the turnip husbandry was adopted and exemplified by Dr. John Rutherford; and, in 1753, it was brought to comparative maturity, and exhibited in connexion with a regular system of cropping, by Mr. Dawson. In 1755 the use of marl and of lime as manures was introduced by Mr. Dawson and Sir Gilbert Elliot; and, in 1737, Mr. Rogers, an ingenious native of Cavers, constructed fanners for winnowing corn, and thence drove an increasing trade, profitable to himself and highly useful to agriculture, in vending the machine. Mr. Wight, who made two agricultural surveys of the county, respectively in 1773 and 1780, declared, on occasion of the latter of them, that "he was amazed at the advances all had made since his former survey, as every field had assumed a better aspect from an improving hand." During the twenty years which terminated in 1794, the lands of the county, in consequence chiefly or solely of melioration, became doubled in their value. Since that period Roxburghshire has distanced some counties, and rivalled most, and probably been outrun by none, in the energetic race of improvement, as to both the management of soil and the rearing of stock, which has so generally and highly distinguished Scotland. About one-third of the entire area is now subject to the plough. Most of the arable farms range between 400 and 600 acres; most of a very numerous class, which are partly arable and partly pastoral, range between 600 and 1,400; and most of entirely, or almost entirely, pastoral farms, range between 1,000 and 3,000.

Roxburghshire has long been famous for the number and excellence of its sheep. Those with black faces and legs, short bodies and coarse wool, which for ages walked the pastures, were wholly discarded before the close of last century, or were retained in thin numbers only for the table, and on account of the delicacy of their mutton. The white-faced and long-bodied breed, so decidedly superior in their wool, obtained everywhere a preference; and they have been subjected to very numerous and successful experiments of crossing and general treatment, with a view to remove some defects, and to improve their carcasses without injuring the quality of their fleeces. If ever a breed of black cattle existed peculiar to Roxburghshire, it cannot now be distinguished. Most of the present stock of the county is altogether motley, and consists, not so much of the offspring of Northumberland, Lancashire, Galloway, Ayrshire, Highland, Guernsey, and Dutch breeds, as of such an intercrossing of the whole as has effaced nearly all trace of distinct origin. The milk-cows are, in general, short-horned, deep-ribbed, and of a red and white colour; but are also found polled, and of every variety of horn, shape, and colour. Horses of many different kinds, though none of them peculiar to the county, are in use. A cross between the Clydesdale and the Northumberland breeds, and crosses between both and the Irish horse, are much esteemed for draught. Ponies from the north of Scotland are very common in most families for children, and make useful drudges.

The manufactures of Roxburghshire have, with very trivial exceptions, their seats in Hawick, Jedburgh, Galashiels, and their dependencies, and are noticed in the articles on these towns. The commerce, in the sense in which an inland county has any, consists principally in the importation of foreign wool, coal, some common necessaries, and a few luxuries, and in the exportation of grain, cattle, sheep, lambs, domestic wool, and the produce of woollen factories. Most of the exported grain is delivered at Berwick, and much of it is sent by land

conveyance to Dalkeith, and there sold in bulk and paid in cash,—affording occasion to load the carts on their return with the superior coal and lime of Edinburghshire; and a considerable proportion is sent through the Kelso market to the hilly regions both of the county itself and of the north-west of Northumberland. Weekly markets for the sale of grain are held on Tuesday at Jedburgh, on Wednesday at Yetholm, on Thursday at Hawick, on Friday at Kelso, and at Melrose on Saturday. That of Kelso is by far the most important and most numerous frequented. Large fairs, especially for black cattle, horses, and sheep, are more numerous than in most other counties. The greatest is that of St. Boswell's, on the 18th of July; and this, jointly with fairs at Yetholm and at Rink in Upper Jedburgh, usually fixes the price of wool with staplers from Yorkshire and other parts of England. St. James' fair, on the site of the ancient Roxburgh, on the 5th of August, is the scene of much miscellaneous traffic,—a minglement of portions of nearly all the trade and commerce of the county. The other fairs are held at Jedburgh, Kelso, Hawick, Melrose, and Yetholm.—Previous to 1764 the county was in a miserable condition as to roads and bridges: it had few places where wheeled carriages could pass, without skilful drivers and close attention; and it had only two useful bridges, respectively at Kelso and at Melrose, over the Tweed; and only two, respectively at Hawick and near Ancrum, over the Teviot,—all the others being awkwardly situated or inconveniently constructed. But between 1764 and 1797 no less than 153 miles of excellent road was laid down, two former bridges were rebuilt, twenty-five new stone-bridges, including the Drygrange one over Tweed and the one over Teviot near Kelso, were erected over the more considerable streams, and an incalculated number of minor bridges and mounds were thrown across rivulets and hollows. Improvement, proceeding since that period with unabated energy, has constructed the splendid new Tweed bridge of Kelso, and the elegant new Teviot bridge at Hawick, and flung several pedestrian suspension-bridges over both the Teviot and the Tweed, and ramified all the more populous parts of the country with roads inferior to none in the kingdom, and intersected even the most upland and sequestered districts with thoroughfares superior to those which were formerly enjoyed by the most crowded seats of population.

From the epoch of the bishopric of Lindisfarne, a major part of Roxburghshire, which was included in the kingdom of Northumbria, formed a considerable section of that ancient diocese; from the reign of David I. till the Reformation, all of it south of the Tweed belonged to the diocese of Glasgow, and from 1238 this large section formed the archdeaconry of Teviotdale, and was ruled by its own archdeacon, under the superintendence of the bishop. Parishes arose amidst the obscurities of dimly recorded ages; and, after the ferment of the Reformation had subsided, stood in number at 33,—twenty-nine of them belonging wholly to the county, and four being shared between it and Selkirkshire. Of these Castletown, owing to the remoteness of its situation, was placed under the synod of Dumfries, and all the others were placed under the synod of Merse and Teviotdale,—fourteen of them composing the presbytery of Jedburgh, and eighteen being distributed among other presbyteries in the quotas of nine to Kelso, eight to Selkirk, and one to Lauder. The same arrangement continues, with the addition of one *quoad sacra* parish to Kelso and one *quoad sacra* parish and two chapelries to Jedburgh. In 1834 there were forty-four parochial schools, conducted by fifty teachers, and attended by a maximum of 3,225 scholars, and a mini-

mum of 2,491; and sixty-eight non-parochial schools, conducted by eighty teachers, and attended by a maximum of 2,849 scholars, and a minimum of 1,526.

For the purposes of justice and police, the county is divided into the four districts of Jedburgh, Kelso, Melrose, and Hawick, in each of which justice-of-peace courts are held quarterly, or as often as requisite. The sheriff-court for the county, and the commissary-court, are held weekly during sessions. The only royal burgh is Jedburgh, the county-town, and the seat of the assize-court for both Roxburghshire and adjacent counties. The towns are Kelso, Hawick, Melrose, and part of Galashiels. The larger villages are Castletown, Lessudden, Yetholm, Denholm, Darnick, Gattonside, Morebattle, Ancrum, and Roxburgh. The smaller villages and hamlets are few, and in general obscure. The chief country-seats are Fleurs-castle, the Duke of Roxburgh; Mount-Teviot, the Marquis of Lothian; Minto house, the Earl of Minto; the Pavilion, Lord Somerville; Stobs-castle and Wells, Sir William F. Elliott; Ancrum-house, Sir William Scott; Springwood-park, Sir George Henry Scott Douglas; Makerston-house, Sir T. B. Mackdougall; Abbotsford, Sir Walter Scott; Edgerston, Rutherford, Esq.; Cavers, Douglas, Esq.; Chesters, Ogilvie, Esq.; Drygrange, Tod, Esq.; Eildon-hall, Henderson, Esq.; and Riddel-house, Spott, Esq. The valued rent, in 1674, was £314,663 Scottish,—probably greater in proportion to the extent of the area, than that of any other county in Scotland. The annual value of real property, as assessed in 1815, was £254,180. The parliamentary constituency, in 1838, was 2,045. Population, in 1801, 33,712; in 1811, 37,230; in 1821, 40,892; in 1831, 43,663. Houses, in 1831, 6,732; families 8,930. In 1841, the population amounted to 46,003; inhabited houses 8,662.

At the commencement of the Christian era, the western and greater part of Roxburghshire was comprehended within the territory of the Gadeni, and the eastern and lesser part within that of the Ottadini. At the period of Agricola's invasion, both districts fell before the Roman power, and afterwards became incorporated with the Roman province of Valentia; and, after the Roman abdication, they, for a short time, shared the flickering independence of the eastern Romanized Britons, and then speedily settled down into a section of the kingdom of Northumbria, retaining but partially the influence of their ancient people, and acknowledging the ascendancy and the sway of the foreign race of Saxons. The 'Sassenach,' though elsewhere, except in Berwickshire and Lothian, unknown in Scotland for many generations later, settled here during the 6th century, and perhaps as early as the 5th; and they have perpetuated the earliness as well as the power, of their ascendancy in the facts—so different from what usually occurs in other Scottish counties—that, in many of the few instances in which British or Scoto-Irish names of places survive, they are pleonastically combined with Scoto-Saxon words of radically the same import, and that the vast majority of terms in the existing topographical nomenclature of the county are Scoto-Saxon, in the modern forms, or in plain English. The Scoto-Irish appear to have made some settlements within the district; but are traceable, more by the flickering light of a few local names which they may be presumed to have imposed, than by physical monuments, or still less by the details of record. As part of the Northumbrian kingdom, and bearing, in common with Lothian, the name of Saxonia, Roxburghshire was invaded and wasted by Kenneth, the conqueror of the Piets. The Scoto-

Saxon people remained, though the sovereignty was ceded to a new master; and, whatever modifications their institutions and customs may have undergone by the abrasion of foreign influence, they prevailed, and remained permanently settled, through the ample extent of the county, under the children of Maleolm Canmore. At the demise of Edgar, in 1107, Roxburghshire, in common with many lands in the southern and western districts of Scotland, passed to Earl David as his appanage; and, over almost the whole of its extent, it was, not so much in legal fiction as in absolute fact, the property of David as its sovereign lord. Though Teviotdale had probably become, at that time, a dependency of the bishopric of Durham, yet in no part of its extensive territory do the monks appear to have acquired almost any temporal possession. When David succeeded to the throne, he ruled the county not as a lordship, but as part of his kingdom, and permanently re-annexed it to the dominion of the crown; but, giving full scope to that love of pompous retinue and that engrossing devotion to the Romish priesthood, which procured him, from sycophantism and monk-ridden ages, the doubtful praises of being the most munificent and the most saintly of the Scottish kings, he almost revolutionized the territory by profuse and numerous grants of its lands as manors of embryo barons, and granges of monastic communities. The Morvilles, the Souleses, the Corbetts, the Riddells, the Comyns, the Olifards, the Percys, the Berkeleys, and the Vesseys—all followers of David from England—were admitted to the possession of extensive domains, and established upon them considerable families. The monasteries of Melrose, Kelso, and Jedburgh, all founded by David, appear, from the chartularies, to have had lavished on them the amassings of his princely wealth, to have been crowded with his vassals, and to have constituted actual colonies of a foreign or new people. Before the demise of William the Lion, the monks of the three convents became the ascendant and domineering proprietors of the county, and, so far as regarded mere physical well-being, the wisest and most beneficent occupants of its soil; but, as respected the elements of social and moral well-being, and all the influences which bore upon the moulding of future manners, and the destiny of future generations, the showy and deceptive yet assured curse of the whole people. Further historical notices of the county are almost all identical with those which have been given of Roxburgh-castle, and need not be repeated.

Sepulchral tumuli of the earliest colonists, and various classes of monuments connected with their ancient worship, are too numerous for separate mention except in our articles on the parishes. The whole extent of the county, as it was by nature strong from its heights and its recesses, appears to have been, in the earliest times, the bloody scene of many conflicts. The great peninsula formed by the Tweed and the Teviot, as is obvious from many remains, was once full of military works, constructed, in some instances, by the earliest Britons, in some by their descendants, in some by the Romans, and in some by later occupants. The Eildon-hills and Cauldsiels-hill, in particular, were strong fortified central points, first of the Britons and afterwards of the Romans. The heights of Rowchester, Kippilaw, and Blackchester also were the sites of strengths successively of the aboriginal Britons, the Romans, and the Romanized Britons; and they were connected with another, or with the Eildon and the Cauldsiels fortifications, by works which have occasionally been mistaken for Roman roads, but which bear a strong resemblance to the Catrail, and which, like that work, were constructed by the Romanized

Britons, and intended by them as barriers against Saxon invasion. British strengths occur in various localities. The most stupendous work of the Britons was the CATRAIL; and the most interesting Roman remain is the great road called WATLING-STREET: see these articles. A Roman road, bearing the modern name of the Wheel Causeway, possibly went off from Watling-street to traverse Upper Teviotdale, and, at all events, traversed the north-east corner of Liddesdale, and left Scotland at Deadwater to pass on, under the modern name of the Maidenway, through Severus' wall, to the Maiden-castle on Stanmore, in Westmoreland.—The most ancient remains of the Saxons are the religious or Culdean-house of Old Melrose, or rather its successor, Red-ahhey near Newstead; and the church of Old Jedburgh, founded in the 9th century, by Bishop Ecceude. But the early Saxons of this shire have transmitted to posterity very scanty monuments of their civil polity, and still scantier of their military actions. Few of the castles which exist in ruin and nod to the ground, and which are regarded by superficial inquirers as the only objects of antiquarian research, belong to either a high or an interesting antiquity. They were all erected on homogeneous plains, with similar materials, and with a view to security rather than to comfort,—huilt of "lyme and stane," after the accession of Bruce, during ages of civil anarchy and wasteful wars; and, whether larger or less, may, when compared with British forts and Roman stations, and ancient ways, be considered as modern antiquities, the wonders of ignorance, rather than the curiosities of knowledge. The earliest and most interesting castles are those, respectively quite extinct, and only vestigeable, of Jedburgh and Roxburgh. The next in antiquity are the extinct one of Clintwood, which imposed first on the neighbouring village, and next on all Liddesdale, the name of Castletown; and the surviving, conserved, and partly modernized one of Hermitage Peel-houses succeeded; but, excepting that of Hudhouse, they all lie in the ruins of time. Strongholds of more modern erection, and more dignified cast, figured in the Border conflicts, and were the scenes of coarse hilarity, and rude, and often lawless enterprise; yet, unless when poetry has painted them on the slides of its magic lantern, and flung over them airs and tints of witchery, they rarely possess any interesting association. Impervious fastnesses lined the strong banks of Oxnam-water, and furnished a place of rendezvous for the Border-warrior when menaced by the English foemen; and, as they aggregately bore the name of Henwood, they gave rise to the war-cry, "A Henwoody! a Henwoody!" which made every heart burn with ardour, every hand grasp a weapon, and every foot hasten to the rendezvous.\*

So early as the commencement of the Soto-Saxon period, and up to the disastrous date of the Maid of Norway's death, Roxburgh was a sheriffdom. Edward I., after he had by intrigue and violence obtained direct dominion over Scotland, seems to have considered this frontier county as his own; and, when he settled the affairs of the kingdom, by his famous ordinance of 1305, he appointed,—as we have seen—a custodier of the castles of Roxburgh and

\* The strengths, more or less entire, which now bear the name of Peels, are Graden, Harden, Prickinghaugh, Whitehaugh, Hillhouse, Riccarton, Mangerton, Puddingburn, and some others. Those which bear the name of Towers, are Moss, Woodden, Ormiston, Gateshaw, Dolphinston, Mossburnford, Crag-Loch, Newton, Fulton, Minto, Hassendeau, Nisbet, Roxburgh, Bronnhouse, Littledean, Darnick, Calmslee, and Smailholm; and those which bear the name of Castles, are Roxburgh, Hermitage, Cessford, Eckford, Whitton, Cocklaw, Crailling, Bonjedworth, Edgarston, Fernihirst, Bedrule, Rew, Comers, Fast, Castleweary, Goldielaud, Brauxhoin, and Halydean.

Jedburgh, and governor, by military regimè, of the whole shire. As soon as the genius of Bruce had achieved the kingdom's independence, Roxburghshire began to enjoy for a short period its ancient policy of peaceful times; but, after the demise of that great prince, it was claimed in sovereignty by the English kings, and suffered no little anarchy from their collisions with the Scottish crown. In 1334, a sheriff was set over it by Edward III., and soon after an antagonist sheriff was appointed by David II.; and, during the revolutions of that age, sheriffs continued to be conflictingly, or alternately, appointed by the respective monarchs according to the fluctuations and the replacements of their power. During all the period of David's captivity, Edward III. nominated sheriffs, and governed as he pleased. As the shire, with the exception of Roxburgh-castle, was freed from the yoke of foreign thraldom chiefly by the exertions of the Douglasses, it afterwards, as to its sheriffship or administration, generally followed their fortunes. In 1398 the sheriffship of the county and the lands of Cavers were granted to George, Earl of Angus, who died in 1402; and having passed to Isobel, Countess of Mar, they were, without the necessary consent of the King, transferred by her to the Earl of Douglas, who was then a prisoner in England. Robert III., conceiving that they had become escheated by being disposed of without his consent, and willing to bestow them as a reward for services, conferred them, in 1405, on Sir David Fleming of Biggar. But James Douglas of Balveny, the second son of the Earl Douglas, soon after assassinated the new sheriff; and paved the way, amidst the afflictions of the King, and the subsequent misrule of the Duke of Albany, for the Douglasses to domineer over the county with the utmost freedom from control. The sheriffship of the county was now, with the lands of Cavers, transferred to Archihald, a bastard son of James, the second Earl of Douglas; and it continued in his family, though probably with some interruptions, till the date of the abolition of hereditary jurisdictions. Archihald Douglas, brother of Douglas of Cavers, claimed, in 1747, a compensation of £10,000 for the sheriffship, and was allowed £1,666 13s. 4d.

ROY (THE), a small river in the parish of Kilmanivaig, Lochaber, Inverness-shire. It rises on the frontier of Lochaber, at a point where that district meets Badenoch and Stratherrick, 5 miles east of the sound end of Loch-Oich; and it runs 16 miles south-westward to the Spean, near the house of Keppoch. Over most of its course it runs parallel with Loch-Lochy, or the line of the Caledonian canal, at 4 or 5 miles' distance. The vale which it traverses takes from it the name of Glenroy, and is well-known to fame for its geognostic phenomena called 'parallel roads.' See GLENROY. A rising ground, which bears the name of Mulroy, and is situated near the mouth of the stream, claims to be the last recorded feudal battle-field in Scotland. The laird of Mackintosh, having been refused some demands which he made on the Macdonnells of Keppoch as his tenants, marched at the head of his vassals to enforce compliance within their own territory; but he was stubbornly confronted on Mulroy, and, after a stiff action, was beaten and captured.

RUBERSLAW, a long, rugged, and peaked hill near the centre of Teviotdale, Roxburghshire. It is so situated as to belong to all the three parishes of Hobkirk, Cavers, and Kirkton. Its range, in elongation, is from south-south-west to north-north-east; and its greatest altitude above sea-level is 1,420 feet. Though rearing its bulk in a rather boldly tumulated region, it forms, through wide openings of the general landscape, a conspicuous, far-seen, and arresting object. It has a bleak and

stern aspect, and bears more marks of volcanic eruption than probably any other hill along the eastern border; contrasting strongly, in its peaked summit, its ragged sky-line, the sharp inequalities of its surface, and the heathy russet or rocky brown of its dress, to the green and beautifully curved and dome-like heights of most of the neighbouring Cheviots. It frequently and in large quantities attracts the electric fluid, and presides amid thunder-storms of unusual awfulness or sublimity. Its rocky recesses and hollow dells were haunts of the persecuted Covenanters; and, in a place among them where the celebrated Peden preached to a large assemblage, not only the spot on which he stood, but the stone on which he spread the Bible, and which served him for a pulpit, is still pointed out by tradition.

**RUBISLAW**, an estate in the immediate neighbourhood of Aberdeen, on which the finest granite in Aberdeenshire is wrought. An exact cube of 1½ inch each side of the Rubislaw granite required a force of 24,556 pounds to crush it; while a similar cube of Peterhead granite was crushed with 18,936 pounds; and of Cornish granite, with 14,302 pounds. The specific gravity of the Rubislaw stone is 2.625. Its goodness increases the lower it is wrought.

**RUCHIL (THE)**, a rivulet in Perthshire, which rises at the base of Benvoirlich, and traverses Glen-grachan and Glenartney, the former east-south-eastward, and the latter north-eastward, to the Earn at the village of Comrie. Its length of course is about 13 miles. Its tributaries are numerous, but chiefly mountain-torrents, and individually inconsiderable.

**RUEVAL (LOCH)**, the sound which separates the islands of North Uist and Benbecula, in the Outer Hebrides. Though nearly closed at the west end by the intrusion of an island, it has free communication at both ends with the sea, and is improperly styled—even in the marine sense—a loch. It is about 9 miles long from east to west, and has a mean breadth of about 3 miles; but it is strewn with such a multitude of islands and islets—Grimsa, Flodda, Bent, Broad Isle, Rona, Flota-more, Flota-beg, and others whose names are scarcely known—as to be altogether a complicated maze of water.

**RULE (THE)**, a rivulet on the southern side of Teviotdale, Roxburghshire. Nearly at a point where the parishes of Southdean, Hohlkirk, and Abbotsrule, meet, it is formed by the union of Catlee, Wauchope, and Harrot burns, the first and the second of which rise within a few hundred yards of the lofty mountain water-shed which divides Teviotdale from Liddesdale. The rivulet, under the name of the Rule, runs due north to the Teviot about 2 miles below Denholm; and, in its progress, divides the parishes of Hohlkirk and Cavers on the west, from those of Abbotsrule and Bedrule on the east. Its length of course, exclusive of windings, and measured from the head of Wauchope-burn, is between 12 and 13 miles. Its channel, for a chief part of the way, is a deep gullet through sandstone, worn by the erosion of the stream, and overhung on the sides by copse.

“Between red ezlar banks, that frightful scowl  
Fringed with gray hazel, roars the mining Rowll.”  
LEYDEN.

The Rule has the repute of being an excellent trout-ing-stream.

**RULLION-GREEN.** See **GLENCROSS.**

**RUM**, an island of the Hebrides, 5 miles north-west of Eigg, 16 north of Ardnamurchan-point, and 18½ north-west of the nearest part of Moydart. Its length from north to south is about 8 miles; its breadth from east to west is about 7 miles; and its superficial extent is about 22,000 acres. Its shores

are rough and dangerous, its surface is a trackless upland wilderness, and its climate is an almost perennial series of storms, fogs, and rain. It consists of an irregular mass of mountainous heights, without plains, and scarcely diversified by a single intervening valley. The loftiest heights, called Ben-More, Halival, and Haiskeval, rise on the east, attain an altitude above sea-level of nearly 2,300 feet, and are almost perpetually involved in mist; the heights next in bulk and elevation occupy the west, and send up one of their summits—that of Oreval—to an altitude of 1,798 feet; and the least lofty summits rise on the north, and send away comparatively gentle declivities toward the shore. As the island forms the only high land between the mountains of Skye and those of Mull, both of which are noted for precipitating torrents of rain on the country around them, it necessarily attracts a vast proportion of humidity, and saturates its surface into moorishness and unprofitable waste. Around the peaks of its mist-clad heights may often be seen the meteorological phenomenon so common in St. Kilda,—that appearance in the clouds which is termed parasitical. Owing to the humidity of the climate, and favourableness of rock for the formation of springs, the island has some perennial springs which are of great magnitude compared to the extent of the country. The two largest almost meet from the opposite hills at the little hamlet of Harris; and, occasionally raging and tumultuous like the torrents of higher lands, they have brought down near the hamlet an enormous accumulation of stones, and formed it into a great terrace. The east side of the island, at a point a little north of the middle, is indented to the length of 1½ mile, and mean breadth of upwards of 1 mile, by an arm of the sea called Loch-Seresort. From this bay to Gindril on the north side, the coast consists of low rocks and moderately elevated cliffs, with occasionally a small beach in front; and elsewhere, it consists of high cliffs, which, in some places, attain apparently an elevation of 400 feet, and which, all round the west, are almost incessantly buffeted by a rolling swell from the Atlantic. Rum, in every economical point of view, is of less value proportionately to its extent than almost any other of the Hebrides; it even refuses to hold, on its steep and weather-beaten shores, the marine vegetables which produce kelp, so long the staple commodity of the western islands; and it is all in the hands of one large tenant. The geognosy and the mineralogy of the island, however, are possessed of much interest. None of the schistose strata superior to the old red sandstone, and its shales and limestones were discovered on this island by Dr. Macculloch; but on this sandstone basis four rocks of the trap family repose, two of which are probably of different dates from the others. Of these, augite rock is the lowest, and about the most abundant. It consists of compact felspar and augite, the former occasionally predominating over the latter, and producing, when the felspar is glassy, a beautiful compound, from the contrast of the two minerals. We may here notice the heliotrope or bloodstone, as it is called, a compound of green earth and chalcidony, for which the island of Rum is remarkable. Its native repositories are the partly basaltic and partly amygdaloidal beds of Scuirmore; but it is among the fragments on the beach at its base that the suit of specimens displaying all the varieties of this mineral are found; and, on the same beach, two beautiful kinds of pitchstone, one black and the other olive-green, also occur in detached masses. Pale onyx agates, seldom of much beauty, are also found among the debris at the base of Scuirmore, along with the heliotrope; the disposition of both seeming to be in nodules, or in fragments of

veins, of various sizes, imbedded both in the amygdaloid and basalt. Dean Munro describes Rum as "ane Forrest of heigh mountains, and abundance of little deire in it, quhilk deire never be slaine downwith, hut the principall saitts maun he on the height of the hill, because the deire will he callit upward ay by the tainchell, or without tainchell they will pass upward per force." A coppice afforded shelter to the young fawns from the birds of prey, particularly from the eagle; and the deer which stocked the island were, in consequence, numerous. But the deer were dependent on the wood, and, when that was destroyed, they disappeared. The island, in allusion to its once having been a vast forest, is said to be still called by the inhabitants *Rioghacd na Forraiste Fiodhaich*, 'the Kingdom of the wild forest.' Population, in 1764, 304; in 1811, nearly 350; in 1836, 120, all belonging to the Establishment. The inhabitants, according to Dr. Johnson, "continued Papists for some time after the Laird became a Protestant. Their adherence to their old religion was strengthened by the countenance of the Laird's sister, a zealous Romanist, till one Sunday as they were going to mass under the conduct of their patroness, Maclean met them on the way, gave one of them a blow on the head with a yellow stick—I suppose a cane, for which the Earse had no name—and drove them to the kirk, from which they have never since departed. Since the use of this method of conversion, the inhabitants of Eigg, and Canna, who continue Papists, call the Protestantism of Rum, the religion of the Yellow Stick." Rum is in the parish of SMALL ISLES: which see.

**RUMBLING-BRIDGE.** See articles **THE BRAN**, and **THE DEVON**.

**RUSKIE.** See **PORT-OF-MONTEITH**.

**RUSTORE**, a promontory in the parish of Assynt, on the west coast of Sutherlandshire. It is the most westerly land in the county, and projects between the openings of Loch-Assynt and Loch-Inver. An ancient chapel stood on the promontory, said to have been built, along with two others, by Angus Macleod, the great-grandson of the first Macleod, Laird of Assynt, in penance prescribed to him at Rome.

**RUTHERFORD.** See **MAXTON**.

**RUTHERGLEN**, a small parish in the Lower ward of the county of Lanark, containing a royal burgh of the same name, from which the laudward part is understood to have received its appellation. It extends along the south bank of the river Clyde, immediately above the city of Glasgow; 3 miles in length by  $1\frac{1}{2}$  in breadth. It is bounded by the Clyde on the north; the parish of Govan on the west; Cathcart on the south-west; Carnunnock on the south; and Camuslang on the east. The whole superficies of the parish is arable, and in general well-enclosed. It occupies a very pleasant position in the vale of Clyde, forming the lower portion of the declivity of Cathkin hills, and is beautifully diversified with a regular succession of small hills and narrow dales; excepting next the river, where it forms itself into some very delightful and fertile plains. Rutherglen has long been celebrated for the spirited manner in which its agricultural operations are conducted. This parish was one of the first which witnessed an improvement in the most important implement of husbandry, and for many years the 'Rutherglen ploughs' were celebrated all over the West country. They were first made in the parish about a century ago, and, according to Lord Kames, must have been among the first improved ploughs made in the northern portion of the kingdom. The mode of their construction was proposed by Lady Stewart of Coltness, who, female though she was,

had a masculine head for promoting agricultural improvement. The name of this parish is also well known in connection with the superior breed of West country horses which are reared in it, but still more from the numbers of the same degree of excellence which are sold at its fairs. These horses are appropriately fitted for draught, and their power, hardihood, and docility, have caused them to be esteemed over the whole kingdom. They are generally of the Lanark and Carnwath breed, which was introduced into the country about a century and half ago. [For further particulars on this head, see article **LANARKSHIRE**.] The parish abounds in coal, and several mines have long been in full and prosperous operation, some of them producing a considerable quantity of ironstone. In other respects it is a most industrious locality, and contains two printfields, a chemical work, a cotton-mill, an extensive Turkey-red dye-works, and a large body of handloom muslin weavers, both in the town and landward districts, whose shuttles are principally set in motion by the capital of Glasgow manufacturers. The burgh is the post-town. By the census of 1841, the population of the landward portion of the parish is 8-8. Assessed property of the parish, as distinct from the burgh, £4,508.—Rutherglen is situated in the presbytery of Glasgow, and synod of Glasgow and Ayr. Patrons, the magistrates and council, the heritors residing in the burgh, the members of the kirk-session, and the proprietors and tenants of the lands of Shawfield. Originally the presentation belonged to the ahots of Paisley; but subsequent to the Reformation, it fell into the hands of the Hamiltons of Eliestoun, and finally passed into the possession of Mr. Daniel Campbell of Shawfield, by whom, in 1724, it was sold to the parties above-named. The stipend of the parish amounts to £280, but it is very difficult of collection, from being paid by about 150 heritors, about a third of whom pay less than 5s., and some of them so low as 2d. each. No fewer than 471 persons voted at a recent election of minister. There is a *quoad sacra* allocation in the parish belonging to the West church, which accommodates 800 sitters; and a Relief church, which contains 950 sittings. In addition to the burgh or parochial school,—the emoluments of which are not stated in Government education returns,—there are 7 or 8 other schools at which the ordinary branches are taught. There is little of interest in the history of the parish which does not more properly belong to the account of the burgh. The old church was celebrated as being the place in which a peace was concluded between England and Scotland in February, 1297; and still more is it remembered in Scottish story as the place where the hase Sir John Monteith agreed with the English to betray Wallace. In Henry's Life of Wallace this contract is detailed in the lines beginning—

"A messynger Schir Amar, has gart pass  
On to Schir Jhon, and some a tryst has set  
At Ruzlan kirk yir twa toggyder met,  
Yan Wallany said Schir Jhon you know yis thing," &c.

During the progress of the battle of Langside, Queen Mary occupied a position at a short distance from Rutherglen; and Ure in his History thus notices an incident which then took place:—"About 150 yards to the south of the main street is a kind of lane, known by the name of Dins-dykes. A circumstance which befell the unfortunate Queen Mary, immediately after her forces were routed at the battle of Langside, has ever since continued to characterize this place with an indelible mark of opprobrium. Her majesty during the battle stood on a rising ground about a mile from Rutherglen. She no sooner saw her army defeated than she took her

precipitate flight to the South. Dins-dykes unfortunately lay in her way. Two rusties who were at that instant cutting grass hard by, seeing her majesty fleeing in haste, rindly attempted to intercept her, and threatened to cut her in pieces with their scythes if she presumed to proceed a step further. Neither beauty, nor even royalty itself, can at all times secure the unfortunate, when they have to do with the unfeeling or the revengeful. Relief, however, was at hand; and her majesty proceeded in her flight."

RUTHERGLEN, vulgarly pronounced *Ruglen*, a royal burgh in the above parish, and in the Lower ward of the county of Lanark. It is situated on the south bank of the Clyde. Hamilton of Wishaw thus quaintly and truthfully describes its position:—"It lies in a pleasant and fertile soil, near to the river of Clyde, about 2 miles above Glasgow; it hath had very little trade for some ages past, because Glasgow lyes between it and the sea, and that all merchandising men of any metall goe to dwell there. It bath ane pleasant green upon the river of Clyde, belonging to the town in commonty." In having outlived its former importance, Rutherglen is only in the position of many other of the old quiet rural burghs of Scotland. It no doubt owed its existence as a municipality to its castle, which, in the olden time, when might was right, attached no small degree of dignity to the locality in which it was situated. So early as 1126 at least, it was erected into a free burgh, as appears from a supplication to the Scottish parliament in 1661, wherein it is stated to have obtained a charter from King David I. in that year; and it cannot now be ascertained whether that charter was the original foundation of the burgh, or only a renewal of some former grant. This charter of King David has been lost, but it is referred to in one of Robert I., dated 20th April, 1324. The burgh received various other grants from different kings of Scotland, including Robert II., James V., James VI., and Charles I. The charter of James VI. is the most detailed in its provisions, and confirms and confers important burghal privileges to the citizens. It contains a description of the then property of the burgh, and grants power to elect a provost, bailies, dean-of-guild, treasurer, and all other magistrates, with the usual liberties and privileges pertaining to royal burghs, such as holding markets, fairs, &c. It is not a little curious that the city of Glasgow was at one time comprehended within the original limits of the burgh of Rutherglen; and it was only by a petition presented to the throne that Alexander II., in the year 1226, ahridged its powers, so far as they referred to Glasgow. At this early date Rutherglen, besides being a place of considerable strength, appears to have been, at the date of its erection into a royal burgh, the only trading and commercial town in the west part of the country; and as Glasgow at the same time only consisted of a few clergymen's houses clustered around the cathedral, the former was no doubt regarded as the most important and enterprising of the two.\* The constitution of the

burgh of Rutherglen was similar to those of the other royal burghs in Scotland down to the year 1670; but a change was then made by which the community obtained greater power in the choice of the magistrates and council than was enjoyed in any of the other burghs; inasmuch as it was declared, that in the new sett then granted to the burgh, that the town-council should consist of 15 persons, 11 of whom should be chosen out of leets presented by the four incorporated trades, and the other four out of a list presented by "the remanent burghesses, inhabitants within the said burgh and territory thereof, bearing scot and lot within the same; and that in choosing the magistrates, viz. the provost and the bailies, 30 persons should be added to the council by the council itself, to have a vote along with them in such choice." This comparatively liberal system existed down till the passing of the Reform bill, and in the old 'close time,' the superior freedom and privileges of Rutherglen were frequently regarded with invidious feelings by the other burghs. According to the report of the Government Commissioners in 1833, the total property of the burgh amounted to about £10,000 in value, producing more than £400 per annum, the principal item in its resources consisting of the town-green, extending to 32 acres of arable land. Rutherglen consists principally of one main line of street, with several diverging lines, and notwithstanding its vicinity to Glasgow, its appearance is decidedly rural, the principal part of its inhabitants being weavers, colliers, or workers employed in the print-fields and other public works in the neighbourhood. Population of the town and parish, in 1801, 2,437; in 1811, 3,529; in 1821, 4,640; in 1831, 5,503. At the last census of 1841, there were 6,510, with 1,289 inhabited houses. In the olden time Rutherglen was privileged to send a member to the Scottish parliament, whose expenses were paid at the rate of 3s. Scots per diem during his attendance there. At the Union in 1707, it had an equal share with Glasgow, Renfrew, and Dumbarton, in sending a representative to parliament; and since the passing of the Reform bill, it has been associated for the same purpose with Kilmarnock, Dumbarton, Port-Glasgow, and Renfrew. The constituency, in 1841, amounted to 170. Rutherglen formerly gave the title of Earl to one of the Hamilton family, and latterly it passed into the house of Queensberry, and expired with the last Duke of that name in 1810.

In times that have passed away, Rutherglen, no doubt, owed a very considerable share of its importance to its castle, which was long considered one of the ancient fortresses of the kingdom. In the struggle between Bruce and Baliol, it fell into the hands of the English, and was besieged by Bruce in 1309, on which occasion the English king sent his nephew, the young Earl of Gloucester, to the rescue of the garrison, but with what success is not very distinctly stated in history. The castle was kept in good repair till a short time after the battle of Langside, when it was burnt by orders of the Regent Moray, from revenge on the family of Hamilton, in whose custody it then remained. One of the principal towers was, however, soon repaired, and being enlarged, became the seat of the Hamiltons, lairds of Shawfield; but on the decline of this family, about 140 years since, it fell into decay, and was soon levelled with the ground. Like almost every other town in the west of Scotland, Rutherglen is asso-

\* The following curious note appears in Ure's History of Rutherglen:—"The existence of Rutherglen, as a considerable town, prior to the building of the cathedral itself, appears from the following traditional account universally known in this part of the country:—It is told that when the High Church was beginning to be built, a passage below ground was made between it and the church of Rutherglen, and that the Picts or Pechls, as they are vulgarly—but perhaps more properly—called, came from Rutherglen through this hidden way every morning, and returned at night, all the time the church was building. Although the subterraneous passage is, like *Dædalus'* wings, undoubtedly fabulous, yet the story is, like his, not destitute of meaning. It shows that Rutherglen was the only place in the neighbourhood where the workmen could find, at that time, proper victuals, and accommodations for themselves. Every thing uncommon, as the building of the High Church was, and the crowds of artists employed in the work, raised

the astonishment of the ignorant vulgar. Incantments and miracles were very plenty in that superstitious age, hence the story of the underground passage, and many other wonders which then appeared, and which are, to this day, handed down by tradition from father to son."

ciated with the Covenanters. On the 29th May, 1679, the birth and restoration of Charles II. was celebrated there with all the usual marks of rejoicing; hut, in the midst of the gaiety, a body of about 80 men, who had been incensed at the persecutions of the government, entered the town, and after having sung psalms and prayed, and having chosen a leader, burned the acts of parliament against conventicles at the cross. This was the first public appearance of the "rising" which was afterwards scattered at Bothwell bridge; but whether any of the members of this original gathering belonged to the town of Rutherglen, is now uncertain. It appears, too, from the ecclesiastical records, that *Ruglen* obtained a degree of unenviable notoriety from being frequently under the notice of the presbytery of the hounds. The presbytery of Glasgow, in 1590, instructed the doctor of the school of Rutherglen to desist from reading prayers, and they complained that those who supplied wine for the sacrament of the Lord's Supper mixed it with water. In 1593, the presbytery prohibited the playing of pipes on Sundays, from sun rising to its going down, on pain of excommunication, and forbade all pastimes on Sundays, which prohibition was ordered to be read in all the kirks, but especially in the kirk of Ruglen. In 1595, the presbytery transmitted letters to the bailies of Rutherglen, to stay the profane plays introduced in Ruglen on the Lord's-day, "as they fear the eternal God, and will be answerable to his kirk." They also complained of the practice of fishing salmon, and of the colliers in Ruglen settling their accounts on Sunday.\* Rutherglen used long to be famous for the baking of sour cakes, and the making of salt roasts, previous to St. Luke's fair; but the observance has gone into desuetude. Sour cream of a peculiar *gout* used also to be made in the burgh, and extensively sold into Glasgow, but this branch of industry has now almost entirely passed away.

RUTHVEN, a small parish on the western boundary of Forfarshire, situated at the head of the deep indentation which the county suffers from Perthshire. It is bounded on the north by Perthshire and Airlly; on the east and south-east by Airlly; and in other directions by Perthshire. It is nearly of a square form, 2 miles deep; and measures, in area, about 1,700 acres. Its surface is a gentle southerly slope, near the foot of the Grampians, and on the north side of Strathmore; and is partly bounded and partly bisected southward by the river Isla. Some rising grounds locally bear the name of hills and laws, but are only knolls and swells. The soil is, in general, a light hazel mould, on a gravelly bottom, and produces excellent grain. Agriculture is in an improved state, and triumphs. Woods, consisting both of natural oaks and of planted fir hardwood, are extensive and embellishing. Marl mires occur to the extent of 30 acres. But shell-marl of the finest quality has been found, not only in these, or under peat-moss, but beneath sand, and, in one place, be-

neath a bed of pure clay, three feet thick. As much of this powerfully manurial substance as could be cast up with one spade in a day, amounting often to 200 bolls, did not, for a long time, cost more than from 1s. 6d. to 2s. Mineral springs are numerous, and of different kinds. Tradition, supported by some monuments, but uncorroborated by history, points to the northern district of the parish as the scene of a conflict between the forces of Edward I. and those of Robert Bruce. A square camp occurs in the south-west. A knoll, named Candle-bill, was the site, in feudal times, of the gibbet erected by the barons of Ruthven. The beautiful modern mansion of Isla-bank stands near the site of an ancient castle, which was at one time the seat of the Earls of Crawford, and, having become an utter ruin, was removed in the last century. The parish is bisected north-eastward by the road from Blairgowrie to Kirriemuir. Population, in 1801, 211; in 1831, 363. Houses 53. Assessed property, in 1815, £3,549.—Ruthven is in the presbytery of Meigle, and synod of Angus and Mearns. Patron, the Crown. Stipend £160 2s. 4d.; glebe £25. Schoolmaster's salary £30, with about £12 fees, and 15s. other emoluments.

RUTHVEN (THE), a rivulet of the Ochils and of Strathearn, Perthshire. It rises in the parish of Blackford, near the house of Gleneagles, and flows 7 miles north-north-eastward, through its natal parish and that of Auchterarder, to the Earn, 2¼ miles below Kinkell.

RUTHWELL, a parish on the coast of Dumfriesshire; bounded on the north by Mousewald and Dalton; on the east by Cummertrees; on the south by the Solway frith; and on the south-west and west by the estuary and the stream of the Lochar, which divide it from Caerlaverock. Its greatest length from east to west is 5½ miles; its greatest breadth is 3 miles; and its superficial extent is between 13 and 14 square miles. The surface, though slightly rising from the frith, and enjoying, in a sense, a southern exposure, is low, flat, and exceedingly tame, and nowhere attains an elevation of 100 feet above sea-level. Green ground or merse, nearly as level as a bowling-green, and consisting of a hardened silt or clayey sand, forms all the southern district, and, in consequence of the recession of the sea, extends about a mile in breadth over what, within less than a century ago, was a bare sandy sea-bed. This dull expanse, besides having no scenic attractions of its own, lifts the spectator so very slenderly above sea-level, that, during the long ebb of the far-receding Solway, the region which that extraordinary tide alternately scours with careering invasion and totally abandons, stretches away before him in the horizon in one monotonous sheet of sand, an absolute wilderness, unrelieved by even a flutter of its own minerals in an eddy wind. About 1,400 acres on the west are the unreclaimed section of LOCHAR-MOSS [which see]; and though of no other present use than to furnish the parishioners with fuel, rest, through an interval of hog, upon a beautiful clayey soil, and, even at the surface, are not quite irreclaimable. The arable grounds amount to between 5,000 and 6,000 acres; and the lands under wood, to upwards of 500. The soil north of the coast district is, in general, a gravelly vegetable mould, tolerably productive. Shell-marl occurs, but not in a position to be compensatingly removed. Limestone is the prevailing rock; but it is poor in its per centage of carbonate, and has ceased to be worked. Many of the inhabitants were long used to collect the superficial sand impregnated with salt on the beach, to wash out and filter the salt through a pit, and to boil the water of the wash and enfiltra-

\* At a later period, the civil authorities appear to have been no less solicitous to elevate the moral status of those under their care; and the following proclamation, by the magistrates and council, for restraining the propensities of a drunkard, may be considered somewhat curious at the present day. It is quoted as follows in Ure's history:—1688. "The Provost, Bailies, and Council, considering the frequent drinking and drunkenness of J— P—, Cowper; and the several abuses committed by him frequentlie; and that no admonitions, nor punishment, can get him restrained theirra. Whairfor, the saides Provost, Bailies, and Council, doe heirby inhibit, and discharge, all the brewers and sellers of drink within this burgh, that they, nor any of them, presume to give or sell any drink to the said J— P—, except what they sell to his wife and bairnes for the use of the howse and family. Under the paine of fyve pounds money *toties quoties*, as they contravene herein. And ordaines intimatione to be made heirof be towke of drum."

tion, so as to produce a coarse culinary salt; and, having been seen at work by James VI. on his way to England in 1617, they received from him, as an expression of his pedantic admiration of their rough ingenuity, an immunity from taxation, and, in consequence, were regularly exempted from payment of salt duties to the Union, and induced, very bootlessly, to prosecute their rude manufacture. The village of Ruthwell stands in the middle of the eastern district,  $6\frac{1}{2}$  miles west of Annan, and  $10\frac{1}{2}$  south-east of Dumfries. It was formerly a long, straggling, decayed, disagreeable place; but was rebuilt about the beginning of the present century by the Earl of Mansfield, and consists of a double row, or two-sided street, of fair-looking houses. In 1509, it was erected into a burgh-of-barony, in favour of Sir John Murray of Cockpool, and acquired the privilege of holding fairs and markets; but it has forgotten all its burghal honours, and is a place of neither trade nor manufacture. Population, nearly 200. Brow, a mile to the west of it, and at the entrance of the estuary of the Loch, is a miserable decayed watering-place; never better than a shabby huddle of mean houses, and now the mere wreck of a mouldering hamlet. Yet the place figures in the former fame of a chalybeate, whose virtues have come to be at a discount, and in the doleful celebrity of having been the last haunt of the poet Burns, in a vain quest after means of restoring his shattered constitution. The poor cottage in which the hard temporarily resided is still pointed out; and also a stone-table, at which the celebrated Earl of Mansfield, and his father, Lord Stormont, drank on the eve of the former's departure to commence his brilliant career at the English bar. Another village, called Clarencefield, originated about the commencement of the century, in an attempt to work the limestone of the parish. It is situated  $\frac{3}{4}$  of a mile north-west of Ruthwell, and has about 100 inhabitants. Comlongan-castle, the property of the Earl of Mansfield, situated nearly in the centre of the parish, and now quite ruinous in the interior, was a place of considerable strength before the Union, and was, for many ages, the residence of the Murrays of Cockpool,—a family of great eminence in Annandale, and occasionally warders of the western border. The building is a quadrangle, measuring 60 feet along each side, and 90 feet in height; and has walls so thick, as to hear being imperforated with small apartments. Vestiges of another old castle, likewise a seat of the Murrays, exist at Cockpool, half-a-mile from Comlongan.—The grand antiquity of the place is a Runic monument, which appears to have been 18 feet high, and is highly ornamented in basso-relievo with religious sculpturings, and bears various Runic and Latin inscriptions. Drawings of it are given in Gordon's 'Itinerarium Septentrionale,' in Pennant's Tour, and, with great clearness, in the New Statistical Account,—accompanied in the last of these works with a lengthened dissertation by the parish minister, the well-known Dr. Henry Duncan. The south road between Dumfries and Annan passes through the parish. Population, in 1801, 996; in 1831, 1,216. Houses 207. Assessed property, in 1815, £4,665.—Ruthwell, anciently a rectory in the deanery of Annandale, is in the presbytery of Annan, and synod of Dumfries. Patron, the Earl of Mansfield. Stipend £262 18s. 10d.; glebe £60. There are two parochial schools and a dame school. Salary of the first parochial schoolmaster, who has an as-

sistant, £34 4s. 4½d., with £30 10s. 4d. fees; of the second £8 11s. 1½d., with £4 fees.

RYAN (Locu), an indentation of the sea in Wigtonshire. It strikes off the Irish channel, or entrance of the frith of Clyde, nearly opposite the Mull of Kintyre, and projects 10 miles partly between Ayrshire and Wigtonshire, but chiefly into the interior of the latter, contributing with Lucebay, and the intervening isthmus, to separate the district of the Rhinns from that of the Moors of Galloway. Over  $4\frac{1}{2}$  miles from its entrance, it has a varying breadth of from  $1\frac{1}{4}$  to upwards of  $1\frac{3}{4}$  mile; and over the rest of its length, a mean breadth of about  $2\frac{1}{2}$  miles. Its direction inland is toward the south-south-east. A sand bank called the Scar runs  $2\frac{1}{2}$  miles diagonally or south-eastward from the middle of the west coast. The loch is a safe and commodious harbour, of easy access, and so capacious as to have ample anchorage-room for the largest fleets. Excellent anchoring-ground occurs over most of its extent, but particularly opposite the village of Cairn, at Portmore, and in the bays of Wig, Soleburn, and Dalmenock. A considerable belt of sandy bottom along the whole head of the loch is left dry at low water; and at nearly the broadest part of this belt stands Stranraer. A public road is carried round most part of the shore.—A committee of the House of Commons on the means of improving the post-office communication betwixt Scotland and Ireland, reported, in 1839, that Belfast-loch is evidently the point of departure, on the Irish side, for the Scotch coast; while "Loch-Ryan is unquestionably the natural point on the Scotch coast. It lies nearly opposite to Belfast-loch, is accessible in all winds, and at all times of tide, and contiguous to the present mail-roads. Finnart-hay is the station in that loch to be preferred, being on the north side, near the sea, and at all times can be gained. The hay is formed by nature, it only requires to be cleared out at the bottom, and a cross jetty seaward to be built, all which would be attended with a trifling expense; and, by making a road of only one-fourth of a mile, would join the present mail-road from Port-Patrick to Ayr and Glasgow at the bottom of Glen-app, and would produce a saving in distance between Belfast and Glasgow of upwards of 29 miles; besides, the mail-coach would have the benefit of the railway from Ayr to Glasgow, a distance of 34 miles, and enable the Irish mail to arrive in Glasgow so as to be despatched to Edinburgh and the north of Scotland by the Edinburgh evening mail, which leaves Glasgow at 10 o'clock at night, and thus save an entire day in the Irish correspondence. Upon the same principle, by making a road of from 8 to 10 miles, from the top of Glen-app to join the present turnpike-road from Barrhill to Newton-Stewart, where it would unite with the mail-road from Port-Patrick to Dumfries, it would decrease the distance from Belfast to Dumfries and the north of England, upwards of 21 miles,—then the Cairn, Stranraer, and Port-Patrick, would be supplied by a horse-post from Finnart-hay; and, in like manner, from Port-Patrick, the intermediate towns of Glenluce, &c., up to Newton-Stewart."

RYE (THE), a rivulet of the north-west district of Cunningham, Ayrshire. It rises near the source of Gogo-water, in the parish of Largs, and flows south-south-eastward, through a hilly country, to the Garnock, at the village of Dalry. Its length of course, exclusive of sinuosities, is  $7\frac{1}{2}$  miles.

## S

SAARTAY, an islet in the sound of Harris. It measures 5 or 6 furlongs in length, and lies 1 mile from North Uist, and 3½ miles south-west of Bernera.

SADDEL AND SKIPNESS,\* an united parish on the east coast of the peninsula of Kintyre, Argyleshire. It forms a narrow belt of territory along the lower part of Loch-Fyne and the whole of Kilbrandon-sound, to a point 8 miles north of Campbelltown. Its extreme length is 25 miles; its extreme breadth is 4½ miles; its mean breadth is a little less than 3 miles; and its superficial extent is about 70 square miles. Its surface is, in general, upland and pastoral. The hills are neither steep, barren, nor rocky; they rise regularly and with an easy ascent from the shore; they have flat summits, or stretch away into small table-lands; and they are generally covered with an intermixture of grass and heath. The glens all run from north-west to south-east; they usually open, at their lower ends, upon beautiful little bays; and they enjoy so great a degree of heat, and such happy visitations of fertilizing showers, as are highly favourable to their agriculture. Seven large streamlets—the largest about 8 or 9 miles in length of course—and twelve smaller ones, cross the line of road which runs along the coast, and are, for the most part, spanned by convenient bridges. A tourist, traversing the parish lengthwise along the road, is presented with a great variety of pleasingly intermixed land and sea views, and alternately moves along a delightful bank overlooking the sea and Buteshire, and suddenly descends into pleasing woods and valleys.—About a mile from the south end of the parish, or 9 miles north of Campbelltown, stand the ruins of Saddle-abbey. The edifice was cruciform. From east to west it measured 136 feet, by 24 over walls; and from north to south, or along the transept, it measured about 78 feet by 24. Upon an extension of 58 feet from the south end of the transept a square or quadrangular court of buildings was constructed to serve for cloisters. Very little of any part of the edifice now exists. The establishment belonged to monks of the Cistercian order, and was founded by Somerled, Lord of Kintyre and of the Isles, who died in 1163, and completed by his son Reginald. It received from its founder the lands of Glensaddle and Baltebun in Kintyre, and those of Casken in the island of Arran; it received from Sir Duncan Campbell of Lochave, who, in 1445, was created Lord Campbell, the abbey-lands of Blairantibert in Argyleshire; and, in 1507, it was, with all its possessions, annexed by James IV. to the bishopric of Argyle.—Three miles north of the abbey is Torriedale-castle; and 1½ mile farther north, and near a church, a mansion, an inn, and a bridge, which all bear the name of Caradell, are a vitrified fort and a large Danish fortalice. The vitrified fort is on an islet in Caradell-bay, has an elliptical form, and encloses about a rood of ground. The Danish fortalice is called the Castle of Aird; it stands on a high rock overhanging the sea, and, while naturally inaccessible on all sides but one, is there defended by a deep broad ditch. It measures 240 feet in length, and 72 feet in breadth, but survives only in a part of the outer wall,

which is built with mud, and has been upwards of 6 feet thick and 12 feet high. On almost every point or projection along the coast are to be seen small Danish forts.—Near the north end of the parish stand the castle and the village of SKIPNESS: see that article. The mansions are Corsaig-house, the House of Cour, and Caradell-house,—the last a picturesque residence with a spacious lawn. The seas along the coast are part of the finest herring fishing-ground in Scotland, and are well-plyed with boats both from the united parish and from Arran. Three places on the coast, or the small bays of Caradell, Summadale, and Skipness, are well-adapted for harbours to accommodate vessels of from 15 to 30 tons. Population of Saddle, in 1801, 799; in 1831, 926. Houses 174. Population of Skipness, in 1801, 968; in 1831, 1,226. Houses 219. Assessed property, in 1815, £5,959.—This parish is in the presbytery of Kintyre, and synod of Argyle. Patron, the Duke of Argyle. Stipend £146 9s. 4d.; glebe £10. There are two parish-churches, situated in the respective parishes and mutually 13 miles distant. Caradell church belongs to Saddle, and was built about the year 1771. Sittings 354. Clonaig church belongs to Skipness, and was built in 1756. Sittings 288. A small Independent congregation enjoy, on about fourteen Sabbaths in the year, the services of one or two ministers of their connexion; and, on other Sabbaths, the district of the united parish, which is vacant for the day, has the services of an Independent preacher. The population of the united parish, in 1835, as ascertained by the elders and stated by the minister, consisted of 2,108 churchmen and 58 dissenters. In 1753 the old parishes of Saddle and Skipness, with a large tract of country between them, were disjoined from the parishes of Killean and Kilcalmonel, to which they had been annexed, and were erected into the present parish. There are two parochial schools and two non-parochial; the former attended, in 1834, by 185 scholars, and the later by 168. Salaries of the parochial schoolmasters £51 6s. 8d., with about £8 fees,—both equally divided. The earliest parochial schoolmaster of the united parish was inducted in 1821.

\* The name *Saddle*, the Old Statist thinks, alludes to the abbey of the district, and is an easy contraction of *Sagarid-dail*, 'the Plain of the priests'; and the name *Skipness*, he thinks, is Norse, signifies 'ship-point,' and probably alludes to the place having been a station of the Norsemen's fleet when Kintyre was under their dominion.

SALEN, a *quoad sacra* parish on the east side of the island of Mull. It belongs, *quoad civilia*, to the parish of Torosay; and is in the presbytery of Mull and synod of Argyre. The whole of it is landward. The parochial place of worship is one of the forty Government churches. Patron, the Crown. Stipend £120; glebe £3 and a manse. Parochial school-master's salary £5, with bed and board in lieu of fees, and no other emoluments whatever. Two parochial schools of other parishes stand near the limits of Salen.

SALINE, a parish in Fifeshire, on the extreme boundary of the county, on the west. It is rather more than 5 miles long from east to west; and is, at the centre, nearly about the same in breadth from north to south; but it narrows greatly at its extremities, and is scarcely more than a mile in breadth. It is bounded on the south by the parish of Carnock; on the east by Dunfermline; on the north by the parish of Cleish, in the county of Kinross; and on the west by the counties of Clackmannan and Perth. The eastern part of the parish is mountainous, rising into a lofty ridge called the Saline-hills; while the western portion of it is generally level. The greater part of the soil of the parish is a mixture of clay and loam, which, in some places, is of a fertile nature, capable of rearing abundant crops of wheat, pease, or beans. The lighter soils bear fine crops of oats and barley. In the eastern division, from its lying high, the rearing of cattle forms an important portion of the agriculturist's care; but here also, in many places, the soil is capable of bearing abundant crops. The village of Saline is clean, and extremely picturesque in its appearance. The houses are very neatly built and white-washed, and have all small kitchen-gardens or plots of flowers attached. The population of the parish, in 1801, was 945; in 1831, 1,139. In 1815 the annual value of real property for which the parish was assessed

was £3,787 sterling; the valued rent of the parish is £4,161 Scots.—This parish is in the presbytery of Dunfermline, and synod of Fife. Patron, the Crown. Stipend £156 17s. 2d.; glebe £15. The parish-church is a handsome building in the pointed style. It is seen from a distance in all directions, and adds considerably to the beauty of the village. The parochial school-teacher has the maximum salary.

SALISBURY-CRAGS, a remarkable hill of 574 feet above sea-level, whose western face—a semicircular sweep partly of naked rocky precipice and partly of very rapid earthy declivity—overhangs the south-eastern outskirts of EDINBURGH [which see], and is separated from Arthur's Seat by the Hunting-hog, a piece of marshy ground about 1,200 feet long and 250 broad, whose surface is about 194 feet above sea-level. A wild hut magnificently positioned path, which is carried round the base of the rocks along the brow of the bold and smooth descent of earth, commands most superb views of the urban landscape of the metropolis, and the broad rich framework of country in which it lies: see ARTHUR'S SEAT. The broad columnar belt of precipice round the summit of the eminence—a belt which looks, in the distance, like a zone of dark crystals, or a plain zone set all over with dark gems, and which procured for the hill its plural name of Crags—forms a romantic and quite a unique feature in the gorgeous scenery of Edinburgh; but it was, seventeen years ago, greatly damaged in the attractions of its south-west front, and—but for the general cry which rose for its protection—threatened with the ruin of nearly all its romance, by being prosaically treated as a common quarry! Greenstone, which has been upheaved through strata surfaced with sandstone and clay, forms the body of the hill. In places where the sandstone at the base has been quarried, beautiful specimens have been found of radiated hæmalites, intermixed with steatites, green fibrous ore of iron, and calcareous spar, forming altogether an uncommon mass. In many parts of the hill have been found also veins of calcareous spar, and fine specimens of talc, zeolite, and amethystine quartose crystals. It is curious that several large blocks of the greenstone of which the Crags are composed are found on Arthur's Seat, at elevations of from 80 to 200 feet above the highest point of the Crags.

SALT-COATS, a considerable little town and sea-port, partly in the parish of Ardrossan, and partly in that of Stevenston, Cunningham, Ayrshire. It is 1 mile east of Ardrossan, 4 south-west of Kilwinning, 7 west of Irvine, 13 north-west of Troon, 13 south-south-east of Largs, 14 west of Kilmarnock, 28 south-south-east of Greenock, 32 south-west of Glasgow, and 74 west-north-west of Edinburgh. Its situation is about the middle of the north or north-west side of the long hut comparatively slender segmentary indentation of the frith of Clyde, which, in a large sense, is called the bay of Ayr,—on ground low and level, and commanding a far sea-view only from the very lip of the frith,—in the neighbourhood of sandy bluffs and flat expanses,—and altogether so characterized as to be redeemed from the most irksome tameness only by the prospect, across the waters, of the splendid forms of Arran. In the interior, too, the town has so many one-story houses, and such fields of red tiles along their roofs, and such deformity and dinginess in the edifices of its salt-works, and such a prevalence of the most common village aspect in its streets, as to be hardly rescued from utter unattractiveness by the presence of a few good public buildings. Two United Secession places of worship, and a meeting-house belonging to the Relief, are plain yet sufficiently creditable structures. A Gaelic chapel, erected in 1836, and eccle-

siastically declared a sort of parish-church, is a neat little Gothic edifice, with a Saxon doorway and a small heltry. It stands at the west end of the town, looking toward Ardrossan, and is surrounded by an enclosure whose front is decorated with pillars. The town's branch-office of the Ayrshire Banking company is a recent and neat erection. The town-house, begun in 1825, is a two-story building, with a handsome spire; and is arranged, in the ground-floor, into shops, and disposed, in the upper story, into a lock-up-house, a committee-room, a library-room, and a large apartment used both as a public reading-room and as the seat of the justice-of-peace monthly courts.

Saltcoats is believed, on the authority of tradition, corroborated by the monumental evidence of considerable heaps of ashes, to have been, at a very early period, the seat of a manufacture of salt. The pristine artisans, it is supposed, were poor persons, who dug up from, very near the surface, as much coal as was needed for their operations, and made use only of little pans and kettles, and formed a kind of squatting community, whose homes were 'cots' on the shore; and who thus originated in their little cluster of 'salt-cots,' both the nucleus and the name of the future town. Saltcoats was of so much note so early as the reign of James V. as to be erected by him into a burgh-of-barony; and probably it retains no practical trace of its burghal character and privileges simply on account of having, soon after the receipt of them, suffered some severe and almost exterminating reverse. About the year 1660 it had so greatly declined as to have only four houses. But in 1684 Sir Robert Cunningham, the inheritor of the whole parish of Stevenston, and the nephew of the gentleman of the name who had purchased the estate in 1656, commenced a series of operations which soon advanced the decayed village, in common with the district in its vicinity, to a condition of comparative prosperity: he constructed, at what till that time was called the Creek of Saltcoats, a harbour which, for the circumstances of the period, was a work of some magnitude, and which still continues serviceable; he built several large salt-pans, and placed the manufacture of salt on an advantageous footing; and he opened various coal-pits on his property, and made the new harbour a place of large export for coal. The few houses which constituted the village, when his works were completed, were all low thatched cots. The first slated house was built in 1703, and still stands in Quay-street,—an object of some interest to the inhabitants. The salt manufacture, after undergoing various fluctuations, has eventually sustained material and perhaps permanent injury by the repeal of the salt-duties, and the consequent introduction of English rock-salt. Instead of seven salt-pans, which used to be in operation, there are now only two. A magnesia-work, in connection with the salt-pans, was the earliest establishment of its kind in Scotland, and continues to employ a number of workmen, and to prosper. Ship-building has, at various periods, been vigorously conducted; and during the twenty-six years which ended in 1790, it produced sixty-four vessels of aggregately 7,095 tons burthen, and upwards of £70,000 in value; but it has been singularly fitful, and three or four years ago looked as if it were totally relinquished. Rope-making, too, has been a fluctuating trade; but now seems, on a small scale at least, to be prospering. A hewery of long standing prospers. Six or seven vessels, each of from 20 to 70 or 80 tons, and aggregately employing about fifty persons, go annually to the North Highland herring-fishing. The domestic fishery is comparatively neglected. Much the largest section of the inhabitants are cotton-weavers, in the

employment of the Glasgow and the Paisley manufacturers. The fabrics woven are principally gauzes, lappets, shawls, and trimmings. The number of looms, including a very few in Ardrossan, was, in 1828, 662; and, in 1838, 572,—all of the latter, except six, plain. Many females are employed in muslin hand-sewing. The shipping of the town has greatly declined; yet it is, in its statistics, so much mixed up with that of Ardrossan, that it cannot very easily be estimated. The principal commerce is with Ireland, and consists in the exchange of coals for agricultural and dairy produce.—Saltcoats, in addition to the places of worship already mentioned, has two chapels, the one Independent and the other Baptist; and it has twelve schools,—one of them parochial, one a free-school for females, and the remaining ten private. An annual fair—once a scene of general harter between the Highlands and the Lowlands, but now principally for Highland cows and for pigs and lambs—is held on the last Thursday of May. Population, in 1821, 3,413; in 1831, 3,800.

SALTERNESS. See SOUTHERNESS.

SALTON, or SALTOUN, a parish in the western division of Haddingtonshire. Its form is ellipsoidal, the longer axis extending north and south, and the east side twice indented. It is bounded on the north-west by Pencaitland; on the north by Gladsmuir; on the east by Haddington and Bolton; on the south and south-west by Humbie; and on the west by Ormiston and Pencaitland. Its extreme length is  $3\frac{1}{2}$  miles; its extreme breadth is nearly 3 miles; and its superficial extent is about 8 square miles. The highest ground is the Skimmer-hills, a broad basel and flattened elevation, situated nearly in the centre of the parish, and rising about 600 feet above sea-level. On the south-east and east this high ground is, in a certain degree, continued by low uplands; but on all other sides the surface falls gradually off to the boundaries, and becomes lost in levels of very slender altitude. A wood, which forms nearly a square  $\frac{1}{2}$  mile deep, and is continuous with a forest of similar size in HUMBIE [which see], occupies most of the hanging plain on the south. Enclosures of hawthorn, occasionally mixed with the sweet-brier and the wild rose, fields in the highest state of cultivation, and rows and little expanses of trees, render the western and northern districts as rich and attractive as almost any in the beautiful county to which they belong. Salton-hurn and the Tyne, the latter receiving the former on the south-west, circle round all the parish except the east, the Tyne twice or thrice deviating from the boundary. Limestone abounds, and is worked, and coal might probably be found. The soil is very various, chiefly a deep, rich clay, but also clayey loam, friable loam, and light sand. Except the area under wood, and about 150 acres in permanent pasture, the whole parish is arable. The village of East Salton stands on the northern slope of the Skimmer-hills, on the Lammernuir-road between Edinburgh and Duns, and is  $5\frac{1}{2}$  miles south-west of Haddington, and 18 east-south-east of Edinburgh. Population 275. West Salton is situated about a mile to the west, and not far from the Tyne. Population 190.—Salton-hall, a mile north of the latter village, and the seat of the Fletchers of Salton, was formerly a fortified residence of considerable strength; but it has been modernized and highly improved.—Hermandston,  $1\frac{1}{4}$  mile north-east of the latter, and the seat of Lord Sinclair, is an ancient but habitable edifice.—The celebrated Burnet, bishop of Salisbury, was rector of this parish from 1665 till 1669, and distinguished himself by his pastoral assiduity; he was called away from his charge to fill the theolo-

gical chair of the university of Glasgow; and when he rose to dignity and wealth, he bequeathed 20,000 merks for the benefit of Salton, to be applied in erecting and partially endowing a new school-house, in enlarging a library for the use of the parochial incumbent, in clothing and educating 30 poor children, and in relieving the necessities of the parochial poor. The children who continue to reap the fruits of his bequest are popularly called 'bishops,' and occupy in the church a gallery, which bears the name of 'the bishop's laft.' Andrew Fletcher, the intrepid and patriotic, though mistaken and republican opponent of the national Union, and the liberal benefactor of his country in the departments of agriculture and manufacturing industry, was born in Salton in 1653, and, as to all of him which was mortal, lies interred in the family-vault below the aisle of the parish-church. In 1710 he went to Holland, where he had formerly, for some time, resided, and took with him James Meikle, a man of considerable skill in the mechanics of the age, and the father of Andrew Meikle, inventor of the thrashing-machine, both of whom were natives of the parish; and aided by these men, and by models of machinery which he and the elder Meikle brought with them on their return, he introduced the manufacture of decorticated barley, the cleaning of corn with fanners, and the art of weaving and bleaching Holland-cloth. Andrew Fletcher, the nephew of the patriot, but better known as Lord Milton, was born in the parish in 1692; and while he held, in trying times, the elevated situation of Lord-justice-clerk, he found leisure, in 1750, to establish in the parish the first bleachfield belonging to the British Linen company. Patrick Scougall, who became bishop of Aberdeen in 1664, was incumbent of the parish during the five years which preceded his being mitred. Henry Scougall, his son, and the devout and amiable author of the well-known treatise, entitled 'The Life of God in the Soul of Man,' was born in the manse in 1660; he became professor of philosophy at Aberdeen when only 19; he was raised to the chair of theology in King's-college when only 29; and he terminated his bright and balmy and odoriferous career at the early age of 38. The barley-mill, built by Fletcher, was the only one in Britain for 40 years, and long sent out highly estimated supplies of 'Salton' or 'pot' barley; but it has been diverted from its uses, and is not locally honoured with a successor. The fanners, introduced by the same benefactor, were peculiar to the parish nearly as long as the barley-mill; but have long since lost all distinctive connection with the district. The bleachfield, established by Lord Milton, was spiritedly conducted while he lived, and at one time employed upwards of 100 persons; but it has passed away, and left not a vestige of memorial. A paper-mill and a starch-work, which, at the date of the Old Statistical Account, employed 16 persons, have also disappeared. A brick and tile work, employing 6 or 7 workmen, is the only existing manufactory. A Salton agricultural society, which worked with vigour, and diffused not a few benefits, is now incorporated with the 'East Lothian United Agricultural society,' which has its seat in Haddington, but holds an annual meeting, and superintends an extensive cattle-show in Salton on the last Thursday of May. The parish has two religious and two friendly societies. Population, in 1801, 786; in 1831, 786. Houses 158. Assessed property, in 1815, £6,314. —Salton is in the presbytery of Haddington, and synod of Lothian and Tweeddale. Patron, Fletcher of Salton. Stipend £271 6s. 10d.; glebe £15. Unappropriated teinds £12 16s. 5d. Parochial schoolmaster's salary £34 4s. 4d., with about £33

fees. A non-parochial school is conducted by two teachers, was attended, in 1834, by 90 scholars, and is endowed with £20 a-year from Bishop Burnet's fund, and a house and field bestowed by General Fletcher Campbell.—The church was given by Hugh de Morville, in the reign of David, to the monks of Dryburgh, and continued, with slight interruptions, to belong to them till the Reformation; and afterwards it was, for a brief period, identified with the fates of the short-lived bishopric of Edinburgh. The manor of Salton belonged to the Morvilles and their successors, the Lords of Galloway, till forfeited during the wars of the succession, but was divided by them, and partially alienated; and in the reign of Alexander III. it belonged to William de Abernethy, and the progenitor of a family who acquired from it, in 1455, the title of Lord Saltoun, and who are now represented by Alexander George Fraser, Baron Saltoun of Abernethy, residing at Philorth-castle in Aberdeenshire, and Ness-cottage in Inverness-shire. The estate was acquired in 1643 by Sir Andrew Fletcher. But while it was yet in the possession of the Morvilles, the part of it which forms the lands of Hermandston was given by Richard Morville to Henry de St. Clair, the ancestor of the Lord Sinclairs of Hermandston. In the 13th century, John de St. Clair erected a chapel at Hermandston, but purchased the consent to his act of the cowled 'fruges consumere nati' of Dryburgh, by giving them two acres of land, and an indemnity that his chapel should not injure the mother-church of Salton.

SAMUELSTON, a village on the southern verge of the south-easterly projection of the parish of Gladsmuir, Haddingtonshire. It stands on the left bank of the Tyne,  $3\frac{1}{2}$  miles south-west of Haddington, and  $5\frac{1}{2}$  east of Tranent. It is an irregular, straggling, dislocated assemblage of small houses; dignified, in its way, by the presence of three farmsteads. It has a saw-mill and two corn-mills; and formerly possessed a somewhat large trade in meal. Population about 200.

SANDA, a small island, at the west side of the entrance of the frith of Clyde;  $6\frac{1}{2}$  miles east by north of the Mull of Kintyre, 4 miles distant from Southend, and 9 from Campbelton, in the peninsula of Kintyre. Its figure is irregular. It measures about  $1\frac{1}{2}$  mile in length, half-a-mile in breadth, and 3 miles in circumference, and contains about 500 acres. The island figures prominently in history as the common station of the Scandinavian fleets during the contests for the possession of Kintyre and the Hebrides. The small, good natural harbour which formed the place of rendezvous is still frequented by the smaller sorts of vessels which navigate the Clyde. It is formed by the main island, and two adjacent islets, and affords a complete shelter to shipping in all kinds of weather. Remains exist of an ancient chapel which was dedicated to St. Columba, and of a circumjacent cemetery which appears to have possessed some fame. Two crosses of rude design, and various grave-stones survive,—some of the latter sculptured with the achievements of the dead whom they commemorate. The cemetery—like most other repositories of the dead throughout the Highlands—is unenclosed, covered with weeds and rubbish, mutilated in its grave-stones, defaced in all its minuter features, and abandoned to neglect, and a ruin which seem to indicate a total want of right feeling respecting both the remembrance of the dead and the anticipation of death. Seamen, however—who, as a class, are pertinacious conservators of traditional superstitions—regard the burying-ground with mysterious fear, and believe that whoever shall step across the trunk of an alder tree which lies prostrate in the place, will die before

the termination of the year. Sandstone constitutes the whole mass of the island, and dips to the south at from 15 to 20 degrees. Hills are, in consequence, formed by it of about 300 feet in height; and, on some of the shores, they terminate in cliffs of moderate elevation. One of the cliffs is perforated into a very large natural arch, and forms a very picturesque object. The island is, for the most part, disposed in sheep-walk; but it abounds in hares and game, and, with the exception of foreign luxuries, produces almost everything which a family can require. An excellent house stands upon it for its proprietor. The sound of Sanda abounds in cod, and affords large periodical supplies of haddocks, whiting, skate, red cod, mullet, mackerel, and other fish; but, during two or three months in the year, it is extremely hoisterous, and prevents the island from being approached by a small boat. Aven—a name which Sanda still occasionally bears—is an abbreviation of the long and sonorous designation anciently given it of Avona Porticosa; Sanda, however, is the original name, and occurs in Adamnan's Life of St. Columba. Two islets, called the Sheep Isle, and Glanamair, lie on the north-east side of Sanda, and are well-calculated for keeping sheep. Their united superficies is about 22 acres. A dangerous rock, above a mile in circumference, and bearing the name of Paterson's rock, lies about a league south of Sanda; and, being always covered by flood tide, and visible at low water, it has endangered many a vessel.

SANDA, or SANDAY, a small island in the Hebridean parish of Small Isles, Argyleshire. It lies on the east side of Canna, and may almost be viewed as constituting a portion of it, the two being united at low water by a beach of shell sand; and it extends eastward about  $1\frac{1}{2}$  mile, with a mean breadth of about half-a-mile, and is distant  $2\frac{1}{2}$  miles from Rum. Its surface, at the end next Canna, is low; but, towards Rum, it rises into gentle elevations, and terminates in abrupt cliffs, which are skirted with detached and considerably high masses of rock. Two rocks, called Dun-na-Feulan, or the 'Gull rocks,' and situated at a short distance from the cliffs, form some striking combinations with surrounding objects, and render the landscape in which they lie decidedly picturesque. They are of different magnitudes, but of apparently the same height, and do not seem to exceed 100 feet in altitude; and the smallest is thin in proportion to its height, and of a steeple-like form, while the other resembles a huge tower. When the soaring mountains of Rum are swathed in clouds, and the hoisterous intervening sound is lashed into rage by a gale of wind, the 'Gull-rocks' are seen to a great advantage. A curious phenomenon, and one which specially invited the attention of geologists, is, that the steeple-like rock consists partly of conglomerate and partly of trap, divided from each other, not by a horizontal but by a vertical plane. The circumstance is the more curious, that the same substances are horizontally related to each other throughout Canna and every other part of Sanda. The island is valuable for both crop and pasture; and, at the date of the Old Statistical Account, had four tenants who held of the proprietor, and paid about £60 of rent. Between it and Canna is one of the best harbours in the Hebrides. See article CANNA.

SANDA, or SANDAY, one of the most considerable of the northern division of the Orkney islands. Its respective nearest points are  $2\frac{1}{2}$  miles north of Stronsay,  $1\frac{1}{2}$  mile east of Eday,  $6\frac{1}{4}$  miles east of Westray, and  $2\frac{1}{2}$  miles south of North Ronaldshay. Its form is exceedingly irregular; and may, in a general view, be regarded as three large peninsulæ, and

two small ones radiating from a common centre. Its length, from north-east to south-west, is 12 miles; but its mean breadth does not exceed  $1\frac{1}{2}$  mile; and its superficial extent is not more than 19 square miles. Excepting a hilly ridge of 200 or 300 feet in altitude on its west side, the island is extremely flat. Its soil is everywhere light and sandy, and, when well-manured with sea-weed, produces as good crops as any which are raised in Orkney. The flat coasts avert the blight which comes from the sea-spray on islands with hold and rocky shores; and they afford such a large supply of sea-plants as, on the one hand, gives a profuse and unrestricted amount of manure for the arable lands, and, on the other hand, produces about one-fifth of all the Orkadian kelp. The farmers are aggregately a superior class to those of most other Orkney districts; and, as the result partly of skilful husbandry, but chiefly of the natural capabilities of the soil, they raise a considerable quantity of grain for exportation, or additional to what is needed for local use. The principal harbours are Kettletoft on the south-east, and Otterswick on the north-east side of the island, opposite to each other, and both pretty safe and commodious. The latter—whose name is a corruption of Odinswick—penetrates the land, or runs down between two peninsulæ, to the extent of  $3\frac{1}{2}$  miles, with a mean breadth of between  $1\frac{1}{2}$  and  $1\frac{1}{4}$  mile; and it is traditionally believed to occupy the site of a wooded plain which was overwhelmed by the sea. Encroachments appear evidently to have been made by the hills; and a complete dis severance across the isthmus between Otterswick and Kettletoft seems to be threatened by high tides. The lowness of the east coast, not only combines with extensive shoals in the vicinity to render the coast very dangerous to mariners, but, in a gale of easterly wind, and during a spring-tide, subjects part of the island to inundation from the sea. Shipwrecks were, at one time, distressingly frequent along the coast; but of late years, they have, in a great measure, been averted by the erection of a lighthouse on Start Point,—the extremity of the north-eastern peninsula. Twelve or thirteen fresh-water lakes, the largest about  $2\frac{1}{2}$  miles in circumference, and two or three others not much inferior in size, occur in various localities, but particularly in the north, and in the peninsula of Burness. Between Kettletoft and Papa-sound in Stronsay, a distance of 7 miles, is the great herring-fishing station of the northern Orkadian islands. The fishery at this place recently gave rise to a village, and, in 1833, prompted the erection of a considerable pier. A remarkable granite or gneiss boulder, about 14 tons in weight, lies on slaty sandstone, near the church of Burness. On the promontory of Elness, which overlooks Papa-sound, the ancient Portsmouth of Orkney, and commands a very extensive view toward the Eastern Ocean, are upwards of twenty vitrified cairns, supposed by Dr. Kiihert to have been signal stations of the Norsemen for communicating with their fleets in the sound. The other antiquities of the island are the ruins of one or two ancient chapels, and of some considerable Pict's houses. Sanda is ecclesiastically divided into Lady parish on the north, and the united parish of Cross and Burness on the south. It has also a meeting-house of the United Secession. See CROSS and LADY. Population, in 1801, including the island of North Ronaldshay, 2,148; in 1831, 1,849.

SANDEND, a small sea-port in the parish of Fordyce, in Banffshire.

SANDERA, a small inhabited island in the district and parish of Barra, in the Outer Hebrides, Inverness-shire. It lies  $3\frac{1}{2}$  miles south-west of the

main land of Barra,  $2\frac{1}{2}$  miles north-east of Pabba, and  $\frac{3}{4}$  of a mile south of Vatersa; and is separated from the last by a strait, called the Sound of Sandera. Though indented in outline, it is not far from being circular, with a diameter of  $1\frac{1}{2}$  mile. The island consists of a single hill of gneiss, and attains an elevation of about 800 feet. Though, to a certain extent, sheltered from the western swell by the islets Fladda and Linga, at 1 and  $1\frac{3}{4}$  miles' distance, it is so extensively sheeted and overwhelmed with drifted calcareous sand as to present the appearance, at some furlongs or miles' distance, of being covered with snow. Yet, in spite of its smallness and poverty, it is inhabited by several families. A very large Danish 'dun' occurs on the east coast.

SANDHAVEN, a recently erected village, in the parish of Pittligo, the property of Sir John Stuart Forbes, Bart. The harbour of Sandhaven, which is now completed, is of easy access for vessels and fishing-boats, is safe, commodious, and free of dues for every thing connected with the fishing.

SANDNESS, a parish in Shetland, constituting, with Walls, Papa-stour, and Fowla, a ministry or united parish: see WALLS. It lies on the west side of the mainland, and the south coast of St. Magnus bay. The headland of Sandness, whence the district has its name, flanks the south side of the entrance of Papa-sound.

SANDSTING, AND AITHSTING, an united parish nearly in the middle of the mainland of Shetland. It is bounded on the north-west by Walls; on the north by a large inlet of St. Magnus'-hay, called Swarback's Minn, which divides it from the island of Mickle Roe; on the north-east by Delting; on the east by Wiesdale in Tingwall; and on the south and south-west by the Atlantic ocean. Its length from north-north-west to south-south-east is 10 miles; and its breadth in the opposite direction is 8 miles. The surface is almost everywhere hilly, neither attaining any considerable elevation, nor admitting any noticeable extent of plain. The rising grounds in the west are generally green, on a mossy soil, with little pasturage in winter; those in the north are dry and rocky, with small long heath, and fine sweet grass; and those in the central districts are covered with a deep moss, and plentifully produce a short lushy heath, and a coarse species of grass. The cultivated ground, amounting to 777 merks, lies generally along the shores. The parish is everywhere intersected by long narrow bays, called voes or friths; and the pasture in the ness or peninsula formed by two voes is generally good. The coast on the west side is rocky and bold, and is perforated by many caves, the resorts of wild pigeons; and, in all parts, it produces abundance of sea-weed for manure. There are upwards of 40 fresh-water lakes, some of considerable size, and many verdant or muddy at the bottom. Of two inhabited islands which belong to the parish, VEMENTRY is the chief, and will be separately noticed; and Papa-Little consists of three marks of land, pays £20 a-year of rent, and is occupied by one tenant. There are likewise 7 pastoral islets or bolms. Fisheries of ling, cod, and herring, are extensive. Kelp-making has quite or nearly ceased. The minister of the parish says, in the New Statistical Account, published in September, 1841, "There is nothing resembling a road in the parish unless a piece which I made some years ago, through the glebe, and carried on about half-a-mile towards the kirk. But there is a decided disinclination to walk on the road, because it wears the rivellus too fast, and because a road would imply a restriction to a particular path; whereas the Shetlanders' delight is to range uncontrolled, and to 'wander as free as the wind on his mountains.'"

Population, in 1801, 1,493; in 1831, 2,194. Houses 367. Assessed property, in 1815, £61.—This parish is in the presbytery of Lerwick, and synod of Shetland. Patron, the Earl of Zetland. Stipend £158 6s. 8d.; glebe £9. The parish-church, upheld by the heritors, was built in 1780, and repaired in 1824. Sittings 465. The old parish-church of Aithsting is still upheld by the people of its district, and is the scene of the parish-minister's labours every third Sabbath. An Independent congregation was formed at Sands in 1828, and assembles in a place of worship, built in 1833, at a cost of about £70. Sittings 120. Stipend £30, chiefly paid by the Congregational Union. Another Independent congregation has a small chapel, never regularly fitted up, at Bister in Aithsting, but very generally assembles in a private room. There are also two Methodist congregations, and one Methodist meeting-house. An ecclesiastical census, taken in March, 1837, exhibited the entire population then to be 2,350; and another ecclesiastical census taken sixteen months earlier, exhibited 158 as communicants in dissenting congregations. The schools of the parish are the parochial-school, with a salary of £26, and about £2 other emoluments, besides fees; a General Assembly's school, with a salary of £18; two schools supported by the society for propagating Christian knowledge, at a salary of £15 each; and four private subscription schools, with salaries varying from 15s. to £4, besides bed and board.

SANDWICK AND CUNNINGSBURGH, a *quoad sacra* parish, in the presbytery of Lerwick, Shetland. It occupies the part of the southern peninsula of the mainland, which lies between the *quoad sacra* parish of Quarff on the north, and the parish of Dunrossness on the south. Its greatest length is about 11 miles; its greatest breadth is about 6 miles; and its superficial extent is about 34 square miles. It consists of the ancient parishes of Sandwick and Cunningsburgh, which are annexed, *quoad civilia*, to Dunrossness, and were made a separate erection by the General Assembly in 1833. The parish ranks as a parliamentary one; yet only the manse, and not the church, was built at the expense of Government. Patron, the Crown. Stipend £120. The church was built by the heritors in 1807, at a cost of £700. Sittings 564. A Methodist congregation has existed in the parish about 18 years, and assembles in a chapel built 16 years ago, at a cost of about £60. Sittings 217. An Independent congregation was established about 24 years ago, and assembles in a chapel, which was built in 1820, at a cost of about £30. Sittings 150. In 1834 the parish-school was attended by 60 scholars, and a school of the society for propagating Christian knowledge by 85. Parochial-schoolmaster's salary £25 13s. 8d., with £8 fees. Population, in 1801, 2,051; in 1836, as ascertained by ecclesiastical census, 2,208. Excepting the principal resident heritor's family, all the parishioners are of the poor and working classes, and employed chiefly in fishing and husbandry, and pay rent under £5.

SANDWICK, a parish on the west coast of the mainland of Orkney. It is bounded on the north by Birsay; on the east by Harray; on the south-east by Stennis; on the south by Stornoway; and on the west by the Atlantic. Its extreme length from north-north-west to south-south-east, is  $7\frac{1}{2}$  miles; its extreme breadth is  $4\frac{1}{2}$  miles; and its superficial extent is about 15 square miles. The general surface presents to the eye alternations of arable ground, and deeply verdant pasture, interspersed with barren breaks. Except at Sandy-bay—which is only about 3 furlongs wide—the whole coast is bold and high, rising sheer up from the sea

to an altitude of from 100 to 400 or 500 feet. In the interior are two or three small lochs; and along the eastern and the southern boundary stretches the whole length of the loch of STENNIS: see that article. Along the craggy cliffs of the coast are found causeways or horizontal strata of stones, bearing various irregular and curious figures, the work of Nature, and the effect of time. These figured stones were particularly noticed in the 1st volume of the Transactions of the Antiquarian Society of Edinburgh, and they served for a period to be the subject of fascinating descriptions; but, by one of the caprices which render public taste respecting matters of curiosity a mere affair of fashion, they have, in a great measure, ceased to draw notice. In a rent or chasm of the craggy cliffs in their vicinity, is a figure bearing a resemblance to a bishop in his episcopal robes. On the coast, close by the shore, stand the ruins of a large building, called the castle of Snusgar. Other antiquities are tumuli, and one or two ruinous old chapels. "In a part of the parish of Sandwick," says the Old Statistical Account, "every family that has a herd of swine kills a sow on the 17th day of December, and thence it is called Sow-day. In the same place the people do no work on the 3d day of March, in commemoration of the day on which the church of Sandwick was consecrated; and as the church was dedicated to St. Peter, they also abstain from working for themselves on St. Peter's day, but they will work to another person who employs them." The parish is traversed by two good roads. Population, in 1801, 970; in 1831, 973. Houses 212. Assessed property, in 1815, £224.—Sandwick is in the presbytery of Cairston, and synod of Orkney. Patron, the Earl of Zetland. Stipend £158 16s. 3d.; glebe £12. The parish was disjoined 9 or 10 years ago from Stromness. In 1834 it had no parochial school, but possessed seven other schools, one of which was maintained by the society for propagating Christian knowledge.

SANNOX, various objects and localities on the north-east side of the island of Arran. The streams, South Sannox and North Sannox, though each not more than 4 miles in length of run, are the largest running waters on the east side of the island, and traverse singularly grand and impressive scenery. Glen-Sannox, the vale of the South Sannox, winds close round the north skirt of Goatfell, and is peculiarly noted for the sublimity of its landscape: See ARRAN. The streamlets are little more than half-a-mile asunder at their mouth; and both have in their channels extensive veins of a pure sulphate of barytes. In 1836 the proprietor received, from two practical chemists who casually visited the spot, a hint of the value of the mineral; in 1839, he completed, at the expense of upwards of £3,000, a manufactory for pulverizing it, and thoroughly preparing it for market; and in 1840 he constructed, at  $\frac{1}{4}$  of a-mile's distance, a quay where vessels might take on board the produce. The quarry is situated about 100 yards up the glen; the ore is transferred thence to the mill by a wooden-railway; and the coopering is placed in the vicinity of the quay. The veins—which seem to be those discovered long ago by Professor Jameson—cross the impetuous mountain-torrent that collects the waters of this wild glen; and two of them have been wrought on both sides of the stream. From them a large quantity of a very pure, crystalline, translucent sulphate, is extracted. Some masses have a slight brownish tint. It is the straight lamellar variety, and for purity exceeds the spar employed in the Ayrshire and Welsh manufactories of baryto-sulphate pigments. By sorting, washing, crushing, grinding, moulding, and drying, the spar becomes a pigment. Various colours

are imparted to the sulphate at the Glen-Sannox manufactory,—such as blue, yellow, and green, of various shades. Three farms along the coast have the names respectively of South, Mid, and North Sannox. A church, dedicated to St. Michael, anciently stood at South Sannox, and is commemorated by its burying-ground, which continues to be in use, and by a rude image of its patron saint placed in the wall of the cemetery. In the vicinity is a monumental standing-stone.

SANQUHAR, a parish in Upper Nithsdale, Dumfriesshire, stretching from side to side of the horn which the county protrudes between Ayrshire and Lanarkshire. It is bounded on the north by Kirkcubright; on the north-east and east by Lanarkshire; on the south-east by Durisdeer; on the south by Penpont; and on the west by Ayrshire. Its greatest length is 18 miles; its greatest breadth is 5 miles; and its superficial extent is  $61\frac{1}{2}$  square miles. The general surface is so high and rugged as to be— for a district south of the Grampians— emphatically Highland. Part of the soaring ridge, called the Lowthers, one of the highest regions of the great southern mountain-range, lifts a water-line along the boundary with Lanarkshire, and sends off ramifications into the interior. These heights, though a vast storage of mineral wealth, have a bleak and barren surface, and fling an aspect of utter wildness over the district in which they preside. Other lofty heights, some green, and others heathy, some rising slowly from their base, and others mounting almost sheer up with uncommon holdness and majesty, some conical, some elliptical, and most of gracefully-curved outline, occupy more than one-half of the whole parochial area; and, in the summer months, they, in most instances, command prospects which dazzle and overpower the eye. One mountain-line of water-shed runs 9 miles along the boundary with Penpont, and another forms the whole of the boundary with Ayrshire; both diverging, but in different directions, from Blacklarg-hill, a summit of 2,890 feet above sea-level. The loftiest of the Lowthers, or eastern heights, has an altitude of 3,130 feet. The vale of the Nith cuts the parish diagonally from north-east to south-west into two nearly equal parts; and is here a mimic strath of considerable beauty, flanked by hill-screens which are cleft by little transverse vales, and discharge through these openings watery tributaries to the Nith. The principal streams are the NITH, the CRAWICK, the WANLOCK, the MINNICK, the EUCHAN, and the KELLO. See these articles. About 15 indigenous streamlets, most of them small, run directly to the Nith; and nearly 40, several of them considerable in size, fall into it through the medium of the other chief streams. Some of these tributaries, and—excepting the Wanlock, whose waters are poisoned for fish by its impregnations with lead—all the larger streams yield very fine trout, but not in great abundance. The soil in the vale of the Nith, and in the lower districts of some of the lateral vales, is either loamy or dry and gravelly, and in either case not infertile; but, elsewhere, it is, in general, moss or clay,—is often spongy,—and, except in little pendicles, is solely though well adapted to grazing. If the whole parochial area be distributed into 225 parts, 1 is undivided common, 2 are covered with copses or plantation, 32 are regularly or occasionally in tillage, and 188 are pastoral or waste. A coalfield, variously stated at 6 miles in length, and half-a-mile in medium breadth, and at about 7 in length and 2½ in breadth, lies along the Nith, with the river above its centre, and is supposed to be a wing of the great field of Ayrshire. The great mineral treasures of the parish—treasures which sensibly enrich the county

and even the kingdom—occur in the vicinity of the village of WANLOCKHEAD: which see. The rocks of the mountains are nearly all of the transition or silurian class.—Eliock-house, on Eliock-hurn, in the vale of the Nith, is notable as the birth-place of the Admirable Crichton; and the apartment in which he was born is watchfully preserved in its original state. His father was an eminent advocate and a Lord of Session in the reigns of Mary and James VI.; and, soon after the birth of his distinguished son, he sold Eliock to the Dalzells, afterwards Earls of Carnwath, and removed to an estate which he had acquired in the parish of Clunie in Perthshire,—a circumstance which has frequently occasioned Clunie to be mistakenly named as the place of the Admirable Crichton's nativity.—Castle-Gilmour, an old baronial residence in the moors, about 3 miles to the east of Sanquhar, is now a modern farm-house. The locality must in ancient times have been very dreary and desolate, for even yet its general aspect is anything but interesting.—The great road between Glasgow and Dumfries passes along the Nith; and a road through Wanlockhead to Edinburgh strikes off from it up the Münnick; but elsewhere the parish offers hardly 100 yards for the transit of a wheeled vehicle. CRAWICK-MILL [which see] is a village on the boundary with Kirkeconnel. Population of the parish, in 1801, 2,350; in 1831, 3,268. Houses 575. Assessed property, in 1815, £10,658.—Sanquhar is in the presbytery of Penpont, and synod of Dumfries. Patron, the Duke of Buccleuch. Stipend £264 19s. 2d.; glebe £30. Unappropriated tithes £912 6s. 7d. The parish-church was built in 1824. Sittings 960. A chapel, in connexion with the Establishment, was built at Wanlockhead in 1755, by the mining company, for the accommodation of their people, at a cost of not more than £70 or £80. Sittings 250. Stipend from less than £60 to £65. Two United Secession places of worship are situated in the burgh; the first built in 1742, with 450 sittings, at an unknown cost; and the second, built in 1818, with 300 sittings, at a cost of about £400, and enlarged in 1830 to the extent of 200 additional sittings. Stipends respectively £125, with £10 for sacramental expenses, and a house, a garden, and a small glebe; and £100, with £6 for sacramental expenses, and a house. In 1834, the parish-school was attended by 44 scholars; and 5 non-parochial schools by 217. Parochial schoolmaster's salary £34 4s. 4½d., with £15 fees, and £5 other emoluments.—Sanquhar was anciently a rectory; and, in the 15th century, it was made a prebend of the cathedral of Glasgow. Comprehended in the present parish, is a great part of the ancient parish of Kilbride or Kirkbride, annexed to it in 1732. The ruins and cemetery of Kilbride still exist near the Nith in the south-east of Sanquhar; and are associated with some stirring stories respecting the times of the Covenanters.

SANQUHAR, a small town and royal burgh in the parish just described, 13 miles north-west of Thornhill, 27 north-west of Dumfries, 32 east-south-east of Ayr, 34 south-east of Kilmarnock, 56 south-south-east of Glasgow, and 56 south-west by south of Edinburgh. It stretches along the turnpike between Dumfries and Glasgow about  $\frac{1}{3}$  of a mile from the left margin of the Nith; and consists almost wholly of one street, about half-a-mile in length, and stretching from south-east to north-west. The street deviates or bends from the straight line, is of varying breadth, and has but a plain, though neither a mean nor a repulsive, architectural appearance. On a rising ground, at the north-west end of the town, stands the parish-church, a very

handsome edifice with a square tower. This succeeded a building which was remarkable for its size and disproportion, and which, from some sculptured stones in its walls, was supposed to be of great antiquity. At an expansion of the High-street, near its north-west end, stands the town-hall, built solely at the expense of the last Duke of Queensberry, and decorated with a tower and clock. The Secession meeting-houses are plain structures, situated the one in High-street, and the other a furlong north-east of the town-house. The absence of any other noticeable building is fully compensated by the presence of Sanquhar-castle. This fine ruin is situated on a steep bank, overlooking the Nith, about  $1\frac{1}{2}$  furlong from the south-east end of the town. Its appearance on the south is highly picturesque. It seems to have been a strong quadrangular structure, with towers at the angles. On the north side was a deep fosse provided with a drawbridge; on the west were gardens, whose site still retains an isleted fish-pond; on another side, was a spacious deer-park; and at a short distance on the south, is the moat on whose summit the barons wielded, in juridical form, their feudal powers of sovereignty. Either the castle, or some fortified predecessor on its site, seems to have given origin, as it certainly gave name, to the town; for 'Sanquhar,' originally and for centuries spelt 'Sancher,' or 'Sanchar,' is simply the Celtic *saen-caer*, 'an old fort.' The earliest proprietors of the castle and circumjacent lands, or Lords of Sanquhar, were the Roos, Roose, or Ross family, cadets of the Earls of Ross, Lords of the Isles. Isobel de Ross, the daughter and heiress of Robert de Ross, the last of the line, married William, the 2d son of Thomas, Lord of Crichton, who flourished in the reign of Robert Bruce. At this epoch, Richard Edgar, a descendant of Dunegal, the Gaelic chief who possessed Strathnith in the reign of David I., obtained possession of the castle and half the barony. But the son of Isobel de Ross, and of William who became Lord of Crichton, appears to have eventually expelled the intruder, and regained the inheritance. The strength is also, amid some confusion of record and tradition, said to have been for some time in the possession of the English in the reign of Edward I., and to have been recaptured, and had its English garrison put to the sword, by Sir William Douglas of Douglasdale. The Crichtons, at all events, became speedily and continuously the lords of the castle, and of the whole barony. Sir Robert Crichton, great-grandson of Isobel de Ross, was, in 1464, appointed by James III. hereditary sheriff of Dumfries-shire. In 1630, Sir William Douglas of Drumlanrig, who had a mortgage on the barony, purchased the whole property—lands, lordship, and castle—to be sent down to his posterity and representatives, the Dukes of Queensberry and the Dukes of Buccleuch. The castle now became, for some period, the chief residence of the proud Drumlanrig Douglasses. Even after William, the 1st Duke of Queensberry, built the magnificent palace of Drumlanrig—now the favourite residence of the present Duke of Buccleuch—he spent but one night within its walls, and retired for the remainder of his life to Sanquhar-castle. See DRUMLANRIG-CASTLE. The old pile was forsaken, however, by the 2d Duke, and strangely abandoned to the most utter neglect. Plunderers speedily thronged upon it, first to divest it of its leaden roof, and next to use it as a quarry for the erection of their sties and hovels; and they made quick work of leaving it not a vestige of its ancient magnificence except its gaunt but venerable fragment of a ruin. A curious monumental relic of the original proprietor's, was, about half-a-century

ago, found near the castle,—a stone inscribed: "Here lies the good Sir John Ross of Ryehill; here lies the good, good Sir John Ross; here lies also the good, good, good Sir John Ross."

Sauquhar owes, in a great measure, its modern prosperity to various benign measures of the last Duke of Queensberry. His Grace, at an expense of £1,500, cut, for at least 21 miles across his estate, the great line of road which passes through the burgh between Dumfries and the central west of Scotland; he cut, at an expense of £600, the cross road which runs up the Minnick to Wanlockhead; he constructed, at the cost of £300, a road in the contiguous parish of Kirkconnel, leading up to a lime-work at Corsancone; and, jointly with the trustees for the encouragement of manufactures, he gave £40 a-year to be distributed among stocking-makers and other manufacturing artificers in the town and its vicinity. Wire-worked stockings and mittens, mostly party-coloured and very various in pattern, long formed a staple manufacture, and afforded a large number of the lower classes a comfortable support. Previous to 1777, the manufacture was so extensive that, for a number of years, one person annually sent to a single house in Glasgow 4,800 pairs of stockings. But Virginia being the principal market, the trade sustained a severe blow at the breaking out of the American war; and it has since dwindled away almost to annihilation. The coal-mines which were opened in the immediate precincts of the town brought, for a long series of years, a considerable wealth, and gave much local employment; and they are still productive, though, as we have seen, much less so than at a former period. Including Crawick-mill, in the near neighbourhood, and within the old royalty, the town is the seat of a considerable woollen and cotton manufacture. The number of looms, in 1838, was 182,—35 of which were factory looms. A carpet-factory produces the same fabrics, and yields the same wages, as the factories of Kilmarnock. Thibets, tartans, and gingham also are woven; the first averaging 6s. 6d. of clear weekly wages, the second 5s. 3d., and the third 4s. 6d. About 300 females are employed in the sewing and embroidering of muslin with cotton. The town has recently been lighted with gas.

Sauquhar was a burgh-of-barony from a very ancient but unascertained date, and was re-erected in 1484; and, at the instance of Robert Crichton, Lord of Sanquhar, it was, in 1598, by charter of James VI., constituted a royal burgh. The town-council consists of a provost, three bailies, a dean-of-guild, a treasurer, and eleven councillors. Municipal constituency, in 1833, 55. The burgh-property is very small. In 1832 the revenue from all sources was £65 17s. 4d., and the total expenditure £4 10s. There are nominally five incorporated trades; but they have the good sense to see that their exclusive privileges only hurt their neighbours and do no good to themselves, and they have, all of their own accord, virtually ceased to be incorporated bodies. The town-council also passed, in May 1833, a resolution well-worth the attention of kindred bodies in more important towns: "That for the future the magistrates and council shall throw the privileges of the burgh open, to the extent of not exacting from any individuals coming into the burgh, and keeping a shop, or carrying on any sort of trade or business whatever, any of the fees or charges hitherto in the use of being levied from persons commencing business in the burgh, and that such persons shall not be interfered with, or have any demand for burgh-fees made upon them." The burgh unites with Dumfries, Annan, Kirkcudbright, and Lochmahen, in sending a member to parliament. Constituency, in

1838, 61. The town has an office of the British Linen Company's bank. Four annual fairs of ancient origin may still be held, but they have fallen very nearly into desuetude. An annual sheep-market and three annual cattle-markets are of recent establishment, and draw a considerable and business-like attendance. Population, in 1821, about 1,250; in 1831, 1,527.

SARCLET, a fishing-village,  $4\frac{1}{2}$  miles south by west of Wick, Caithness-shire. A small cove, overhung by a bank which forms the site of the village, has, at considerable expense, been constructed into a good harbour for fishing-boats.

SARK (THE), a small river in the extreme south-east of Dumfries-shire. It rises in two head-streams, the one from the north-west corner of Canobie, and the other from the north-west extremity of Half-Morton, and has a sinuous course of 10 or 11 miles in a southerly and a south-south-westerly direction to the head of the Solway frith. It, for  $2\frac{1}{2}$  miles, divides Half-Morton from Canobie; and afterwards, or over a distance of between 5 and 6 miles, it divides Scotland and England. Its sources lie among the lower declivities of the Eskdale hills, but by far the greater part of its course is across either a low and beautiful plain or along the skirts of the Solway-moss of Cumberland. During a comparatively dry summer the stream almost ceases to exist.

SARK (THE BLACK), a rivulet in the south-east of Dumfries-shire, tributary to the Sark. It rises at Burnfoot-hill, near Sarkshields, in the parish of Kirkpatrick-Fleming, and flows south-eastward through that parish, and through Half-Morton and Gretna, to the Sark,  $\frac{3}{4}$  of a mile above Springfield.

SARKFOOT, a small village and sea-port in the parish of Gretna, Dumfries-shire. It stands at the mouth of the Sark,  $1\frac{1}{2}$  mile south of Springfield and  $8\frac{1}{2}$  east of Annan. The harbour admits vessels of 120 tons.

SAUCHIE (NEW and OLD), two large and contiguous villages in the parish and county of Clackmannan. They are situated about  $1\frac{1}{2}$  mile north of Alloa, and 6 miles north-west of Kincardine. Their inhabitants are principally colliers and other parties connected with the Earl of Mar's coal-mines. New Sauchie had, in 1838, a population of upwards of 880. A hired room was, in 1837, fitted up with 100 sittings as a dissenting preaching-station. A chapel in connexion with the Establishment was built here in 1841-2; and a handsome school-house was erected at the expense of the late Mr. Erskine of Mar.

SAUCHIEBURN, a battle-field in ST. NINIAN'S: which see.

SAULSEAT, or SOULSEAT, an ancient parish and an abbey in the north of Wigtonshire. The parish was a vicarage under the monks of the abbey; and, about the middle of the 17th century, it was incorporated with Inch. Its ecclesiastical revenues are divided between the minister of Inch and the minister of Portpatrick. The abbey stood on a peninsula of Sauseat-loch, in the vicinity of the present manse of Inch. The building was in ruins in 1684, when Symson wrote his 'Description of Galloway'; and it is now commemorated only by a few crushed and melancholy remains. An extensive burying-ground which seems to have surrounded it, and which is still partially in use, contains some curious though no very ancient monumental inscriptions. The abbey was founded, in the 12th century, by Fergus, Lord of Galloway, for Premonstratensian monks. It had its name, as Symson thinks, either from being arrogantly described as 'Sedes Animarum,' or from having had a person of the name of Saul as its first abbot, and so being 'Sedes Saulis.' Chalmers says, "It was the mother of the more celebrated and opulent

priory of Whithorn, as well as the abbey of Holywood, both of which were planted by monks of the same order. It appears to have been the original establishment of the Premonstratensian monks in Scotland; and the abbots of Soulseat were the superiors of that order in this kingdom." Its abbacy was one of the few in Scotland, the appointment of which remained with the King, and could not be disposed of or controlled by the Pope. The abbey never rose to any eminence nor ever figured conspicuously in history. In 1568 its abbot, along with some of the most distinguished men of the kingdom, subscribed a bond obliging themselves to defend Queen Mary.

SCALLOWAY, a sea-port village in the parish of Tingwall, Shetland. It stands at the head of Scalloway-bay, on the west coast of the mainland, 3 miles south-south-west of Tingwall church, and 6 miles west-south-west of Lerwick. The cottages are of a better description than most in the northern islands; and, arranged round a fine semicircular sweep of bay, they combine with the sea-scene in front, and the old castellated mansion of Scalloway towering above them in the rear, to form quite a picturesque landscape. The harbour is naturally good, and is supposed to have, in its relative position to the castle, given to the locality the name of Scalloway, or 'the roadstead beside the mansion,'—*Scalla* signifying a mansion, and *vic*, transmuted into *way*, a roadstead. The village was anciently a burgh, and the capital of Shetland. Though Mr. Scott of Scalloway is now the only gentleman of property residing in it, most of the great Shetland landowners, within sixty or seventy years ago, had residences here. Excepting the family mentioned, and a few tradesmen, the whole population, amounting to about 500, consists of fishermen and their families. A small Independent chapel was built here in 1838; and a church in connection with the Establishment, promoted by private subscription, was in the course of erection in 1841. In the village is a school maintained by the Society for Propagating Christian Knowledge. For the convenience of the fisheries the port is provided with a large quay, warehouses, and a cooorage.—Scalloway-castle, situated above the village, is covered all over with the infamy of association which belongs to the name of Patrick Stewart, the tyrannical Earl of Orkney. It was built by that despot about the year 1600, in circumstances which give it a prominent place in the history of oppression. A previous mansion of the Earl, at Sumburgh, having given way in consequence of the sandiness of its foundation, the despot compelled the inhabitants, on pain of forfeiting their property, to find as many men as were required for speedily building a new castle, and to supply them gratuitously with provisions; and he superintended and matured the execution of his ignoble plan, by means of a military force. The castle, though now a mere shell, exhibits plentiful and distinct indices of its original condition. It was built of Sandstone brought from Orkney, and possessed no peculiarity of design, but was a servile copy of the castellated mansion common at the period. The structure is three stories high, and is surmounted at each angle by a small handsome round turret. The windows are very large; but the principal door is quite disproportionate and even puny. The apartments, on the ground-floor, are an excellent kitchen and vaulted cellars, sending off a broad flight of ascending steps; and the apartments above are a spacious hall and suits of ordinary sized chambers. On the lintel-stone of the gateway is part of a Latin inscription which, in its un mutilated form, was, "Patricius Steuardus, Orcadiæ et Zetlandiæ Comes, I. V. R. S. Cujus fundamen saxum est, Dom. illa

manebit, Labillis e contra, si sit arena perit. A.D. 1600."

SCALPA, an island of the Skye groupe of the Hebrides. It is separated from the east coast of Skye by Scalpa-sound, which, in many places, is not more than half-a-mile broad; and it lies off Loch-Ainort, and is 2 miles south of Raasay, 7 south-west of Applecross, and 8 west of Loch-Alsh. It is of an irregularly oval shape of  $4\frac{1}{2}$  by  $2\frac{1}{2}$  miles; and has the longer axis from north-west to south-east. Most of its area is occupied by a grassy mountain of uneven summit and rounded outline, displaying much bare rock, yet nowhere marked by asperities or wearing a barren aspect. The descent, in most places, but especially along the side which confronts Skye, comes down in smooth and gentle declivities to the sea; but, towards the north-east, it terminates in bold but not very high cliffs. The sound of Scalpa is a noted rendezvous of the berring-fleet; and it abounds in oysters, some of which, both fish and shell, are black, while others are of a dingy diluted blue colour. These oysters are supposed to be only a variety of the common species, and to derive their unwonted hue from the dark mud in which they breed. On the island are vestiges of an ancient chapel dedicated to St. Francis, and conjectured to have been originally Culdee. Scalpa belongs ecclesiastically to STRATH: which see.

SCALPA, or SCALPAY, a small inhabited island in the Harris district of the Hebrides. It lies at the entrance of East Loch-Tarbet, half-a-mile from the northern, and  $2\frac{1}{2}$  miles from the southern, headland. It measures nearly 3 miles in extreme length, and upwards of  $1\frac{1}{2}$  mile in extreme breadth; but is exceedingly indented, and cut into small peninsulæ by the sea. It is low and heath-clad; and consists of irregular protuberances of gneiss. A bed of serpentine, generally placed at a high angle, and often having a vertical position, traverses a promontory in the extreme east. On this promontory stands a lighthouse, built in 1788. Near the western extremity are two of the best natural harbours in the Hebrides.

SCALPA-FLOW, a large expanse of water among the southern Orkney island, forming a sort of Orcadian mediterranean. Irrespective of lateral recesses and outlets, it measures about 15 miles in extreme length from north to south, 8 miles in mean breadth, and 45 or 47 miles in circumference. In a general view, it may be regarded as having Pomona on the north, Burray, and South Ronaldshay on the east, the Pentland frith on the south, the conjoint island of Walls and Hoy on the west, and the small islands of Cava, Rysay, Faray, Calf, Flota, Switha, and Hunda in its bosom. In the extreme north-west, it opens by Hoy-sound, 7 miles in length and 2 in mean breadth, to the Atlantic ocean; in the north-east, it opens by Holm-sound,  $3\frac{1}{2}$  miles by 2, to the German ocean; in the middle of the east side, it opens by Water-sound, 4 miles by half-a-mile, to the same ocean; and, in the south, it has the island of Swinna near the middle of the line where it becomes identified with the Pentland frith. This isle-begirt sea abounds, in its numerous recesses, with safe roadsteads and fine harbours. The chief is Long-hope, in Walls, quite landlocked, capacious enough for the largest fleet, and possessing good anchorage and sufficient depth of water for the largest ship in the British navy; and others are Holm-sound, Floxa-sound, St. Margaret's-hope, and Pan-hope. The tide, at its entering Scalpa-Flow from the south-west, and through the sound of Hoy, flows with rapidity akin to its current through the Pentland frith; but it gradually slackens, till its motion becomes scarcely perceptible. At one part of the

coast of Græmsay, lying in the sound of Hoy, the current, in consequence of being intercepted by a reef of rocks, runs 9 hours in one direction, and 3 in the opposite. Scalpa-Flow abounds with shoals of dog-fish, with haddocks, skate, flounders, and mackerel, and occasionally with herring.

SCARBA, an island in the Hebridean parish of Jura and Colonsay, Argyleshire. It lies  $3\frac{1}{2}$  miles west-north-west of Craignish point on the mainland of Argyleshire, and  $1\frac{1}{2}$  mile north of the island of Jura, from which it is separated by the tumbling and tumultuous sound of CORRIEVRECKAN: see that article. The island measures about 3 miles, both in extreme length and in extreme breadth; but, northward of a line about  $\frac{2}{3}$  of a mile from the southern extremity, it gradually contracts till it terminates very nearly in a point. Most of the area is occupied by a single mountain of an oblong conoidal form, which towers aloft to the height of about 1,500 feet, and is conspicuous at a distance as much for its outline as for its altitude. The shores on the south, the west, and the north, are generally high, rocky, and precipitous; and, in some places, they consist of a perpendicular face or sheer fall of the mountain of several hundred feet. All these shores and the high grounds, wherever not quite naked, are for the most part covered with heath. But the east side of the island is eminently beautiful: it recedes in a semi-circular curvature from the sea, so as to enclose a fine bay in a magnificent amphitheatre; it rises up along the sea-board with an uniform and quite practicable acclivity; it has a subsidiary and comparatively low ridge of rising ground along the skirt of the interior mountain; it is sheeted over with verdure and with natural woods, occasionally interrupted by projecting rocks; and, in all the magnificent sweep of its recess from the bay, it commands a view of the variegated and intricate channel of the Slate islands, with the sound of Oban, and the distant ranges of mountains that extend from Ben-Cruachan to Ben-Nevis. Quartz rock, dipping toward the east in angles of 40 or 50 degrees, forms the principal body of the mountain; but it alternates with and passes into micaceous schist; and both it and the varieties which the intermixture with it of the micaceous schist produces, alternate with clay-slate. Scarba is inhabited by only a very few families.

SCARP or SCARPA, an island in the Hebridean parish of Harris. It lies half-a-mile north-west of the nearest point of the mainland of Harris, and 7 miles north-north-west of Taransa. It extends north-west and south-east, and measures about 3 miles by 2. It consists of one rocky mountain of gneiss, which rises about 1,000 feet above sea-level. The island is inhabited.

SCARR or SKARR (THE), a small river of Nithsdale. It rises on the east side of Blacke-hill, within half-a-mile of a point where the counties of Dumfries, Kirkcubright, and Ayr meet, and flows south-eastward to the Nith,  $\frac{2}{3}$  of a mile below Keir church. Excepting over  $1\frac{1}{2}$  mile before falling into the Nith, its entire course is in the interior and along the boundary of PENPONT: which see.

SCARSCOCK, that part of the great central mountain-range of Scotland which separates the south-west of Braemar in Aberdeenshire from Athole in Perthshire. The chief summits rise to an altitude of 3,500 feet above sea-level.

SCARVAY, a pasture islet of probably  $1\frac{1}{2}$  mile in circumference, in the sound of Harris,  $3\frac{1}{2}$  miles west of Aird-Rhenish on the mainland of Harris.

SCATAVAGH-BAY, an indentation of the sea on the east coast of Harris. It is  $2\frac{1}{2}$  miles long, and, at the entrance,  $1\frac{1}{2}$  mile broad; it opens about

a mile south of the entrance of East Loch-Tarbet; and it is partly sheltered seaward by an islet called Gresavagh.

SCATWELL, a beautiful pastoral valley, watered by the combined streams of the Meig and the Conon, in the parish of Contin, Ross-shire.

SCAVIG (LOCH), a remarkable inlet of the sea, a scene of deeply impressive, of wild and dismal grandeur, on the west coast of the Isle of Skye. It is about 4 miles both broad and long, and penetrates among the Coolin or Cuchullin mountains. Its flanks are stupendous heights of bare rock, which shoot abruptly up from the bosom of the sea, and, being composed of the mineral called hyperstein, have a singularly dark and metallic aspect. "But," says Dr. Macculloch, who brought this remarkable piece of scenery into notice, and is the fittest person to describe it, "it is impossible to convey any idea of this spot, which before my visit had never been seen by a stranger, and was indeed known to few even of the inhabitants of Skye. Scarcely any but the shepherds had trod these sequestered retreats, the dwelling of clouds and solitude; fit baunts for the poetical demons of the storm. Loch-Scavig is inaccessible by land on the north side, and equally so on the south to all but the active and practised mountaineer. The traveller whose object is picturesque beauty, should enter it from Stratbard. In this direction the view from the sea is extremely fine, the dark ridge of the Cuchullin, with all its spiry and serrated projections, flanked by the equally dark and lofty ridge of Blaven, forming a varied and rugged outline on the sky. On entering the bay, these summits disappear, as they retire below the high skirts of the hills which descend into the sea, varied by projecting points and rocky islets, and surrounding the spectator with a continuous surface of bare and brown rock, scarcely presenting a symptom of vegetation. The falling of a cascade, the deep dark green of the water, and the wheeling flight of the sea-birds that frequent this retired spot, are the only objects which vary the uniformity of colours and of character it everywhere displays. On landing, similar scenes meet the eye in every direction, no intruding object occurring to diminish the effect produced by the gloomy grandeur and savage aspect of the place."—[Description of the Western Islands.] A long valley at the head of the bay, enclosing the fresh-water lake Corriskin, displays scenery of kindred character, accompanied with interesting associations. See CORRISKIN.

SCHICHALLION, a huge isolated mountain on the boundary between the parishes of Fortingall and Dull, 4 miles south-east of Kinloch-Rannoch, or the east end of Loch-Rannoch, Perthshire. The altitude of its summit above sea-level is 3,564 feet. The mountain stands at the eastern entrance of the district of Rannoch, a little detached from the long ridge of 7 miles breadth at the base, and 3,000 feet or upwards in mean elevation, which divides Rannoch from the vales of Glenlyon and Fortingall; and, seen on entering the country by any approach from the Lowlands, it has a conspicuous and commanding appearance. Viewed from the north-west, it seems a cone; but viewed from the south or east, it is seen to be elongated, eastward and westward, to rest on a long narrow base, to rise gently at its east end, and to lie steep on the west and on the south side. Its outline is, on the whole, curvilinear, and has fewer angles and breaks than that of most of the monarch-heights of the Highlands. The view from its summit promises, *a priori*, to be magnificent; but, when actually seen, it greatly disappoints. The valley of the Tummel is sufficiently remote to appear trifling; Loch-Rannoch seems stript of its attractions, and

sinks into comparative tameness; Glenlyon is shut out by the interposed mountain-range; and all else is a tumultuous sea of wild elevations, among which the eye traces few striking forms. Schichallion is known throughout the scientific world as the scene, in 1777, of curious observations by Dr. Maskelyne, astronomer-royal; and it afterwards acquired additional celebrity from the visit and notices first of Dr. Playfair, and next of Dr. Macculloch. The name, when etymologically written, is *Sith-chailinn*; and is said to mean a detached hill, the resort of the fairy-queen. An unexplored cave near its south-west corner is supposed to be continued to an opening, which exists in the face of a rock a very long way to the east; and, on the part of the credulous and romancing Highlanders in the circumjacent country, it is believed to be disposed in cells, and to be provided with a door which spontaneously makes such a sweep upon its hinges round any person who advances a few yards within the entrance, as to shut him for ever in from returning to the world. The ancient forest of Schichallion exists only in fallen, few, and melancholy vestiges. See GLENMORE.

SCONE, or SCOON, a parish in Strathray, Perthshire; bounded on the north and north-east by St. Martin's; on the east by Kilsindy, and the Murray's-hall, and Balthayock districts of Kinnoul; on the south by Kinfauns and the Kinnoul-proper district of Kinnoul; and on the west by the Tay, which divides it from Perth and Redgorton. Its greatest length from north to south is about 4 miles; its greatest breadth is about 3 miles; and its superficial extent is about 6,000 imperial acres. The district is one of the most lusciously beautiful in Perthshire; and forms part of the gorgeously adorned and somewhat circular basin, all whose sides look down upon "the fair city" of Perth. The surface maintains a general rise or slow ascent from the Tay to the eastern boundary; yet, it is now spread out in little levels, now dimpled into depressions, and not infrequently rolled or swollen into small hills of gradual and easy ascent. No rocks or precipices occur, except in the lips of quarries; and no abrupt breaks, or steep banks, except by the sides of the brooks. All the western district has a cultivated and highly-embellished appearance; much of the central and the eastern districts is thickly feathered over with wood; and almost every spot, whether on the rising grounds or on the plains, luxuriates in the vegetation of either farm-crop, garden produce, or the forest. The soil, in some places, especially near the river, is a strong rich clay; in others, is gravelly and light; and in others, is a good loam. Excellent freestone, in some places of a reddish colour, in others, grey or azure, and in all well-adapted for building, has been very extensively quarried. The Tay, till it comes abreast of Scone palace, is shallow and rapid; but afterwards it is stemmed by the tide, and becomes deep and placid, like a floating mirror, reflecting the beautiful scenery on its banks. Four brooks, two of which drive several mills, and produce a small sort of trout, traverse the parish westward to the Tay. The modern village of Scone stands about  $2\frac{1}{4}$  miles north of Perth, and  $\frac{3}{4}$  of a mile east of the Tay, opposite the mouth of the Almond. Its site is a plain which, as compared to other parts of the parish, except the east, is high, and which singularly and very healthfully combines airiness with shelter. The village, or rather little town, is regularly arranged in streets and by-lanes, and consists for the most part of neat and substantial houses. Population, in 1792, 466; in 1838, between 1,200 and 1,300. Four or five other villages exist; but they are all small. At Stormontfield,

formerly called Colenhaugh, and situated on the Tay, directly opposite Luncarty, is an extensive bleachfield.—Two Druidical circles occur within 14 yards of each other near the eastern boundary. The Roman road from the camp at Ardoch to the foot of the Grampians, traverses the parish from west to north-east. Vestiges of an oblong encampment of about 1,500 feet in circumference, and of a fortification, called the Silver-castle, were not long ago describable on the margin of the Tay. The parish is traversed northward and north-eastward by the roads from Perth to Blairgowrie, Cupar-Angus, and Newtyle. Population, in 1801, 1,670; in 1831, 2,268. Houses 442. Assessed property, in 1815, £7,338.—Scone is in the presbytery of Perth, and synod of Perth and Stirling. Patron, the Crown. Stipend £267 11s. 2d.; glebe £55. Unappropriated tithes £91 17s. 11d. The church was built in 1803 or 1804, and enlarged in 1834. Sittings 638. A United Secession congregation was formed in the parish some years before 1755. Their chapel, situated in the village, was built in 1810, at a cost of upwards of £1,000. Sittings 560. Stipend £120, with £8 for communion expenses, and a house and garden. In 1834, the parish-school was attended by 132 scholars; and three non-parochial schools by 129. Parish-schoolmaster's salary £34 4s. 4½d., with from £15 to £20 fees, and about £13 other emoluments.

ANCIENT SCONE, though as a town or village it has ceased to exist, teems with interest as to at once its antiquities, its historical associations, and the modern objects which occupy or environ its site. It stood in a hollow, or recess of the grounds of the upward swell or gentle acclivity from the Tay, and looked out upon the river and upon the vale of Perth. Its distance from "the fair city" was little more than a mile; very advantageously qualifying it, amid the inconveniences and the cumbrous movements of a rude age, to hold a similar relation to Perth, the meeting-place of parliaments and the residence of courtiers and noble, to that which Windsor now holds to London. During the middle ages of the Scottish monarchy, it shared with Dunfermline and other places the favour of being the residence of Scotland's kings; and, from an early age till a period succeeding the Union of the Scottish and the English crowns, it was first regularly and afterwards occasionally, the distinguished scene of the royal coronations. A celebrated stone, of many reputed virtues in a dark age, the subject of wildly romantic tales, an object of high antiquarian interest, and still an emblem of royal state, and part of the furnishing of a coronation at Westminster, was, in 834, brought hither from Dunstaffnage by Kenneth I., and flung a special though imaginary magnificence over the place, till it was seized by Edward I. and carried away to England. See DUNSTAFFNAGE. All the Scottish princes who mounted the throne in the interval, or all from Kenneth II. till John Baliol, were attracted by the stone to receive their crown at Scone. Charles II., when on his expedition into Scotland, was, on January 1st, 1651, the subject of the last Scone coronation; and he made the occasion memorable by the facility with which he seemed to gulp down "the Solemn League and Covenant of Scotland," and the cool nonchalance with which he afterwards disgorged it in the face of a fond and confiding people who had hailed him as "a covenanted king." Scone must, previously to the transfer to it of the coronation-stone, have been, for some reason or reasons, a place of note,—sufficiently distinguished by associations of historical interest or reputed sanctity or urban importance to win for itself a preference to all other localities as

the retreat of kings and the place of deposit for the state's most highly prized relic. It is called by some writers the ancient capital of the Picts; hut, whether called so in sheer fable, or in the way of fiction founded on fact, it most probably acquired its pristine fame as the seat of a Culdee establishment. An abbey which rose on the ruins of the Culdee college, and brought the innovations of Romanism into the place of the less corrupted system of the followers of Columba, and substituted monks under the stolen name of the famous Augustine for comparatively simple missionaries who were ignorant of the mysteries of clerical celibacy and of priestcraft, was founded in 1114 by Alexander I., and dedicated to the Holy Trinity and St. Michael. This abbey enclosed the famous stone of coronation, and witnessed the crowning of the later Scoto-Saxon kings. It possessed, at the Reformation, a rental of £1,140 6s. 6d. in money, besides a great amount of revenue in agricultural and fishery produce; and, in 1604, it was erected into a temporal lordship in favour of Sir David Murray, a cadet of the family of Tullibardine. Both the abbey and the ancient palace were spoiled and burned at the Reformation, by a motley mob from Perth and Dundee, actuated, some by aversion to Popery, some by private resentment, and some by the hope of booty. The abbey wall is supposed, from traces which have been observed of its foundations, to have enclosed an area of 12 acres. A spot about 100 yards due east from the south-east corner of the present palace, is the site of the abbey church, now umbrageously covered with a clump of trees. Between 60 and 70 yards north of this spot is a mound or hillock, vulgarly called the Boot-hill, and more learnedly denominated *Omnis Terra*, or *Every-man's-land*. The common tradition concerning this eminence is, that, at the coronation of a king, all the barons or landowners who assisted, brought in their boots as much earth from their property as enabled every man, while standing on his own land, to see the king crowned; and that, after the ceremony, they emptied the earth from their boots on one spot, and in an increasingly accumulating heap, and this made it both *Boot-hill* and *Omnis Terra*. Another tradition ascribes its formation to Kenneth, and affirms that he promulgated from it his edicts called the *Macalpine laws*. The Highlanders call it *Tom-a-nhoid*, 'the hill where justice is administered;' and *Boot-hill* may probably be a corruption of *Moot-hill* or *Moat-hill*, and may signify the hill of meeting,—the seat of judicial or baronial assemblage. The conventions of the nobles are said to have been anciently held on the eminence; and the barons of the kingdom, it is alleged, could receive investiture as lawfully by delivering earth and stone from it as by delivering them from their own lands. About the year 1624, when what remained of the old abbey church fell, David, the first Viscount of Stormont, built on the *Boot-hill* an elegant parish-church. In the latter part of last century, the whole of this building, except the aisle, was thrown down. On the north wall of the aisle is a very stately marble monument, representing the interior of a chapel or oratory, and containing three statues, one of them as large as life, to the memory of David, first Viscount of Stormont; and, on the east wall, is an elegant monument of blue and white marble, containing in a niche a marble urn, with the embalmed heart of the deceased, to the memory of Lady Stormont, the first wife of the 1st Earl of Mansfield. — On ground which may or may not have been the site of the ancient royal palace, or of part of the buildings of the abbey, stands the modern palace of *Scone*, or *Scone-house*, the seat of the Earl of Mansfield, who

represents the old family of Stormont. The edifice is in that style of architecture which prevailed about two centuries ago, and, though heavy and cumbrous, has more of a noble and venerable air than if it were one of the most finished modern buildings. Its length is 210 feet, and its breadth 105. The gallery, situated on the east side, ceiled with timber and arched, and decorated over the whole of one side with paintings representing the successive stages of a stag hunt, and introducing James VI. into every scene, is 140 feet in length. In a chamber, called the king's room, off the south end of the gallery, is a bed of light orange-coloured damask satin, said to have belonged to James VI.; and in a chamber called the queen's room, on the west side of the house, is a bed of flowered crimson velvet, said to have been the work of Queen Mary, when a prisoner in the castle of Lochleven. Round the house, except on the south-west, run a shrubbery and a plantation, intersected with serpentine walks, and intermixed with some of the finest and largest old trees in the country. The view from the house to the west, embracing the gorgeous slope to the Tay on the foreground, the Tay itself, the town and vale, and brilliant environs of Perth in the centre, and the encircling Grampians at the distance of 15 miles on the background, is one of the most charming which can well be imagined. Eastward of the house the grounds become a perfect labyrinth, a lavish profusion of shrubbery, nursery, garden, bower, and other forms of embellishment. In the midst of this mass of gay vegetation stands the market-cross of the ancient village or town of *Scone*,—a narrow upright stone, 13 feet high, ornamented at the top, and rising from an octagonal pedestal which rests on a quadrangular flight of steps. The cross has not, like many other ancient market-crosses in Scotland, forsaken its town, hut survives on its original sight after its town has perished.

**SCONSER**, a hamlet, ferry-station, and seat of a post-office, on the east coast of Skye. It is situated on the south side of the entrance of *Loch-Sligichan*, 2½ miles south-west of the south end of the island of Raasay, 9 miles south-east of the village of Portree, and 23 miles from the ferry of Kyle Rhea, to which place the *Sconser* road extends.

**SCOONIE**, a parish in Fifeshire, forming the west side of the bay of Largo, and at the estuary of the river Leven. The coast is low and sandy, and the surface of the parish rises gradually in swelling knolls towards the northern extremity. Its extreme length, from south to north, is about 4½ miles; its breadth, at the south, about 2 miles, but gradually narrowing towards the north, where it is scarcely half-a-mile in breadth. On the south it is bounded partly by the water of Leven, and partly by the frith of Forth; on the east by the parish of Largo; by the parish of Ceres on the north; and by the parishes of Kettle, Kennoway, Markinch, and Wemyss on the west. At the northern extremity of the parish the three presbyteries of Cupar, St. Andrews, and Kirkcaldy meet together. The population of the parish, in 1801, was 1,681; in 1831, 2,556. The number of acres in the parish is about 3,855; of which there are 3,250 under tillage; 250 in pasture, but in progress of being cultivated; 250 under wood; and 105 of uncultivated links. The average value of raw agricultural produce raised yearly in the parish is £14,050. The average rent of land varies from 16s. to £4 per acre. The annual amount of real property for which the parish was assessed, in 1815, for the property tax, was £6,779; the valued rent is £5,452 Scots. The principal manufacture in the parish is the spinning of flax and tow, and the manufacturing of linen goods. In 1835 there were five

mills for spinning flax and tow, in which 98 males and 156 females were employed; and 148 males and 22 females employed in hand-loom weaving. Besides this there was a foundery for cast-iron, at which 45 males are employed; one saw-mill and wood-yard, at which 30 were employed; a bone-mill and a brick and tile-work, at each of which 12 males were employed; and an ochre-mill employing 3 males. The town of Leven, at the mouth of the river from which it takes its name, has been described in a separate article. The estate of Durie, which occupies the southern portion of the parish—the town of Leven being entirely feued from it—is the property of C. Maitland Christie, Esq. The mansion-house, with its pleasure-grounds, is situated to the north of the town. Anciently this estate belonged to the family of Durie of that ilk. Sir Alexander Gibson, son of George Gibson of Goldingstons, had a charter of them in 1614. Sir Alexander was admitted, in July 1621, an ordinary lord-of-session; and, in 1628, he was created a baronet by Charles I. He died at his house of Durie in 1661. He made a collection of the decisions of the court-of-session, from July 1621 to July 1642, which were afterwards published by his grandson, and are known by the name of 'Durie's Practicks.' He was unquestionably one of the most eminent men of the time in which he lived.\*—This parish is in the presbytery of Kirkcaldy, and synod of Fife. Patron, the Crown. Stipend £257 19s. 5d.; glebe £50. Unappropriated tithes £288 7s. 1d. The old parish-church, which belonged to the priory of St. Andrew's, was situated in the churchyard, about  $\frac{1}{4}$  of a mile to the north of the town of Leven. The present church was erected near the town about 60 years ago; and was en-

\* A curious and well-known tradition, as to his lordship's being kidnapped, is given by Sir Walter Scott in the 'Border Minstrelsy.' The Earl of Traquair, Lord high-treasurer of the period, had a lawsuit of some importance before the court-of-session, and he had every reason to think that the judgment would turn upon the opinion of the presiding judge, Sir Alexander Gibson of Durie, who had the casting vote in the case of an equal division among his brethren. The opinion of the president was known to be unfavourable to the Earl, and the point was, therefore, to keep him out of the way when the question should be tried. In this dilemma he had recourse to a person called Christie's Will, one of the Border moss-troopers, and a lineal descendant of the celebrated John Armstrong of Gilnockie, who at once engaged to kidnap the president. Upon due scrutiny he found it was the judge's practice frequently to take the air on horseback on the sands of Leith, without an attendant. In one of these excursions Christie's Will, who had long watched his opportunity, ventured to accost the president and engage him in conversation. His address and language were so amusing that he decoyed the president into an unfrequented and lurzy common called the Figgate Whims, where riding suddenly up to him he pulled him from his horse, muffled him in a large cloak which he had provided, and rode off with the luckless judge trussed up behind him. Will crossed the country with great expedition, by paths known only to persons of his description, and deposited his weary and terrified burden in an old castle in Annandale, called the tower of Graham. The judge's horse being found, it was concluded he had thrown his rider into the sea; his friends went into mourning, and a successor was appointed to the office. Meanwhile the poor president spent a heavy time in the vault of the castle. He was imprisoned and solitary, receiving his food through an aperture in the wall, and never hearing the sound of a human voice, save when a shepherd called his dog by the name of Batty, and when a female domestic called upon Maudge the cat. These he concluded were invocations of spirits; for he had sagaciously supposed himself to be in the dungeon of a sorcerer. At length, after three months had elapsed, the lawsuit was decided in favour of Lord Traquair, and Will was directed to set the president at liberty. Accordingly he entered the vault at dead of night, seized the president, muffled him once more in his cloak, without speaking a single word; and, using the same mode of transportation, conveyed him to Leith sands, and set down the astonished judge on the very spot where he had taken him up. The joy of his friends, and the less agreeable surprise of his successor may be easily conceived when he appeared in court to reclaim his office and honours. All embraced his own persuasion that he had been spirited away by witchcraft; nor could he himself be convinced of the contrary, until, many years afterwards, happening to travel in Annandale, his ears were saluted once more with the sounds of Maudge and Batty, the only notes which had soled his long confinement. This led to a discovery of the whole story; but in these disorderly times it was only laughed at as a fair ruse de guerre.

larged and improved in 1822. It contains 1,000 sittings.—In the parish-school, besides the ordinary branches of education, Greek, Latin, French, and mathematics are taught. The teacher has, besides his school-fees, the maximum salary, an excellent dwelling-house, school-house, and an allowance for deficiency of garden-ground. There are two other unendowed schools in the parish, at which the same branches of education are taught as in the parish-school; and a school for young ladies.—There is a chapel in connection with the Relief synod, and an Independent chapel.

SCOTLANDWELL, a village in the parish of Portmoak, Kinross-shire. It stands at the south-west base of the West Lomond-hill,  $\frac{3}{4}$  of a mile east of Loch-Leven, 1 mile south-east of Kinnesswood, and 5 miles south-east of Milnathort. Population about 500. Many of the inhabitants are crofters of the carse-ground which extends between this village and Loch-Leven and have, by their skilful culture, greatly improved its soil and aspect. The parish-church of Portmoak stands on the skirt of the hill overlooking the village. In the vicinity are some noted springs, whence the village is said, by some persons, to have received its name in the times of Cromwell: see PORTMOAK. An hospital, designated Fons Scotiae, however, was founded here, toward the middle of the 13th century, by William Malvoisine, bishop of St. Andrews, and was granted by his successor, David de Benham, to a community of Red Friars. Some vestiges of the chapel of the monastery, and of the accompanying cemetery, amidst the gardens of the villagers, are the only remains of the establishment.

SCOTSCRAIG. See FERRY-PORT-ON-CRAIG.

SCOTS DYKE (THE), an old ditch and embankment, about 4 miles in length, forming a part of the march-line between England and Scotland. It strikes off abruptly from the Esk, at a point about 4 miles north of Longtown, and runs west to the banks of the Sark, which flows southwards to the Solway frith, and which, from the point of contact with the Scots Dyke, to its efflux in the Solway, forms the boundary of the two countries. The small district situated south of the Scots Dyke, and bounded on the east by the Esk and on the west by the Sark, used formerly to be known as the Debateable Land, or, in other words, was claimed by both kingdoms. Generally speaking, it is but a bleak district; and although the chief portion of the ground—which once was covered with birch, alder, mountain-ash, and various other trees that do not refuse to grow upon upland and moorish soils—has long since been disforested, and though portions of the land have been brought into cultivation, some parts of this tract are still known by the names of shaws and forests, besides which it continues to exhibit several extensive wastes and morasses.

SCOUGAL, a chapely in the ancient parish of Aldham, incorporated with that of Whitekirk in Haddingtonshire. The chapel, now in ruins, is about 4 miles east-north-east of North Berwick. The family of Scougal produced some eminent men.

SCOURIE, or SCOURY, a village and small seaport in the parish of Edderachyis, on the west coast of Sutherlandshire. It stands on a small bay of its own name, at the west end of the road through Sutherlandshire, by Loch-Shim, from the Dornoch frith; and, by sea, is  $9\frac{1}{2}$  miles north-east by north of the headland called Ru-store, and 21 miles south of Cape Wrath. The township, except where it looks out upon the bay, is quite surrounded by an amphitheatre of rugged ledges of rock; and the land is comparatively verdant and arable, and possesses the attractions of contrast to the sterile and rocky sur-

face of the mountain-screens. The village is the site of the parish-school, a reading-club, a savings' bank, a new and good inn. The bay of Scourie is only about a mile in length; and it opens upon the inhabited island of Handa, a place of curious cliffs and of horizontal basaltic columns, the retreat of prodigious numbers of sea-fowl, and altogether one of the most wonderful objects on the west coast of Scotland: see HANDA.—In the 16th century a branch of the Mackays, by iniquitous measures which are detailed in our article on EDDERACHYLIS [which see], took possession of the south-western part of what came to be called Lord Reay's country, and adopting Scourie as the seat and centre of their influence, assumed the designation of the Mackays of Scourie. One of this race was Lieutenant-general Hugh Mackay, the celebrated commander-in-chief in the reign of William and Mary. He fought against Dundee at Killiecrankie, and displayed much military skill in his retreat; he had brilliant military successes in Ireland, particularly at the battle of the Shannon; and he commanded the British division of the grand army at the siege of Namur. He ran so distinguished a career that he was to have been rewarded with the title of Earl of Scourie, but suffered utter damage, as is said, from the intrigues of his rival, Mackenzie of Cromarty.

SCRABSTER, the upper or interior part of Thurso-bay, on the north coast of Caithness-shire. The anchorage in Scrabster-roadstead is under high cliffs in a westerly recess of the bay, and is good, and sufficiently screened from westerly winds. The entire bay, whose parts are respectively called Dunnet, Castletown, Murkle, Thurso, and Scrabster, is protected on the east side by Dunnet-head, and on the west side by Holburn-head, two of the boldest headlands on the north sea. Proposals are now in circulation for the formation of a harbour here, which would be of great advantage to the Reay country from Loch-Inver to Tongue. In the centre of a crescent-formed bank which skirts the head of Scrabster-bay, and about half-a-mile west of Thurso, beautifully overlooking the sea, are the ruins, or rather the reduced vestiges, of Scrabster-castle, anciently a residence of the Bishops of Caithness, and afterwards a fortress of the crown. Enough of vestiges remain to indicate that the place was large and strong. In the 12th century John, Bishop of Caithness, was here tortured by the cutting out of his tongue and the pulling out of his eyes, and was afterwards cruelly put to death; and, in the following century, Adam, another Bishop of Caithness, was, at Halkirk, dragged by the hair, scourged with rods, and boiled to death in a large cauldron.

SCRAPE, a mountain on the boundary between Drummelzier and Manor, Peebles-shire. It is round-hacked, consists of greywacke veined with quartz, has an altitude, above sea-level, of 2,800 feet, and commands an extensive and interesting prospect. Along its top are traces of a road which is supposed to have been Roman, and which probably connected the camp at Lyne with the great road from Carlisle, up Annandale and down Lanarkshire. "The tap o' Scrape," says a contemporary, "is the object of ob-jurgatory proverb in Tweeddale."

SCRIDEN, a place of sublime magnificence on the declivity of Goatfell, near Sannox, in the island of Arran. A prolonged and stupendous hanging file of loose masses of rock, confusedly and fantastically segregated, and looking a tremendous torrent of boulders, seems ready to overwhelm everything beneath in an apparently impending fall. "A large portion of the mountain," says Dr. Macculloch, "has fallen from above, strewing the long declivity with immense masses of fragments, which, in their progress, have

covered the shore with ruins. The aspect and the combinations of these groups of broken rock are varied at every instant in proceeding along the shore; while in every point of view they are equally grand and equally picturesque. As the eye ranges along the steep descent on which they lie, the retiring aerial perspective seems almost to obscure the summit, confounding it with the sky; while the spectator can scarcely avoid making a hasty retreat from a torrent of rock which seems about to overwhelm him with its ruins, and which, even now, appears in all the activity of motion. They who have had the good fortune to witness the avalanche of a mountain of ice may perhaps imagine the effects of that, of which no phenomenon of less magnitude can convey an adequate conception."—[Western Islands.]

SCURE-EIGG. See EIGG.

SEAFIELD, a hamlet and small port in the parish of Kinghorn, Fifeshire. There is a sufficient depth of water at Seafield for vessels of the largest class, at all states of the tide; and a harbour and pier could be here constructed, with good shelter from easterly winds, at a moderate expense. The depth of water in this harbour would be 11 feet at the lowest spring ebbs, and 28 feet at high water. The estimate for the full execution of this plan—which has been projected—is £30,000; but a pier, on a modified scale, might be executed for £7,000, in consequence of almost the whole materials required being found on the spot. At low water of ordinary spring tides, there would be 8 feet water at the landing-slip; 800 feet of wharfage in the tide-harbour, and good shelter from easterly winds. A level road could connect the harbour with Kirkcaldy in the meantime, and a railroad might easily be formed between these places. Additional accommodation, when wanted, will be found either on the south or north of Seafield-tower. A natural ravine on the south could be very cheaply formed into deep wet and graving docks of great extent, fit for the reception of the largest ships of the navy.

SEAFORTH (Loch), a projection of the sea on the east coast of Lewis, in the Long Island. It is  $6\frac{1}{2}$  miles wide at the entrance, and, for  $5\frac{1}{2}$  miles, hears north-westward, and gradually diminishes to a breadth of  $\frac{2}{3}$  of a mile; it then bears  $7\frac{1}{2}$  miles northward, with a breadth varying between  $2\frac{1}{2}$  miles and  $\frac{1}{2}$  of a mile, and embracing in one place an island of its own name  $1\frac{1}{2}$  mile long; and it finally goes off from the head of the northward part in two arms westward and eastward, 1 mile and  $2\frac{3}{4}$  miles, with a mean breadth of probably 3 furlongs. Over 9 miles from its entrance, it divides Lewis from Harris; and over the rest of its length it penetrates the Lewis parish of Lochs. The mountains around its entrance rise to a great height, and, together with much grandeur of outline, form groups of highly-picturesque composition. In all the narrow or central and upper part, the loch, being environed with lofty ground, and forming a stupendous natural canal, is gloomy and impressively sequestered, and seldom has its silence broken except by the rush of waters, the roar of winds, or the bleating of the mountain-scaling sheep. Of numerous bays which are formed by the windings of the loch round projecting headlands, Marig is both the most picturesque and the most useful; it recedes behind Seaforth island, and is completely land-locked; and, while forming an excellent natural harbour, it presents an extraordinary scene of wild magnificence. The loch, though frequented by shipping, is subject, from the clefts of the surrounding mountains, to sudden squalls and gusts, which render its anchorage not altogether safe. At a shoal, 3 or 4 miles above Seaforth island, the current of a spring

tile runs at the rate of 8 miles an hour, and makes a noise which, in calm weather, can be heard at the distance of several miles. This shoal cannot be passed by boats except near high water.—Seaforth gave the title of Earl to a branch of the family of Mackenzie, created Baron Mackenzie of Kintail in 1609, and Earl of Seaforth in 1623. The earldom became attainted, in 1716, in the person of William, the 5th Earl; and is believed to be represented by George F. Mackenzie, Esq. of Allangrange.

SEAMAB. See MUCKART.

SEAMMADALE (Loch), a small fresh-water lake, in the parish of Kilninver, Mid-Lorn, Argyleshire. It extends about 2 miles from east to west, and sends off the small river Euchar 5 miles westward to Loch-Feochan, a little below Kilninver church.

SEATON, or SETON, an ancient parish in Haddingtonshire, annexed, after the Reformation, to Tranent. The church, whose nucleus or original pile was very old, stood near the mansion-house of the Setons, and enclosed their family-tomb, and received from them whatever decorations and endowments their proud superstition imagined would add to its sacredness and utility. In the beginning of the reign of Robert III. Catherine Sinclair of Hermandston, the widow of Lord William Seton, "biggit an yle on the south side of the kirk, of fine astlar, pend it, and theikit it with stane, with an sepulchar therein, where she lies; and founded an priest to serve there perpetually. This lady, in her widowhood, dwelt where now"—in the days of old Sir Richard Maitland—"are the priests' chambers in Seton, and planted and made all their yard that they have got at this day, and held an gret house and an honourable." In 1493, George, Lord Seton, erected the church into a collegiate establishment for a provost, six prebendaries, two singing boys, and a clerk; and assigned for their support the tithes of the church, and various chaplainries which had been established in it by his ancestors. At various dates, other members of the family made additions to the edifice, multiplied its decorations, increased its wealth, and erected within it some sumptuous monuments. In 1544, the English invaders under the Earl of Hertford, while destroying Seton castle, spoiled the church, and "tuk away the bellis and organis and other tursable thingis, and pat thaim in thair schippis, and brint the tymber-wark within the said kirk." The edifice suffered much amidst subsequent commotions; and is now one of the most cadaverous, care-worn, and beggared relics of architectural grandeur which the kingdom contains. It was, while undamaged, a handsome, perhaps superb, Gothic structure, with a spire; but its doors and windows are plugged with melancholy planks of coarse unshaven timber, its floor is fractured and pulverized, its tombs are outraged and disembowelled, its walls and monuments are coated over with moisture and dirt, and its whole condition is the equalid and repulsive transition-point at which all the life and the attractions of undilapidated architecture have ceased, and the still and deathlike but venerable and impressive beauties of architectural ruin have not begun.—The palace of Seton, or Seton-house, built in the reign of James VI., and one of a class which excelled in taste and elegance any mansions which were built during the next three or four reigns, was esteemed, at the period, much the most magnificently constructed and furnished house in Scotland. It had gardens and terrace walks which, as well as its apartments, were the delight of kings. Drawings of it taken by Grose, in 1789, immediately before its demolition, show it to have consisted, like Kenmure, and some other mansions contemporaneous

with it in date, of two sides of a quadrangle, united by a rampart. When, in 1603, James VI. was on his way to take possession of his English crown, he met the funeral of the 1st Earl of Seton, who had been one of the closest adherents of Mary, and who, along with two of his children, figures so conspicuously in Sir Walter Scott's tale of 'the Abbot'; and he halted his retinue, and, till the funeral passed, seated himself on a small part of the building which still remains entire in the vicinity of the present road. In 1617, the same monarch, when revisiting his native kingdom, spent at Seton his second night after crossing the Tweed; and, at a subsequent period, Charles I. and his court were entertained here, when on a progress through Scotland.—The Setons obtained, in the reign of William the Lion, a charter of the lands of Seton, Winton, and Winchburgh. Alexander de Seton, one of the family line, and the nephew of Robert Bruce, obtained from his royal uncle the manor of Tranent, and other extensive possessions of the noble family of De Quincy, attained by espousal of the cause of Edward. The Setons became one of the richest and most influential families in Scotland; they were connected by intermarriage with all the principal families of the country; and, by giving younger sons to the heiresses of Gordon and Eglinton, they, in fact, though not in name, transmuted these two great families into Setons. They became Lords Seton in the 14th century, and Earls of Winton and Lords Tranent in 1600; and they were attainted, in 1716, in the person of George, the 5th Earl, for his participation in the rebellion of the preceding year. The Barons of Seton trace their descent back to Saher de Seton, who lived in the beginning of the 12th century, and the earliest records in Scotland establish that their ancestors then flourished as the Baronial family of Seton, the possessors holding *in capite* of the Crown the extensive properties of Seton and Winton in East Lothian, and of Winchburgh, the principal castle of which was Niddry in Linlithgowsbire, and all of which except the last they continued to enjoy until 1715. The family became ennobled in the person of William, the 1st Lord Seaton, who lived previous to 1366, and it is recorded of this nobleman, that he "was the first creatit and maid Lord in the parliament, and he and his posteritie to have ane voit yairin and be callit Lordis." Accordingly, in the Records of the Scottish parliament, held at Scone, 26th March, 1371, at the coronation of Robert II., William de Seton is named among the "Nobiles Barones" as "Dominus de Seton." It is related, too, that a chivalrous successor, George, 7th Lord Seaton, the gallant and devoted adherent of Mary Queen of Scots, declined the dignity of earldom, being unwilling to forego what he considered a great distinction, and that his accomplished Sovereign commemorated the fact in the following lines:

"Sunt Comites, Ducesque alii, sunt denique Reges,  
Setoni Dominium, sit satis esse mihi."

From the earliest period the family of Seaton have stood prominent in the history of Scotland. Their military ardour, and their dauntless and patriotic bearing, appear from their ancient war-cry of "Sett-on," and from their earliest motto, still borne by their descendants, of "Hazard yet forward." It was in consequence of so many other noble families having sprung from them that the Barons of Seton were styled "Magnæ Nobilitatis Domini," and of their intermarriages, upon four different occasions, with the royal family, that their shield obtained the addition of the royal or double treasure. A recent authority, following up the learned Anderson in his *Diplomata Scotia*, states that the house of Winton, "on ac-

count of its innumerable high connections and ramifications, may now be held the noblest in North Britain." The unshaken loyalty with which the family ever supported the throne of Scotland, is marked by another of their mottos—"Intaminatis fulget honoribus"—and it was this heroic spirit and steady loyalty to the ancient dynasty of their country that led to the forfeiture of the estates in 1715, and left the high honours which they bore in abeyance for a time. The estates which the family held were of princely extent, and the chief seat was recognised in the royal charters as the palace of Seton, in consequence of its being often the place of royal entertainment, and which had also for ages been the scene of great magnificence and splendid hospitality. The representation is claimed both by the Earl of Eglington and by George Seton, Esq.

SEATOWN. See EAROL.

SEIL, an island of the Hebrides, in the parish of Kilbrandon, Argyleshire. It lies 4 miles south of Kerrera, and  $6\frac{1}{2}$  miles south-east of Mull; and is separated on the east by a very narrow strait from the mainland district of Nether Lorn; on the south by sounds of 2 or 3 furlongs broad from Torsa and Luing; and on the west by sounds of half-a-mile, and 1 mile in breadth from Easdale and Sheep Isle. It measures  $4\frac{1}{2}$  miles in extreme length from north to south, and  $2\frac{1}{2}$  miles in extreme breadth; but is much indented by the sea, and has a very irregular outline. Its surface is disposed in three parallel ridges, two intervening valleys, and a belt of plain along part of the shore. The northern ridge, which is the highest and most rugged, attains an apparent altitude of upwards of 800 feet, and presents to the sea on the north side of the island a series of naked precipices. The middle ridge is prolonged more decidedly than the former, and in a north-easterly direction; it does not acquire an elevation of more than 400 feet; and, though in many parts presenting faces of bare rock, it descends at each end to the sea in flat and verdant shores. The southern ridge is low and narrow; it extends from side to side of the island in the same direction as the former; it is distinguished even at a distance by its grey colour and its numerous protrusions of bare rock; and it is succeeded on the south-east by a flat shore, much indented, but verdant and fertile. Clay slate, in several varieties, constitutes the larger part of the island; but, in consequence of the immediate vicinity of the superior slate of Easdale, it is not very extensively worked. The soil, wherever the form of the ground admits of cultivation, is good, well-swarded, and capable of high culture. Several summits of the ridges command pleasant views of the intricate channels, and numerous islands along the coast of Lorn, and of the distant mountains of Mull and Jura. The east side of the island, and the confronting land in Lorn, form, with the intervening strait, a series of very rich class landscapes. The strait somewhat resembles the famed Kyles of Bute, but is more isleted, more romantically narrow, and riper in those flexures of channel and projections of land which seem to prohibit farther progress. The shores, on the Seil side, now lofty and now low, are finely variegated with arable fields, green meadows, waving trees, and rugged rocks; and on the Lorn side they are high, extensively sheeted with hanging wood, and romantically varied with ornamental culture, wood-embosomed cliffs, and sharply receding bays and creeks. The straits between these shores is at least 3 miles in length; and, over most of this distance, it rarely exceeds 200 yards in breadth, and in one place toward the north, contracts for a considerable way to a breadth of only 50 or 60 yards. The tidal stream, running with considerable

velocity through this passage, generally wears the appearance of a great inland mountain river; and it betrays its marine connexions only at low water when the rocks look up with a shaggy dress of sea-weed. The water is sufficiently deep at half tide to admit the passage of the boats of the country; and across the narrowest part of the strait strides a bridge of one large arch to maintain communication between the island and the main land,—the only provision of its class in Britain excepting two bridges upon a small scale in Shetland, and the superb bridge of Menai between Anglesea and continental Wales. Not only in the strait along the east side of Seil, says a writer to whom we owe much, "but throughout the whole complicated strait which separates Torsa, Luing, Shuna, and Seil from each other, and from the main land, scenes of the most entertaining class of picturesque beauty occur. The islands, in endless variety of form, are washed by winding seas, and diversified with rocks and wood, while they are enlivened by human habitations, improved cultivation, and by the countless boats and ships that navigate these straits; the varied mountains of Mull and of the Appin and Morven lands, rising blue in the distance."

SELKIRK, a parish partly in the north-west verge of Roxburghshire, and partly in the east of Selkirkshire. It consists of a main division, and two detachments. The main part lies principally in Selkirkshire, and has the burgh of Selkirk nearly in its centre, yet overleaps the boundary with Roxburghshire, to the extent of  $2\frac{1}{2}$  miles by 1. It is bounded on the north by the Tweed, which divides it from Stow and Galashiels; on the east by Galashiels and Bowden; on the south-east by Lilliesleaf and Ashkirk; and on the south and the west by Yarrow. One of the detached parts is situated wholly in Roxburghshire; lies  $1\frac{1}{2}$  mile south of the nearest part of the main body; is partly bounded by the Ale; measures  $2\frac{1}{2}$  miles by  $1\frac{3}{4}$ , but resembles a heart or blunted triangle in outline; and is surrounded by Ashkirk, Lilliesleaf, Minto, and Wilton. The other detached part is all situated in Selkirkshire, but stretches along its verge; it lies 2 miles south of the nearest part of the main body, and  $2\frac{1}{2}$  miles west of the Roxburghshire detached district; it measures  $2\frac{1}{2}$  miles by  $\frac{3}{4}$ ; and it is surrounded by Yarrow, Ashkirk, and Robertson. The greatest length of the main body, from north-west to south-east, is  $7\frac{1}{2}$  miles; and the greatest breadth of it is 7 miles. The area of the whole parish, as stated by no fewer than four authorities, is only 10 square miles; but seems to us, both from data which these authorities themselves furnish, and from rapid measurement on the map, to be five or six times that extent. The main division is cut into not very unequal parts by the Ettrick, and washed on the west by the Yarrow. The banks of the Ettrick possess much quiet beauty and soft picturesqueness; and add to their own variety of slope and abruptness and haugh and hill-scene, as much well-arranged wood as largely compensates for their denudation of their ancient thickly-feathered forest. The Tweed courses along the boundary amid a profusion of wood, and looks as if still enjoying the wild freedom and basking in the warm umbrage of the period, when the beasts of the chase came down in herds to lave its pure waters. The Yarrow, for 2 miles above its connexion with the parish, and onward to the Ettrick, exhibits nature in a bold and striking aspect; cutting its turbid course along an ingulphing hollow of rugged rocks, richly overhung by its native woods, and exhibiting in a fresher the wild tumultuousness which it displayed to Thomson when he saw it—

"Work and boil and foam and thunder through."

On its left bank are the modern mansion and wooded grounds of Broadmeadows,—the farm of Foulshiels, where Mungo Park, the African traveller, was born,—the beautiful and richly sylvan lands of Harehead and Hareheadwood; and on its right are Philiphaugh-house, situated on a hill, overlooking the wooded Carterhaugh and the confluence of the stream with the Ettrick,—the modern and elegant ducal pile of Bowhill, diving amongst a sea of forest,—and chief of all, NEWARK CASTLE, [which see,] the place where ‘the Last Minstrel’ sung his ‘Lay,’ and the spot where afterwards

“Arose the Minstrel’s lowly bower;  
A simple hut; but there were seen  
The little garden edged with green,  
The cheerful hearth and lattice clean,  
There sheltered wanderers by the blaze  
Oft heard the tale of other days;  
For much he loved to ope his door,  
And give the aid he begged before,  
So passed the winter’s day, but still,  
When summer smiled on sweet Bowhill,  
And July’s eve, with balmy breath,  
Waved the blue bells on Newark-bush,  
When thro’ the slaw in Harehead-slau  
And corn was green on Carterhaugh,  
And flourished broad Blackadro’s oak,  
The aged harper’s soul awoke!  
Then would he sing achievements high,  
And circumstance of chivalry,  
Till the wrapt traveller would stay,  
Forgetful of the closing day;  
And noble youths, the strain to hear,  
Pursook the hunting of the deer;  
And Yarrow, as he rolled along,  
Bore burden to the Minstrel’s song.”

The surface of the parish is all of a hilly character; but from resting on a high base, and having a rolling and softly-featured contour, possesses much less of an upland appearance than many a district of not half its hilliness. The grounds on the east side of the Ettrick are all green, and may be called swells and undulations rather than bills. The heights between the Ettrick and the Tweed are heath-clad and lofty. Peatlaw and the Three Brethren cairn are the most elevated, and respectively rise 1,964 and 1,978 feet above sea-level, or 1,604 and 1,618 feet above the level of the Ettrick’s bed at Selkirk. The proportions of the parochial area which are pastoral, arable, and under wood, are to one another respectively as 15, 12, and 5. The white-faced breed of sheep walk the pastures, to the exclusion almost entirely both of cattle, and of other varieties of their own species. The soil of the arable grounds is light and dry, and yields a comparatively early harvest. The prevailing rocks are greywacke and greywacke-slate. In addition to the mansions incidentally mentioned, Haining and Sunderland-hall are elegant seats. Oakwood-tower, a ruin in the peninsula between the Ettrick and Wool-burn, and now the property of Scott of Harden, is famous as the residence of the wizard Sir Michael Scott, and as the scene of some traditions and legendary tales in which he figures. On the Ettrick, immediately below the influx of the Yarrow, is the battle-field of PHILIPHAUGH: which see. Andrew Pringle, Lord Almoor, a lord-of-session during the last century, and a distinguished scholar and orator, was a native and proprietor of the lands of Haining. Roads are carried along all the three principal streams, and in four lines eastward from that on the right bank of the Ettrick. Population, in 1801, 2,098; in 1831, 2,833. Houses 435. Assessed presbytery, in 1815, £20,397.—Selkirk is the seat of a presbytery, in the synod of Merse and Teviotdale. Patron, the Duke of Roxburgh. Stipend £275 5s. 9d.; glebe not stated. Unappropriated teinds £897 6s. 11d. The parish-church was built in 1749, and last repaired in 1829. Sittings nearly 800.—A United Secession congregation was established in the parish about the

year 1752. Their present place of worship was built in 1805, at an expense, with subsequent repairs and improvements, of £1,247 7s. 10d. Sittings 856. Stipend £160.—A preaching-station, in connexion with the Secession, is maintained in summer at Hope-house, and, in 1835, had an attendance of about 200. The population, according to an ecclesiastical survey in 1836, was then 3,064, and was about to experience an increase of probably 300 from an influx of factory operatives. The 3,064 were distributed into 1,179 churchmen, 923 dissenters, 41 non-describers, and 921 persons below 12 years of age.—The parish-school has attached to it a boarding establishment, and affords a very wide range of tuition, including classes, and continental languages and some departments of physical science. The master employs two assistants, and has, including allowance for a house, £50 of salary, and about £80 fees. In 1834, the parish-school was attended by 101 scholars; and 7 other schools were conducted by eight teachers, and attended by 352 scholars.—The earliest church of the district was simply the chapel of the King’s court, and arose from a royal hunting-seat having been established in the Forest. It hence, in the old unrefined English of that age, was called Sele-chyrche, ‘the great or the good church.’ When the abbey—to be mentioned in our notice of the town—sprang into existence, and occasioned the erection of a new village under the name of Selkirk-Abbatis, and flung upon the old village the distinctive appellation of Selkirk-Regis, David I. gave his church, situated in the latter village, to the abbot, on condition of his acting as chaplain to the royal castle. In the ancient statement of the property of the monks of Kelso, the successors or representatives of the monks of Selkirk, they say that they had the church of Selkirk-Regis “in rectoria,” and also the church of Selkirk-Abbatis “in rectoria,” respectively worth £20 and £2 a-year. How long the two churches remained separate is not known; for, as distinct churches, they are forgotten by tradition, and exhibited only in recondite record; but they were probably conjoined at some period by the abbot, that he might pocket the proceeds requisite to support one of the curates.

SELKIRK, a royal burgh and county-town, stands on the mailroad between Edinburgh and Carlisle, 6 miles south of Galashiels, 7 south-west of Melrose, 11 north-north-west of Hawick, 22 east-south-east of Peebles, and 36 south-south-east of Edinburgh. Its site is chiefly the summit, and partly the slope, of a high and irregular bank or terrace which flanks a beautiful baugh of the right bank of the Ettrick. During about 7 centuries, and down to the commencement of the present century, it sat in almost utter seclusion from the world, and scarcely maintained its ancient and not very important bulk against the abrasions of time. Its situation, away from any thoroughfare except a mountain one between Edinburgh and Carlisle, and accessible on one side only through a wilderness of wild upland moors, and on the other only by a circuitous and steep ascent up the bank which it surmounts, seemed to have quite incapacitated it for sharing in the modern improvements of Scottish towns. It was all ill-built, irregular, and of mean appearance; and looked like a ten times repaired edifice, originally strong, and toughly tenacious of existence, yet quite time-worn, half-ruinous, nodding to decay, and threatened with desertion. Now, however, it begins to look spruce and prosperous; it has a street or two entirely new and neatly edified; it possesses many elegant private residences; it is adorned with several modern and public pieces of architecture; it experiences the exhilaration of manufacture and trade; it is kept

cleanly in its thoroughfares, and lighted at night with gas; and though still retaining much of the wo-begone street-lines of the days of its dinginess, it resembles, on the whole, a vernal landscape which, while it continues to exhibit the peelings and the scratchings of winter, has donned much of the meek gay dress of the expanding foliage. The ancient access from all places on the further side of the Ettrick advanced up the Philphaugh, and crossed a venerable bridge, which still stands and is strong and serviceable, and, by a circuitous sweep, climbed laboriously up the bank, so as to enter the burgh from the south or south-west; but the modern access crosses the Ettrick by a new and handsome bridge not far above the confluence with the Tweed, and runs thence up a haugh along the right bank of the stream till within  $\frac{1}{4}$  of a mile of the burgh, and then slowly, and with a very slight curvature, and a beautiful sheet of roadway, ascends the terrace, lined for a great way with neat new houses, and entering the body of the town at the point of the greatest thoroughfare. The chief and central part of the burgh is the market-place, a very spacious triangular area, picturesque in appearance, and airy commodious for fair and market. This area, on the side parallel with the river, receives the new Edinburgh road, and, at the south-west angle, receives the old access; and at other points it sends off thoroughfares which, combinedly with the two thoroughfares to the Ettrick, all having the market-place for their body, give the plan of the town somewhat of the general outline of a crab. The longest of the streets is the Townhead, which goes off wendingly on the east, and climbs the lower acclivities of the slowly ascending moors on the way to Hawick. On the south-west, or shortest side of the market-place, finely overlooking the large area, stands the town-hall, a neat modern erection, winged with good houses whose ground-floors are disposed in large shops,—surmounted by an elegant spire of 110 feet in height,—and arranged in the interior into apartments for the burgh and sheriff courts, and for public meetings, and a library.—In the open area of the market-place stands a very conspicuous public well, embellished with the town-arms, and a monument erected, by the county, in 1839, to the memory of Sir Walter Scott. The latter structure is beautiful, and does much honour to the genius of Mr. Ritchie, of Musselburgh, the sculptor. The pedestal is erected upon a broad base, 14 feet square, and measures 20 feet from the ground to the plinth on which Sir Walter stands. The statue measures from 7 to 8 feet in height. The whole is sculptured from large blocks of the finest freestone, and protected by a handsome iron-railing. Sir Walter is represented in his Sheriff's gown—one hand holds a law process, the other rests on his staff; on one side the base contains the inscription, which is as follows:—

"Erected in August 1839,  
In proud and affectionate remembrance  
OF  
SIR WALTER SCOTT, BARONET,  
Sheriff of the County  
FROM  
1800 to 1832."

"By Yarrow's stream still let me stray,  
Though none should guide my feeble way,  
Still feel the breeze down Ettrick break,  
Although it chill my withered cheek."

The other three sides are ornamented with the burgh arms. A thistle, forming a magnificent wreath, and the arms of Sir Walter Scott, complete the fourth side; over these the pedestal rises with much elegance, the die of it bearing a winged harp with laurel wreaths, as if flying round the feet of the Bard, with the word 'Waverley.' The cornice is well-brought out and finished in excellent taste. A curious struc-

ture, which served as a market-cross, once stood also in the area; but, by that extraordinary fatality, that strange perversion of taste which seems to have for half-a-century swept like a simoom over the intellects of the town-councils of Scotland, it was dealt with as an obstructor of the thoroughfare, and delivered to the Gothic admiration of the quarriers of old stones. The ancient tolbooth, and the stalls of the old flesh-market likewise, stood in the fine open area; and, without any person's having cause to regret them, have disappeared. The new prison stands in the new street leading down to the Ettrick; but, while semi-ornamental, does not seem to be very secure. The two places of worship in the town are of plain but not repulsive appearance. Of two good inns, the larger stands on the side of the market-place which is parallel with the river, is large and commodious, has a spacious room for balls and public meetings, and enjoys the patronage of the gentlemen of the county.

An inkle-factory of long standing, but never of any great importance, has become defunct. A small tan-work, about half-a-mile east of the town, is remarkable more for the length of time it has existed, than for the amount of work it has performed. A small fulling-mill and some stocking-ooms employ a very few workmen. But two large woollen factories, of quite recent origin, known by the designation of the Ettrick mills, and situated on the river at the debouch of the new Edinburgh road, amply compensate the want or paucity of other manufactures. The one belongs to Messrs. William Gilmour and Co. of Glasgow, and the other to Messrs. Davidson, Brown, and Co. of Galashiels; and both were erected or brought into operation about the end of 1836. The fabrics woven, and the wages earned, are the same as at Galashiels. A waterfall near their site, which belonged to the corporation of the burgh, and which they had agreed among themselves to sell for £40, was put up to auction in 1838, and was so sharply competed for as to be knocked down at £210. While in the model-room, at the last meeting of the British Association at Glasgow, splendid carpets in imitation of the rich produce of the looms of Turkey faunted conspicuously in the view, an extremely modest, but on that account attractive space was occupied by some varieties of the fabrics woven at the Ettrick mills. "This description of goods," says a journalist,—whose remarks, however, must be understood as including chiefly Galashiels, and partly Hawick, the Ettrick mills not having come into existence at some of the periods of which he speaks:—"This description of goods is known technically by the name of 'Tweeds,' as we should suppose from the locality, and is proper to Scotland. It comprehended those kinds of soft and elastic pieces of cloth, of different degrees in fineness, which are now so much in demand for trowsers, hunting-jackets, and shepherd's clothing. The better sorts, such as what are called in the printed list 'Royal Blue Prince Albert's check,' are equal in point of finish, and vastly superior in durability, to the first-class of West of England cloths; and are so much in request in the London market that the manufacturers find it impossible to supply the demand. It is undoubtedly a beautiful article. The 'Breadalbane' is a species of tartan of singular richness, and the 'brown and green,' and 'brown and red heathers,' are imitations, and successful ones, of the complexion of the Scottish mountains when the heather is in leaf and in bloom. The checks and plaidings are well-known. They have a soft flannelly feel, and are perhaps the lightest and the warmest dress that can be worn. Now—what struck us was this—that the manufacture in question is new to Scotland, that it was begun, and is, we

believe, exclusively prosecuted by a Glasgow house—that its variegated fabrics extend to every quarter of the world—that in the course of little more than ten years it has risen so rapidly as fairly to come into competition with the long-established fabrics of Yorkshire—and that little beyond the finest Australian wools are consumed in it. To those who know anything of the history of the woollen trade these will not appear unimportant considerations. Until the Messrs. Gilmour started their mills in Selkirkshire, Scotland had literally no woollen manufacture. It was confined to England, where it took root in the days of Edward the Third, (1331,) or, as others will have it, as early as the reign of Henry the Second (1185); but was not naturalized in this country till within the last twenty years. There might be, and doubtless there was, north of the Tweed, a domestic manufacture of the coarser stuffs worn by the peasantry; but up to the present hour there is scarcely a yard of fine cloth consumed in Scotland which does not come from the south, except what is made at the Ettrick mills; while the description of goods immediately under consideration is wholly produced there. We could desire no better evidence than this of the enterprise of countrymen."

The manufacture of thin or single-soled shoes, it is well-known, was anciently so considerable and dominant a craft, as to give the name of Sutors to the whole body of hurgesses. A song, familiar to most persons in the south of Scotland, has for its first verse:

"Up wi' the Sutors o' Selkirk,  
And down with the Earl of Hume;  
And up wi' a' the braw lads  
That sew the single-soled shoon!"

These words have been the subject of fifty times more literary controversy than they are worth; and—in the face, or with some critical explosion, of the facts, that there was no Earl of Home till the year 1604, and that the Selkirk hurgess who performed the chief feat at Flodden was a weaver—they have been generally construed by antiquaries who have commented on them, to refer to the poltroonery of Lord Hume on the one hand, and the bravery of the Selkirk shoemakers on the other, at the stern conflict of Flodden. The sutors, at all events, are said to have been so prevailing and ascendant a body at the date of the conflict, that they monopolized the honours won by the united citizens on its field of fame; and they obviously could have acquired their conspicuousness in story, and their nominal possession of all the aggregate rights of burghess-ship, only by a remote and long-continued predominance of both numbers and craft. To be made a sutor of Selkirk, both now and for many ages past, is in the uniform and hoisted language of the place, to be created a hurgess. The candidate for admission, too, is expected, at a festivity of the town-council and freemen, to pass through his mouth a small bunch of such bristles as are used by shoemakers, and one which has been previously passed through the mouths of all the freemen at the hoard; and unless he thus, as the phrase is, "lick the horse," he is construed to decline obedience, or refuse due acknowledgment and respect to the dominant craft, and cannot be allowed to share their burghal privileges. Sir Walter Scott, on being made a hurgess, tried to compromise refinement and complacency by rinsing the eshlashed 'hirse' in his wine; but he was compelled to make amends, both by mousing the washed horse, and by drinking off the liquor it had polluted. The horse—saturated with the saliva of whatever Selkirk sutors are pleased to attend upon the ceremony—is so cherished an emblem of the ruling party's power, or at least of their craft

and propensities, that it is even appended to the seal of the ticket of freedom, and has, in courtesy, been withheld from not another qualifying hurgess except Prince Leopold, now king of Belgium, who visited the town in 1819. So important a body did the shoemakers continue even down to the middle of last century, that, in 1745, when the magistrates of Edinburgh were commanded by the Highland army to furnish them with 6,000 pairs of shoes, they ordered first one-third of the whole, and afterwards a few hundreds more, from the shoemakers of Selkirk, agreeing to pay for them a stipulated price. "At the present day," very neatly, though mistakenly, says a contemporary, "there are more of this than any other trade in the burgh; and not long ago one whole street was filled with them,—whence the popular rhyme,

"Sutors aye, sutors twa,  
Sutors in the Back Row!"

which, being cried at the top of one's voice in the said street, was sufficient to bring sutors, and sutors' wives, and sutors' bairns, and all that ever lay in sutors' arms, out like a nest of hornets; and the offender would alone have to thank his heels, if he escaped as comfortable a lapidation as any man could desire to have his bones blessed withal on a summer's day." In 1832, the five incorporated crafts of the burgh stood, as to the respective number of their members as follows: Hammermen, 44; shoemakers, 24; weavers, 24; tailors, 22; fleshers, 9;—and, at the same date, the shoemakers remained stationary, while each of the other crafts had been increasing during the preceding ten years. The sutors, even then, yielded the palm of numbers to the hammermen; they have, since the erection of the Ettrick mills, become much outnumbered by the weavers; and they thus continue only by courtesy, and by the proscription and fond associations of ancient usage, to represent either hurgess-ship or the productive industry of the burgh.

Selkirk has a branch-office of the British Linen company's bank; the office of 'the Ettrick Forest Savings' bank; two subscription libraries; one parochial library; a friendly society; a temperance society; a Bible and Missionary society; and a society for the improving of the breed of sheep and cattle. A weekly market is held on Wednesday; and annual fairs are held on the 5th of April and the 31st of October, for hiring servants; on the 15th of July, for hiring shearers; and on the 31st of July for the sale of lambs. Communication is maintained with Edinburgh and Hawick by a stage-coach, in transit three times northward and three times southward in the week; with Edinburgh and the west of England by the mail-coach in daily transit; and with Edinburgh, Galashiels, and other places, by local carriers.—The burgh, though entitled to have a provost, forebore to elect one during about a century and-a-half preceding the passing of the Reform bill. Their last provost before that period was an extravagant and wasteful country gentleman, who had been foisted on them by the government of James VII.; and the town-council, when reporting their sett to the convention in 1709, naively stated that, in consequence of this person having involved them in heavy debts, they had resolved to content themselves with bailies. The number of the council has been always 33; but the mode of election underwent a change in the course of last century. The sett was extremely complicated; there was no restriction as to re-election; each deacon was elected from leets shortened by the council, and had a colleague freely elected by the corporation; and, in other respects, the old council chose the new. Under the Reform act, the

council numbers 33 as before, and consists of a provost, 2 bailies, a treasurer, and 29 councillors. Constituency, in 1833, 110; of whom 68 were burgesses. The town's property has been estimated at about £26,000; and its debts amounted at 1st October, 1833, to £16,088. Its revenues, as returned to parliament, was £284. In 1833, the revenue was £1,039 15s. 8<sup>3</sup>/<sub>4</sub>d.; and the expenditure £2,452 12s. 10d.—£1,187 3s. 8<sup>3</sup>/<sub>4</sub>d. of the latter being for public works. The taxes levied are the cess and petty customs. The burgh-boundaries are extensive, comprehending 2,399 acres of land lying without the town; and they remain unaltered by the municipal Reform act, the burgh having, as regards the elective franchise, been thrown into the county. The magistrates are assisted by the town-clerk as assessor; they exercise the jurisdiction common to royal burghs; and they have the patronage of the town-offices, and of the burgh-school, and an endowed female-school, and some influence over the parish or grammar-school. Fees paid to the town for entering burgess vary from 3s. 4d. to £1 3s. 4d.; to the hammermen, £15; to the tailors and the weavers, from £5 to £15, according to the scarcity or sufficiency of workmen; and to the shoemakers and the fleshers, nothing short of an actual local apprenticeship of six years, or of marriage to the eldest daughter of a freeman. The effect of the exclusive privileges is to give the incorporations a monopoly; and the last entry, before 1833, with the incorporation of hammermen, for which a fine of £15 was paid, was forced upon a skilful tradesman in the south of Scotland, to enable him to carry through a contract within the territory of the burgh. There is no separate police-establishment, and no nightly watch. The only criminal officers are the burgh-officers, and ordinary and special constables; and the public wells are kept in repair, and the streets lighted, cleaned, and paved out of the common good.

Selkirk is a town of high antiquity; but, owing to its lying out of the ordinary thoroughfare of both ancient war and modern commerce, it has figured but inconspicuously in history. The Scoto-Saxon kings finding sport through Ettrick woodlands, very early established a hunting-seat on its site, and occasioned the formation of a sort of king's town. The castle which they built seems to have been princely enough for the reception of the monarchs and their courts; and as it was erected for the amusements of peace, rather than for the struggles of war, it was probably constructed of slight materials; but it looms very dimly through the haze of record, and stood no one can tell on what particular spot. A church which rose in its vicinity, and which was called for both by the castle itself and by the infant town, gave, as we have seen, its name to the locality, and remotely also to the river and the forest. In 1113, a colony of Tyronensian monks was settled near the castle and village; and remained there during 15 years of penitentiary trial. Radulphus—who conducted them to the spot—was the original abbot; and he was succeeded first by William, who is recollectcd by Fordun,—and next, in 1124, by Herbert, who became the first abbot of Kelso, and rose to be bishop of Glasgow. In 1128, the monks, on account of inconvenient accommodation, were removed to Kelso; yet they afterwards continued to hold a very intimate connection with their original seat. One curious fact is, that the abbot, while the king's castle remained in Selkirk, was bound, by the tenure of his land, to act within the castle as the king's chaplain; and that if ever the sovereign shall be pleased to restore the castle, the Duke of Roxburgh, who wears 'the fair-

lined slippers of the abbot,' is bound both to act as chaplain in the castle, and to repair the bridge. The distinction between the new village of Selkirk-Abbatis, which rose around the abbey, and the old village of Selkirk-Regis in the vicinity of the castle, speedily fell into disuse after the monks' removal. Some mills which David I. had at Selkirk, show that, while the chase was the main object of the royal residence, agriculture had made some progress in the vicinity of the town; and they remained royal property till at least the time of Robert Bruce. One mill belonged also to the monks, and afforded them no little profit after they became settled in Kelso. David I., after his accession in 1124, probably did not reside much at Selkirk; as he gave preference to Roxburgh, on account both of its greater security and its superior attractions. The castle of Selkirk was frequently inhabited by William the Lion, and was the place from which he granted and dated many of his charters; and it was occasionally the home of his son and his grandson, Alexander II. and Alexander III. But before the accession of Robert I., this ancient hunting-seat disappears from the eyes of the antiquary. Aymer de Valence built a peel-house at the town,—a fact which seems to intimate that, in his days, the place had ceased to possess a royal residence. Selkirk long continued a town in the king's demesne; but did not become a royal burgh till a much later period. While the rulers of other towns were obliged to swear fealty to Edward I., we do not perceive any corporate body from Selkirk upon their knees before their superior lord. During the long conflicts for the succession of the Crown, the town was often granted to the successive partisans of the rival kings. When James IV. was marching to his gory death on Flodden-field, 100 townsmen joined him under their town-clerk. They fought stoutly; they all scorned to flee; they almost all fell in the field; and few of them returned with their gallant leader to the Forest. William Brydone, the town-clerk, and his successors in office, were, in guerdon and commemoration of his bravery, created knights by a charter of James V., which recites the valour of himself and of those he led; and 1,000 acres of the Forest, now worth about £1,500 a-year, and divided into a great number of small properties, was given by the monarch to the townsmen. An English standard wrested from the foe, and carried off the field of battle by a weaver who fought by the side of Brydone, is still in the possession of the corporation of weavers, and is annually borne at their head in a processional and gala survey of the 1,000 acres of the royal grant. The sword of Brydone, too, is still preserved in the town by his descendant, and regarded as a venerable relic. So exasperated were the English at the distinguished resistance of the Selkirk band, in circumstances where the proudest of the land had lowered their swords, that they soon afterwards burnt the town; yet, in doing so, they only afforded James V. an opportunity of repeating his approbation of the burghers in giving them timber from his forests, to replace what the fire destroyed. Tradition says, that when the few survivors of the 100 heroes were returning from Flodden, they found, by the side of Lady-Wood-Edge, the dead body of the wife of one of their fallen comrades, with a child sucking the breast; and that, in consequence, the town adopted, and still retains, as its armorial bearings, a female holding an infant, and seated on a sarcophagus, the Scottish lion in attendance, and a wood in the background. The next historical event of note with which Selkirk had connexion, was the brief but decisive and celebrated action of PHILIPPAUGH; which see. When the middle division of the Highland

army, in 1745, approached the town in their progress toward England, four foragers, sent forward to make a public levy of provisions, walked into the booths or among the stalls, then situated in the market-place, and began, in the unceremonious style of caterans, to appropriate whatever they found most tempting and portable. Several butchers instantly remonstrated, and seemed willing to try the mettle of their cleavers against the Highland cleavers, when a muscular and agile young fellow of their number tore the shaft from a handbarrow, and, with this rude instrument, and little aided by his comrades, began to belabour the four kilted intruders, and in a few minutes drove them from the town. He, of course, required to lie perdu till the whole brigade had passed quite away to the south.

"The burgh of Selkirk," report the Commissioners on Municipal Corporations, "is said to be of ancient foundation, but the oldest charter preserved is one granted by King James V., dated 4th March, 1535. It proceeds on the narrative that the charters of ancient foundation of the burgh, and liberties thereof, granted to the burgesses and community by his Majesty's progenitors, had perished, whence merchandizing amongst the burgesses had ceased, to their great detriment, and the prejudice of the liberties of the burgh, and the loss of his Majesty, in regard to the customs and firms due out of the burgh. The charter proceeds to grant of new, and to confirm for ever to the burgesses and community, 'Nostrum burgum de Selkirk, in liberum burgum ut prius in perpetuum, cum omnibus et singulis terris, communis et possessionibus, quibuscunque ad eundem spectant. cum potestate ipsis, ballivos et alios officarios necessarios, prout retroactis fecerunt, temporibus annuatim eligendi.' The privilege is given of an annual fair, with a court, gallows, and other liberties, and to hold burghal courts, and full privileges of trade, as any other burgh in the kingdom, all to be held in free burghage, for payment to his Majesty of the burghal firms, and other duties used and wont. A precept, under the Great seal, was granted of the same date, upon which sasine followed, and the instrument, dated 22d March, infests the burgh, *inter alia*, in the south and north commons of the burgh. This charter was confirmed by James V., after he had attained majority, along with, 1st. A licence to the bailies, burgesses, and community, to till 1,000 acres of their common lands, notwithstanding any acts or statutes to the contrary; and, 2d. A grant of a fair-day at the feast of Conception. In 1540 James V. granted another charter, upon the narrative that the burgh of Selkirk 'prope Angliam, Liddalsdail, et alias vicinas et minime pacificas provincias, furibus, raptoribus, proditoribus, et aliis transgressoribus, plenas jacet, et per ipsos et alios viros potentes, defectu nobilis et boni viri, ipsum, et incolas ejusdem defendere sepius, combustus, depre-datus, destructus, et oppressus extitit,' giving power to the bailies and community to choose a provost, and granting to them a power of sberiffship within the liberty and territory of the burgh, and to hold courts of sheriffship, with the usual powers, and to repledge the inhabitants of the burgh and territory from other judges. This charter farther confirms the feu of the burghal firms and small customs of the burgh, granted to the bailies and community for payment of £5 of feu farm. And for security of the burgh liberty is given to the bailies and community to have walls and a ditch round the burgh. Upon the precept following on this charter, sasine was taken, dated 11th October, 1540. All these charters were ratified by the Scottish parliament in an act in favour of the burgh, dated 28th June, 1633."

Selkirk gives the title of Earl to a branch of the

ancient and once far-dominant house of Douglas, which, previous to the strong check which was given, in 1455, to its bold spirit and careering fortunes, had extensive possessions in the Forest. The 1st Earl of Selkirk was Lord William Douglas, the eldest of the 1st Marquis of Douglas' sons by his second wife; and he was raised to the earldom, in 1646, with the adjunct of Baron Daer and Shortcleugh. This nobleman married Ann, Duchess of Hamilton, and, in consequence, became the 3d Duke of Hamilton from the date of the dukedom's creation, and the 1st in the line or family of Douglas. His peerage of Earl of Selkirk became concealed for a time beneath his ducal bonnet; but afterwards descended, first to his 3d son, Lord Charles Douglas, and next to his younger son, Lord John Hamilton, Earl of Rutherglen. In 1744 Dunbar Hamilton of Baldoon, the grand-nephew of the 3d Earl, succeeded to the title; and, in 1799, he left the honours to his 7th son, Thomas. This, the 5th Earl, was the most distinguished of those who have yet inherited the title; and lives in a cheerful nook of history as the advocate of liberal views respecting emigration to British America, and the promoter of a British settlement on Prince Edward's Island. Dunbar James Douglas, the present Earl, and son of the 5th, succeeded in 1820. The chief seat of the family is at St. Mary's Isle in Kirkcudbrightshire: see MARY'S ISLE (ST.).—Selkirk bannocks' have long been in fame, and continue to enjoy their reputation. They originally were made of barley-meal, and had a form and a consistency suited to the name they bear; but now they are composed of the finest wheaten flour, and differ from the ordinary produce of the bakery only by the excellence of their manufacture, and an occasional intermixture of confections. In their plain form, and as tea-bread, they are greatly in request in all the country lying within 15 miles of the town, and are sent in regular supplies to Galasbiels, Innerleithen, and Hawick.

SELKIRKSHIRE, a county in the south of Scotland, lying so comparatively near the boundary with England as to be reckoned emphatically a border district. It is bounded on the north-west by Peeblesshire; on the north by Peeblesshire and Edinburghshire; on the north-east, east, and south-east by Roxburghshire; on the south by Roxburghshire and Dumfriesshire; and on the west by Dumfriesshire and Peeblesshire. The boundary is formed by water-shedding lines of heights for 9 miles detachedly, and very sinuously in the north; for 9 miles curvingly in the south; and for 22 miles continuously with the south line, and with little irregularity round the south-west corner, and along by far the greater part of the west. But elsewhere the boundary is exceedingly capricious and fitful as to its material, and often serrated, jagged, and almost pronged in outline, so as to be utterly bewildering to strangers, and almost perplexing to inhabitants interested in knowing it. The county lies between 55° 22' 20" and 55° 41' 54" north latitude; and between 2° 47' 40" and 3° 18' 46" longitude west from Greenwich. Its greatest length, from north-east to south-west, or from the confluence of the Tweed and the Gala to Micklewhinfell, overbanging the source of Ettrick-water, is 27 miles; and its greatest breadth, in a line at right angles with that between the above points, or from the place at which it is left by Glensax-burn on the north-west to Bortwick-brae on the south-east, is rather more than 17 miles. Its area, owing to the awkwardness of its outline and the inequality of its surface, cannot, without great difficulty, be ascertained: accurately measured from Ainslie's map, it is 257 square miles, or 164,480 acres; calculatingly estimated by Dr. Douglas, in his Agricul-

tural Survey of the County, it is 240 square miles, or 153,600 acres; and conjecturally estimated, or partially measured by persons practically and intimately acquainted with the boundaries, it is supposed to come short of even the latter of these measurements. A pendicle of the county lies detached on the east: see SELKIRK.

Excepting a very narrow portion on its eastern side, or the vicinity of its burgh, Selkirkshire is a continued series of heights, intersected by gulleets, glens, and very narrow vales. Seen from any central or towering eminence which commands a view of most of its area, it appears a continuous sea of hills without one mark of life, one dwelling-place of man, upon its rudely rolling surface. Though situated in the centre of the Southern Highlands, all of it lies on a base of from 280 to nearly 800 feet above sea-level,—averaging probably a little more than 500. The mean altitude of the bed of its streams is thus only about one-half of the altitude of the vale of Badenoch on the Spey, or the large dreary plain of the Moor of Rannoch on the north-west limit of Perthshire. Its heights are, in numerous instances, mountainous or toweringly hilly. Blackhouse-hill rises above sea-level 2,370 feet; Windlestrae-law, 2,295; Minchmoor, 2,280; Ettrick-pen, 2,200; Lawknees, 1,990; Wardlaw-hill, 1,980; Hanging-shaw-law, 1,980; Three-Brethren-cairn, 1,978; Black-Andrew-hill, 1,966; Peat-law, 1,964; Old Ettrick-hill, 1,860; and a great number between 1,000 and 1,800. These, indeed, are the measurements of Ainslie; and they have been reckoned rather extreme by persons of skill, and, to a certain extent, falsified by recent and minute observations; yet they are sufficiently exact to convey a fair idea of the general summit-elevation of the district. The heights, though having, on the whole, a monotonous character, frequently exhibit considerable variety; and, in the west, where they form the screens of St. Mary's-loch, the Loch of the Lowes, and the Upper Yarrow, they rise in dark steep masses, and usually turban their heads in picturesque clouds. The clothing of the surface is, generally, a pleasant green, calmly and finely pastoral, contributing, with the acclivities which it covers, a mingled sweetness, solemnity, and sequesteredness of landscape; but it is occasionally a dingy and lugubrious russet; and, in a region in the south-east between Borthwick and Ettrick waters, it stretches away in an expanse of cold black heath, drearily patched with such prosaic lakes as serve only to demonstrate the morassy character of their environs. The numerous furrowed excavations which intersect the heights, and serve as channels to the streams, are rarely more in width than the merest glens; and, even along the course of the larger waters, seldom attain the expansion of valleys or even vales. But they abound in picturesqueness and romance; they are to so large an aggregate extent wooded with copses or plantation as to be really 'bushy dells,' and they acquire both scope and many interesting features by sending numerously off among the heights those abrupt fissures or ravines, and those hrief hill-locked vales, which are called respectively cleughs and hopes. Many of the houses of the county are situated 600, and some upwards of 1,000 feet above sea-level.

The waters of the county well up in myriads of springs, and are all pure, salubrious, and untainted to any perceptible degree by mineral solution. St. Mary's-loch and the Loch of the Lowes, the two principal lakes, are described in their appropriate place. Other lakes, though numerous, are all small; they belong principally to Roberton and to Yarrow; and they are noticed in the articles on the parishes. The Tweed has 10 miles of its beautiful course,

generally in an easterly direction, through the northern district; and often gives the name of Tweedside to the richly wooded and very ornate though narrow vale which it here traverses,—just as it popularly gives the name of Tweeddale to Peebles-shire, which it and its tributaries drain, and geographically yields the name of Lower Tweeddale to that part of Roxburghshire which, while traversing, it so gorgeously embellishes. The Gala joins the Tweed at the point where the latter departs; and previously forms, for 3 miles, the boundary with Roxburghshire. The Ettrick, strictly or characteristically the river of the county, has its entire course of about 28 miles within it; and divides it from its south-west extremity north-eastward to the Tweed, 2 miles above the mouth of the Gala, into two not very unequal parts. The Yarrow, the chief tributary and at the same time the rival of the Ettrick, rises only 3 miles north-west of the latter's upper course, and flows parallel to it at about the same mean distance till within  $3\frac{1}{4}$  miles of the Tweed, and then debouches south-eastward to the Ettrick. These four streams are fully described in their respective places; and they have all—we need hardly remark—been so celebrated in song as to have borrowed for Selkirkshire, from the creativeness or at least the enthusiasm of poets, almost a fictitious splendour. The principal tributaries of the Tweed, within the county, are Gaihope-burn, Cadon-water, and the Gala on the left, and Glenkinnen-burn and the Ettrick on the right; of the Ettrick, are Tushielaw-burn and the Yarrow on the left, and Tima-water and Rankleburn on the right; and of Yarrow, are Kirkstead and Douglas burns on the left, and Altrive-burn on the right. Glensax-burn, a tributary of the Tweed in Peebles parish, drains a projection on the north-west. The Borthwick forms, for some miles, the boundary with Roxburghshire on the south-east. The Ale rises in the county, but soon departs into Roxburgh. The only cascade in the county is one of 20 feet high, in the course of a rivulet in Roberton; yet romantic lins and rapids occur in the Ettrick and the Yarrow.

Selkirkshire, though poor in minerals, has some attractions for both the geologist and the mineralogist. Most of the surface appears to have been one vast bed of schistose transition-rocks, chiefly greywacke with a basis of clay-slate; and, in the numerous intersections and cross-lines where it is worn down into ravine and glen, it exhibits on the confronting sides of the cuts stratum answering to stratum in a manner which beautifully exhibits the powerfully erosive yet undisturbing action of running water. Peats, dug from numerous mosses, form almost the sole fuel of the agricultural population; and coal is imported from Lothian for the use of the towns of Selkirk and Galashiels.—The soil of the sheep-walks, owing generally to its lying on greywacke granite or gravel, is sound and dry; and even where it is clayey, or lies on clay or till, it is prevented from being hurtfully retentive, by the firm consistency of its surface, or the great steepness of its bed. Excepting in the extensive and dreary moor between Ettrick and Borthwick-water, and in a very few spots near the sides of streams and on the tops of mountains, marshy-grounds are unknown. Very little pure clay soil exists in the county; and where it occurs in mixture or as a substratum, it is generally found on the sides of hills nearly midway between their summit and their base. The soil of the arable grounds is light, dry, and easily managed; and in the few places where it lies on till it is so drained by the declivity of the ground, that a little care in disposing the ridges carries off both the springs and the surface-water.

Agriculture, considering how rugged and seemingly how altogether pastoral the district is, has made singular achievements as to both the extent of area subjugated to the plough, and the degree of skill with which it is farmed. About 50 years ago, on a mistaken and exaggerating assumption which assigned to the county an area of about 181,000 acres, the lands were computed to be distributed into 169,650 acres of pasture; 9,300 acres of arable ground; 2,200 acres of plantation and coppice; and 1,250 acres of gardens and pleasure-grounds. At present, on the proximately correct yet quite high enough assumption, that the area is about 153,000 acres, we compute, from good data, that about 140,610 acres are pastoral, morassy or waste, 10,310 acres regularly or occasionally in tillage, and 2,720 acres under natural and planted wood. Though the arable land all lies from 280 to nearly 800 feet above sea-level, its culture is as good and productive as that of almost any land in Great Britain. In Galashiels and Selkirk parishes, where the plough is driven to the summit of many a considerable height, wheat is grown in large quantity; it even forms a considerable part of the rotation; and at 700 feet above sea-level, it has often been raised, says one writer, "to what would be called a good crop in the Lothians;" and, says another, to the amount of "60 lbs. per Winchester bushel." Such a result is the more surprising, that, as we are told by Dr. Douglas, "very little of the arable soil is sufficiently deep and strong for producing wheat." "But nearly the whole of it," adds that writer, "is admirably adapted for turnips, clover, barley, and oats. Pease, too, succeed very well. The white grains, though not large, have thin husks, are plump, and of an admirable quality. Turnips seldom fail; and a very great weight of clover has been raised upon an acre. White clover appears in every field that is surrendered to pasture, without having been sown, and indeed is found throughout the whole county wherever the soil is dry." Three-fifths of the whole arable ground lies in the parishes of Selkirk and Galashiels; and nearly another fifth lies in the parish of Yarrow, chiefly in its lower or eastern extremity. In all the south-western half of the county tillage is confined to the little baughs and the small contiguous slopes.—Great attention is paid throughout the large pastoral districts to the improving of the breed of cattle and sheep. Lord Napier has made strenuous and successful exertions to arouse and direct the solicitude of sheep-farmers: at the conclusion of the war, he settled down in the vale of the Ettrick, and hegan, *con amore*, to take and to give lessons in sheep-busbandry; and, in 1819, he succeeded in forming a pastoral society, which, since the date of its establishment, has steadily and successfully directed the energies of the farmers. The society meets annually in the month of June, and, in rotation, at Newark in Selkirk, at Tinnies in Yarrow, and at Thirlstane fair-grounds in Ettrick; and it is supported not only by every respectable farmer in Selkirkshire, but by many farmers of the adjacent counties of Peebles, Roxburgh, and Dumfries. "From the time of King James, down to the year 1785," says Hogg in his 'Statistics of the County,' "the black-faced or forest-breed continued to be the sole breed of sheep reared in the district; and happy had it been for the inhabitants had no other been introduced to this day. However, about that period, the farmers in the eastern division of the county hegan to introduce the Cheviot breed, which, for the space of 10 years, continued to creep westward by slow degrees, till the year 1796, when the demand for Cheviots hegan to increase so rapidly, and still to go on progressively, till it absolutely

grew little better than the tulipo-mania that once seized the Dutch." A garden-tulip is better than a marsh-grown bulrush; and a Cheviot sheep is now all but universally—except for the knife—esteemed better than a black-faced 'ewie wi' the crooket horn.' Hogg, were he still alive, would find few persons even in the Forest, to sympathize with his lament; and not very many to admit it as quite a correct statement. So early as 1798, all the sheep-walks of Selkirkshire, excepting in a small tract upward from Hindhope on the Ettrick and Ladhope on the Yarrow, were wholly stocked with white-faced sheep, of a kind rather accommodatingly called Cheviots. The change which substituted these for the former tenants was effected not by expelling the black-faced breed, but generally by using Cheviot tups for a succession of years, till all marked traces of the coarse wool, short bodies, and black faces and legs, had disappeared. A mongrel breed was thus produced, which, though called or mis-called Cheviot, and though improved in wool while retaining the hardness of the race whence they sprung in the female line, were greatly inferior to the new Cheviot, and both in shape and in size, and even in wool, retained mischievously much of that breed whose alleged expulsion, but only whose transmutation, Hogg so curiously bemoans. Breeds, better deserving the name of Cheviot, yet so crossed as to aspire to honours which even that name cannot claim, now all but universally walk the sheep-pastures. The 'old black-faced' sheep, in the rough character which belonged to it before the era of modern improvement, was, some 14 or 15 years ago, re-introduced to two or three farms; but it has never re-acquired favour, or been fairly tolerated except where the less hardy white-faced is too fragile for the abrasions of the climate.—Black cattle obtain but inferior attention. The cows are generally of the Ayrshire breed. Highland kyloes have, for several years, been introduced to hill-pasturage. The horses to which preference is given are generally of the Northumberland breed. Hogs and poultry share the same very limited attention which is given them in Roxburghshire. There are several rabbit-warrens. Forty-three years ago, Dr. Douglas said, in reference to the whole county, "The farmers are by no means so well accommodated with either dwelling-houses or offices; both being, in general, paltry and ill-built. Most of the dwelling-houses are of one story, low in the roof, badly lighted, and covered with thatch. The walls, however, are of stone and lime; and of late a few of these low houses have been slated. The offices are still more pitiful, meanly and rudely constructed, and awkwardly placed. Some stables and cow-houses are so low, as scarcely to admit horses and cattle of an ordinary size." Though improvements have in some instances been handsome, and in many perceptible, they have neither been so numerous nor so reforming as to prevent Dr. Douglas' dreary picture from being an accurate representation of the state at the present hour of farm-houses and farm-offices over a large part of the county.

Selkirkshire, as is well-known, was anciently all forest; and, till a comparatively recent period, had all its history shaped by its forest condition. See **ETTRICK-FOREST**. In some ages which preceded the wasteful wars of the succession, the district appears to have been more productive and populous than at any subsequent period. Every church had its village, every seat its hamlet, and every farm its cottages; and all enjoyed the warmth, and indirectly benefited from the herbage of the sheltering woods. "The abbey-property lying around Selkirk," Chalmers says, "would not make a little farm according

to the agricultural system of the present times; and yet, during the ancient regime, maintained in comfort and content 36 families." But whatever rude and semi-savage prosperity existed was ruined by the international wars, and gave place to four centuries' duration of feuds and rieving and accumulated misery. Agricultural resuscitation did not occur till the close of the first quarter of the 18th century. The year 1722 witnessed 12,000 ewes milked daily during the month of June at Tait's-cross; and the following year has been assigned as the general era, but not the era for Selkirkshire, of georgical improvements. Dr. Mercer, the earliest improver of the county, began skilfully to develop his modes of enclosing and culture only so late as 1759.—The only manufactures of the county are those seated at GALASHIELS and SELKIRK: which see.

Selkirkshire, as a district wholly upland, suffered till a late date nearly as great inconveniences from the want of roads as if it had been a portion of the northern or western Highlands. The first turnpike was a line of 12 miles through Selkirk, stretching from Hawick by way of Crosslee toward Edinburgh; and it was constructed by act of parliament passed in 1764. The present turnpikes are 11 miles of the Edinburgh and Carlisle mailroad through Galashiels to Selkirk; 9 miles from Crosslee by Yairbridge to Selkirk; 9 miles from Holilee, in the direction of Peebles, to Galashiels; and 24 miles from the boundary with Traquair in Peebles-shire, up the parish of Ettrick. Other roads traverse the vales of the Yarrow, the Tweed, the Tima, the Ale, the Cadon, and Rankle, Tushiclaw and Altrive burn. Deeply sequestered though the district be, it offers a cut across its surface for the transit of the projected railway between Edinburgh and Hexham, and will lift the railway to a maximum of elevation on its height of HANGINGSHAW-LAW: which see. The only weekly market is at Selkirk; and the only fairs are at that town and at Galashiels.

Selkirkshire, as to ecclesiastical or parochial matters, is very strangely distributed. Though 9 distinct parochial names are upon its list, it has only 2 complete parishes, and only 5 parish-churches. It comprehends all Yarrow and Ettrick; about eleven-twelfths of Selkirk; two-thirds of Galashiels; one-third of Roberton; one-third of Ashkirk; one-fourth of Stow; one-fourth of Innerleithen; and a small corner of Peebles. It thus shares parochial territory in one instance with Edinburghshire; in 2 with Peebles-shire; and in 4 with Roxburghshire. The parish which it shares with Edinburghshire, is in the presbytery of Lauder, and synod of Merse and Teviotdale; those which it shares with Peebles-shire are in the presbytery of Peebles, and synod of Lothian and Tweeddale; and the remaining 6 are in the presbytery of Selkirk, and synod of Merse and Teviotdale. The education returns of 1834, assign to Selkirkshire the whole of Galashiels and Selkirk, as well as its own two complete parishes, but withhold from it any share in other parishes; and, in consequence, estimate it at between one-eleventh and one-tenth less than its real population. But thus estimated, its parochial schools were 5, conducted by 8 teachers, and attended by a maximum of 385 scholars; and its non-parochial schools were 13, conducted by 14 teachers, and attended by a maximum of 617 scholars.—The county has no other burgh than Selkirk; no other town than part of Galashiels; and no other village than the little hamlets of Ettrick, Yarrow-feus, and Yarrowford. The principal seats are Bowhill, the Duke of Buccleuch; Thirlstane-castle, Lord Napier; Torwodlee; Gala-house; Holilee; Sunderland-hall; Yair-house; Haining; Broad-meadows; and Hangingshaw-house.

The county, its constituency swelled by that of its burgh, sends a member to parliament. Constituency, in 1838, 617. Valued rent, in 1674, £80,307 Scottish. Assessed property, in 1815, £43,584. Population, in 1801, 5,070; in 1811, 5,889; in 1821, 6,637; in 1831, 6,833; in 1841, 7,989. Inhabited houses, in 1831, 1,094; families 1,391. Inhabited houses, in 1841, 1,446.

All the territory which now constitutes Selkirkshire was part of the ancient possessions of the British Gadeni; and, immediately after the Roman abdication, it began to be overrun by the Saxons; and soon after 1020, it became the seat of some settlements of the Scottish people. The Gadeni seem, in their original occupancy of it, to have lived rather as hunters than as shepherds; and, after they became Romanized, they may have made some advances toward the secondary or supra-primitive condition of society. The Saxons, though they took firm possession, appear not to have cleared away the fords; for, after seven changeful centuries succeeding the Roman abdication, Ettrick forest retained all its honours of both the wood and the chase. Except in the eastern division of the county, there are no British remains which would evince the inhabitation and mark the usages of the aboriginal people,—no Druid temples, no stone monuments, no ancient sepulchres, no hill-forts. In the eastern and now the cultivated division, there are remains of several British strengths, formed generally between the circular and the oval; and, amidst some of them on the Borthwick-water, are vestiges of a square or Roman camp. The most remarkable British antiquity is the CATRAIL: which see. Three crosses, called William's, Tait's, and Craik, stood respectively on a height near Broad-meadows, on Kershope-hill, and on Craik-moor; but wherefore or by whom erected cannot be known. Comparatively modern antiquities are principally ruined castles and moss-grown towers, some erected in the 12th century, but most of them in subsequent ages of foreign hostilities or domestic feuds. The principal are Oldwark-castle, Newark-castle, and Deuchar-tower, on the Yarrow; Dryhope tower, near St. Mary's-loch; Blackhouse-tower, on Douglas-burn; Blindee-tower, on Gala-water; and Kirkhope, Thirlstane, Gamescleuch, and Tushie-law towers, on the Ettrick.

Ettrick-forest seems to have been under the jurisdiction of the constable of the King's castle at Selkirk, in nearly the same way as if it had been under a sheriff; and it was probably erected into a regular sheriffdom previous to the sad demise of Alexander III. Yet the earliest sheriff who appears on record is Alexander Synton, under the date 1292. Edward I., in 1304, granted to Aymer de Valence, the Earl of Gloucester and his heirs, the keeping of the forest, the castle, and the town of Selkirk; and, next year, when settling the government of Scotland, he recognised the Earl of Pembroke as hereditary sheriff of the county. From soon after the accession of Bruce till 1455, the forests of Selkirk and Traquair were, with the juridical powers of a free barony, held of the Scottish crown successively by Sir James and Sir Hugh Douglas, and their heirs the Earls of Douglas. Yet, during a large part of this period, the English sovereigns regarded Ettrick forest as a sheriffdom in the possession and under the government of their creatures. But, in 1346, William, the 1st Earl of Douglas, expelled the English from 'Douglasdale,' and took possession of 'Ettrick-forest.' After the attainder of the Earl of Douglas, the sheriffdom, or the jurisdiction tantamount to it, remained for some time attached to the Crown; and successively, in 1503 and 1509, it was given in the former year temporarily, and in the latter hereditarily.

rily, to John Murray of Falahill. In 1748, John Murray of Philiphaugh, the descendant of Murray of Falahill, received as compensation £4,000; and, in that year, of a million greedy and rahid pretensions, the Duke of Douglas claimed £2,000 for the regality of Selkirk, and £34,000 for the whole of his jurisdictions, but was compensated, in toto, with £5,104 5s. 1d. The sheriffship, under the new regime, was held first by Charles Campbell of Monzie, and for many years, as every body knows, by our great national novelist, Sir Walter Scott. Such civil history as belongs to the county will be found in the articles **ETTRICK-FOREST**, **SELKIRK**, **PHILIPHAUGH**, and **ROXBURGH-CASTLE**.

**SELLAY**, a pasture island, in the Harris district of Long Island, about 2½ miles in circumference; 1¼ mile north of Pabba, and 3¾ miles north-west of Cape Difficulty. On its south-west side lies an islet called Little Sella.

**SELLER-HEAD**, a promontory on the east coast of Lewis; 8 miles south-south-east of the Butt of Lewis, and 17 miles north-north-east of Stornoway.

**SENWICK**, originally **SANDWICK**, an ancient vicarage, now comprehended in the parish of Borgue, 3½ miles south-south-west from Kirkcudbright. According to tradition, this church, which formerly contained a very considerable quantity of plate, was plundered by French pirates, who safely escaped with their booty; but a storm arising immediately after they had put to sea, the ship was dashed upon a rock, at a little distance from the shore, opposite to the church, and every person on board perished. In memory of this event, the rock has ever since been styled, The Frenchmen's Rock.

**SERDGOIN**. See **FENWICK**.

**SERESORT (LOCH)**. See **RUM**.

**SERF'S (ST.) ISLE**, an islet in Loch-Leven, Kinross-shire. See **PORTMOAK**.

**SERIDON (LOCH)**, an indentation of the sea on the west coast of Mull. It runs up between the Ross-of-Mull and the district of Grihon; and measures 9 miles in length, and nearly 1½ mile in mean breadth.

**SERPENT RIVER**, a romantic little stream in the parish of Kilmalie, Lochaber, Inverness-shire. It falls into the head of Loch-Leven, and is noted for being in a measure subterranean below a cascade, and immediately above its embouchure.

**SETON**. See **SEATON**.

**SHAGGIE (THE)**, a rivulet in the parish of Monzie; which see.

**SHAINT**. See **SHIANT**.

**SHALLAIN**. See **LOCH-GARRY**.

**SHANDWICK**. See **NIGG**.

**SHAPINSHAY**, an island and parish in Orkney. It lies 1½ mile north of Carness-point in the united parish of Kirkwall and St. Ola; 2½ miles east of Rendall parish; 3¼ south of the island of Eday; and 4¼ west of the most southerly part of Stronsay. It extends nearly 5 miles from east to west, and about 4¼ from north to south; but is sweepingly indented on the north side by a large hay called Viantro, and has several small indentations on its south side. On the shores, and over a considerable distance inland, the surface is low, tolerably level, and disposed in rich fields of grass and corn; but toward the centre, it gradually rises, and becomes, to a great extent, barren waste or ill-improved sheep-walk. The soil, though, in most places, thin and shallow, is naturally fertile. The southern district, in consequence of improvements introduced and conducted by the late Colonel Balfour and his son, enjoys enclosures and modes of cultivation, maintains breeds of cattle, and presents an orderly and almost ornate appearance, superior to those of most districts in Orkney. A

village rose under the fostering care of the same improvers, and draws out its houses around the fine bay of Ellwick. This bay opens toward Kirkwall; and, sheltered across the entrance by the green islet of Ellerholm, it forms almost as fine a natural harbour as any in Orkney. It has from four to six fathoms of water over a bottom of hard clay covered with sand; and on the west side of it is a fine beach, with abundance of excellent fresh-water. Only a few years after the village was built, the proprietor had 4 brigs and 4 sloops engaged in the general trade of the country, and the inhabitants had about 80 boats, employed chiefly in fishing. A bed of limestone occurs near How, and has long been profitably worked. Lead mines, paying a rent of £500 a-year, were commenced some time last century, and conducted for a short period with spirit; but, for some cause which we do not find very clearly stated, they were hopelessly abandoned. Picts' houses, situated for the most part on selectly pleasant spots, are numerous along the shores, and usually lift their large ruins and conical heads at such intervals that two or three are within view of each other. The standing-stone of Shapinshay, situated near the centre of the island, and standing erect 12 feet above the surface of the ground,—and the black stone of Odin, a huge mass of rock lying prostrate on the sand of the northern shore,—are both supposed to have been sacred objects in the rites of Scandinavian superstition. A place called Grucula, on the west coast, nearly opposite the skerry of Vasa, where the tides are rapid and the sea is shallow, is traditionally said to have received its name from the stranding upon it of one of the ships of Agricola, in the celebrated voyage of discovery round the northern seas of Britain. A ward hill in the centre of the island, and on its highest ground, commands a map-like view of the whole or part of 15 parishes. The principal landowners are Captain Balfour and Mr. Laing; the former of whom resides on the island. Population, in 1801, 744; in 1831, 809. Houses 157. Assessed property, in 1815, £142.—Shapinshay, as a parish, is in the presbytery of North Isles, and synod of Orkney. Patron, the Earl of Zetland. Stipend £158 6s. 8d.; glebe £28. There is on the island an United Secession meeting-house. There are two schools,—the one parochial, and the other private. Parochial schoolmaster's salary £25 13s. 3d., with £4 10s. fees.

**SHEE (THE)**, a small river in the extreme north-east of Perthshire. It commences at the Spittal of Glenshee, 5½ miles south-south-west of the point where the counties of Perth, Forfar, and Aberdeen meet; and is there formed by the confluence of a small stream called the Beg or 'Little,' with the united waters of the streamlets Lochty and Tatnich. It runs 3 miles south-eastward, and 9 southward to Rochalzie; and there unites with the Ardlie to form the Ericht. Its head-waters, and rather more than a third of its course, are in the parish of Kirk-michael, and it afterwards has that parish, part of Caputh, and the whole of Bendochy on its right bank, and 2 miles of Forfarshire and parts of Ratray, Alyth, and Blairgowrie on its left. Over most of its course it is strictly and even wildly a Highland stream.

**SHEEP'S ISLE**, a small Hebridean island, about a mile west of the north-west side of Seil, and 4¼ miles south of Kerrera. It measures scarcely a mile in circumference, and has an abrupt rocky boundary of low cliffs. The islet forms geognostically a connecting link between Mull on the one hand, and Seil and Kerrera on the other. Its name of Sheep's Isle is a fictitious one, given it by chorographers; and its real name is Inis-Capel, which the same chorographers have, in the translated form of Mare-

Island, erroneously applied to the Garvelach islands, 5 miles to the south-west.

SHERIFFMUIR, the name of various localities in Scotland, imposed on them on account of their having been the plains or moors on which the weapon-shaws, or feats of arms of the Middle ages, were performed under inspection of the sheriffs. The Sheriffmuir most known is one in the parish of Dunblane, at the north base of the Ochils, the scene of a sanguinary though indecisive action during the rebellion of 1715: See DUNBLANE.

#### SHETLAND, or ZETLAND ISLES,

A group of islands, islets, and rocks, constituting the most northerly land in Scotland, and situated in the Northern ocean, north-north-east of the Mainland and of the Orkney Isles. They form the barrier of the British dominions on the north, and are comprehended in the shire of Orkney. They lie, in general terms, and measured to their nearest coast, 15 leagues north-north-east of Orkney; 47 leagues north of Buchanness; and 44 leagues west of Bergen in Norway, the nearest point of Continental Europe. Two of the islands, called Fair Isle and Foula, or Fowla, lie respectively about 20 miles south-south-west, and 17 miles west by south of the most contiguous parts of the Mainland of Shetland. The other islands form a compact group, and lie between  $59^{\circ} 48' 30''$ , and  $60^{\circ} 52'$  north latitude; and between  $52'$  and  $1^{\circ} 57'$  longitude west from Greenwich. In general appearance they have a more rugged and mountainous interior, and more hold, precipitous, jagged, and sharply indented coast-lines, than even the naked and sea-worn Orkneys. Invasions of the sea, bays, and inlets of all forms and moderate sizes make the most whimsical inroads upon the land, and cut the islands into series of the most curiously shaped peninsulæ. These bays generally bear the name of voes, sometimes that of friths, and sometimes that of wicks; they are upwards of 50 in number; they, in some instances, measure several miles in length; and they almost all afford safe anchorage for ships of great burden. The helts of navigable sea which separate island from island are denominated sounds. Upwards of 30 islands are inhabited, though in several instances only by a few individuals; about 70 are grazing islets, called holms, which afford herbage for cattle or sheep, but offer no shelter or sustenance to man; and a great but unascertained number are skerries or rocks, mere sea-washed and naked stone, totally destitute of vegetation for the support of live stock. Mainland alone possesses about half the area, and more than half the population of the entire group; but it is so often and deeply peninsulated by the sea, as to be economically though not geographically a series of islands; it has an irregularity of outline as wild and wayward as can well be conceived; it stretches away due north in a long, narrow, tattered belt of land which sends out torn and shivered expansions about the middle; and while possessing a mean breadth of from 2 to 7 miles; it contracts at the isthmus called Mavis-Grind, to less than 100 yards, and even there, is in a great measure conquered by spring-tides of the sea. Yell, the island next in size, lies from 2 to 4 miles north-east of Mainland; it is separated by Yell-sound,—a band of sea powdered with holms and skerries; it possesses no very high land; and, while deeply indented with four or five voes, it is otherwise pretty regular in outline. Unst, the third in size, contains much valuable arable land, as well as excellent hill-pasture, and lies about 2 miles north-north-east of Yell. Fetlar, akin in character to Unst, but containing considerable tracts of hilly country, lies west of

Yell, and south of Unst, between 3 and 4 miles from each. Whalsey, surrounded with a cordon of dangerous islets, is situated from 2 to 3 miles east of Mainland, at a point a little north of its middle. Bressay, a comparatively lively island, of considerable fertility, and presenting in summer a pleasant appearance as seen from Lerwick, lies on the east of Mainland, several miles south of its middle, and so near and hookedly as almost to render landlocked the intervening sound, and make it the excellent harbour well-known to all mariners who frequent the northern seas as Lerwick harbour or Bressay sound. Papa-Stour, a delightful little island, with a large comparative extent of arable land, lies about 2 miles from the most westerly point of Mainland,—a promontory about the middle of the western coast. The two islands of East and West Barra, fructiferous in grain, form two belts of land extending north and south, and separated from each other by a very narrow long sound, which is navigable from end to end only by boats; they lie off the west coast of Mainland, a little south of the latitude of Lerwick, and are separated from it by Cliff-sound, from  $1\frac{1}{2}$  mile to 2 miles broad; and they communicate with each other by a wooden-bridge across the narrow channel which divides them. Trondra-house, and some other islets, lie in the vicinity. Foula, or Fowla, the ultima Thule of the ancients, the most precipitous hill-ground in the Shetlands, destitute of any harbour for shipping, and possessing only one landing-place for boats, is solitarily situated about 17 miles west-south-west of Watness, the nearest point of Mainland. Fair Isle, rising into three lofty promontories, and everywhere inaccessible except at one point, lies upwards of 20 miles south-south-west of the southern extremity of Mainland; and though politically included in Shetland, geographically holds a medium, or half-way place, between that group and Orkney. The other islands are too inconsiderable to require mention of their relative position.

The coasts of Shetland are rocky and unequal, and the hills, which overhang them, bleak and mossy. By the action of the sea upon the mass of rocks which has been shivered down into islets and skerries, scenery of a jointly novel and sublime description has been formed. Rocks of immense size everywhere rise sheer up from the water, and tower aloft in pinnacles or little table-lands, often at a great distance from any land; some are perforated by magnificent arches of great magnitude and regularity,—some have deep caverns and subterranean recesses,—others are cleft in two nearly to the bottom,—and others shoot piercingly up into acuminated tops, and present an endless variety of form and appearance. The coasts and the environing islets of Papa-Stour are profusely holed with large and romantic caverns. A lofty and vast insulated rock on its east is perforated from side to side with a gigantic marine tunnel; it lets through irregular rents from its summit straggling streams of light, which aid the tortuosities and intricacies of the gloomy boat-navigation; and just where the light is direct enough to seem like a revelation to a wrecked and dark world, a yawning and vaulted recess goes aside from the tunnel, and reverberates in low and distant murmurs, or with a hoarse and sullen splash, the ripple of the tide's waves, and the sound of the visiting boatman's oars. Lyra, Skerry, Fulgæ Skerry, and other rocky islets, and huge detached blocks, on the north-west of the island, rise steeply and toweringly up from the waves; and, while striped along their summits with deep verdure, present, in their perpendicular sides, such series of dark and vaulted entrances into caverns as resemble the tiers of sepulchral arches along the side of a large Gothic

crypt. On the west side of the peninsula of Northmaven in Mainland, a succession of high and precipitous rocks withstand the whole shock of the Atlantic; and about 250 feet direct inland from their brink, are two immense perforations from the surface downward, called the Holes of Scraada, separated from each other by a solid mass of grass-covered rock, but communicating with the sea by stupendous cavernous-tunnels leading out at the front of the cliff, and, in the case of one of them, bringing up the tide to the extremity of the perforation in a violence of roar and tumult which almost threatens to tear down the walls of wondrously invaded rock. Doreholm, in a spacious bay a little to the south, springs aloft from the water in a stupendous natural arch 70 feet high. Most of the west coast of the islet of Mickle-Roe is bored into a series of sinuous and many-shaped caves, possessing not a little beauty and grandeur. At Burrarfirth in Unst, a sublime natural arch opens the way to a tunnel or elongated cavern, which carries boat-navigation 300 feet into the bowels of the earth. The islet or holm of Eaglesbay, in the parish of Northmaven, is, to a great depth, cut sheer down into two parts by a perpendicular fissure formed in the effluxion of many ages by the disintegration of a soft vein of greenstone. The Noss—an islet 500 feet long, and 170 broad, situated immediately east of Bressay—rises sheer up 160 feet from the surface of the sea, has a flat summit finely carpeted with verdant sward, and is girt completely round by perpendicular walls of rock; yet it maintains communication with the coast of Bressay by means of strong ropes stretched across the intervening chasm, and of a cradle or wooden chair, run along the ropes, and capacious enough to convey a man holding a sheep upon his knees.—The phenomena and the awful grandeur of coast-scenes in a storm, strictly resemble those of Orkney, or probably surpass them in the ratio of the greater sternness of resistance offered by the bold cliffs to the careering waves: See ORKNEY.—While a wild grandeur, and the romantic beauties of simple nature constitute greatly the prevailing attractions of Shetland, spots of cultivated retirement, and scenes of mingled softness and sublimity, such as blend the amenities of landscape with its magnificence and its menaces, are not altogether unknown. The view down Wiesdale voe, on a fine evening in summer, from the house of Mr. Ross of Sound, among the islets to the southward, is of no mean description for either beauty or variety; and, could part of the lands on each side of the voe, and some of the islands be clothed with trees, it would be unsurpassed by few scenes in even the most picturesque countries. About half-a-mile from the beach of the almost landlocked and richly margined bay of Balta, a commanding view is obtained of the northern ocean across a foreground of well-cultivated land; so that the serenity of fields and villages, and of what seems a nearly unruffled lake, is contemplated in combination with the tempestuous motion of a stormy sea. From the cavernous and wondrous coast at the Holes of Scraada, verdant plains of several miles in extent, and bearing the name of the Villens of Ure, stretch away into the interior; and from the lofty cliffs which overhang the sea, and command the 'Holes'—a scene quite gorgeous is beheld amidst the burnishings of a calm and sunny summer evening,—the western ocean swelling on in gentle undulations toward the land,—the fishing-boats almost disappearing on its distant waves,—the wild screams and bold gyrations of the sea-fowl among the rocks,—the verdure of the broad expanse of fields,—and the yawning and awful gulphs of Scraada immediately under the eye, unite to produce

a compound of emotions singular for both its elements and its strength. Dunrossness also presents many beautiful examples of interesting contrast in scenic grouping, and contains some fields which would not suffer by a comparison with almost any in Mid-Lothian. Of numerous hills which diversify the face of the country, and traverse it in all directions, Rona's-hill, or Mons Ronaldi, the highest, is situated in the parish of Northmaven, and commands a very varied and extensive prospect, bringing up to the spectator an excellent conception of the thousand ramifications and intersections which occur between sea and land. Fitful-head, at the southern extremity of the country, is a hold and extensive rock, and can be seen at a great distance by vessels approaching Shetland from the south-west. The cliffs of the island of Fowla often literally lose themselves in the clouds; they usually appear of a dark-blue colour; and they are sometimes encinctured with a bank of clouds, and send up their central peak distinctly above the highest wreaths.

The climate of Shetland, though by no means generally insalubrious, is very variable and humid. Spring can hardly ever be said to commence till toward the end of April; and little genial warmth is felt before the middle of June. The summer sometimes continues through September, but generally terminates with August. Autumn, four years in five, is very uncertain in its weather; and it almost never extends beyond the middle of October. Winter, in a style of character much more hybernal than is known in the Lowlands of continental Scotland, holds undisputed dominion during at least five months in the year. Winds from the north and east are characterized by a colder, but at the same time more settled, weather than winds from the south and west; and they prevail during the months of February and March. Heavy gales from the west and north-west occur in September, and often destroy much of the crop in a single night. Fogs prevail greatly in May and June. Mild weather is prevalent throughout October. But when that month ends, and during the three months which follow, gales from the most opposite points spring up in the space of a few hours, and chase one another in rapid succession, bringing down in their careerings saturating loads of rain and snow. Though keen frost, dry or snowy, has been known to continue two months without the occurrence of a thaw, snow is seldom observed to lie long at a time. While vicissitudes of temperature are at all seasons rapid, cold is seldom or never intense, and has rarely been observed to descend more than 10° below the freezing point, or to continue long at that depression. But the same insular influences which mitigate the frigidity of winter modify the geniality of summer; and while the medium temperature of the winter months may be estimated at 38°, that of the summer months cannot be estimated higher than 65°.—On the shortest day, the sun rises at 17½ minutes past 9, and sets at 42½ minutes past 2; so that he is 5 hours and 25 minutes above the horizon. The long winter nights are, to a certain extent, cheered by the brilliance of moonlight and the fitful and often beautiful coruscations of the aurora borealis; yet, almost constantly rioted over by the stormy and conflicting elements, they would, to any person but a hyperborean, appear exceedingly gloomy. But what winter wants in cheerfulness is amply compensated by the continuous light and the brilliance of summer. The nights, early in May, begin to be very short; and, from the middle of that month till the end of July, they have a blending of twilight during the brief period of the sun's absence, and are virtually transmuted into day. Nothing of its kind can surpass the calm serenity of

a fine summer night in Shetland. The atmosphere is so clear as to allow the eye an uncontrolled and extensive range; the hills and the headlands look more majestic than during the blaze of day, and have a solemnity superadded to their grandeur; the water in the voes and sounds appears dark, and as smooth as glass; no living creature, except a solitary gull skimming the surface of the sea, interrupts the tranquillity of the scene; and no sound, except the distant murmuring of the waves among the rocks, disturbs the reign of utter silence.

Near as the most inland part of the islands is to the main sea, or some one of its vastly numerous belts and indentations, not a few pleasant rills trot down the hill-sides of Shetland, and diffuse verdure and liveliness in meandering courses athwart the fields. Many of the streamlets are liable to be so much swollen by rain as, for a time, to become hardly passable; some of them, especially near the sea, abound in large fine trouts; and, though they aggregately descend from a considerable height, they are regular in movement, and in no instance form a cascade of more than a few feet high. Fresh-water lakes are also numerous, and large enough to contribute to cheerfulness and recreation. Four occur in the parish of Lerwick; one near Tingwall church; one or two in Unst; one near the manse in Fetlar; and several in Yell. None exceed 2 miles in length; some are interspersed with little islets; and all are stored with eels, several have abundance of trout, and those that communicate directly with the sea have large flounders. A chalybeate spring, generally believed to possess good medicinal properties, occurs in the vicinity of Lerwick.—The currents among the different islands are extremely rapid, and run in every direction; and those of the greatest extent and power occur at the northern and southern extremities of the country. Even in the calmest day, the agitation of the sea, in the course of the tide, off Seaw and Sumburgh-head, resembles that produced by a storm, and, as contrasted to the smooth surface at a brief distance, presents a very striking phenomenon.

Wernerian primitive rocks compose most of the inland and northern districts of Shetland; and they form the hulkier part of hills, and serve as a basis on which the fletz rocks recline. Granite is of comparatively rare occurrence. Gneiss is frequent; and, as it exists here, does not seem to be metalliferous. Mica-schist is the most common of the primitive rocks; and, when sufficiently quartose, it long furnished material for an export trade in millstones, and even yet supplies material for local use. Clay slate forms extensive strata in cliff hills, and elsewhere is observable in small quantities; but it presents no beds which could be advantageously quarried into roofing-slate. Hornblende slate and granular hornblende rock occur chiefly in Unst, Fetlar, and Hillswick; and, owing to its blackness of colour and fineness of grain, has frequently been mistaken for bituminous coal or its accompanying shales. Drawing slate, holding an intermediate rank between black chalk and glossy alum slate, occurs along with the hornblende rocks, and like them has been mistaken for coal, in Unst and Fetlar. Serpentine forms hills of considerable height in Unst and Fetlar; it acquires, when exposed for some time to the air, a reddish brown coloured crust, and, on that account, has been mistakenly reported as ironstone; it forms an excellent material for the construction of unmortared walls; it powerfully resists the action of fire, and has been successfully used in the building of ovens; and it affords specimens of sufficient variegation and density and susceptibility of polish to be converted into trinkets. Primitive limestone

everywhere abounds; it usually has a bluish colour, and takes a granular fracture; it admits a good polish, and might be used as marble; and, when burnt, it yields a very pure and excellent lime.—A perpendicular vein of common iron pyrites, nearly 30 feet broad, traverses the mica-schist in the parish of Dunrossness, and occurs in small veins in other localities. Magnetic ironstone exists in thin beds in the mica-schist of Hillswickness, and in small veins in the serpentine of Unst. Micaceous iron-ore, containing from 70 to 80 per cent. of iron, traverses the mica-schist in small veins at Hillswick, and occurs in a vein several yards thick on the north side of Fitful-head. Garnets of considerable size and beauty are in various places often found enclosed in the mica-schist.—Fletz rocks, on the east side of Shetland, commence at Rova head, and extend southward along the coast to Quendale, including the islands Bressay, Mousay, and Fair isle; but are frequently uncontinuous, and allow the primitive rocks to hold entire possession; and, on the west, they form the greater part of the parishes of Walls, Sandness, Papa-Stour, and Fowla, the promontory between Ronasvoe and Hillswick, and the detached rocks called Ramna-stacks. The strata are usually much inclined to the horizon, and, in some instances, are almost vertical. Sandstone is either laminated, and affords supplies of flags and slates; or massive, compact, and finely granular, and constitutes a good building material; or, more generally, a conglomerate, whose basis consists of coarse yet small grains of felspar and quartz with scarcely any visible cement, whose enclosed substances are large rounded masses of granite, gneiss, mica-schist, and quartz, and whose adaptations to purposes of utility are in consequence limited and of slender value. Slate-clay, though not common, affords slabs which are used as whetstones, and thin plates which serve as an inferior kind of writing slate. Bituminous shale is observed in Bressay and Fowla, and occurs in the latter in company with thin beds of clay ironstone. Secondary limestones are rendered uninteresting by the mountain limestone; and are less pure, and not so crystalline. Other rocks, but of little practical importance, are greenstone, porphyry, amygdaloid, claystone, and compact felspar.—A vein of copper-ore, nearly 14 feet thick, traverses a reddish-coloured argillaceous sandstone at Sandlodge, near Sumburgh-head, and has repeatedly been worked; and another occurs in a mural precipice of sandstone, upwards of 300 feet high, north of Naversgill, in Fair Isle. The Sandlodge vein, near the surface, has copper-pyrites much mixed with hemalite; and about 40 fathoms down has that ore disseminated in sparry ironstone, along with iron-pyrites; it contains small quantities of native copper and grey copper-ore; it possesses abundance of fibrous malachite in the cavities of other ores, or in the form of a surface-coating; and it contains a great proportion of iron ores, particularly brown hemalite. Small veins of hemalitic iron-ore are situated in a bed of amygdaloid on the south side of Papa-Stour. Bog iron-ore occurs in almost every moss and moor in the country.—Beds of sandy clay, much used as mortar in house-building, are found in several places under the soil, or covered with peat-moss. Porcelain clay, formed by the decomposition of gneiss, and bearing locally the name of Fuller's earth, but neither great in quantity nor very pure in quality, is found at Lambogga in Fetlar, and in a glen near Weisdale. Peat-moss, such as affords the inhabitants a constant and plentiful supply of fuel, and varying from a few inches to nearly 12 feet in thickness, not only occurs in pretty extensive beds in the low grounds and valleys, but also covers some of the loftier hills. Shell-marl, though

existing in a bed of considerable extent in the vale of Tingwall, is by no means common throughout the country; but, in consequence of the abundance, the general diffusion and the purity of limestone, it has never been desiderated. Sandflood, or blowing sand, has converted into a scene of matchless sterility whole tracts of land in the neighbourhood of the Quendal-hay which were formerly cultivated and fertile; and, in other localities, but happily within confined limits, it has displayed its desolating power, and sternly admonished proprietors what they may expect from carelessness in the supervision of their lands.—The soils of Shetland are in general light and gravelly, and seem well-adapted for the rearing of green crops. They frequently are much mixed with moss earth, and acquire from it a blackness of colour. The decomposition of limestone rock, occupying the place of a substratum, has imparted fertility to the soils of the isle of Barra, and the vale of Tingwall and Whittness; and a pulverization of felspar from trap and primitive rocks has given considerable fertility to Papa-Stour and Eshaness.

The lands of Shetland are distributed into about twenty comparatively large, and a considerable number of comparatively small estates. The Earl of Zetland's personal entailed estate is extensive; but loses much of its value from being dispersed throughout the country in detached portions. Lands were originally allodial, and descended or were transmitted without any form of written investiture; they afterwards became transmissible only by a simple bill of sale; and they are now generally held by charter from the Crown, or from the Earl of Zetland as the Crown's donee. About 2,000 merks are feued from the Crown or the Earl of Zetland for the full original rent, excepting eightpence sterling per merk of land.—The merks into which all enclosed land is divided ought, it is said, to consist each of 1,600 square fathoms; but they are everywhere of such unequal dimensions, that hardly any two can be found of the same size. The total number of merks stated in the oldest rentals is about 13,500; an additional number of 6,000 or 7,000 was added during the effluxion of ages till the year 1808, by enclosing and cultivating portions of common, but was not included in the enumeration of merks of rental land; and probably about the same number has, principally through the influence of the Shetland Agricultural Society, directed to the enclosure of commons, been added during the last 33 years. The aggregate extent of enclosed and improved land, including in the estimate both arable and meadow ground, may therefore amount at present to 26,000 or 27,000 merks, or nearly the ninth part of the entire surface of the country. The enclosures generally come close upon the sea-board, and stretch away thence toward the moors on the hills. Each enclosure contains from 4 to 70 merks; it frequently belongs to different heritors, and is always subdivided among several tenants; and it is called a town or a room, and bears, in addition, a distinctive name. The uncultivated ground outside of the enclosure is called the Scatthold; it offers an unrestricted extent of common pasturage to the sheep, cattle, and horses of each tenant of the town; and, if it contain peat-moss, it supplies the tenants, to whatever amount they severally please, with peat-fuel. A tenant of a town whose scatthold has no peat-moss must purchase the privilege of cutting peat on some other common, and pay for it what is called a hogalif, a sum which seldom exceeds three shillings a-year. The kelp-shores and the pasture-islands are usually retained in proprietors' own hands, and seldom or never let to a tenant along with other land. Farm-houses, in some places, par-

ticularly in Unst, are provided and kept in repair solely by the landowner; and in other parts they are maintained jointly by him and the tenant. The extent of land farmed by a tenant varies from 3 to 12 merks, and occasionally includes more; but may be regarded as averaging only 5. About 30 years ago, leases for a great number of years were scarcely known, and for any period whatever, or in a regular form, were comparatively rare; but now, since the influence of the Agricultural Society has been felt, and a certain amount of importation of the agricultural spirit and practices of the Scottish continent has been effected, they begin to be not uncommon, and may without difficulty be procured. Yet in the great majority of cases even to the present period, a tenant can see no advantage in having a lease, and simply makes a verbal agreement to occupy a farm under specified conditions for one year, or more, and regards himself, when the time expires, as having no further claim upon the land, and as perfectly at liberty to make a new engagement. But whether he rents merely from year to year, or in periods of three or five years, his landlord, unless at the expense of violating what most of the Shetland heritors regard as a point of honour, and what public opinion vigilantly protects as an understood and virtual right, will not raise his rent, or refuse to renew his possession, except for culpable insolvency or serious misdemeanour. Farms, therefore, which have never once been in leasehold, continue, in numerous instances, to be tenanted by several generations of the same family. The Shetlander, quite contrary to the representations which have currently been made of his condition, as if he were destitute of every advantage possessed by farmers on the Scottish continent, thus enjoys nearly all the benefits of a lease, in combination with an unrestrained liberty to remove at brief intervals.—Rents are now, in greatly the majority of instances, paid wholly in money, but continue, in few but increasing instances, to be paid, as they almost all were till about 20 or 30 years ago, partly in labour and in various articles of country produce, such as butter, fish, and oil; and they vary in amount according as the tenant has the exclusive disposal of his labour, or agrees to fish for his landholder, and to deliver to him, at a fixed low price, all the produce which he can bring to market. The merks are divided into different classes, called sixpenny, ninepenny, and tweldepenny merks, to designate differences in the rents corresponding to the size and produce. But the distinctions, though originally founded on real differences, are now to a great extent practically inaccurate; a sixpenny merk being sometimes as large and productive as a tweldepenny one. In 1808, a merk of sixpenny land was estimated to yield, in value of real rental, 10 shillings a-year; and a ninepenny and a tweldepenny merk respectively 15 and 20 shillings. A tenant paying partly in labour, and obliging himself to dispose of the surplus produce of his farm and fishings to his landlord, formerly paid only about one-half of the estimated rent expected from one who paid wholly in money; but now he usually pays at the same rate as one of the other class, and, in return, receives the full market-price for his labour and commodities. The peculiarities in the mutual relation between the Shetland landlord and tenant have been so generally and grossly misunderstood, and have been so instructively developed by some recent and little-known occurrences, that some passages respecting them in Dr. Edmondston's General Observations on Shetland, just published in the New Statistical Account, must be interesting to most readers. After noticing how mischievous to the moral and social habits of the Shetlanders is the practice of their serving an-

nually in the Greenland whale-ships, how justly and uniformly the practice has been reprobated by the more sagacious of the landholders, and how attempts on their part to impose upon it a salutary restraint have been stigmatized as arbitrary oppression, Dr. Edmondston says: "This is only one instance, however, amongst many, in which Shetland proprietors have been cruelly traduced as the tyrants of their tenants, unable to appreciate either their rights or their capabilities, or the interests and duties of their own position. It was formerly a common practice, which is still followed in some districts, for the tenant to give his landlord a few days' work every year: this was mutually beneficial, and, in a country where regular daily labourers, as a class, are hardly to be found, was necessary. These days' work eventually formed part of the rent, and thus in reality were hired labour. Yet this, too, has often been railed against as unjust exaction, as if a Shetland cottar were above the sphere of day labour, or as if he might practise it for the benefit of any one except his landlord." Dr. E. states, that crude declamation against the proprietors rendered the tenants discontented with their situation, and forced on a change in the ancient relation between them and their landlords, which he asserts to have been the remote yet general and efficient cause of a destitution which prevailed, during four years preceding 1840, in the local supply of provisions. The Earl of Zetland, then Lord Dundas, obtained parliamentary leave, a few years ago, to dispose of his feus and other burdens on the Crown-lands; and these have since been almost all bought up by the Shetland heritors. Various peculiar burdens, the chief of which were scat, wattle, sheep-penny, and ox-penny, occasioned, till a recent date, not a little vexation, but are now consolidated into one due, which varies from 4d. to 1s. 6d. per merk. *Scat* is supposed to be a land-tax formerly payable to the Crown of Norway; and, by a decision of the court-of-session in 1829, was converted into a feu, and rendered exigible, not only as before from lands in tillage, but also from lands not in cultivation. *Wattle* was originally a contribution, in Popish times, to an emissary of the Bishop of Orkney and Shetland, a woman of great pretensions to ascetic sanctity, who promised her dupes temporal abundance in compensation of their small gratuity; and, being detected by the Earls of Orkney to have become a regular payment to her, it was introduced to their rentals, and has ever since been exacted. The *ox* and *sheep-penny* is variously said to have originally been an imposition of Earl Patrick Stewart, for maintaining his workmen while building the castle of Scalloway, and a voluntary contribution made to the Earl of Bothwell when he touched at Shetland on his flight to Norway. The teinds are represented as a severe burden upon occupiers of land, and are distributed into such kinds, and exacted in such forms, as to press heavily upon industry; and, while the peculiar burdens were fully exigible, the two classes of imposts would, but for the profits of the fisheries, have, at an early period, occasioned a great part of the lands to be relinquished as worse than a mere nominal possession, and to fall into the hands of the superior.

Agriculture, though in some places improved, is, on the whole, in a miserable and semi-harbarous condition. Except in the culture of potatoes, and a few patches of turnips, summer-fallow, though much needed, continues to be very little known. Many of the best arable lands have been annually manured, and cropped with either hear or oats for half-a-century, without either enjoying a single year's repose, or once producing a different kind of crop. The inferior or outfield grounds, less fertile in soil, are al-

ternately scoured out of heart, and abandoned to re-acquire their feeble energies. Over a very large part of the country a suitable or systematic rotation, the turnip husbandry, the cleaning of land under crop, the construction of drains, the amelioration of soils, and all the rudimental or more common refinements of modern agriculture, are almost as completely unknown as in the 16th century. Rotation of any sort, in places where the idea is conceived and acted on, usually consists of bear, potatoes, oats, ley, and oats,—the ley or fourth year crop, however, being sometimes detrimentally omitted. Potatoes are much more extensively cultivated than before, and have come so much into favour as seriously, perhaps menacingly, to curtail the amount of cereal produce. Oats are usually allowed to become witheringly ripe before they are cut, and, in consequence, are often ruinously shaken by the high autumnal winds. "It may be affirmed," says Dr. Edmondston, "that if the principal cereal crop had been bear, or if the oats had been sooner cut, the better half of the corn crop of the last four years" of scarcity "might have been saved." The manure generally used is a mixture of sea-weed, farm-yard dung, peat-ashes, and mould; and it operates so well that, in spite of the maltreatment of the soil, and the unrepressed growth of weeds, the crops, in average seasons, are good. Field turnips have, on a small scale, been recently introduced. The common close cabbage is grown on poor soil, manured only with peat-ashes, and in small circular enclosures of about 40 or 50 feet in circumference. —The Shetland plough has only one stilt, with a double-feathered sock; it is drawn by four oxen yoked a-breast, the driver walking backward, and the ploughman walking by the side of the implement; and is so light that it can easily be carried by one man, and is utterly incapable of making, in any kind of soil, what would be considered good work. But this ill-constructed and uneconomical instrument is now rather an object of antiquarian curiosity than of actual use. The common Scotch plough is generally in favour with such farmers as have extensive enough farms to employ it, and probably is kept from general adoption only by the minutely-divided state of the arable lands. The ancient, light, long-shafted Shetland spade, with a blade greatly narrower than the common garden-spade of Scotland, and having a projecting piece of wood to receive the pressure of the foot, is employed in turning over greatly the larger proportion, probably nine-tenths of the whole arable land; and is found to be well-adapted to the character of the soil, the ruggedness of the surface, and the very limited extent of most of the farms. Three or four persons generally dig in company; and, in the course of a day, they perform much more work than a stranger would think practicable. A few wains belonging to landed proprietors, and drawn by oxen, are the only wheel-carriages; and, owing to the want of roads, and the ruggedness or swampiness of the surface, even they, in many places, cannot advantageously, or at all be employed. Ponies with pack-saddles, carry most of the small amount of produce which requires land transport; and the multitudinous intersections of the country in all directions by friths and voes, practically affords natural inland navigation to within probably  $\frac{1}{4}$  of a mile of nineteen-twentieths of all the arable ground. Dr. Edmondston suggests that the employment of small steam-boats, using peats for fuel, might, for some time to come, be a fair substitute for all desiderated facilities of general transport. Such water-mills as exist, are of a very ancient and simple construction; they have no wheel, and possess, as a substitute, a wooden perpendicular cylinder, about 4 feet long,

provided with floats, and sending up an iron spindle through a hole in the under millstone to a firm fixture in the upper one; they are so diminutive as seldom to have millstones of more than from 30 to 36 inches in diameter; and, as to their masonry, they are mere low sheds of unlewn stones, stretching across the slender hills of the country. Hand-mills or querns are still to be found in most of the farm cottages, apparently differing in their construction little or nothing from such as, in ancient times, were generally used over the civilized world, and continue to be occasionally dug up in continental Scotland as rare antiquities. The grinder, generally a female, seizes a handle which is fixed on the surface, and near the edge of the upper stone, and briskly drives the stone with a rotatory and horizontal motion, all the while pouring in with the left hand a supply of corn through a hole in the centre. The centrifugal force causes the meal to fly outwards, and to drop from between the stones on the table, at every point of the circumference; and a contrivance, called "a lightening tree," exists for raising or depressing the upper stone as to grind the meal of coarser or of finer grain at pleasure.

The cattle, sheep, swine, and horses of Shetland, are of races now almost peculiar to the country; and possessing not a little hardiness, and other properties of adaptation to the climate and soil. The cattle, in point of shape, is probably equal or superior to any of the native Scottish breeds, except the West Highland. The cow is small,—the four quarters of a fattened one seldom weighing more than two cwt.; and she yields excellent milk, though usually to the amount of only from 3 to 6 imperial quarts in the day. Both summer and winter the cows are kept every night in the house, and littered with heath or peat-dust. The farmers make a considerable quantity of butter, though chiefly of inferior quality; but they make little cheese, and, in many instances, know not how to manufacture it. The ox is nearly one-third heavier than the cow, and is active, gentle, docile, and better adapted to the yoke, in the present state of the country, than the horse. Though both ox and cow are usually about 15 years old before being fattened for the knife, their beef is tender and highly flavoured. The pasture-isles or holms, which, from being uninhabited, have escaped the paring of their surface for manure to the arable lands, and, in general, produce a fine succulent pasture, are almost the only places where cattle will properly fatten, and they soon impart substance and plumpness to the lean and meagre victims of a previous scanty allowance. The cattle of Papa-Steour appear to be a different breed from the prevailing one of the other islands; they are larger and not so well-shaped, and seem to be descended from the short-horned breed of the South of Scotland.—The Shetland sheep are the *oves cauda brevi* of naturalists, and resemble in form, fleetness, and agility, the argali or wild sheep of Siberia. They are common to Norway, Sweden, and European Russia; and, till 70 years ago, were the chief breed of the Hebrides and the interior Scottish Highlands. They are small in size; seldom or but slightly horned; short in face, back, and tail; erect and pointed in the ear; long in the legs, and fine boned; variously white, grey, black, dunnish-brown, piebald, streaked and speckled in colour; and naturally wild, hardy, agile, and little liable to disease. The Shetland horse, or sheltie, is usually from 9 to 10 hands high, and almost never exceeds 11; he is of a dark-mouse grey colour, and, till 3 or 4 years old, is covered with long woolly hair; he does not acquire maturity of size and hardiness till 8 or 9 years of age; and he is strong, spirited, and enduring, far beyond the proportion of his bone and hulk. "When well-

fed from an early age," says Miss Sinclair, "the ponies grow nearly to the height of a donkey; but, some years ago, Mr. Hay reared a perfectly well-formed pony, which measured only 26 inches high;—not so tall as a moderately sized hobby-horse! I have heard sportsmen talk in praise of a horse that would canter round a cabbage-leaf; but here was one literally capable of doing so. The very largest men ride these tiny little creatures at full speed, looking from a distance as if they had merely hooked on a pair of additional legs, being scarcely raised a foot off the ground, and yet racing rapidly along." The shelties range in herds over the commons and hills, and are as wild as the sheep with which they share the herbage; and, like them, they are never admitted within the walls of a building, and have often to scamper off to the coast and assuage their hunger with the marine vegetation of the beach. They never, even during long snows, receive more than a trifling quantity of food, to sweeten the rough meals of sea-weed on which they are obliged to subsist; and when winter ends, they are sometimes so exhausted by the half-starvation of months, that they must feed till summer on the young grasses of spring before receiving sufficient strength to bear a rider over the moors; yet they often preserve their health and agility undamaged, and are alleged to possess their peculiar hardiness and all their valuable properties, by being compelled to eat for themselves, and oppose their native sagacity to the acerbities of the weather. The sheltie, when wanted for the saddle or to carry peats or other burden, must be ensnared in his wild walk; or, in cases where his services are often or promptly required, he is not trusted to roam the wastes, but kept manacled or uneasily shackled in the fore-legs; and he then hobbles about like a rabbit, suffers a deterioration of his paces, and, of course, is easily caught. When intended to carry peats or manure, he is equipped with a *klibbar* or peculiarly formed wooden-saddle, to which are appended cassies or straw-baskets; and when intended to carry a rider, he is equipped with a modern saddle and bridle, and with a long hair-cord tether and a tether-stick,—the tether coiled and borne in a bundle during the ride, but brought into requisition for fastening the animal to a grassy spot at the end of the journey. The ponies are seldom if ever killed in old age; but allowed to traverse their ancient pastures till nature is exhausted.—The hogs, like all the other domestic animals of Shetland, are small and peculiar. Their colour is dunnish-white, brown or black; their bones are small, and their ears erect and pointed; their nose is singularly strong; their back is much arched, and displays a curved hedge of stiff, erect bristles; their size is not much larger than that of terriers; and their habits are hardy, active, and mischievous, rendering them a race of miniature wild boars. They are everywhere reared throughout the islands, and, though very numerous, might, with little trouble and much profit, be considerably multiplied; they run loose on the commons during summer, and, as soon as the potatoes are reaped, are admitted within the enclosures to dig up and turn down at pleasure; and, somewhat aided by the shelties and the sheep, they work not a little havoc upon the turf and stone fences, and often inflict serious damage upon the labours of the husbandman. The carcass of the hog is said to weigh from 60 to 100 lbs.; and the pork is generally lean, and of very delicate flavour.—Poultry are far less an object of attention than might reasonably be expected. Though geese are kept by but a few individuals, large flocks of them might be reared by almost every farmer.—Rabbits abound in the south of Mainland, and have seriously augmented

the evils occasioned by the natural accumulation of drifted sand.—“Many very curious arctic birds,” says Miss Sinclair, “stray over to this country; and I have seen one most beautiful snow-owl, which had been killed in this neighbourhood, as large as an eagle, and the colour of a swandown muff. Eider ducks are very abundant; and eagles so very destructive, that 5s. a-head used to be given for shooting them. Swans appear in great flocks during spring. Of course all the breeds here must live on the ground, having neither hedges nor trees in which to form a colony; hut the plovers and other unambitious kinds make themselves quite at home. I am told the crows build their nests of fish-bones, as a substitute for sticks, which shows a great deal of genius, equal to that of the Greenlanders, who form their houses of whalebone.” The mountain-linet, which is rare in the Lowlands of Scotland, abounds in the Shetland islands, and is a very formidable foe of the husbandmen, cropping the young turnip and corn plants as they peep out from the ground, tearing them up by the root, and extensively defeating the labours of tillage and sowing.

Shetland, like Orkney, has neither forest, grove, nor coppice; and, in regard to even shrubbery, is rarer than the naked Orcadian group. Yet not a few unwarrantable sayings have been penned respecting the dismalness of its unwooded aspect, the extreme dwarfishness of its few shrubs, and its alleged incapacity to produce a tree. The lively authoress whom we have already twice quoted, shakes off one of the current prejudices, but at the same time gives rash sanction to another, when she says: “The woods and forests of the Shetlanders could scarcely supply so much as a pair of Dutch clogs, and still less a new flag-staff; but we must suppose the trees were all cut down, to show the sea-views which are so very fine. The tallest and grandest tree I saw during my stay on the island, was a stalk of rhubarb nearly 7 feet high, which had run to seed, and waved its head majestically in a garden below the fort,” at Lerwick, “looking quite shady and ornamental.” We learn from Dr. Edmondston that, in one or two gardens, sycamores and other trees, planted probably a century ago, are 40 or 50 feet high, with a girth of upwards of 6 feet a yard from the ground; that there are a few natural dwarf bushes of birch, willow, and mountain-ash; that evidence exists in the peat-mosses of trees having formerly been abundant; that no experiment at planting has yet been fairly made; and that there appears no peculiarity in either soil or climate to warrant any *a priori* opinion unfavourable to the country’s arboricultural capacity. Shetland and Orkney, in fact, are probably in not a very different plight in reference to wood than the whole sea-board of the Lowlands of Scotland was previous to the spirited experiment of the Earl of Haddington in East-Lothian. See TYNNINGHAME.

The Shetlanders, to be understood in their habits, their social character, and their political position, must be viewed as emphatically and engrossingly a great community of fishermen, who fish for their food as men, for their rents as farmers, and, for nearly the whole staple of trade, as members of the social body. A proportion of them, as has already been hinted, have long been in the practice, like a proportion of the Orcadians, of annually serving in the Greenland whale-ships; and these may be regarded as half-sailors when away, and irregular members of society when at home. All the others, with the exception of a fractional part so very small that it cannot enter into a general view of the community, are more or less fishermen; for, whether they be farmers or whatever else, they, on the whole, look mainly to the finny tribes for their means of

subsistence. Their regular fisheries are of three classes; that of the coal-fish, or *gadus carbonarius*; that of the Haaf, or deep sea-fishing; and that of the herring.—The coal-fish are singularly abundant, and easily caught; and, being at once palatable, nutritious, and always prolific and accessible, and furnishing, in their livers, an oleaginous matter whence oil is obtained for lighting up the Shetlander’s hut, they constitute both the main staff of life throughout the islands, and the means of diffusing cheerfulness through the long winter evenings. Throughout successive years of scarcity, this fish has often for days together formed the sole food of the Shetland peasant; and when want of corn and potatoes presses most heavily, as in the four years ending in 1840, it has providentially proved to be more than usually abundant. But for the wondrous manner in which He who ‘holds the waters in the hollow of his hand,’

“Throgs the seas with spawn innumerable,”

of this eminently useful fish, just in the manner most adapted to the circumstances of the islanders, and in quantity proportioned to the failure of their resources by land, they must, in spite of liberal charitable donations from their more happily situated fellows, have, in great numbers, fallen victims to famine. Whoever reflects on the lavish abundance of the fish, their habits, and their wondrous subordination to the support of human life amid the hyperborean asperities of such a country as Shetland, must be practically an infidel not to see the agency and the paternal care of the infinitely wise and good Governor of the world.—The fry of the fish appear in May in comparatively small quantities, and little more than an inch long; they increase in numbers till about the month of August, when they are very abundant, and measure from 6 to 8 inches in length; and, during all this period, they are provincially designated *sillochs*. Against the following March they grow to the length of about 15 inches, and then obtain the name of *pittocks*; and afterwards they thrive with rapidity till they attain the mean size of cod, and they are then called *sethes* or *saites*. The smaller fry seem to court the security of dense thickets of sea-ware, which shelter them from the keen eye of the feathered tribes which prey on them; and the larger fry frequent all parts of retired bays, and swarm almost everywhere upon the margin of the coast, but have their favourite resort among the constant floods and eddies of the tide, near sunken rocks and bars which are alternately covered and abandoned by the waves. “There is probably,” says Dr. Hibbert, “no sight more impressive to the stranger who first visits the shores of Zetland, than to observe, on a serene day, when the waters are perfectly transparent and undisturbed, the multitudes of husy shoals, wholly consisting of the fry of the coal-fish that Nature’s full and unsparing hand has directed to every harbour and inlet. As the evening advances, innumerable boats are launched, crowding the surface of the bays, and filled with bardy natives of all ages. The fisherman is seated in his light skiff, with an angling rod or line in his hand, and a supply of boiled limpets near him, intended for bait. A few of these are carefully stored in his mouth for immediate use. The baited line is thrown into the water, and a fish is almost instantaneously brought up. The finny captive is then secured; and while one hand is devoted to wielding the rod, another is used for carrying the book to the mouth, where a fresh bait is ready for it, in the application of which the fingers are assisted by the lips. The alluring temptation of an artificial fly often supercedes the use of the limpet; and so easily are cap-

tures of the small fry made, that young hoys or feeble old men are left to this business, and which is not unfrequently carried on from the brink of a rock, while the more robust natives are engaged in the deep sea fishery, or the navigation of the Greenland seas." The sethe, or full-grown fish, is usually caught in the deep tide-ways near the coast, at the south and north extremities of the country, and is particularly abundant in the whirling sea of Sumburgh-Roost; but, though hitherto little searched for in other fishing-grounds, it is believed to occur, like the fry, all round the country, and to be profitably fishable in every tidal current. "From saithe," says Dr. Edmonston, "being caught with little hazard near land during summer, requiring small capital, and always selling readily in the home-market, it will probably ere long be prosecuted as the most profitable and generally attainable branch of the fishing."

The Haaf or deep-sea fishing, comprehending cod, ling, and tusk, is at present the most extensive department, and has long furnished the staple articles of Shetland export. The *Haaf* means any fishing-ground for ling, cod, or tusk, at some distance from the coast; the distance varying from 10 to 50 miles. Ling and cod—as is well known—frequent respectively the deep valleys and the high banks of the sea; and, though cod has hitherto been comparatively little fished, it is likely to become henceforth a bulky produce,—a prodigiously large cod-bank having recently been discovered, which extends from the west of Shetland all the way south to Orkney. The tusk or Forsk fish, resembles ling, but is not so long; it is a rich and highly-flavoured fish; and it may be regarded, as far as Great Britain is concerned, as having its sole habitat in the Shetland seas.—At numerous stations in the country, chiefly in the north, the deep-sea fishing has been prosecuted for a very long period; and, during the three summer months, it anciently drew numerous vessels from Holland, Denmark, and the Hanse towns of Germany, either to take a part in its stirring scenes, or to exchange goods for its produce. The Dutch, about two centuries ago, sent annually several hundreds of doggers, of about 60 tons each, to engage in this fishery; besides 1,500 or 2,000 busses of 80 tons each, to fish for herrings. In common also with Danes and Germans, they sent vessels to barter for cod and ling with the Shetlanders; and, on landing, they either found booths ready erected for their use, or were allowed, at an exorbitant charge for ground-rent, to erect shops of their own. Sixty or seventy years ago, the Dutch had so far decreased in importance as to have only 200 busses employed; but Danes, Prussians, Flemings, and French had as many more, while the English had only two, and the Scotch only one. Foreigners at length almost ceased to pay visits; the cod-branch of the fishery ceased; and the ling-branch of it had a precarious existence. So impoverished were the Shetlanders, that the landowners were obliged, as the only method of reviving the fishery, to provide their tenants with the means of finding boats and tackling; and they then established with them that system of mutual dependence, as to rent and produce, which we noticed in speaking of the tenure of farms.—The fishery is limited to two or three months in summer; and, being not a little dangerous, it is prosecuted only by the hardiest and most athletic of the islanders, in boats or small decked vessels, which sail in fleets. "After waiting for a fair wind, or the ceasing of a storm," say the Messrs. Anderson, "the most adventurous boatmen give the example to their comrades, starting off in their yawl, and taking the first turn round in the course of the sun, when they are

instantly followed by the whole fleet, each boat of which strives to be first at the fishing-station. Arrived at the ground, they prepare to set their tows or lines, provided with ling hooks. Forty-five or fifty fathoms of tows constitute a bught, and each bught is fitted with from 9 to 14 hooks. Twenty bughts are called a packie, and the whole of the packies a boat carries is a fleet of tows. The fleets belonging to the Feideland haaf are so large as seldom to be built with less than 1,200 hooks, provided with 3 buoys, and extending to a distance of from 5,000 to 6,000 fathoms. The depth to which the ling are fished for varies from 50 to 100 fathoms; and after the lines are all set which, in moderate weather, requires from three to four hours, the fishermen rest for two hours, and take their scanty sustenance; their poverty, however, allowing them no richer food than a little oatmeal and a few gallons of water; for the Shetlanders can rarely supply themselves with spirits. At length one man, by means of the buoy rope, undertakes to haul up the tows; another extricates the fish from the hooks, and throws them in a place near the stern, named the shot; a third guts them, and deposits their livers and heads in the middle of the boat. Along with the ling, a much smaller quantity of tusk, skate, and halibut, are caught, the two last being reserved for the tables of the fishermen; and six or seven score of fish are reckoned a decent haul, fifteen or sixteen a very good one, and, when above this quantity, the garbage, heads, and small fish are thrown overboard, the boat, notwithstanding, being then sunk so far as just to 'lipper' with the water. If the weather be moderate, a crew is not detained longer than a day and a half at the haaf; but as gales too often come on, and as the men are reluctant to cut their lines, the most dreadful consequences ensue, and many of the poor fishermen never reach land." The curing and drying of the fish, when landed, are conducted with great regularity and skill. Pebbly heaches, smooth, dry, and swept by constant currents of cool air, are numerous, and form excellent grounds for the drying. But since the curing has ceased to be, as formerly, under the sole superintendence of the lairds, it is said to have suffered deterioration in management, and occasioned some fall in the market-value of the fish.

The herring-fishery, anciently attended to by the Dutch, and afterwards almost totally abandoned, did not draw attention from the Shetlanders till after the commencement of the present century, but has been sedulously and successfully prosecuted during the last twenty years. The fishing-season extends from the middle of August till the middle of October. The herrings are not so abundant as they have, for many years past, been on the east coast of continental Scotland; and they have tantalized the fishermen with the same irregularity of movement, though not to the same extent, as on the Scottish western coasts. Owing to the storminess and rapid vicissitudes of the climate, the whirling and tumultuous character of the tide-streams, and the comparatively small extent of land which covers the boats when a wind springs up from the shore, the fishery is much more hazardous than any south of Orkney. Had-dock and some other kinds of fish, additional to such as we have mentioned, are caught for home use, but they engage little attention, and are not separate or express objects of pursuit. Smaller and larger seals, called respectively tang-fish and haaf-fish, abound on the coasts. The 'ca'ing whale' occasionally appears off the coasts in assemblages of from 100 to 500; and gives occasion to much excitement in its capture: see YELL.

The manufactures of Shetland are, in most mat-

ters, very primitive, and in others very limited. The greater portion of the inhabitants combine, in a rough way, the practice of all the ordinary arts, each individual acting as his own shoemaker, tailor, carpenter, and general handicraftsman; kelp-making was never practised to the same extent as in the Hebrides; and, in various districts, is now almost or altogether relinquished. A straw-plait manufactory at Lerwick, which promised for several years to acquire some importance, has become defunct. The making of herring-nets was recently introduced, and may probably succeed. The knitting of stockings, woollen-gloves, and kindred fabrics from the wool of the Shetland sheep, is the most extensive manufacture, and employs a large number of females. The hosiery has long been in high repute for the softness and beauty of its texture; and, though partially jostled aside by the capricious and despotic movements of fashion, it still holds a prominent place in the market. Stockings vary in price from 1s. to 10s. a-pair, and, in occasional extraordinary instances, bring so high a price as 40s.; and the gloves usually vary between the same ordinary prices as the stockings, and occasionally sell for 15s. The commerce consists in the exchange of fish, hosiery, and country produce for nearly all the miscellaneous articles of manufacture and colonial produce; and it gives a decided balance in Shetland's favour, or shows a marked ascendancy of the value of exports over that of imports. Nearly the whole of it is conducted with Leith. Though Orkney and the northern continental counties lie comparatively near, surprisingly little intercourse with them exists. The weekly visit of the Wick steamer, connecting Lerwick with every principal port all the way south to Leith, has effected wondrous changes, but is enjoyed during only the summer half of the year. Dr. Edmondston, in a tone of just remonstrance, says, "The mail-steamer running all the year through would be a signal boon, as bringing Shetland completely within the vortex of the British market; and no satisfactory reason has yet been given why this advantage, often solicited, has been withheld. The isles of Man and of the Channel enjoy many peculiar and important privileges; distant colonies are pampered, and it might not be unreasonable to expect some fostering patronage and commercial indulgence to be extended to the long-neglected Shetland islands." A few years ago one of the chief merchants of Lerwick, the owner of upwards of twenty vessels, became so embarrassed by the detention of his letters, that he sailed to Edinburgh to inquire for them in person; and even when there he could obtain them only by legally proving his identity, and surmounting other serious difficulties.

The Shetlanders display various peculiarities which either mark their Scandinavian origin or distinguish them from their Celtic and Saxon fellow-subjects. They are low in stature, small-featured, unrobust, symmetrically formed, light, nimble, and generally fair-haired. They possess much hardihood and power of physical endurance; and they are aggregately versatile and lively, fitful and fond of alternate excitement and repose. They intermix the English language with Norse terms and idioms, and speak it with a smooth and expressively modulated enunciation, far different from the phlegmatism and monotony of the prevailing Scottish dialect, and akin, in some respects, to the dialects of both the English and the Irish, but mellowed and almost pensive in its tones. Their carriage, whether among themselves or to strangers, is mild, and their mode of address respectful. The lower orders wear heavy wooden clogs, which seem liable to fall off at every step; and, when equipped for the sea, many of them have

a worsted head-dress of many colours, and shaped like the common Scottish nightcap, a surtout of tanned sheep-skin, which covers their arms and descends from below their chin to their knees,—and capacious neat-skin hoots which reach to the knees, and vie, in their ample dimensions, with the notable leather galligaskins with which painters have long been wont to encompass the royal calves of Charles XII., when they have represented him as planning the trenches of Fredericshal. This leathern dress was at one time common in Norway, and is still worn by the inhabitants of the Faroe islands. The Shetlanders, however, seem to be becoming tired of both it and the nightcap, and numerous substitute the common sea-jacket and trowsers, and a plain hat of straw.—They are fond of music, dancing, and parties of pleasure; but they know little of refinement in their amusements, and happily have of late years been considerably reclaimed from their habits of mental dissipation. Their music, with the exception of a few rude native airs, is the Scottish; and their only musical instrument is the violin. Each gentleman in the vicinity of Lerwick has a town and a country-house, and these so near to each other as, in several instances, to be in full mutual view. "All the principal families here," says Miss Sinclair, "make a regular 'fitting' every season from town to country, probably leaving their PPC cards for each other, and, after taking a pathetic leave of the metropolitan gaieties, set out, by easy stages, changing horses as often as may be necessary, and plunging into the wilderness of rural enjoyment within half-a-mile. In London those who have no estates often close their front windows for the summer, and withdraw out of sight while etiquette forbids their being visible in town; and to the Shetland gentry the change is scarcely greater." All classes are singularly hospitable, and would share their last morsel with a neighbour, or even a total stranger. The use of ardent spirits prevails very little in comparison with other parts of Scotland; and promises, in some places, to yield the ground entirely to tee-totalism. But a passion for tea, to the extent of feeling the narcotic influence of the herb, seems so strong and general as to threaten the country with serious disaster. Many persons suffering the pangs of starvation would rather experience the soothing effect of tea than expend their last penny on bread. Tea-drinking, says the lively lady we have just quoted, "amounts here almost to an absolute vice; and the Shetlanders must positively establish a toast-and-water society immediately. About £25,000 worth of Bohea is annually entered at the custom-house in Lerwick, besides which a great quantity is smuggled by Dutch fishing-boats." The vices of the islanders which most draw the attention of a stranger are their adroitness in mercenary flattery,—their expert and pertinacious intermeddling with domestic and private concerns which do not belong to them,—their exorbitant extortions in the shape of boat-charges,—their occasional seizure of wrecks which have been cast upon their coasts,—and their general enslavement to the superstition of charms, witchcrafts, and apparitions. Yet the moral condition of the country is much better than would be generally conjectured, and appears to have been recently experiencing extensive amelioration.

Shetland appears to have been chiefly Pagan till the 13th century; it formed part of the diocese of Orkney in the time of episcopacy; it was late in receiving the doctrines of the Reformation; and it seems not to have fully adopted Presbyterianism till the close of the 17th century. It now constitutes twelve ministeries or *quoad civilia* parochial charges; which form the presbyteries of Lerwick and Burra-

voe, and the synod of Sbetland. But its parishes, with one or two exceptions, are all unions of two, and oftener of three or four original parishes; and are aggregately provided with twenty-five parochial places of worship, additional to such as belong to *quoad sacra* parishes, and have been built and endowed by Government. Small dissenting places of worship, belonging principally to the Independents and the Methodists, amount in number to about twenty; but, with hardly an exception, are remarkably poor structures, and have an accompaniment of purely missionary effort, comparatively small in its extent, and very self-denied in its character. The country is an important field for Christian enterprise; and, while it makes a silent yet deeply earnest appeal to the sympathy of the promoters of evangelical missions, it does not offer the obstacle of language, which has been so often, though most incongruously, urged as a plea for neglecting the Western Islands.—Judging from the Education returns of 1834—some of which are incomplete, and have to be filled up by taking the average of the rest—the parochial and the non-parochial schools are respectively eleven and about forty in number, and are attended, the former by about 580 scholars, and the latter by about 1,400.—Shetland politically forms part of the county of ORKNEY and SHETLAND;\* which see. The only town is LERWICK; and the chief villages are SCALLOWAY and UYEA; see these articles. There are some good mansions. Population, in 1793, 20,186; in 1821, 26,145; in 1831, 29,392. Houses, in 1831, 4,859.

The history of Shetland is so largely and minutely identified with that of Orkney, that, after the sketch in our article on the latter, very few particulars remain to be stated. The Celts who, at an early period, made lodgments on Orkney, appear never to have set foot on Shetland; and, at all events, have not left any monuments in its topographical nomenclature. Saxon rovers probably infested the country, as they did Orkney, during some time preceding the year 368, when they were routed by Theodosius. Vestiges of the Romans having been here occur in the cases of a small Roman camp in Fetlar, and of coins which have been found of Galha, Vespasian, Trajan, and Ælius Cesar. The Scandinavians, from whom descended the present inhabitants, landed probably at or before the 6th century; they found shelter in the numerous voes and tortuous friths for their piratical vessels; and from these they took their name of Vikingr, or Bay-kings, and thence, as well as from hays in Orkney and the north-east coast of continental Scotland, they sailed out to sweep the seas, and devastate the sea-boards of northern Europe. *Hiattlandia*, or *Hiattland*, or 'the High Land,' was the name which the country received from these bold and restless pirates; and this has, at various and successive periods, been changed into *Yeattland*, *Helland*, *Zetland*, and *Shetland*.† Ha-

\* Doubts have been started whether Orkney and Shetland originally composed one county, or whether they were both united to Scotland at the same period. It is certain there is no mention of Shetland in the marriage-contrast between James III. and the daughter of Magnus of Norway, whereby the Orkney islands came to be engledd for the dowry of that princess; and the acquisition of Shetland is by some referred to a much later period,—that of the reign of James VI. Shetland retained the udal law, with other ancient practices derived from Norwegian origin, longer than Orkney, which, lying nearer to Scotland, came sooner under the influence of its laws and customs. Indeed the Sætdanders continued to consider Norway as the parent-country, down to a very recent period.

† The letter *z* in old Scottish, always represents the sound of *y* or *ie*; and the first printers having followed the orthography as they found it in the manuscripts, their adoption of this character has been the cause of much mispronunciation on the south side of the Tweed. Thus *Lunzie* should be read as if written *Lunye*. The *z* has become very inconveniently stationary in many names of persons and places, as Mackenzie, Menzies, Dalzell, &c. In these names the power of *y* given to *z* rules

old Harfager of Norway, in revenge of the Vikingr having turned their arms against the mother country, revolutionized most of the affairs of Shetland, introduced a portion of both the order and the exactions of a regular government, and peopled the country with tribes and families who had a steady attachment to the interests of Norway. He is believed to have been the first Norwegian monarch who exacted a land-tax from his subjects; and was the originator of the Shetland peculiarities of measuring land by merks, and distributing it into scathold and udal territory. The scat or land-tax was, in the first instance, imposed only on the unenclosed or pasture-lands, in order that the exaction might fall solely upon the produce of the flocks; and hence the distinction of scathold and udal, odhal, or free, applied to respectively the taxed and the free portions of each possession. The country, in consequence of its lying naturally apart from the other districts of the Norwegian earldom of Orkney, was made a separate province, called a *foude*, and placed under the administration of a grand *foude* or chief civil governor appointed by the King of Norway. Each of several districts into which it was subdivided was watched over by an inferior *foude* or magistrate, aided by 10 or 12 *rancilmen*, who acted as conservators of the peace, and a law-rightman, who regulated weights and measures. The courts of judicature bore the name of *tings*, and were held in the open air, chiefly within circular enclosures of loosely-piled stones. The *ting* of the inferior *foude* and his *rancilmen* had jurisdiction only in matters of petty trespasses on land, and affairs of equally diminutive importance. The *tings* of the grand *foude* were either executive or legislative, and bore in the respective cases, the names of the circuit-*ting*, and the law-*ting*. The circuit-*ting* was held for districts called *tingsokens*, each of which comprehended several of the territories of the inferior *foudes*; and it disposed of appeals from the inferior courts, and of those serious offences which these judicatories were incompetent to try, and which were punished by fine or confiscation. The law-*ting* was held once a-year on an islet, in a fresh-water lake in the parish of Tingwall, to which it gave name; it was presided over by the grand *foude*, but constituted by the obligatory attendance of all the *udallers*, or native proprietors; and, by the free and multitudinous voice of its members, it made new laws, remodelled or repealed old ones, and adjudicated such causes as involved the life or death of the accused.—The antiquities of Shetland are numerous, and, in many instances, interesting. Remains of the forts of the Vikingr still abound, and possess nearly as high attractions for the antiquary as any class of ancient structures in Europe. Circular watch-towers, belonging to the same period, are also numerous. *Stenhartes*, or stone axes, which were used till a comparatively late date of the Scandinavians, have been numerous found. Vestiges of several of the enclosures, within which the law-courts were held, still exist. Remains of small churches and chapels are so numerous, and

the way in which they are spoken in Scotland, which is the correct pronunciation. Sometimes, however, *y* and *z* are used indifferently; thus Dalzell is often spelt Dalzell. The practice of writing *Zetland* instead of *Yelland* has caused *Sh* to be substituted for the *z* in the common name of the *Ultima Thule*. However, the noble Earl who takes his title from that island, has thought fit to adopt the old orthography. An etymologist, who looks for a meaning in ancient names, would probably have preferred the *y* to the *z*. He might conceive that *Yelland* is *out* or *outerland*, in reference to the mainland of Scotland; in the same way as a similar compound Jutland, the Cimbric Chersonesus, is the *outerland* of Holstein; for the German *j* corresponds with our *y*, and in the irregular orthography of the Anglo-Saxon *y* and *u* interchange. Hence we have for *out*, *outer*, *outside*, &c., *ut*, *utan*, *yte*, *ytun*, and *Ytenaland* is quoted by Medinger and others as the Anglo-Saxon name of Jutland.

historical evidence survives of the quondam existence of so many more, that a topographical wonderer how so poor a country could have maintained a corresponding number of Popish priests and altars, and bewails the miserable delusion which manifestly prompted a reliance on chapel-building, and purchased masses as a succedaneum for faith in the Redeemer, a regard to the saving work of God in the soul, and a heartfelt delight in the spiritual worship and enlightened service of the Most High.

**SHETTLESTON**, a large village in the Barony parish of Glasgow, and county of Lanark. It is situated about 2 miles to the east of the city on the road to Edinburgh, and may be considered a suburb of the former. The inhabitants are principally of the humbler orders, consisting of handloom weavers, colliers, and agricultural labourers. It has long had a chapel-of-ease, which, with its surrounding district, has now been erected into a *quoad sacra* parish. Population, in 1841, 7,209. Houses 1,504.

**SHEVOCK (THE)**, a rivulet of Aberdeenshire; dividing Insch and Culsamond on the north, from Kinneithmont, Premmay, and Oyne on the south; and falling into the Urie a little above Old Rayne.

**SHEWALTON.** See **DUNDONALD**.

**SHIANT ISLES**, a small cluster of basaltic and picturesque islets in the Minsh, 6 miles east of Rughishin, on the coast of Lewis, 18 miles south of the town of Stornoway, and 7 or 8 miles south of the line of the packet between Stornoway and Poolewe. Irrespective of some detached rocks, they are three in number, and bear the name of Garv-Eilan, Eilana-Kily, and Eilan-Wirrey. The first and the second measure each about 2 miles in circumference, and are connected with each other, Garv-Eilan on the north-north-west, and Eilan-na-Kily on the south-south-east, by a neck of rolled pebbles which is covered only at a concurrence of spring tide and tempestuous wind. Eilan-Wirrey lies about 3 furlongs south-east of the one island, and 4 north-east of the other, so as to form with them a triangular group; and it measures only about a mile in circumference. They all present a verdant surface, the hollows and declivities abounding in rich pasture; and they form a single sheep-farm, superintended by a single family, who reside on Eilan-na-Kily. This island, the chosen home of the solitary sheep-farm, and the scene in pleasant weather of a seclusion from the world altogether delicious, seems anciently to have been the seat of a monastery or a hermitage. Its name means 'the Island of the cell.' On its surface exist the vestiges of an ancient building now nearly levelled to the foundation, consisting of square masonry laid with lime, and on too small a scale to have been a castle of strength, or the habitation of a chief. These ruins are probably the memorials, or possibly the remains of a chapel, which is recorded to have stood on the Shiant isles, and to have been dedicated, like many an ecclesiastical edifice in the west, to the founder of Scottish Culdeism; or they may indicate a monastic residence which, in the later and corrupter period of Culdeism, was raised as a cell in subordination to Iona. From this structure all the little group of islands seems to have derived its designation of 'Shiant,' or sacred. But the Shiant isles, as they contain natural columnar structures similar to those of Staffa and the Giant's Causeway, are objects of interest chiefly to the geologists and the lover of the picturesque; and, had they occupied a position less distant and more accessible in reference to the swarms of pretended virtuosi, whose taste or opportunities afford no longer space than 24 or 48 hours to a tour, they could scarcely have failed, since the era of

steam-navigation, to acquire a fame fully more distinguished than either of their natural rivals.

**SHIEL (LOCH)**, a lake in the south-west of Inverness-shire; about 10 miles long, and 2 broad, dividing the district of Moydart from Ardgower. It has a small island, called Island-Finan, on which are the ruins of a church dedicated to St. Finan. It discharges itself into the Western sea at Castle-Tioram, by the river Shiel.

**SHIELDAG**, a *quoad sacra* parish and a village on the west coast of Ross-shire. The parish belongs, *quoad civilia*, to the parishes of Lochcarron, Applecross, and Gairloch; and was made a chapelry in 1827, and a separate erection, by act of the General Assembly, in 1833. Its greatest length is about 18 miles, and its greatest breadth about 15. Excepting two families of shepherds, who live in the interior, the whole population are seated in a rugged tract of country along the coast. Population, in 1836, 2,231.—The church and manse were built in 1827, by a parliamentary grant, and cost £1,480 15s. Sittings in the church 300. Patron, the Crown. Stipend £120. The minister officiates once a-month at Kishorn,—a preaching-station in connexion with the Establishment at the south end of the parish. The place of worship there was built by the people in the neighbourhood, and the proprietor of Applecross. Sittings 220. There are in the parish four schools, two of which belong to the General Assembly, one to the society for propagating Christian knowledge, and one to the Gaelic society. That of the Gaelic society affords tuition only in Gaelic, and is attended by 37 scholars; and the other three are both Gaelic and English, and are attended by 197.—The village of Shieldag stands on a hay of its own name, 15 miles north-west of Janetown. Shieldag bay or loch measures about 2½ miles in length, and 1 mile in mean breadth, and is simply an offshoot southward of the central compartment of Loch-Torridon. In its bosom lies a little island, called Eilan-Shieldag. The village has a good inn, but is very poor,—its inhabitants being almost all, more or less, dependent on the precarious herring-fishery. Population 200.

**SHIN (THE)**, a short but picturesque river in Sutherlandshire. It issues from the south end of Loch-Shin in the parish of Lairg, and runs 7 miles southward to the Oikel, in the parish of Creich, 5 miles above Bonnar. The vale which it traverses derives from it the name of Strathshin; and though narrow, is cultivated, wooded, and rich in the features of close landscape. At the river's exit from the lake, and on its east bank, are the village of Lairg, an indifferent inn, and a coble and piers. Two miles from the river's confluence with the Oikel is the linn of Shin,—a waterfall not much distinguished for its scenery, but quite remarkable for its height as a successful salmon-leap.

**SHIN (LOCH)**, a lake in the parish of Lairg, Sutherlandshire. It extends from north-west to south-east; has an extreme length of about 17 miles, and a mean breadth of rather less than 1 mile; and bisects lengthwise the greater part of the parish. It possesses strictly a Highland character, but wants the magnificence of mountain-flank, and the opulence of forest, and the ornamenting with islet and demesne, which distinguish many of the first-class lakes of the Highlands. Its south-eastern extremity, indeed, is overhung by a fine sweep of wood, and washes a slope beautifully studded with the neat cottages, the humble church and the peaceful manse of the village of Lairg; and its west end is so sublimely encircled by the stupendous mountain-masses which are grouped with Ben-More-Assynt,

as to need only wood and a little culture to produce the picturesque blendings of grandeur and beauty; but its central and greatly chief extent—to adopt the unnecessarily strong yet descriptive language of Dr. Macculloch—"is little better than a huge ditch without bays, without promontories, without rocks, without trees, without houses, without cultivation, as if Nature and man had equally despised and forgotten it."

**SHINNEL (THE)**, a charmingly picturesque rivulet in Nithsdale, Dumfries-shire. It rises in two small head-waters, on the west side respectively of Allan's-cairn and Black-hill on the boundary with Kircudbrightshire; it flows 10 miles south-eastward nearly along the centre of the parish of Tynron; and making a sudden bend at the farm-house of Ford, it proceeds  $1\frac{1}{2}$  mile north-north-eastward, and falls into the Skarr less than a mile above Penpont. Just at the point of uniting with the Skarr, it rushes with great impetuosity over a remarkable ridge of bold rocks; and between 2 and 3 miles above this point, or a little below Tynron-manse, it makes a considerable waterfall, called Aird-linn, and owing to its being richly fringed and shaded with wood is there highly picturesque.

**SHIRA (THE)**, a small river in the north-east of the district of Argyle proper, Argyleshire. It rises on the south side of Benvalagan, at the point where Argyle, Cowal, and Glenorchy meet, and flows 10 miles south-westward to the west head of Loch-Fyne,  $1\frac{1}{2}$  mile above Inverary. A little above its embouchure it forms a small deep lake, called Loch-Dubh. The glen which it traverses receives from it the name of **GLENSHIRA**: see that article.

**SHISKEN**, a hamlet in the parish of Kilmory, and isle of Arran. Here is a chapel-of-ease, and in the churchyard is a tomb, called the tomb of St. Maol Jos, or 'The servant of Jesus.' This saint fixed his residence on the little island of Lamash, and officiated by turns at Shisken, where he died at an advanced age. It is situate upon the western coast of the island, at the distance of 6 computed miles from Kilmory.

**SHOCHIE (THE)**, a rivulet of Perthshire. It drains the parish of Monieck eastward; forms a junction with the Ordie, and is conducted mingledly with that stream along an artificial canal, across a narrow part of the parish of Redgorton, to the Tay at the village of Luncairy.

**SHOTTS**, a large parish in the middle ward of Lanarkshire; bounded by New Monkland on the north; Cambusnethan on the south; Bothwell on the west; and Torphichen, in Linlithgowshire, on the east. It extends 10 miles in length, by about 8 in breadth, contains 32,000 imperial acres, and rises in elevation from 250 to 900 feet above the level of the sea. Originally the district was named Bertram-Shotts, and formed part of the extensive barony and parish of Bothwell, from which it was disjoined soon after the Reformation, and the name of Bertram dropped. The parish has rather a bleak unproductive appearance, and, until within these last few years, was rather characterized by sterility than abundance. It has long been popularly believed that Shotts contained the highest cultivated land in Scotland, which is now well ascertained to be a mistake. The Hirst-hill, however, is the most elevated point between the frith of Forth on the east, and the frith of Clyde on the west; and both from its summit and from those of the Tilling and Cant hills, the prospect is one of the most extensive and beautiful in Scotland. "From the Cant hills, six complete shires, with part of eight more, are seen. Here the whole country, from Arthur's-seat to the hills in Arran, and the western

termination of the Grampian range, fills the eye. While the observer turns round, carrying his eye from south to north, the whole space from the Pentland, Tinto, and Loudon hills, on the one hand, to the Lomond, the Ochil, and the Campsie heights, on the other, successively comes under his view. Into this extensive prospect, with the hills already mentioned, enter the city of Glasgow, and the towns of Paisley and Hamilton, with villages and gentlemen's seats not to be numbered. This great stretch of country, a few miles south-east of Shotts excepted, has the appearance of much richness and cultivation." [Old Statistical Account.]—Shotts is much more celebrated for its mineral wealth than its surface production. It forms part of the great Lanarkshire coal-field, which is most extensively and profitably worked. Ironstone is also found; but as the band is not considered superior, it has not been worked to any extent. In addition to the opening of the collieries, the most important event in the industrial history of Shotts, has been the establishment of its works;—the first of which, called the Omou iron-work, was established in 1787 by Colonel William Dalrymple of Cleland, and the other, called the Shotts-work, in 1802, by a company of private individuals. They are in full operation; and to the smelting of iron, in the case of the latter establishment, an extensive foundry was added a number of years ago, which enables it to carry on no insignificant rivalry with the great Carron company. The marine and land engines, and other kinds of machinery, which have proceeded from its engineering department, have imparted to the Shotts works a creditable degree of celebrity; and the vast amount of money weekly circulated in the shape of wages has been the life and spirit of the whole neighbouring country. There are four villages in the parish; viz. Shotts works, Omou, Harthill, and Sallsburgh, and the post-office of the parish is established at the former. The great public road from Edinburgh and Glasgow has run through the parish from time immemorial; and of late years from 20 to 25 public coaches have passed through it daily. The opening of the Edinburgh and Glasgow railway, however, by diverting the great stream of passenger-traffic into its own channel, has completely altered this state of things; and the turnpikes of Shotts, in comparison of what they were, are now dull and deserted. Population, in 1801, 2,127; in 1811, 2,933; in 1821, 3,297; in 1831, 3,220; in 1841, 3,852. Assessed property, in 1815, £9,012.—The parish is situated in the presbytery of Hamilton, and synod of Glasgow and Ayr. Patron, the Duke of Hamilton. Stipend £300 per annum. The church was built in 1820, and seated for 1,200 persons. There is a flourishing congregation connected with the United Secession in the parish, the church belonging to whom was erected in 1771. There are three endowed schools in the parish, in addition to at least an equal number which are unendowed. The salary of the parochial master is £34 4s. 4½d. per annum, with £6 school-fees, and £8 8s. other emoluments. One of the schools, not parochial, belongs to the Shotts iron-works; another is called the Murdostown-school, and endowed by Sir Thomas Inglis with £19 annually,—and another, called the Harthill-school, is endowed by the late James Wilson of Whithorn, with the interest of £500 sterling.—There is little of historical interest attaching to Shotts. Like almost all the parishes in the west of Scotland, its inhabitants were, in the covenanting times, strongly imbued with the national horror of 'black prelaicy,' and furnished their contingent to the battle of Bothwell-brig. The banner borne by the band from Shotts on that occasion is still pre-

served at the farm of Nethertown, and hears the well-known motto,—‘For Scotland’s covenanted work of Reformation.’ The ashes of one of the Covenanters repose in the churchyard, and his gravestone bears the following inscription:—“Here lyes the bones of William Smith, who lived in Moremellen, who, with others, appeared in arms at Pentland-hills, in defence of Scotland’s covenanted work of Reformation, in anno 1666; agreeable to the word of God, in opposition to popery, prelacy, and perjury, and was murdered on his return home near this place.” This parish has given birth to some eminent men: viz., Mr. John Miller, professor of law in the University of Glasgow, well-known to the public as a learned author; Dr. Matthew Baillie, the celebrated anatomist and physician, who was son of Dr. James Baillie, minister of Shotts, and brother to the celebrated Joanna Baillie; and Mr. Gavin Hamilton, the celebrated historical painter. Dr. Cullen, the talented physician, began his practice in this parish.—Two cattle and horse fairs are held annually at the Kirk of Shotts on the 3d Tuesdays of June and November, respectively, O. S.—A railway has been projected from Shotts to the Wishaw and Coltness railway. Its length will be 8 miles, 5 furlongs, 188 yards; and estimated expense about £70,000.

**SHUNA**, an Hebridean island in the parish of Kilbrandon, Argyleshire. It lies  $\frac{1}{2}$  mile south of Torsa, and the same distance south-west of the entrance of Loch-Melfort; and is separated from the Slientime-moor and the peninsula of Craignish on the east, by a sound of between 1 mile and nearly 2 miles broad; and from the island of Luing on the east by a very narrow strait, called the Sound of Shuna. Its greatest length from north to south is about 3 miles; and its greatest breadth is nearly  $\frac{1}{2}$  mile. Its surface is a continuously rolling, tumulated, and broken ground, whose tiny summits nowhere rise higher than about 200 feet above sea-level. It possesses much of that intricate mixture of land and rock which, with the aid of wood and culture, abounds in mild and soft pictures of rural beauty; it derives picturesqueness from its encirclement with intricate hands of sea, overhung by the lofty and hard featured heights of island and continent; and it has everywhere such a profuse and curious interspersed of natural woods of birch and alder, with protuberant rocks, and with pendicles of cultivated and pasture-land, as to look, from end to end, like a large sea-girt ornamental park. Though topographically grouped with the slate islands, it possesses little or none of the clay-slate so prevalent in Luing and Seil, Easdale, Lunga and Scarba; yet it presents interesting objects of study to a geologist; and at each end it has a bed of dark-blue crystalline limestone, which has long been wrought for economical purposes.

**SHURIRY (Loch)**, a lake about  $\frac{1}{4}$  mile long, in the parish of Reay, Caithness-shire. The river Forss issues from it, or, more properly, traverses it; hut, above the lake, bears the name of the Torran.

**SIBBALDIE**. See **APPLEGARTH**.

**SICCAR-POINT**. See **COCKBURNSPATH**.

**SIDLAW, SEEDLAW, or SUDLAW HILLS**, a long ridge or chain of heights, extending north-eastward and east-north-eastward from Kinnoul-hill, on the left bank of the Tay, in the immediate vicinity of Perth. The chain is detached from the Ochil range only by the intervention of the Tay and the Earn; just as the latter range is detached from the Lennox-hills only by the intervention of the vale of the Forth; and jointly with these ranges it forms the Lowland screen, or the screen on the Lowland side, of what, without any great accommodation of

language, may be called a continuous valley along the skirt of the Highland frontier, from the vale of the Leven in Dumbartonshire to the German ocean at Stonehaven. To the more marked and emphatic, and to the popularly designated part of this great valley or ‘Strathmore,’ belongs the screen of the Sidlaws. Yet the heights are not strictly either a range or a chain. They extend with considerable ridgy regularity from Kinnoul hill, north-eastward to a point a little distance south-east of the town of Forfar; they there fork into two lines, the one of which goes off in undulations and detachments, yet with very observable continuity nearly eastward to the sea at Redhead, while the other proceeds irregularly north-eastward, becomes almost lost in the vicinity of Brechin, and afterwards rallies and straggles on along the Lowland side of the How of Kinnardine to the sea at Stonehaven. Such in extent are the Sidlaws in the large and properly geographical sense; though, in the popular application of the name, they are very generally restricted to their sweep through Forfarshire from the parish of Lundy on the south-west to the promontory of Redhead on the east: see **FORFARSHIRE**. Many of the hills, of which the celebrated **DUNSINNAN** [which see] is the most remarkable example, are isolated in position, and have conical summits. Some, such as the hills of Lower, of Dunnichen, of Dumberrow, and others, are rounded and detached, and overhang intervening valleys. In some instances, as in the ridge of the Tulloes, which runs along the southern frontier of the parishes of Inverarity, Dunnichen, and Kirrken, the heights form a long flat regular range of moderate elevation. The greatest altitude is about 1,406 feet above sea-level; but this, or an altitude very little inferior, is attained by many of the summits. Seen from Fifeshire, they appear a lofty brown mountain-barrier drawn out like a huge rampart to cover the interior of Perthshire and Angus. Some of them are cultivated to the summit, and many which, 50 years ago, were covered all over with stunted heath, now seem to groan beneath loads of green umbrageous timber. The prevailing formation of the Sidlaws is the old red sandstone,—part of the vast bed which so curiously waves in several great and successive curvatures across Forfarshire. On the side facing Strathmore, the strata dip to the north at an angle of about 45°; but they diminish in dip as the hills are crossed, till on the side facing the Lowlands, especially in the upper part of Carmylie, they become nearly or altogether horizontal. The sandstone is of various colours, red, brown, gray, white, with a slight tinge of green; and it is, in some instances, susceptible of a remarkably smooth polish. The strata alternate with beds of shale, and occasionally with some beds of conglomerate which measure from 50 to 100 feet in thickness. Trap-rocks, chiefly of greenstone, and to some extent of porphyry, occur plentifully in intersecting veins, and occasionally in surmounting nodules and masses. An impervious houlder-formation covers a large part of the surface.

**SIMPRIN**, an ancient hut suppressed parish, now united to Swinton, and consisting of some wavy swells and their intervening plains in the lower Merse, Berwickshire. It is chiefly remarkable as the parochial charge, from 1699 till 1707, of the well-known Thomas Boston of odoriferous memory, and afterwards minister of Etrick. The session-register during the whole period of his incumbency, is all in his autograph, and is still preserved. The church in which he officiated was small, and has long been an utter ruin. A large barn—in this case quite as interesting an object as the church—was employed by him as the scene of ordinances at all

sacramental and other extraordinary occasions. Hye de Simprin possessed the manor in the reign of Malcolm IV., and gave the church to the monks of Kello. The whole parish was long the property of the Cockburns of Langton; but, in 1758, was sold by them for the liquidation of debt. The village of Simprin has disappeared.

**SINCLAIRTOWN**, a village in Fifeshire, in the parish of Dysart, immediately adjoining to Pathhead, containing, in 1811, 947, and, in 1836, 1,240 inhabitants, mostly employed in weaving.

**SKARR (THE)**. See **SCARR**.

**SKEN (LOCH)**, a small wild lake in the north-east of the parish of Moffat, and the extreme north of the district of Annandale, Dumfries-shire. It is situated within a mile of the point where the counties of Dumfries, Selkirk, and Peebles, meet, within  $1\frac{1}{2}$  mile of the source of the Yarrow, and within half-a-mile of the sources of the Megget and the Fruid, early tributaries respectively of the Yarrow and the Tweed. Its elevation above sea-level is believed to be upwards of 1,000 feet. Its length is 1,100 yards; its extreme breadth is 400 yards; and its depth is not known. Its basin is mossy, bleak, and wild. On one of two or three rocky islets which darkly stud its bosom, the eagle—which is now a rare bird in the Southern Highlands—was used to bring out its young. The trout of the lake are large,—some of them 11 inches in length; and are the most delicate in flavour of any in the circumjacent country, forming an attraction to the “wellers” at Moffat. The stream by which the lake discharges its superfluous waters in tribute to the river Moffat, forms the magnificent cascade called the **GREY MARE’S TAIL**: which see.

**SKELMORLY**. See **LARGS**.

**SKENE**, a parish in Aberdeenshire, 6 miles west of the city of Aberdeen. It is bounded on the north by Kintore and Kinellar; on the east by Newhills; on the south by Peterculter; on the south-west by Echt; and on the west by Cluny and Kemnay. Its greatest length, from north-west to south-east, is  $6\frac{3}{4}$  miles; its greatest breadth, in the opposite direction, is  $4\frac{1}{2}$  miles; its mean breadth, over most of its extent, is somewhat less than 2 miles; and its area is 9,393 acres. Loch Skene, a fine oval sheet of water on the boundary with Echt, is about a mile long, and upwards of  $\frac{3}{4}$  of a mile broad, and abounds with pike and eel. Leuchar-hurn, a small affluent of the Dee, traverses the lake, and, over  $4\frac{1}{2}$  miles above and below it, runs along the boundary. The surface of the parish is prevalently rocky and broken, and, in the northern district, is hilly and bleak. Upwards of one-third of the whole area is black moor; 500 or 600 acres are moss; about 1,600 acres are pasture-ground; and the rest is disposed in arable lands and plantations. The soil subject to the plough, though predominantly gravel, is exceedingly various in both composition and fertility. Skene-house, a seat of the Earl of Fife, is accompanied by a considerable expanse of woods. A very large cairn, and traces of a rectangular encampment, exist about a mile from the church. The parish is traversed westward by the roads from Aberdeen to Ballater, and Logie-Coldstone. Population, in 1801, 1,140; in 1831, 1,677. Houses 374. Assessed property, in 1815, £3,425.—Skene is in the presbytery and synod of Aberdeen. Patron, the Earl of Fife. Stipend £158 6s. 8d.; glebe £20. The parish-church was built in 1801. Sittings 686.—An Independent chapel was built in 1802 at Blackhills; and is believed to have cost but a little more than £100. Sittings 235. Stipend £40, with a dwelling-house and an acre of ground.—An ecclesiastical census, taken in 1835, showed the population then to be 1,734; only 67 of

whom were dissenters. In 1834, the parish-school was attended by 58 scholars; and six other schools, two of them kept by females, were attended by 177. Parochial schoolmaster’s salary £30, with £18 fees, £20 8s. from the Dick bequest, and £12 allowance for a garden.

**SKEOTISVAY**, an island, about  $\frac{3}{4}$  of a mile long, and half-a-mile broad, in the Harris district of the Hebrides. It lies in East Loch-Tarhet,  $\frac{3}{4}$  of a mile west of Scalpa.

**SKERRIES**, a general name throughout Orkney and Shetland for numerous sea-girt rocks, and for rocky islets which carry no herbage.

**SKERRIES (OUT)**, three inhabited islets and some detached rocks in the extreme east of Shetland. They lie 5 miles north-east of Whalsay, 10 miles east of Lunnansness point on the mainland, 10 miles south-east of South Yell, and 13 miles south by east of Fetlar. Each is somewhat more than a mile long; and the three form a triangular group, at the distance from one another of a few hundred yards. They are remarkable as the wildly secluded seat of a stirring population, and the scene of extensive fisheries for ling. These islets are parochially in the district of **NESTING**: which see.

**SKERRIES (PENTLAND)**. See **PENTLAND**.

**SKERROW (LOCH)**, a highly picturesque sheet of water, of a triangular form, situated about 8 miles north of Gatehouse, and nearly at the extremity of the parish of Girthon. Its circumference may be estimated at fully 2 miles. Upon the east side the shore is lined with a kind of reddish granite sand, which is much esteemed by mowers for putting upon their hones when sharpening the scythe. Loch-Skerrow is studded with islands, which give it a romantic appearance. The two largest are thickly covered with trees, hushes, and herbage of various kinds, grown very close together into a thicket. The hot-toms of these islands are formed of masses of huge stones, wildly jumbled together. One of these woody islands has evidently been the habitation of the eagle, for the remains of a huge nest are still to be seen sticking in the thicket. This highly romantic loch is the favourite resort of wild ducks and gulls. It has both trout and pike, but it cannot be said to abound with either. The trout are of a beautiful symmetrical shape, small headed, thick bodied, and prettily tapered towards the tail. Their flesh is as red as a salmon’s, and far superior to the salmon of Dee. They are exceedingly shy and capricious, at all times, and very difficult to allure; two or three of them are now reckoned not a bad day’s work.

**SKERRYVORE**, a dangerous rock or reef 13 miles south-west of Tiree, and about 27 miles west of Iona. The reef extends about 10 miles in an eastern and western direction. In July 1840, the foundation-stone of a lighthouse, to be erected at the expense of the commissioners of northern lights, was laid upon this rock by the Duke of Argyll. The building will be 130 feet in height in addition to that of the foundation, which is carried above the highest tide.

**SKIACH (LOCH)**, a small lake  $\frac{3}{4}$  of a mile in length, and well stored with excellent trout, in the parish of Little Dumkeld, Perthshire. A furlong or two south of it is Little Loch-Skiach, about half the size of the other. The superfluous waters of both run to the Bran.

**SKIACH (THE)**, a rivulet of Ross-shire. It rises in several head-streams among the eastern skirts of Ben-Wyvis, and has a run of about 8 miles north-eastward to the Cromarty frith, near the church of Kiltearn. During a drought in summer, it almost entirely disappears; but, after heavy rains or the thawing of the winter snows, it is a voluminous and

headlong torrent, and, but for being restrained by embankments, would utterly desolate the arable grounds on its banks.

**SKIPNESS**, a parish in Kintyre, Argyleshire, now united to **SADDEL**: which see. Skipness-point is the headland at the south side of the entrance of Loch-Fyne. Skipness-bay, immediately to the south is a creek, receiving a rivulet of 5 miles length of run, and confronting Loch-Ranza in Arran. Skipness village stands at the head of the bay. Skipness-castle, a little north of the village, and surmounting the headland, is a structure of great antiquity, of imposing appearance, and in good preservation. Its outer wall is 7 feet thick, 33 high, and 450 long. Two small projecting quadrangular towers rise from opposite corners. The principal tower does not project, and soars aloft from the north-east corner; and it is handsomely fitted up, and continues to be inhabited. Around this tower are modern additions which at once relieve the time-worn and heavy aspect of the original edifice, and afford accommodations more in keeping with the modern notions of domiciliary comfort.

**SKIPOINT (Loch)**, an intricately ramified chain of marine sounds and straits across the island of South Uist, at the mean distance of about 5 miles from its north end. It is usually described as simply projecting into the island; but really bisects it from sea to sea, so as to render it two islands in reality while only one in name. To add to the confusion, the loch or strait assumes, at the west end, the name of Loch-Gamoslechan. All the land immediately connected with it is a museum of low rocky islands and promontories; forming the commencement of that chequered and diversified mixture of flat lands and maze waters which separates South Uist from Benbecula.

**SKIRDURSTAN**. See **ABERLOTH**, Banffshire.

**SKIRLING**, a small parish in the extreme west of Peebles-shire; bounded on the north-east by Kirkurd; on the east by Broughton; on the south by Kilbucho; and on the west by Lanarkshire. Its form is an oblong, terminated on the north by a tapering triangle. Its length from north to south is  $3\frac{3}{4}$  miles; its extreme breadth is  $1\frac{3}{4}$  mile; and its superficial extent is about 2,640 Scottish acres. The surface all lies at a considerable height above sea-level, and is rolling and uneven; yet it has no mountains, and only three hills, all small and verdant. About four-fifths of the area are in tillage; about 30 acres are wooded; and what remains is partly moorland covered with short heath, but chiefly green, and excellent pasture. The soil, though generally light, is fertile. Biggar-water runs eastward along the southern boundary, and receives some feeders from the parish. The village of Skirling, with a population of about 100, stands near the middle of the parish,  $2\frac{1}{2}$  miles north-east of Biggar,  $2\frac{1}{2}$  north-west of Broughton, and 25 south-south-west of Edinburgh. In this sequestered hamlet are a friendly society, a jail, and three annual fairs. Two of the fairs, held respectively on the first Wednesday after the 11th of June, and on the 15th of September, are considerable markets for horses and black cattle. Two other annual fairs of the place are extinct. Skirling-house, once a large and strong edifice, accessible at only one point, which was defended by turrets, and approached by a stone-bridge across an enviroing morass, has quite disappeared. Population, in 1801, 308; in 1831, 358. Houses 61. Assessed property, in 1815, £2,199.—Skirling is in the presbytery of Biggar, and synod of Lothian and Tweeddale. Patron, Sir T. G. Carmichael, Bart. Stipend £216 4s. 10d.; glebe £60. Unappropriated tinds £83 15s. 2d. Schoolmaster's salary £34 4s. 4½d., with about

£26 fees. The ancient name of the parish was successively Skrawlyne, Scraline, and Skarlin.

**SKOU (KYLE)**, a belt of marine water, at the continuation eastward of Loch-Assynt, between the parishes of Assynt and Edderachyllis, on the west coast of Sutherlandshire. It is about  $4\frac{1}{2}$  miles in length, and varies in breadth from about  $1\frac{1}{2}$  mile to probably 100 yards; and, at its inner end, it is continued in two lines, each about 2 miles long, by Lochs Coul and Dhu, which occupy two of the wildest and most romantic glens in the county. Kyle-Skou affords safe anchorage, and is frequented by prodigious shoals of fish; and it is, in consequence, one of the richest and most industriously plied fishing-grounds in the north-west of Scotland.

**SKY**, or **SKYE**, the largest of the Hebridean islands, excepting Lewis. It belongs politically to Inverness-shire, and lies opposite the continental parts of that county and Ross-shire. It is washed on the north and north-east by the south end of the Minch, looking away to the North sea; on the east by the sounds of Rona, Raasay, and Scalpa, separating it from the cognominal islands,—by intervening or adjacent openings of sea from 6 to 14 miles broad, separating it from Applecross and Lochcarron,—and by Loch-Alsh, from  $\frac{3}{4}$  of a mile to  $2\frac{1}{2}$  miles broad, separating it from the district of Loch-Alsh; on the south-east by Kyle-Rhea and Glenelg-bay, from a gun-shot to  $1\frac{1}{2}$  mile broad, separating it from Glenelg,—and by the sound of Sleat, from  $2\frac{3}{4}$  to  $6\frac{1}{2}$  miles broad, separating it from Knoydart and Mòrrer; on the south and south-west by the Deucealedonian sea, studded at the distances respectively of  $\frac{3}{4}$  of a mile, and of  $5\frac{1}{2}$ ,  $6\frac{3}{4}$ , and  $9\frac{1}{2}$  miles with the islands of Soa, Eigg, Rum, and Canna; and on the west by the Little Minch, separating it from Benbecula, North Uist, and Harris. Its extreme length, in a line due south-east from Vaternish point to the headland at the entrance of Loch-Cambuscross in Sleat, is  $46\frac{1}{2}$  miles. Its breadth, for  $3\frac{1}{2}$  miles at the north-west end, embraces only the narrow promontory of Vaternish; over the next 13 miles, it attains a maximum of 25 miles, and averages about 20, but includes broad inlets of the sea which deeply indent the land; over the next 26 miles, it makes various contractions and expansions, but, on the whole, tapers down from 15 miles to 4½; and, at the south-east extremity, which forms the district and peninsula of Sleat, it abruptly shoots out to 21 miles. The area is said to be nearly 350,000 acres.

Sea-lochs and bays are so numerous, that only the principal can be stated. Loch-Snizort, on the north-west, sends off the subordinate inlets of Lochs Uig, Snizort-Beg, Greeshernish, and Dubeck, and separates the peninsula of Trotternish on the east from that of Vaternish on the west. Loch-Follart or Dunvegan, also on the north-west, sends off from its east side the large ramification of Loch-Bay, and separates Vaternish from Duirinish. Loch-Pooliel cleaves the centre of the north-west end of Duirinish. Loch-Bracadale, on the south-west, forks into the subordinate waters of Lochs Roag, Caroy, Struan, and Harport, and separates Duirinish from Minginish. Lochs Brittle and Eynort penetrate the south-west side of Minginish. Lochs Scavaig, Slapin, and Eishart have a common and very broad, but nameless entrance, immediately north-west of the peninsula of Sleat; and they jointly effect the great contraction in the breadth of the island which occurs in its south-east division. Loch-na-Daal penetrates the south-east side of Sleat. Loch-na-Beste enters from the waters of Loch-Alsh, and looks out upon the cognominal district on the continent. Broadford-bay, and Lochs Ainort, Sligachan, Portree, and Staffin indent, at wide intervals, the north-east side

of the island.—The principal headlands are Aird or Trotternish-point, in the extreme north; Vaternish-point, in the extreme north-west between Lochs Snizort and Follart; Airdmore-point, at the entrance of Loch-Bay; Dunvegan or Galtride head, between Lochs Follart and Pooltiel; Idrigil-point, on the north side of the entrance of Loch-Bracadale; Dunan-point, on the south side of the entrance of Loch-Brittle; Strathaird, or the Aird of Strath, between Lochs Scaavaig and Slapin; Swishnish-point, between Lochs Slapin and Eishart; Sleat-point, at the south-west extremity of the island; Ardivazar-point, in the sound of Sleat, and forming the landing-place from Arisaig; and Ru-na-Braddan, on the north-east coast of Trotternish.

The coasts of the island abound in interesting and exquisite scenery. Over several miles south-west of Trotternish-point, a breast-work is presented to the sea, perpendicular, occasionally columnar, and exhibiting fine specimens of basaltic formation. In this range, a little south of the picturesque ruins of Duntulm-castle, a small promontory presents, on a scale of comparative grandeur, a resemblance to some parts of Staffa; three caves of from 15 to 30 feet in height occupying the front, and colonnades about 60 feet high filling the intervals, and extending away along the sides. From this point to the head of Loch-Snizort the shore is low and cultivated; and where it wends round Loch-Uig, it displays a heautous softness of foreground and a grandeur of immediate back-ground which combine to make a singularly interesting picture: see SNIZORT. Round the peninsula of Vaternish, the coast is a constant alternation of vertical cliffs and low shores, which, when first seen, rivets attention, and would be permanently interesting were it less profuse, but tires by its repetition, and becomes monotonous from its uniformity. The shores and islets of Loch-Follart, borrowing some effect from the picturesque aspect of Dunvegan-castle, and woven into continuity by the intervening waters, form a richly variegated sheet of beauty. From Dunvegan-head to Loch-Bracadale, the coast consists, for the most part, of cliffs various in altitude and abruptness, but generally lofty, and often falling precipitously, sometimes sheer down, from their summits to the water-edge: these cliffs are composed of horizontal and somewhat equal beds of substances much diversified in colour, and amounting in some places to upwards of twelve in number, and they, in consequence, present a singularly striped appearance; but they are far too uniform in character and rectilinear in outline to offer good subjects for the pencil. On this part of the coast and southward, occur some detached pyramidal masses of rock similar to the 'stacks' which figure so curiously on the coasts of Shetland and Wick; three, called Macleod's Maidens, and attaining an extreme altitude of about 200 feet, occur near Idrigil point; and two, which are perforated, occur respectively in Loch-Bracadale and not far from Loch-Eynort. The shores of Loch-Bracadale are, in general, low, flat, and cultivated; but on the south they become perfectly vertical cliffs, holed with caverns, and plunging their bases into the sea. Round Talisker-hay, 2 miles south of Loch-Bracadale, a low heath looks up a retired and verdant valley. From this point to Loch-Brittle, the cliffs suddenly recommencing, rise speedily up to a sublime elevation; they are very varied in outline, numerous and intricate in their parts, and agreeable in their tones of colour; they appear, when seen in front, to be quite or nearly perpendicular; they have fore-grounds of high and conspicuous detached rocks, which are often perforated with exceedingly complicated arches; and they, in consequence, ex-

hibit some of the most magnificent compositions of rock-scenery which are anywhere to be seen in Scotland. These cliffs appear to have a mean altitude of not much below 800 feet; and the cascades which fall over them are so dispersed in spray before reaching the ground or the sea, that they descend in showers of drizzling rain. At one part a considerable portion of the cliff has been brought from the summit down to the shore, exhibiting a very remarkable mountain-slide, and forming at its base an altogether untraversable promontory. Round Loch-Brittle, the coast has but small elevation, and is disposed in terraces, yet runs frequently out into low projecting points; and hence to Loch-Scaavaig, the cliffs, though again becoming prevalent, attain but a comparatively small elevation. At the north-west side of the entrance of Loch-Scaavaig, the declivities of the hills begin to come down, at a considerable angle, upon the sea, without any intervening cliffs; and they produce a coast remarkable at once for its difference of character from that of nearly every other coast in the kingdom, and for its surpassing degree of wild and savage grandeur. See SCAVAIG (LOCH). Along the north-west side of Loch-Slapin, extends a range of cliffs, rarely loftier than 60 or 70 feet, but perforated and intersected with such an extraordinary number of caves and fissures that they sometimes in a given distance occupy nearly as much space as the parts of the cliffs which remain solid. The chief of the caves is the celebrated spar one noticed in the article STRATHAIRD: which see. A gloomy and sublime solitude of mountain-scenery reigns around the head of Loch-Slapin; and from several points in the vicinity, as well as in Loch-Eishart, the distant views toward the north-west, including an expanse of sea, bounded on the opposite sides by the contrasted forms of the Skye mountains and the Rum hills, are grand and striking. Though the greater part of the coast of Sleat possesses little interest in itself [see SLEAT], yet the prospect of the opposite shore, formed by the wild and lofty mountains of Lochs Nevis and Hourn, is deeply impressive; and, in the narrower part of the sound between Skye and the continent, "the land rises high, and with a rapid acclivity, displaying broken rocks, interspersed with coppices and brushwood, and enlivened by innumerable torrents, and, together with the proximity of the sides, the rapidity of the tide, and the quick succession of objects, all conspire to excite an interest which is preserved till we arrive at Loch-Alsh. Here, the variety of the coast-line, the wide but intricate expanse of water, the scattered rocks, the picturesque and various outlines of Sky itself and of the mainland, with the ruins of Kylehaken-castle, its rising town, and the hustle of the shipping that frequents this sea, combine to produce scenery scarcely exceeded on the western coast." [Macculloch.]—From Loch-Alsh to Portree, the shore, though possessing some distinctive features, has little character or beauty. See STRATH and PORTREE. From Portree to Ru-na-Braddan, extends a line of cliffs, 700 feet in height; offering not a cove nor an intervening patch of low ground on which a boat can be drawn up. Seen from a little distance, it seems to be an uninterrupted wall of successive stages, surmounted by a green terrace, and occasionally skirted by huge fragments interspersed with verdure; but, when more closely examined, it shows now a gentle declivity from the summit to the sea, now a succession of mural faces and esplanades coming down like a huge staircase to the strand, and now a lofty precipice overhanging the sea, and sending off an unequal and hold ascent toward the pinnacled, turreted, and cloud-cleaving peaks of the Storr mountains in the interior. A

cascade at Holme, over a part of the mural cliffs which is 300 feet high, flings a rivulet in a single spout, right over the precipice to such a distance from the base of the rocks, that a tourist may sail beneath it in a boat, and mark in security how it forms a watery circle in the air, and a foaming and tumultuous boiling in the sea. From Ru-na-Brad-dan to Trotternish-point, but especially around and near Loch-Staffin, extends a series of by far the grandest basaltic formations in the three kingdoms, very little excelled by Staffa in even minute beauty of detail, and reducing that celebrated island almost to insignificance by their contrasted magnitude and sublimity. See STAFFA (LOCH). At one part of this vast columnar range occurs a cascade about equal to that of Holme in height, and, though inferior to it in volume, possessing a high interest in the simple and unbroken manner in which it leaps over the face of the vertical and lofty colonnade. "When the squalls which blow from the high lands in this stormy region descend so that the sea rises in smoke beneath them like the vapour from a caldron, but little of this stream reaches the waves below."

The surface of Skye, with the exception of the plain of Kilmuir and a small tract near Loch-Bracadale, almost wholly consists of three distinct assemblages of mountains, and intermediate expanses of high and undulating land. A connected view of its parts will be best obtained by commencing the survey of it at its south-east end, or rather at its south-western extremity in the point of Sleat. From this point a continuous ridge, 1,200 feet or upwards in altitude, and irregularly torn on each side into sinuous ravines and glens which conduct its waters to the sea, extends to Loch-na-Daal, and there suddenly subsides into a low tract of inconsiderable breadth. A second ridge, unique with the former both in direction and in geognostic structure, and sending up five principal summits to an elevation of about 2,000 feet, starts up on the north-east side of the low tract, and stretches away to Loch-Alsh. These ridges, which form a connected though interrupted range, descend rapidly to the sea on the south-east, and, in bulk, altitude, and character, figure conspicuously among the hills of the island. An irregular tract of comparatively low land extends parallel to this range from Loch-Eishart to the east side of Broadford-bay; and forms a kind of junction toward Kylehaken, with a continuation north-north-eastward to that place of the belt of low ground which occupies the cleft or discontinuous part of the two ridges. A second irregular hilly ridge extends quite across the island, from Swishnish-point to the head of Broadford-bay; and beyond this stretches the narrow valley of Strath, with a comparatively small mean elevation. From this valley to a line drawn between Lochs Brittle and Sligachan, occurs the most conspicuous part of the island, a confused assemblage of mountains from 2,000 to 3,000 feet high, and distinguishable, by striking differences in outline, feature, and colouring, into two great portions. The southern and greatly larger portion is a segregation of tame, smooth, conoidal hills, all separate from one another, nearly all streaked with broad sheets of red rubbish, coming down from their summit to their base, and many of them arising abruptly, and without a single feature of relief, from the labyrinth of intervening low ground. The northern portion contrasts strongly, and in almost every particular, with this dismal sea of red, rounded, characterless hills; it has a leaden and murky darkness of colour which no light appears capable of harmonizing, and which seems, even amid the blaze of a summer's sun, to cover all the region with night, so that when clouds wreath the summits, a deep and

horrible abyss appears opened beneath into which the eye vainly endeavours to penetrate; and it consists of peculiarly rugged and serrated ranges and masses of mountain, whose pinnacles and projecting crags darkly indent the sky along the whole line of both summit and profile. The Cuchullin hills, which form the chief part of this dark group, rise with a rapid and rocky ascent from the shores of Soa-sound and Loch-Brittle; and, consisting of six obscurely divided summits, extend curvingly toward the north-east, and present an almost continued precipitous face deeply furrowed by torrents. Some lower but equally rocky heights, of similar composition and character, unite with them to enclose the wildly romantic lake of CORRISKIN [which see]; and Mount Blaven runs off in a more easterly direction, in the form of a long acute ridge,—lifts its bare rocky summit above the dark and far-extending mass of the whole mountain-assemblage,—and constitutes the highest ground in the island. Between this great conjoint group of red and black heights, and a line drawn from Loch-Snizort to Portree, occur the little valley of Talisker, the green pastures of Lochs Brittle and Eynort, and the low, open, cultivated grounds of Bracadale; but with these exceptions, the whole country is an undulating upland of from 600 to 1,000 feet or upwards in elevation, nearly all covered with brown heath, and barren, naked, and haggard in aspect. The chief heights in this large division are those of the promontory of Dunvegan, and the two flat-topped eminences called Macleod's Tables; and almost the only object of scenic interest is the hasaltic colonnade of Great Brishmeal above Talisker. Along Trotternish, from Portree to Trotternish point, extends a long ridge which abounds in varied combinations of grand and picturesque beauty. The STORR, its loftiest height, is itself an assemblage of pyramidal, tower-like, and grandly elevated summits, and exhibits, in combination with the clouds which alternately sweep and embrace it, a wondrous aerial gallery of romantic pictures; See SNIZORT. The rest of the ridge presents to the west a gradual declivity, and often displays on the east long stretches of precipitous and vertical descent, or successive tiers of mural face, which occasionally become columnar, and blend, as around Loch-Staffin, with the wondrous hasaltic formations of the coast, to produce surpassing magnificence of landscape. On the west side of this ridge lie the rich and interesting ground around Loch-Uig, and the plain of Kilmuir,—the latter, the largest continuous tract of arable land in the island, and emphatically known as the granary of Skye.

The rocks of the heights which range from Sleat-point to Kyle-Rhea are quartz rock, argillaceous schist, and red sandstone, accompanied by a body of gneiss, chlorite schist, and some other substances. Those of the district immediately north-westward are white sandstone, steatite, serpentine, and graphite limestone,—the last greatly the most abundant, occasionally passing into the second and the third, acquiring, toward the north-west, a highly crystalline texture, and finally disappearing beneath mountains of syenite. Those of the great central assemblage of heights are, in the red-streaked portion, chiefly syenite, and, in the dark portion, chiefly hypersthene rock. Those of nearly all the extensive region west and north of the Cuchullins are the most common varieties and forms of trap, overlying secondary formations, and composing unconformable hills and terraces. But on portions of the splendid cliffy coast from Portree to Holme, and on an elevated plateau extending thence to Loch-Staffin, occurs a perfect exhibition of the several series and members of the secondary rocks from the combrash

down to the lias.—The most noticeable minerals found on the island are analcime, chabasite, stilbite, nadelstein, garnet, laumontite, ichthyophthalmite, olive, prehnite, chalcedony, steatite, epidote, hypersthene, and actinolite. The limestone of Strath is, to a considerable extent, unornamental coloured marble, which owes its green and yellow tints to the presence of serpentine, and scarcely yields in heauty to kindred specimens of ancient marbles. Oxidulous iron occurs in thin veins in the Cuchullin and other hypersthenic hills. Beds of shell-marl are somewhat numerous in the limestone districts. A stratum of coal, little more than an inch thick, lying between common shale and siliceous schist, is enclosed in trap between Loch-Sligachan and Conur-dan; other thin and short beds of it are found, in a high position entangled among trap, at Talisker and Scorrihreck; irregular nests and large amorphous masses of it have been found in five or six separate localities,—the largest, in Loch-Portree, having yielded to mining 500 or 600 tons; and beds, rarely more than a few inches thick, occasionally and dispersedly alternate with shale and sandstone, in various parts of Trotternish, but, in most cases, are either overwhelmed or cut off by trap. Yet the whole coal of the island, though an object of much anxiety to proprietors and the inhabitants, seems to be comparatively insignificant in either topographical distribution or economical application.

The rivulets of the island are numerous, and freely drain its surface; and, though of little note as perennial streams, they very often swell to great bulk of volume, and are, for the most part, well-stored with trout and salmon. In two of them, Kilmartin and Ord, is found the great horse-mussel in which pearls are formed. The chief fresh-water lakes are those of Corriskin, Creich, Colmkill, Leathan, Mhoineach-Mhor, Duarrish, Waak, Na-Caplich, and Daalvil; and most of them, together with many lochlets, or permanent ponds, abound in trout and eel. Corriskin is celebrated for its sublime scenery and classical associations; Colmkill, situated in the north-east of Trotternish, is the largest in size, and has its name from a chapel on an islet which was dedicated to Columba; and Na-Caplich is remarkable for containing the rare plant, *ericaucalon*.—The climate of Skye is singularly moist and variable. “When the reader is told,” says Dr. Macculloch, “that I made seven [unsuccessful] attempts, and in five successive summers, to ascend the Cuchullin hills, he will form some notion of the nature of the climate. Sky is, however, exempt from the durable snows which, during the winter, cover the adjoining mainland.” The air is generally laden with vapours; and rain falls, on the average, three days in every four throughout the year. The clouds, attracted by the hills, sometimes break in useful and refreshing showers; at other times, suddenly hursting like a water-spout, they pour down their contents with tremendous noise, deluging the plains below, and often destroying the hopes of the husbandman. But nearly all the farmers, admonished by frequent losses, have wattled-burns with lateral openings closed only by twigs and houghs of trees; and in these they succeed in drying whole or part of the scanty crops, even in the most rainy seasons. Stormy winds set in about the end of August or beginning of September, and give their powerful aid to endanger the uncut crops. Agues, fevers, rheumatism, and dysenteries, as might be expected, are prevailing distempers; yet the climate is far from being aggregately unhealthy, and nurses as large a proportion of the inhabitants to a good old age as many a climate of sensible halminess and amenity.

Over about nine-tenths of the island extends a

trap subsoil equal to probably the best in Scotland, but, for the most part, entirely suffocated by peat or stones, and so exposed to storm and rain as to have its intrinsic excellencies all practically neutralized. Over most of the remaining district extends a calcareous soil, with every variety of elevation, exposure, and drainage; yet, totally unlike nearly all soil elsewhere of its class, it is exceedingly waste and infertile; and, with small exceptions, in the bottom of the valleys, it presents a surface hoggy, brown, and barren, scarcely exceeded in poverty of vegetation by the scanty and stunted soils which lie on quartz, and not even producing, in most places, the well-known plants which are the usual inhabitants of calcareous land. A large proportion of the area of the island is, for economical purposes, all but utterly valueless; most of even the pastures consist of moorland covered with heath and very coarse grass; yet many tracts of green herbage occur, the most conspicuous of which are in Trotternish and around Loch-Eynort. By far the larger proportion of the pastures are occupied in the rearing of a race of black cattle which are noted for their good qualities. The arable lands are, in general, confined to the shores of the sea and some of the sea-lochs, and are most extensive—though even there but a very small part of the area—in Snizort, Bracadale, and Sleat. Though the ancient system of joint-tenure has wholly disappeared, and a considerable extent of land has been reclaimed, and some improvements in husbandry have been introduced; yet the condition of agriculture continues, on the whole, to be comparatively primitive; and, in indication of this, the caschrome, or ancient crooked spade, is very generally in use, as the only succedaneum for a plough, and even the quern, or hand-mill, maintains, in some of the remote districts, its highly antiquated reputation. Excepting in part of SLEAT [which see], wood, though anciently covering a great proportion of the island, is now very nearly unknown. “The almost absolute want of trees,” says Macculloch, “immediately attracts attention; since the form of the land, often affording sheltered situations, is favourable to their growth; while its small value for other purposes removes one of the obstacles to planting; a branch of rural economy that would also be much aided by the facility so often here afforded for enclosing large tracts at a small expense.”

The chief articles of export are black cattle, fish, and kelp. But the proceeds of these, together with the scanty agricultural produce, are not competent to the support of the population. About nine or ten years ago, when such large sums were contributed to the relief of famishing multitudes in Ireland, many of the Skye-men were in almost as much need of charitable aid as the Irish, and might be seen flocking in hundreds to the shore at ebb-tide to gather shell-fish as the chief article of their food. In 1836 and 1837 the distress was so great that the whole of the small tenants, or about one-half of the whole population, were in want, and even those who had money or other means at their disposal, could not find provision to purchase. From about 1821 destitution has, to a less or greater extent, prevailed during two or three months of every summer; and, at an earlier period, it made a sufficient number of visits to be familiar in the island. Government has at various periods sent corn to allay the local famines; and the islanders have been known, at a time when they acquired ability, to reimburse the cost of it, and remit the money to the Treasury. Lord Macdonald and Macleod of Macleod, the two principal proprietors, have not only, during popular distress, been kind and lenient as to rents, but made important contributions; and, in 1837 alone, the former gave upwards

of £2,000 worth of provisions, and at the same time drew, from some districts, a rental less than enough to pay teinds and other public burdens. So greatly is the island over-peopled, in proportion to its resources, that, in spite of very extensive and annually repeated emigrations which have taken place, no amount of public works, such as roads and quays, will operate very visibly for the reduction of distress, till a large proportion of the population be withdrawn. A great and increasing number of the islanders earn a livelihood by temporary removal to the Lowlands of Scotland, either to labour in public-works or to act as harvest-reapers. So very considerable, for a long series of years, has been the permanent emigration to America, that, even eleven or twelve years ago, the assertion became a current *on dit*, that there were as many Skye-men in America as in Skye. Even in Australia a settlement on Hunter's river was so colonized by Skye-men as to have obtained the name of Skye district. But, owing chiefly to friends having preceded them, and to the mode of living by husbandry and fishing being the same as at home, the fields of emigration usually preferred by recent emigrants are Cape Breton and Prince Edward's island.

The inhabitants, in consequence of the arable lands lying along the coasts, and fishing being a joint occupation with husbandry, have almost all their dwellings within  $\frac{1}{4}$  of a mile of either the sea or some one of its inlets. Yet their avocational employment on the fisheries is nearly all confined to the herring-season; and only or chiefly the younger members of families catch rock-cod, cuddies, lythes, and other fish which are used in domestic consumption. They possess, as to dress, none of the distinctive marks of the curious tribes who act as fishermen on the east coast; and rarely, in so much as the article of a short jacket, have they a costume adapted to a sea-faring life. Nor do they hang out any emblem of participation in the hood and usages of the Gael. The kilt is nowhere to be met with, and seems never to have been worn; and the prevailing, almost the universal fashion, is short coats, trowsers of coarse cloth, and the common felt-hat. The Skye-men, in common with some other Hebrideans and western Highlanders, "when they make their appearance in any of the towns of the east coast, may almost be detected by their hats; from the picturesque shapelessness and amphibious consistency which their head-gear speedily acquires from steeping in the Atlantic mists. Such a thing as a straw-bonnet is not to be found among all the female peasantry of Skye, or of the highlands and islands in general. The lasses go hare-headed, trusting to the attraction of the emblematic snood; matrons bedizen themselves with the varieties of the venerable mutch, curtch, and toy; and the clothing of the female population of Skye is hence generally coarse and mean in the extreme. No comfortable cloak of 'guid blue cloth,' which many of the east coast Highland wives have added to their wardrobe, is to be seen. The old women throw a dirty blanket over their shoulders, the others have seldom anything to vary their simple gowns of dark blue or brown stuff. An air of squalid penury, too, soon settles about them; and, in middle-age, their prematurely-pinched, care, and penury-worn features are far from engaging. Kindly feelings and affections, however, live under this unpromising exterior. The people of Skye and the adjacent islands, and west coast of the adjoining counties, are of short stature, firmly knit, active, and more mercurial than the central Highlanders. Such generalizing observations must, of course, not be strictly interpreted." [Anderson's Guide to the Highlands.]

The principal towns or villages are Portree, Stein,

Kyle-Haken, Broadford, Isle-Oronsay, Armadale, and Uig. The old ferry between Skye and the continent is at the narrowest part of the strait of Kyle-Rhea, near the parish-church of Glenelg. An excellent ferry at Kyle-Haken, 5 or 6 miles farther north, connects Skye with the Inverness-road by Loch-Aish, and, in a great measure, supersedes the old ferry. A third ferry, in the sound of Sleat, 14 miles south-west of the old ferry, connects Armadale or Ardivazar-point with Arisaig. One road commences nearly at Sleat-point, and runs north-eastward by Armadale to Loch-na-Daal, and thence northward to Broadford;—another runs north-westward from Kyle-Rhea to Astak;—another runs from Kyle-Haken, along the east coast, by Astak and Broadford, and, at these places, connects itself with the two former; it thence makes a serpentine movement from side to side of the narrow part of the island to the head of Loch-Sligachan; and it there forks into two branches, the one of which extends northward to Portree, while the other extends north-westward to Dunvegan and near the extremity of Vaternish;—and another, the continuation of the northerly branch of the former, starts from Portree; makes a tour of the whole coasts of the peninsula of Trotternish; and, at a point  $2\frac{1}{2}$  miles east of the head of Loch-Smizort, sends one line right onward in a return to Portree, and another off at a sharp angle to proceed westward to a junction with one of the former lines in Vaternish.

Numerous ruins occur on different parts of the coast, of those circular structures which, whether fort, watch-tower, beacon, or temple, are usually called Danish; such of them as were forts are all designated duns,—such as Dun-Skudborg, Dun-Derig, Dun-Skeriness, and Dun-David; but they are, in every instance, so far destroyed as to convey hut a very slender notion of their original condition. Of various monumental, or possibly Druidical stones, the most conspicuous are those near Loch-Uig. A cairn on the summit of Ben-na-Caillich is seen at a great distance, possesses very unusual magnitude, and is the subject of some local legendary traditions. Dunvegan-castle is the only very remarkable ruin of a modern-antique structure. Knock-castle survives in only a small part, and seems to have been merely a castellated mansion. Duntulm-castle, though small, is somewhat entire, and displays, what is rare in Highland structures of its class, some remains of architectural ornament. Dunscaich, the traditional residence of 'the King of the Isle of Mist,' and an object of interest to persons versant in Gaelic poetry, is the scanty ruin of a comparatively modern building, which could not have been the Dunscaich of song.

Some particulars as to the political administration of Skye, are stated in the article on PORTREE. The island is ecclesiastically divided into the 7 *quoad civilia* parishes of Braacadale, Duirinish, Kilmuir, Portree, Sleat, Smizort, and Strath, and the 2 *quoad sacra* parishes of Hallen and Stenschall. These parishes, together with that of Small Isles, constitute the presbytery of Skye, in the synod of Glenelg. The patronage of Braacadale and Duirinish belongs to Macleod of Macleod; and that of all the other parishes to the Crown.—Lord Macdonald is proprietor of about three-fourths of the island, and, excepting Strathaird and another estate, which belong respectively to Macalister and to Macleod of Raasay, Macleod of Macleod is the proprietor of the remainder. The resident gentry are noted for their hospitality, and surprise a Southron by surrounding him with all the comforts and elegancies of life. Population, in 1821, 20,627; in 1831, 22,796. Houses 3,985.

## SLAINES-CASTLE. See CRUDEN.

SLAINS, a parish, very nearly in the form of an isosceles triangle, on the west coast of Aberdeenshire. It is bounded on the north by Cruden; on the south-east by the German ocean; and on the west by Foveran and Logie-Buchan. Its north side measures  $4\frac{1}{2}$  miles, and each of the other sides  $6\frac{1}{2}$ . A brook which strikes the Ythan at a sudden bend of the latter, and afterwards the Ythan to the sea, trace all the western boundary, and cut the parish into a cuneiform peninsula. The Ythan is here navigable for sea-borne vessels; and it abounds in salmon, flounders, cockles, and mussels, and, at a comparatively recent period, furnished large pearls. The loch of Slains, nearly in the centre of the parish, covers about 54 acres; has a mean depth of about 25 feet; abounds with pike, perch, and eel; and is encompassed with pleasant green banks, which require only some sylvan embellishment in order to the whole scene being softly and charmingly picturesque. Several good medicinal springs, chiefly chalybeate, have been useful in cases of gravel and bile. One-third of the coast is a sandy beach; and the rest is high rocky cliff, strangely torn and indented, and presenting vast and horrible chasms. Of several caves which perforate the yawning cliffs, one is nearly 600 feet long, and occasionally 20 feet high,—and another, called the Dropping cave, or the White cave of Slains, is so richly incrustured with stalactites, and profusely watered with the calcareous drippings from a porous rock which forms them, that though the whole has been prosaically swept away for transmutation into manure, a new gorgeous coating, similar in appearance to carved white marble, has been very rapidly formed. The surface of the parish is in general level, and the soil fertile; and, in consequence chiefly of a great local supply of marl, limestone, and shell-sand, georgical improvement walked comparatively early abroad, and acted with energy, diligence, and skill. The chief plantations are around Gordon-lodge, the seat of the Gordons of Pitlurg. On a strong peninsulated rock, whose base is washed by the sea, stands the ruin of the ancient castle of Slains, formerly the seat of the Errol family, and demolished, in 1594, by James VI., on the rebellion of the Earl of Huntly. In a hollow, by the side of a brook, stand the ruins of a very ancient chapel, dedicated to Adamnan, the successor of Columba, and possessing entire an arched Gothic window. A corner of the parish is cut by the road from Aberdeen to Peterhead; and the rest of the district is well-provided with facilities of communication. Population, in 1801, 970; in 1831, 1,134. Houses 254. Assessed property, in 1815, £3,043.—Slains is in the presbytery of Ellon, and synod of Aberdeen. Patron, Gordon of Cluny. Stipend £217 9s. 4d.; glebe £9. Unappropriated tithes £57 19s. 4d. Schoolmaster's salary £30, with £14 fees, and £2 10s. other emoluments. The present parish comprehends the ancient parishes of Slains and Forvie, and seems, as to its ecclesiastical property, to have all belonged before the Reformation to one of the colleges.

SLAMANNAN, a parish of a triangular form, in the extreme south-east of Stirlingshire; bounded on the north by Falkirk and Muiravonside; on the south-east by Linlithgowshire; and on the south-west by Lanarkshire. It measures  $6\frac{1}{2}$  miles along the north, 4 miles along each of the other sides, and about 11 square miles in area. Such is the ancient parish; but, about the year 1730, there was annexed to it a part of Falkirk parish, about  $4\frac{1}{2}$  miles long from east to west, and about 1 mile in mean breadth; and this district has Muiravonside on the east, and Dumbartonshire on the west. Avon-water runs all

the way between the two districts, and over the remaining part of the northern boundary of the old, cutting off the ancient parish from the rest of Stirlingshire. Eight cutting indigenous brooks join it in its progress; one of them tracing much of the boundary with Linlithgowshire, and, at one place, expanding itself into a lake. Black-loch, on the south-western boundary, measures  $\frac{3}{4}$  of a mile, and sends off its superfluous waters to the great canal reservoir. Little Black-loch, a lake of much similar size, is situated in the interior. Ellridge-loch, in the annexed or northern district, is  $\frac{3}{4}$  of a mile, and sends off sufficient water-power to drive machinery. The lands for about half-a-mile on each side of the Avon have an interspersion of haughs and meadows, and are of a light, friable soil; those for a mile in breadth, in the interior of the old district, are a strong, hard clay; and those in the northern and southern extremities, are naturally churlish and morassy; but, in the aggregate, they are finely cultivated, and have a pleasant appearance. In the mossy lands there is still some expanse of unreclaimed bog. Several castles which once stood in the parish have disappeared. Of two conical artificial mounds, similar in form and supposed design to those of DUNPACE [which see], one was levelled and made the site of the church. The mansions are Balquhaston, Bankhead, and Ellridge. The parish, though profusely provided with facilities of communication, is not traversed by any great line of road. Population, in 1801, 923; in 1831, 1,093. Houses 196. Assessed property, in 1815, £3,745.—Slamannan is in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. Patron, the Crown. Stipend £256 11s. 10d.; glebe £28. Schoolmaster's salary £34 4s. 2½d., with £20 fees, and £13 other emoluments. There is a private school. Part, or perhaps all, of the parish was obtained in 1470 from James II., by Lord Livingstone; and, along with the advowson of the church, was held by his lordship's successors, the Earls of Linlithgow and Callander, till their attainder in 1716. The parish appears to have been anciently called St. Laurence,—on account, of course, of the dedication of its church to the saint; and, in presentations and other legal instruments, it is still designated 'the parish of Slamannan, otherwise St. Laurence.' An excellent fountain, a little south-east of the church, still bears the name of St. Laurence's well.

SLAMANNAN\* RAILWAY. This railway derives its name from the above parish, through which it passes. Prior to the formation of the railway, the only roads existing in this part of the country were little better than tracks formed by droves of cattle passing between the South and the annual cattle-trysts at Falkirk, which have, of late years, been improved, though still bad enough.—The turnpike-road, by Bathgate to Edinburgh, passes about 3 miles south of the parish-church, and that by Falkirk about 5 miles to the north. The act of parliament for constructing the railway was passed in 1835. The line is in fact a continuation of the Glasgow and Garnkirk and the Ballochney railways, though different companies, and extends

\* The word *Slamannan* is said to signify in Gaelic 'the back of the world.' If this etymology is correct, the name seems to be appropriate enough, as a more out-of-the-way lying parish is, perhaps, not to be found in the south of Scotland; and this is the more to be wondered at, seeing that it lies in a direct line, and equidistant between the two principal cities of Edinburgh and Glasgow. Tradition informs us that persons, who had committed any crime, took refuge in Slamannan—as Rob Roy did of old in the Highland recesses—for as the saying went—'Into Slamannan sail from the world,'—no metropolitan policeman daring in those days to penetrate so far inland, more, perhaps, from the fear of starvation than from any opposing force they might have to encounter, as in the case of the 'Bold outlaw.'

from the eastern terminus of the latter railway in the parish of New Monkland and county of Lanark, to a point on the side of the Edinburgh and Glasgow Union canal, in the parish of Muiravonside and county of Stirling, called Causewayend. Its total length is  $12\frac{1}{2}$  miles, and the distance of its eastern terminus (Causewayend) from Glasgow, is about 26 miles,—and from Edinburgh, in a direct line, 19 miles,—and by the canal 24 miles. Though the country through which it passes is unfruitful on the surface, it has been lately proved to be rich in minerals,—and upon this understanding were the proprietors of the railway induced to expend the amount necessary for its formation, about £140,000. The line was opened in the autumn of 1840, and since then has been in full operation,—the traffic consisting principally of minerals, a considerable quantity of coals being sent along it, and thence per Union canal to Edinburgh; and more coal and ironstone fields are being opened up, and connected with the railway, the supply from which will, it is expected, increase the traffic to such an extent as will afford a very profitable return to the company. The iron-works near Airdrie are also partly supplied by minerals sent along the western part of the railway. A passenger-trade has been carried on since the line opened between Edinburgh and Glasgow, and intermediate places, in connection with the contiguous railways and stage-coaches and canal boats, between Causewayend and Edinburgh. Previous to the opening of the Edinburgh and Glasgow railway, about 3,000 passengers per month were thus conveyed between the two cities. The total revenue of the company, in 1841, was between £8,000 and £9,000,—it having only been one complete year opened. The whole of the trade is carried on by locomotive power, except the incline, which is wrought by a stationary engine; and though the gradients are often as steep as 1 in 100, the passenger-trains travel at an average rate of 25 miles an hour,—and with a gross load of 60 to 70 tons of goods at the rate of 10 to 18 miles an hour. The company are provided with 5 locomotives, 12 carriages, and about 100 waggons.—The cuttings, embankments, and bridges, which are extensive and numerous, are all formed for a double railway, though only a single way of rails has been laid, the traffic not having as yet required the second line. The whole of the works are substantially constructed. The line at the western end passes over a flow-moss from 30 to 40 feet deep, for a distance of 2 miles. Here the rails had to be literally floated on rafts of timber, and continued floating for some time after the trade commenced, until at length, by continued pouring in of hard material,—such as gravel, stones, &c.—this part of the road is now comparatively firm and solid. It had, however, for some months after the trains commenced to run, a very singular, and to many, an alarming appearance,—the engine and carriages, as they went along, causing a deflection of the platforms or rafts, of from 2 to 3 feet, which gradually rose to their proper level behind the train, exactly like a sluggish wave, as soon as the whole had passed over.

SLATEFORD, a village in the extreme east of the parish of Colinton, Edinburghshire. It stands on the left bank of the water of Leith, on the road from Edinburgh to Lanark by way of Carnwath; and is  $3\frac{1}{4}$  miles south-west of Edinburgh, and 3 miles north-east of Currie. It is the site of a United Secession meeting-house, and of an extensive bleach-field. Connected with the meeting-house, but available for the whole village, is a library. The Union canal is carried across the vale of the water of Leith

at the village by a lofty aqueduct of 8 arches. Population about 220.

SLEAT, a parish at the south-east end of the island of Skye, Inverness-shire. It forms an irregular belt of 21 miles in length; and extends from north-east to south-west. Loch-an-Daal, which indents it on the south side to the depth of 2 miles, and leaves an isthmus of only about  $1\frac{1}{4}$  mile to the head of Loch-Eishart on the opposite side, cuts the parish into two natural divisions. The north-east division is  $8\frac{1}{2}$  miles in length, and about  $1\frac{1}{2}$  mile in mean breadth; it is separated by a lofty hilly range from the parish of Strath, or the rest of Skye; and it is washed on the other sides by Loch-Alsh, Kyle-Rhea, and the inner part of the sound of Sleat. The south-west division forms a slenderly ellipsoidal peninsula, whose axes measure respectively  $12\frac{1}{2}$  and  $5\frac{1}{2}$  miles; it is on the long sides of Loch-Eishart and the sound of Sleat; and it terminates in a headland, which is called Slat-point, and looks toward Eig at the distance of  $5\frac{1}{2}$  miles. The entire area, exclusive of lakes and sea-lochs, is 33,335 acres. The sound of Sleat, which divides the parish from Morar, Knoydart, and Glenelg, on the continent, diminishes in width from  $7\frac{1}{2}$  miles at the south-west entrance, to  $\frac{1}{4}$  of a mile at Kyle-Rhea, where it passes into Loch-Alsh. The population is almost wholly located upon the coasts. The extremities of the parish are all upland; but constitute tolerable pasture-ground, and maintain a race of black cattle equal to any in the neighbourhood. The whole north-west side is a pleasant, and occasionally picturesque range of rough heights and cultivated slopes and hollows. The east side, over about 5 miles by from 1 to  $1\frac{1}{2}$ , is a belt of arable land, carpeted with a deep and not unproductive clay. Woods, both natural and planted, are extensive and luxuriant; three considerable copses of oak, ash, elm, birch, mountain-ash, hazle, and willow, are the only remnant of the ancient forest of Skye; and the plantations exist principally around Armadale-castle, and toward the manse. The New Statistical Account, assuming the whole area to be only 23,856 acres, states it to be distributed into 1,335 acres of arable land, 3,956 of green pasture, 18,265 of hill-pasture, and 500 of wood. The only mansion is ARMADALE: which see. Two old castles, Dunskaich and I-Chamuis, both anciently the residences of the barons of Sleat, survive in fragmentary ruins which evince them to have been places of considerable strength. ORANSAY-ISLE [which see] possesses a well-known harbour, and gives the parish valuable facilities of communication. A parliamentary road runs across the north-east end of the parish from the ferry of Kyle-Rhea, and district-roads radiate from Isle Oronsay. Population, in 1801, 1,903; in 1831, 2,957. Houses 500. Assessed property, in 1815, £20,223.—Sleat is in the presbytery of Skye, and synod of Glenelg. Patron, the Crown. Stipend £158 6s. 7d.; glebe £6. The church was built in 1681. Sittings about 500. All the parishioners, excepting one Baptist and about 30 Roman Catholics, profess to be churchmen. A catechist, salaried at £7, is maintained by the society for propagating Christian knowledge. The parochial schoolmaster's salary is £30, with £3 fees. Attendance, in 1834, 85. A schoolmaster, employed by the society for propagating Christian knowledge, is paid £15, and has a house and a piece of land. Average attendance 80. A schoolmaster, supported by the General Assembly, is paid £4. Average attendance 65.

SLEUGACH. See LOCH-MAREE.

SLIGACHAN, a marine loch and a savagely grand glen, in the island of Skye. The loch is

noticed in the article **PORTREE**: which see. The glen commences in the vicinity of Corriskin and Scavaig, and strongly resembles them in scenic character: see **CORRISKIN** and **SCAVALG**. Its length north-north-westward to the head of Loch-Sligachan is about 5 miles; and thence north-north-eastward to the sea, about 3 miles. Its breadth, nowhere more than a mile, contracts in some places to a gorge of a few hundred yards. Its flanking heights are composed principally of black-looking hyperstein rock, almost totally destitute of vegetation; they soar aloft, now at a slight angle, now perpendicularly, to sublime altitude; and they terminate in such edgy ridges and needle-peaked pinnacles, as even the hardest mountaineer may contemplate with wonder. The Messrs. Anderson, in their tasteful and graphic 'Guide to the Highlands,' pronounce this glen a rival, in wildness and grandeur, to any of the most established fame in Scotland, and add:—"The mountains are a great deal higher, bolder, and not less savage than those of Glencoe; and, in traversing this sequestered strath, we feel a constant and almost painful consciousness, that no other form of mortal mould exists within its desert precincts. A solemn silence generally prevails, but is often and suddenly interrupted by the strife of the elements. The streams become quickly swollen, rendering the progress of the wayfaring stranger not a little hazardous; while fierce and fitful gusts issue from the bosom of the Cuchullins. The heaven-kissing peaks of this strange group never fail to attract a portion of the vapours, which, rising from the Atlantic, are constantly floating eastward to water the continent of Europe; and fancy is kept on the stretch to find resemblances for the quick succession of fantastic appearances which the spirits of the air are working on the weather-beaten brow of these hills of song."

**SLITRIG, SLITRIDGE, or SLITTERICK, (THE)**, a rivulet of Teviotdale, and a tributary of the Teviot, Roxburghshire. Both of two rilly head-streams which form it respectively 3 and 3½ miles below their sources, have their origin within a few hundred yards of the summit-line of the lofty mountain-range which divides Teviotdale from Liddesdale, and forms the water-shed between the streams of the eastern and those of the western sea, the one rising on the east side of Leap-hill, in Hobkirk, and the other on the south side of Greatmoor-hill, in Upper Cavers. The united stream, exclusive of sinuosities, has a course of only 5½ miles, which it pursues through the parishes of Cavers, Kirkcoun, and Hawick, and then falls into the Teviot at the town of Hawick. Its descent is very great,—probably not much short of 1,000 feet; and its current is, in consequence, rapid and impetuous. Over a great part of its course, it has a rocky path; occasionally it careers down a shelving descent; and, at one place, it forms a picturesque linn or cataract. Its vale, though gorgy, and screened by bold green heights, repeatedly expands into little haughs; and is pleasantly tufted with wood; and, so high up as 4 miles above Hawick, or just within Upper Cavers, is spread out into the rich and beautiful demesne of Stobs-castle, the seat of Sir W. F. Elliott, Bart. The stream, as a whole, is charmingly picturesque; and it imparts some fine features to the town-landscape of **HAWICK**: which see. Dr. Leyden, one of several poets who have celebrated it in verse, seems to have been annoyed by the harshness and slubberliness of its name, and capriciously gives it the soft designation of 'Slata.' The rivulet, as might be inferred from its location and gradient, is subject to sudden, rapid, and high freshets.

**SLOY (LOCH)**. See **ARROUHEAR**.

**SMALHOLM, SMALLHOLM, or SMAILHOLM**, a parish in the north-west corner of the Merse district of Roxburghshire; bounded wholly on the north and the west, and partly on the south and the east, by Berwickshire,—chiefly on the south by Makerston,—and chiefly on the east by Kelso. Its greatest length, from east to west, is 4½ miles; its greatest breadth is 2¾ miles; and its superficial extent is about 3,970 acres. The surface is agreeably undulating, and lifts its highest ground about 500 feet above sea-level. The soil is very various; but, in general, has a mixture of clay, and is tolerably fertile, and highly susceptible of cultivation. Excepting about 60 acres of plantation, and about 450 acres of natural pasture, the whole area is in tillage. Limestone occurs, but is not worked; and hard trap rock is sufficiently plentiful to furnish large supplies of road metal. The only noticeable stream is the Eden, which runs 2½ miles along the northern boundary. The village of Smalholm, with a population of about 360, stands nearly in the centre of the parish, on the post-road between Edinburgh and Kelso, 6 miles west-north-west of Kelso, and 7 east-north-east of Melrose; but it is properly a cluster of 3 villages which bear the names respectively of East-Third, West-Third, and Overtown.—The farm of Sandy-knowe, in this parish, was the property of the paternal grandfather of Sir Walter Scott, and the scene of many of the musings of his precocious boyhood. Sandy-knowe or Smalholm-tower, situated among a cluster of rocks, on an eminence in the farm, engaged much of his attention, and has acquired celebrity from having afforded such suggestions and imagery as materially contributed to the formation of his peculiar style of poetry. It is a large square building, entirely ruinous, and originally a border-keep; and, previous to enchantment being flung over it by the mighty modern minstrel of Scotland, it figured in topographical notices simply as "a conspicuous landmark to direct vessels to Berwick." The apartments rise above one another in separate floors or stories, and mutually communicate by a narrow stair. An outer wall surrounds the building, and encloses an outer court; and it is so defended on three sides by precipice and morass, that the tower is accessible only by a steep and rocky path on the west. It anciently belonged to the Pringles of Whytbank, and is now the property of Lord Polwarth, the lineal descendant of Scott of Harden. Sir Walter Scott, in a note prefixed to the 'Eve of St. John,' says that he wrote that ballad in celebration of Smalholm-tower and its vicinity; and in the epistle preliminary to the third Canto of *Marmion*, he notices the influence which the place had exerted on his tastes, and beautifully describes its scenery.—Population, in 1801, 446; in 1831, 623. Houses 122. Assessed property, in 1815, £3,888.—Smalholm is in the presbytery of Lauder, and synod of Merse and Teviotdale. Patron, Bailie of Jerviswood. Stipend £205 12s. 9d.; glebe £17 5s. Unappropriated teinds £391 4s. 8d. The church was built in 1632, and has often been repaired. The monks of Dryburgh had lands in the parish; and the monks of Coldingham owned the church, and served it by a vicar. Parish-schoolmaster's salary £34 4s. 4½d., with £26 or £27 fees, and £4 14s. other emoluments. In 1834, the parish-school was attended by 93 scholars, and a private school by 60.

**SMALL ISLES**, an Hebridean parish consisting of the inhabited islands of **ETEC**, **RUM**, **CANNA**, and **MUCK**, which are separately described, and of two or three uninhabited islets noticed in the articles on these islands. Eigg is in Inverness-shire; and the other islands are in Argyleshire. Population, in 1811, 1,547; in 1831, 1,005. Houses 159.—The par-

ish is in the presbytery of Skye, and synod of Glenelg. Patron, the Crown. Stipend £158 6s. 7d.; glebe £25. The minister resides in Eigg. There is no parish-church. A school-house in Eigg used as such has no pews, and is distant about 20 miles from Canna, 8 from Rum, and 6 from Muck. The only place of worship in the last of these islands is a farmhouse or the open fields. A mission in Rum and Canna, supported by £75 a-year from the royal bounty, was suppressed in 1835. About one-half of the population are churchmen; and the other half are nearly all Roman Catholics. A Roman Catholic place of worship, consisting of the lower part of an inhabited dwelling-house, and measuring 40 feet by 20, exists in Eigg. Stipend £20. The parish-school is in Eigg; and there is a Gaelic Itinerating school in Muck. The parish, previous to 1726, formed part of Sleat; and after its separate erection, it bore the name successively of Eigg, Short Isles, and Small Isles.

**SMITHYHAUGH**, a village of quite modern erection, in the parish of Auchterarder, Perthshire. It is pleasantly situated on Ruthven-water, about 2 miles east of the town of Auchterarder. Its inhabitants are chiefly weavers in the employment of the Glasgow manufacturers. Population 400.

**SNIZORT**, a parish in the island of Skye; bounded on the north by Kilmuir; on the east by the sound of Raasay; on the south by Portree; and on the south-west by Bracadale; and on the west by Duirinish and Loch-Snizort. Its greatest length, from north to south, is 12 miles; its greatest breadth is 6 miles; and its superficial extent is about 60 square miles. Loch-Snizort enters from the Little Minch, between the points of Vatarnish or Unish and Duinn, and is there  $9\frac{1}{2}$  miles wide; it penetrates  $8\frac{1}{2}$  miles south-south-eastward, between Vatarnish and Trotternish, with a breadth which gradually decreases to  $4\frac{1}{2}$  miles; it has nearly in its centre the cluster of little islands, called the Ascrib Isles; and it sends off, in the manner of horns from its head, the two divergent lochs of Greeshernish and Snizort-Beg. The latter is partly on the boundary, and partly in the interior of the parish; it is  $5\frac{1}{2}$  miles long, and less than 1 mile in mean breadth; it forks and circles into numerous sea-lochlets and hays; and it is shallow, and has frequent sunk rocks. Loch-Uigg, which goes off Loch-Snizort 3 miles above the entrance of Loch-Snizort-Beg, forms a circular basin, landlocked on all sides but the west, and upwards of  $1\frac{1}{2}$  mile in diameter; and  $\frac{1}{4}$  of a mile from its margin, the ground suddenly rises in the form of an amphitheatre, enclosing upwards of 200 acres of prime arable land, and a hamlet or seat of population with about 600 inhabitants. The coast, except at the head of the lochs, is bold and rocky. The surface of the interior is a broken and rugged expanse of green and heathy heights, cloven by the three considerable glens of Haltin, Hiuistil, and Uigg, and by several minor openings. The only properly mountainous ridge—the rest of the heights being merely hills—runs from north to south at a distance of between 1 mile and 2 miles from the east coast; this ridge bears the name of the Storr, and is huge, lofty, shaggy, and pinnacled; and it sends up a chief cluster of cliffy and torn summits, which rise to the height of several hundred feet above the adjacent masses, and which shoot up from the bosom of a fog like a series of air-borne spires, and towers, and walls,—a far-away city on the clouds. Seven streamlets are frequented by salmon, and often swell into large and impetuous rivers. Much of the parish is irreclaimable waste; and most of the remainder is occupied in the rearing of black cattle. The soil of the arable grounds, though various, is prin-

cipally a gravelly loam on a cold clay. The large farmers have adopted approved and scientific principles of agriculture; but the crofters pursue the old system, use the old implements, and expend vast labour in doubtful stirring, and sometimes in actually damaging the soil. The herring-fishery, once great and lucrative, has of late years failed; but a salmon, and cod, and ling fishery in Loch-Snizort sends large supplies to the Clyde and the Mersey.—In an islet formed by the water of Snizort, and now used as a cemetery, are the ruins of an old cruciform church, which probably was once the cathedral or parent-church of the whole island. In various localities are cairns, tumuli, and vestiges of Druidical temples. On low ground, near a lofty rock, is a natural obelisk of uncommon height or magnitude; seeming, when seen from a distance, to be a large steeple; measuring 360 feet around the base; swelling below the middle to a larger girth; and thence tapering away to nearly a sharp point at an altitude, as is thought, of upwards of 300 feet. On the boundary with Portree, is a beautiful cascade over a precipice of about 90 feet in height. Beneath it, and nearly opposite its middle, an arched hollow path passes across the rock, so broad that five or six persons may occupy it a-breast, and so situated that they are secure from the body of water which rolls over them, and, but for seeing it dash upon the rocks below, might suppose it to be a thick curved pillar of smoke. A good road traverses the whole length of the parish, connecting Uigg with Portree. Population, in 1801, 2,144; in 1831, 3,487. Houses 558. Assessed property, in 1815, £833.—Snizort is in the presbytery of Skye, and synod of Glenelg. Patron, the Crown. Stipend £158 2s. 11d.; glebe £15. The parish-church was built about 35 years ago. Sittings 450. A thatched house at Uigg, with accommodation for 400, is occupied every fourth Sabbath as a preaching-station by the parish minister. A Baptist chapel at Uigg, belonging to a congregation established about the year 1808, was built in 1812. Sittings 30. Stipend from £40 to £50, paid out of the general Baptist fund. All the parishioners, except about 20, are represented to be churchmen. In 1834, the parish-school was attended by 49 scholars; and four other schools by 299. Parochial schoolmaster's salary £30, with £2 13s. 6d. fees, and £4 16s. 9d. other emoluments. Two of the non-parochial schools are wholly for Gaelic reading; a third belongs to the General Assembly.

**SOA**, an island of the Hebrides, south of Minginish, and south-west of Loch-Scavaig, in Skye. It is separated from Minginish by Soa-sound, from  $\frac{3}{4}$  of a mile to  $1\frac{1}{2}$  mile broad. The island is 3 miles long from north-east to south-west, and  $2\frac{1}{2}$  miles in extreme breadth; but it is nearly bisected by two bays, indenting it on opposite sides. Its surface is low and broken, and nowhere rises to an elevation of more than 400 or 500 feet; and its coast is bold and rocky, and generally presents to the surge perpendicular cliffs of 60 or 70 feet in height. Its geognostic structure is an alternation of red sandstone and greenwacke, traversed by trap.

**SOA**, an island of the Hebrides, about a mile in circumference, forming one of the small remote group of St. Kilda.

**SOAY** (**MICKLE** and **LITTLE**), two small islands in the mouth of West Loch-Tarbet, on the west coast of Harris. They lie about  $\frac{1}{2}$  of a mile apart; are jointly upwards of  $1\frac{1}{2}$  mile long; and are separated from Harris by the sound of Soa, which is  $\frac{3}{4}$  of a mile in width.

**SOAY**, a small pasture-island near the entrance of Loch-Inver, Assynt, in the west coast of Sutherlandshire.

SOLWAY FRITH (THE), a gulf or very large bay, projecting from the Irish sea north-eastward between Scotland and England. Its commencement or entrance on the English side is obviously at St. Bee's-head in Cumberland; but, on the Scottish side, is far from being distinctly marked, and has been very variously stated. Burrowhead, at the southern extremity of the district of Machars in Wigtownshire, is the furthest and the most commonly assigned entrance; yet between that headland and Balmae-head or even Balcarry-point, respectively 14 and 24½ miles in a straight line east-north-eastward, the whole Scottish coast directly confronts the entire expanse of the Irish sea. Measured from Burrowhead, it extends about 58 miles in length and 37 miles at the entrance; but measured, as we think it ought to be, from Balcarry-point, it is little more than half the measurement at the entrance, and only about 33½ miles in length. From Balcarry-point to the little estuary of the Pow in the parish of Cumnertrees, it extends nearly direct north-eastward,—gradually contracts in its limits, though with occasional expansions,—and has a breadth in the maximum of about 19 miles, in the minimum of about 8, and in the mean of about 13; and from the estuary of the Pow to its termination—a distance of 12 miles—it extends, in an easterly direction, and has a varying breadth of from 1½ mile to 3½ miles, and a mean breadth of about 2½,—the maximum being at the estuary of the Pow and in the parish of Greta, and the minimum in a line between the parish of Annan and Bowness, and in the short space east of Redkirk-point. The frith's marine expansions, and its receptions of running water, are few and unimportant on the English side compared to the Scottish, and, such as they are, belong to the hydrographical topography of England. The Sark, the Kirtle, and some smaller streams enter it on the Dumfries-shire coast, without forming estuaries. The Annan, the Pow, and the Lochar enter it on the same coast through estuaries of but small extent. The Nith, before entering it, forms a long and gradually expanding estuary between Dumfries-shire and Galloway. The chief streams which enter it in Galloway, calculating to the extreme point of Burrowhead, are the Southwick, the Urr, the Dee, the Fleet, the Cree, and the Bladenoch; and its principal marine expansions within the same range of sea-board, are the estuary of the Urr, Auchencairn-hay, Kirkcudbright-bay, Fleet-hay, and, chief of all, Wigton-bay. The coast along Dumfries-shire is low and sandy, and ascends by an exceedingly low gradient from the line of high-water mark; but along the greater part of Galloway it is hold and rocky, and exhibits cliffs, caverns, pinnacles, isolated rocks, and a variegated rampart in such frequent and curious combinations as to produce abundance of picturesque scenery.—The Solway, as to the depth of its water, the character of its beach, and especially the phenomena of its tides, differs widely from every other frith in Scotland, or even from every other marine indentation in the world. The cause of its peculiarities is briefly explained in the section, 'MARINE WATERS,' in our general introductory article, and needs not be again noticed. Over a distance of probably about 20 miles from its head, the whole of its bed, excepting the narrow and canal-like channels of the Nith and the confluent waters which enter near the eastern extremity, is alternately a surgy brown sea, tintured with silt, and oscillating with the rebound of the tide, and a naked, flat, unrelieved expanse of sand, a wilderness of desolation, a miniature Sahara, strangely interposing its dark and dreary projection between the blooming slopes of Cumberland and the finely outlined and warmly tinted lands of Scotland. Much

of its beach, or rather of its bed, even its broader and more seaward parts, is of the same character; so very much, indeed, that were the frith estimated or admeasured only by the space it covers at low-water, it would figure in comparative insignificance, or exceedingly limited proportions. All its tides are rapid, and constitute rather a rush or careering race than a flow or a current of waters. A spring tide, but especially a tide which runs before a stiff breeze from the south or the south-west, careers along at the rate of from 8 to 10 miles an hour; it is heard by the people along the shore upwards of 20 miles before it reaches them, and approaches with a hoarse and loud roar, and with a brilliance of phenomena and demonstration, incomparably more sublime than if the wide sandy waste were densely scoured with the fleetest and the most gorgeously appointed invading army of horsemen; before the first wave can be descried from the shore, a long cloud or bank of spray is seen, as if whirling on an axis, and evanescently zoned and gemmed with mimic rainbows, and the rich tintings of partial refractions, sweeping onward with the speed of a strong and steady breeze; then follows a long curved white and flowing surf; and when the magnificent banner of spray, and this surfy pioneer have made distinct announcement, finally and suddenly appears the majestic van of the tide, a speckled and deeply dimpled body of waters, from 3 to 6 feet high a-breast, rolling impetuously forward, and bringing closely in its rear a tumbling and tempestuated mass of marine vales and hillocks, glittering and gorgeous all over with the most fitful play of the prismatic colours. As the tide enters the contracted parts of the frith and the lower parts of the side estuaries, it acquires such additional features of romance and novelty as render it altogether an object *per se*, and one of the most interesting that can form a main feature of any landscape: See GLENCAPLE. Accidents occasionally occur with ships, and have been very frequent, though much less so of late years than before, with persons venturing within high-water mark. The rivers which traverse the bed of the frith being easily fordable, strong inducement is offered by the shortness of the path to cross the sands to England during the recess of the tide. But Scotchmen, even when well-mounted, have, in numerous instances, and occasionally on an amount constituting a literal catastrophe, been overtaken and drowned, while returning from the Cumberland fairs. Even persons best acquainted with the locality are liable to be mistaken in their calculations of the time when the tide will approach; and, when they have proceeded partly across, may hear the appalling sound of the watery invasion so near and menacing, that a clear atmosphere, a good steed, much self-collectedness, and a steady remembrance of the direction of the path, may all be necessary for their preservation. Dense fogs frequently arise, and so bewilder professed and experienced guides, that they can proceed in safety only with the aid of the compass; and quicksands are occasionally formed, and fitfully shift their localities, obscurely but awfully menacing every intruder who has not watched the impressions made upon the ground by almost every successive tide.—The fisheries of the Solway are extensive and various. Some curious particulars respecting their former condition, as every reader of Sir Walter Scott's novels knows, are worked into the tissue of the most stirring incidents in the tale of Redgauntlet. The mode of fishing is principally by stake-nets, which are wholly submerged by the tide, and which, when the tide is out, contribute their lank proportions and thoroughly prosaic appearances to the pervading dreariness of the landscape. Salmon, herling, sea-trout, flounders,

and codlings or small cod, are taken in large quantities; turbot and soles occur, but are not plentiful; herrings, at a former period, were in some seasons caught and cured in great abundance, but of late they appear but occasionally, and not in large numbers; and mussels and cockles are gathered along the shores by poor persons, and carried weekly to the markets of Dumfries and Carlisle. The fishings usually commence early in March, and close before the end of September.—The Solway, in spite of the singular and rather dangerous character of its tides, is of vast value to Dumfries-shire and Kirkcudbrightshire for its navigation; much more so, in proportion, than it is to Cumberland. Not only the seaboard, but most of the interior of the counties, is too far distant from Scottish coal of any sort, and especially from coal of good quality, to obtain it by land-carriage; and is dependent on Workington, Whitehaven, and other places near the mouth of the English side of the Solway, for supplies of fuel. The amount of tonnage in vessels employed in importing coals is, in consequence, aggregately great. The export trade of the two counties, too, or the outlet for the produce of their arable farms, their grazing-grounds, their sheep-walks, their dairies, and their poultry-yards, is almost wholly with Liverpool and other English towns on the western coast, and exists in a profitable or even available way only by the navigation of the Solway. Three steamers, two of them large and powerful, now regularly ply to Liverpool, from respectively Dumfries, Annan, and the ports of Galloway; and, additional to the usual advantages of stean-conveyance, yield the local and valuable one of clearing the Solway at a single tide. Ports are numerous; and safe landing-places occur at rapid intervals along nearly the whole coast. The chief and presiding port is that of DUMFRIES; which see. Ordinary tides rise about 10 or 12 feet, and spring tides about 20; and they fling enough of water up to the very head of the frith, to let vessels of 120 tons move up the channel of the stream to the foot of the river Sark. The Solway has long been gradually receding from the land: it once filled the large area now occupied by Lochar-moss; it covered less than a century ago lands which are now verdant or arable a mile distant from the present high-water mark; and it possessed, within the recollection of very many persons, nearly all along its shore, ground which it has entirely ceased to invade. See LOCHAR-MOSS and RUTHWELL.

SORBIE, a parish on the west side of the district of Machars, Wigtonshire. It is bounded on the north by Kirkinner; on the north-east and east by Wigton-bay; on the south by Whithorn; and on the west by Glasserton. It consists of an oblong, stretching east and west, and measuring  $5\frac{1}{2}$  miles in extreme length, and  $2\frac{1}{2}$  in extreme breadth; and of a southerly projection  $3\frac{1}{2}$  miles in length, and between  $1\frac{1}{2}$  and  $1\frac{1}{4}$  in mean breadth, extending along the bay. Its area is about 8,900 acres. The surface is a beautiful alternation on small green hills and fertile plains. Several of the hills, though rising to no great altitude above sea-level, command the superb prospect of the Irish sea, the Solway frith, the Isle of Man, and the coast of Cumberland. The coast, exclusive of the windings of the bays and headlands, is about 7 miles in extent; and, from the north-east extremity, more than half-way southward, it is, with some exceptions, flat and sandy, and, for nearly a mile, where it screens the upper part of Wigton-bay, it overlooks an expanse of sand which is left dry at low-water. In the south the coast is rocky and precipitous, repeatedly rises nearly 200 feet above sea-level, and, in one place, is perforated by two very large and curious caves. The principal

headlands are EAGERNESS [which see] and Crugleton. The principal bays are those of GARLESTON, RIGG, and PORT-ALLAN: which see. But Orchardton-bay, Brandy-port, Innerwell-port, Port-Magean, Port-Whapple, and some other small bays beautifully indent the coast, and offer safe landing-places for cargoes of lime, sea-shells, or coal. Flounders, soles, skate, cod, lobsters, oysters, and many other species of fish abound; but, except at INNERWELL [which see], they appear to draw no attention. The lands of the parish, to the extent respectively of about 500 and 750 acres, are covered with wood or disposed in natural pasture; and, over all the rest of the area, are arable, and well-enclosed and sheltered. The soil, though not deep, is exceedingly fine. The native rocks are all of the transition-class; granite occurs in boulders; shell-marl existed, but has all been used; other minerals are not of noticeable importance. Pure and perennial springs are many and copious. A beautiful lake lies on the west border: See DOWALTON (LOCH). The village of Sorbie stands nearly in the centre of the parish,  $4\frac{1}{2}$  miles north of Whithorn, and 6 south of Wigton. It was begun, in the latter part of last century, under the encouragement of the Earl of Galloway; and it is in general well-built, and has a population of about 180. A damask manufactory, of about half-a-century's standing, is situated in the village; and has some celebrity for the quality and patterns of its fabrics. The larger village of GARLESTON [which see] stands  $2\frac{1}{2}$  miles east of Sorbie, on the coast. The only modern mansion of note is GALLOWAY HOUSE: which see.—Crugleton-castle, on the estate of Sir Andrew Agnew of Lochnaw, Bart., is an interesting though very greatly dilapidated ruin. Its site is a precipitous promontory about 200 feet high, on the coast, midway between Rigg-bay and Port-Allan. Part of an unornamented arch, and lower parts of some walls, alone remain to attest its ancient spaciousness and strength. The fosse is quite distinct, and encloses about an acre. John Comyn, Earl of Buchan, possessed and resided in the castle as heir-parcener of the Lords of Galloway; and, in 1292, he obtained leave from Edward I. to take lead from the ruins of the Calf-of-Man to cover eight towers of the edifice. The castle was involved in the fortunes of his family; and, though said to have become the residence of the ancient and wealthy family of the Vases of Barnbarrow, was ruinous before the year 1684.—Eagerness-castle, situated on the cognominal promontory, has nearly disappeared, and does not figure in history.—Sorbie-place, the seat in the reign of James IV., and till the latter part of the 17th century, of the family of Hannay, was anciently a tower of some strength, and is now a picturesque ruin, surrounded with wood,  $\frac{2}{3}$  of a mile east of the village of Sorbie. Good roads intersect the parish in all directions. Population, in 1801, 1,091; in 1831, 1,412; in 1841, 1,691. Houses, in 1831, 239. Assessed property, in 1815, £10,760.—Sorbie is in the presbytery of Wigton, and synod of Galloway. Patron, the Crown. Stipend £244 13s. 7d.; glebe £15. The parish-church, situated at the village of Sorbie, was built in 1750. There is an Independent place of worship at Garlieston. The present parish comprehends the ancient parishes of Sorbie, Crugleton, and Kirkmedan. Sorbie—or, as it was then written, Sourby—formed, in the 12th and 13th centuries, the two divisions of Great and Little Sorbie, each of which had its church. The monks of Dryburgh having acquired both of the churches, prevailed on the bishop of Candida Casa or Galloway to unite them; and thenceforth held them as one vicarage till the Reformation. The church of Cru-

gleton was very early given to the monks of Whit-horn; and, after the Reformation, it followed the various fortunes of the rest of their property. The church of Kirkmedan—dedicated to the same saint as the modern Kirkmaiden and two ancient parishes, all in the same county—long belonged to the canons of St. Mary's Isle, and was afterwards transferred to the bishop of Galloway. The three ancient parishes were united at the middle of the 17th century. In 1834, the parish-school was attended by 67 scholars; and three non-parochial schools—two of them in Garlleston—were attended by 160. Parish-schoolmaster's salary £33 3s. 8d., with £9 ls. 2d. fees. Patrick Hannay, who lived in the 17th century, and published some poems which once had reputation, but now are very rare and almost forgotten, was a native of Sorbie.

SORN, a parish in the north-east of the district of Kyle, Ayrshire. It is nearly a square, 6½ miles deep; and comprehends about 23,000 acres. It is bounded on the north by Galston; on the east by Muirkirk; on the south by Auchinleck; and on the west by Mauchline. The surface, in a general view, is high in the east, and declines toward the west; but it is much diversified by moorland, hill, rising ground, hollow, and haugh. Blackside-end-hill, the highest ground, and situated in the north-east, has an altitude of 1,540 feet above sea-level, and commands a gorgeous view of Ayrshire and Strathclyde, and parts, it is said, of fourteen other counties. The river Ayr, running westward, drains the greater part of the parish, and flows between steep, hold, copse-clad, and picturesque banks. The Cessnock, a tributary of the Irvine, has some of its headwaters in the north-west. Cleugh-burn, which falls into the Ayr amid the brilliant scenery around Sorn-castle, traverses a deep and richly wooded glen, and has some romantic and fascinating cascades. Calcutt occurs in fine specimens on the face of the precipices over which this streamlet leaps. Carboniferous limestone occurs in great plenty, and has been both long and extensively worked. Coal occurs, though to what extent is not known; and hitherto it has been little mined. Ironstone is plentiful; and was, at one time, exported hence to Muirkirk. Sandstone of very various character and hardness is plentiful. The soil, in the haughs, is a gravelly loam; and elsewhere is, for the most part, a reddish clay. Upwards of a third of the parochial area is cultivated pasture; upwards of one-fourth is hill-pasture, moss, or wilderness; somewhat less than one-sixth is reclaimable, but uncultivated natural pasture; somewhat less than one-sixth also is in tillage; and one acre in every thirty-two is under wood. The village of Sorn stands on the right bank of the Ayr, 4 miles east of Mauchline. It has two annual fairs, the one on the second Tuesday of March, old style, and the other on the first Monday of November, new style. Population of the village about 300. The neat and pleasant little manufacturing town of Catrine stands 1½ mile to the west: see CATRINE.—Sorn-castle, immediately west of the village of Sorn, is most delightfully situated on a lofty and well-wooded rocky terrace overlooking the Ayr. The building is of very high but unknown antiquity. About the year 1406 it became, along with the manor of Sorn and other lands in Kyle, the property of Andrew Hamilton, 3d son of Sir David Hamilton of Cadzow, ancestor of the Duke of Hamilton; and, in subsequent times, it passed by marriage to the Earls of Winton, and by purchase to the Earls of Loudoun and three other successive families of proprietors. A Dowager-countess of Loudoun lived in it till within a few months of her hundredth year, attended by servants who attained nearly as great a

longevity. Under the miserable persecutions of Charles II. the castle was taken possession of as a fortalice of the royal forces, and made the seat of a garrison for overawing the Covenanters.\* Dr. Matthew Stewart, and his son, the celebrated Dugald Stewart, were landowners in the parish and frequent visitors. The house which they occupied still stands; and near it, in a beautiful and airy situation, are a new mansion and tasteful pleasure-grounds, the property and seat of their descendant. The illustrious and devout but much misrepresented Scottish worthy, Alexander Peden, was born and died in the parish. Exhausted with his prolonged toils and sufferings in traversing the kingdom as a proscribed minister, and believing himself to be approaching his dissolution, he returned to his brother's house in Sorn to die; but he was there in the immediate vicinity of the garrison posted in Sorn-castle, and lived chiefly in an artificial cave,—uniformly protected, as he had been in an hundred places before, from the peering searches of the blood-thirsty soldiery. He was visited on his death-bed by the celebrated James Renwick; and, after he had been specially but vainly searched for in his brother's house, he died there at the age of 60, in the year 1686. Some villanous but perfectly harmless indignities were offered by the wretched persecutors to his mortal remains: see CUMNOCK (OLD). The parish is traversed eastward by the road from Ayr to Muirkirk, and southward by that from Galston to Auchinleck. Population, in 1801, 2,606; in 1831, 4,253. Houses 483. Assessed property, in 1815, £7,783.—Sorn is in the presbytery of Ayr, and synod of Glasgow and Ayr. Patron, Somerville of Sorn. Stipend £195 11s.; glebe £15. The parish-church, situated in the village of Sorn, was built in 1658, and repaired and somewhat enlarged in 1826. Sittings 611. Catrine—as noticed in the article on that village—has a place of worship connected with the Establishment, and a United Secession meeting-house; and two or three years ago it was erected into a *quoad sacra* parish. The population of Sorn, *quoad civilia*, was exhibited by an ecclesiastical census of 1836, as then amounting to 4,053, and consisting of 3,287 churchmen, 729 dissenters, and 37 nondescripts.—The parish was, in 1692, disjoined by the teind-court from the originally huge parish of MAUCLINE: which see. Its original name was Dalgain, the ground for the church, manse, and glebe having been a gift from the proprietor of Dalgain; hut, owing to the vicinity of the church to the ancient castle, the most commanding artificial object in the district, it gradually became changed to Sorn: see DALGAIN. In 1834 there were thirteen private schools, six of which were attended by 192 scholars; and one parochial school, attended by 66. Parish schoolmaster's salary £34 4s. 4½d., with £13 fees, and £10 9s. other emoluments.

.SOULIS-CROSS. See KILMARNOCK.

\* Sir William Hamilton, whose daughter and heiress married George Lord Seaton, and carried the property to the Earls of Winton, was one of the senators of the college of Justice, and lord-treasurer to James V. On the eve of the daughter's marriage, the King set out to honour the bridal with his presence; but he had to traverse a long and dreary tract of moor, moss, and miry clay, where there was neither road nor bridge; and, when about half-way from Glasgow, he rode his horse into a quagmire, and was with difficulty extricated from his perilous seat on the saddle. Far from a house, exposed to the bleak wind of a cold day, and environed on all sides by a cheerless moor, he was compelled to take a cold refreshment in no better a position than by the side of a very prosaic well; and he at length declared, with more wild pettishness than wit, that "if he were to play a trick on the devil, he would send him to a bridal at Sorn in the middle of winter." The well at which he sat is still called the King's well; and the quagmire into which his horse went is called the King's stable. An inn in the vicinity is now the principal stage between Glasgow and Kilmarnock, and daily offers to every wayfarer luxuries, one-hundredth part of which would once have been highly prized by a King.

**SOULSEAT.** See SAULSEAT.

**SOULSEAT.** See INCH, Wigtonshire.

**SOUTHDEAN**, or **CHESTERS**, a parish in the extreme south of Teviotdale, Roxburghshire. It is bounded on the north by Lower Jedburgh; on the east by Oxnam and Upper Jedburgh; on the south-east and south by Northumberland; on the south-west by Castletown; and on the west by Hobkirk and Bedrule. Its greatest length from north to south is  $9\frac{3}{4}$  miles; its greatest breadth is  $6\frac{1}{2}$  miles; and its superficial extent is about 44 square miles. In the extreme south it tapers nearly to a point; about a mile northwards it suddenly expands and soon attains its extreme breadth; and, over  $4\frac{1}{2}$  miles at the north end, it has a mean breadth of only  $2\frac{3}{4}$  miles. The southern district is boldly hilly; runs up to the summit-range of the Cheviots; and has the whole or part of several bulky and lofty heights, particularly Peel-fell, Carlintooth, Needslaw, and Carter-fell. Even the northern district is, to a large extent, upland and pastoral; but has soft and gay features, and admits considerable intersticing of arable ground. **JED-WATER** [which see] rises in the parish, and has a prolonged connection with it; flinging much picturesqueness and beauty over its landscape. **RULE-WATER** [which also see] rises and flows for some distance in the west. Kerry-burn, a tributary of the English Tyne, drains a corner lying south of Carlintooth. Agriculture rules over about 3,000 acres, grows wheat, practises the turnip-husbandry, and performs feats not very common in a pastoral district. Taste and economy have covered about 500 acres with plantation. Sheep-farming exists here in its pride, and has under its care upwards of 15,000 Cheviot sheep of greatly improved breed, and nearly 2,000 long-wooled sheep. Wool was formerly sent almost all into England, but is now extensively purchased by the woollen-manufacturers of Roxburghshire. Excellent red and white sandstone is worked in several quarries; limestone is inexhaustible; coal is believed to exist, but has been vainly searched for; antimony occurs, but not in such quantity as to be profitably worked. British camps, Border peel-houses, and the usual varieties of strength and fortalice exists in such number as to show how stirring and blood-stained an arena the parish must have been of early wars and Border marauding.—The father of Thomson the poet became minister of Southdean two years after the latter's birth, and was buried in the churchyard. Young Thomson received most of the impressions which formed his characteristic style of poetry from the parish and its neighbourhood. The Rev. Mr. Veitch and Mr. Bryson, as Dr. M'Cree tells us, found, among the Southdean hills, a retreat from persecution. Mr. James Davidson, who had terriers called Pepper and Mustard, and was an enthusiastic lover of field-sports, and who occupied the farm of Hyndlee  $1\frac{1}{2}$  mile south of the mountain-pass called 'Note o' the Gate,' and 6 miles south of a Liddesdale farm called Thorleshope, a corruption of Charleshope, is believed, in the district, to have been the original of Sir Walter Scott's Dandy Diunont, in the tale of Guy Mannering.—The principal landowners are Lord Douglas, Elliot of Wollee, and Henderson of Abbotsrule. The parish is cut southward by the roads from Jedburgh respectively to Liddesdale and to the vale of the Tyne by Kerryburn. Population, in 1801, 697; in 1831, 839. Houses 139. Assessed property, in 1815, £7,848.—Southdean is in the presbytery of Jedburgh, and synod of Merse and Teviotdale. Patrons, the Crown and Lord Douglas. Stipend £234 9s. 3d.; glebe £40. Unappropriated tithes £354 17s. 3d. Schoolmaster's salary £44 4s. 4½d., with £15 9s. 1d., and from £6 to £6 10s. other

emoluments.—The present parish comprehends, in the north-west, a part of the suppressed parish of Abbotsrule. Southdean seems to have had its name from containing the southern dean or valley of Jed forest; and it has its more popular designation of Chesters from the church being situated at a hamlet of that name, and remotely from the vicinity to the church of a marked camp or 'castra.'

**SOUTHEND**, a parish at the southern extremity of the peninsula of Kintyre, Argyleshire. It is bounded on the north by Campbelltown; and on all other sides by the sea. Its length, from north-east to south-west, is about 11 miles; and its breadth, in the opposite direction, about 5. The surface exhibits a beautiful and variegated prospect of hills, neither high nor rocky, and of valleys traversed by streamlets, and thickly sprinkled with farm-houses. The brooks frequently overflow their banks, and plough up new channels. A great part of the higher grounds which formerly were heathy and waste, have been converted into arable lands and green pasture. Along the coast are the remains of some Danish forts; the largest of which is on the Mull of Kintyre: see **KINTYRE (MULL OF)**. On a peninsulated pyramidal hill, one face of which falls sheer down to the sea, anciently stood Dunaverly-castle, one of the strongholds of the Lords of the Isles. A fosse across the neck of the peninsula, and two or three concentric walls round the face of the ascent, combined with the great natural advantages of the site, to render the place a fortalice of uncommon strength: see **DUNAVERTY-CASTLE**. Not far from this place, and about 100 yards from high-water mark, occurs a bank of fine coral. The island of Sanda, opposite the site of the castle, belongs to the parish: see **SANDA**. A road runs north from near the Mull to Campbelltown. Population, in 1801, 1,825; in 1831, 2,120. Houses 341.—Southend is in the presbytery of Kintyre, and synod of Argyle. Patron, the Duke of Argyle. Stipend £158 6s. 7d.; glebe £15. In 1834 the parish-school was attended by 98 scholars; and three other schools by 213. Ruins exist of an ancient church which was dedicated to St. Columba. Another church, dedicated to St. Bland, seems, along with its cemetery, to have been swept away by the freshets of a rivulet which washed its site.

**SOUTHERNESS**, a village and a headland in the parish of Kirkbean, Kirkcudbrightshire. The village stands close upon the shore, near the cognominal headland, 16 miles south of Dumfries, and 11 south-east of Dalbeattie. It was built some time after the middle of last century by Oswald of Aucheneruive near Ayr, in the expectation of its becoming a mining-village and depot for coal; but, the desired mineral having been vainly searched for in the neighbourhood, the village became transmuted into a sea-bathing retreat.—Southernness-point forms the western side of the entrance of the estuary of the Nith, and is situated in North latitude  $54^{\circ} 53'$ , and West longitude  $3^{\circ} 37'$ .

**SOUTHWICK**, a rivulet and a supposed parish in the southern extremity of Kirkcudbrightshire. The parish is now united to **COLVEND**: which see. Southwick-water is formed by three streams, two of which rise among the Criffel-hills, and the other and longest in Kirkgunzeon; and it runs  $3\frac{1}{2}$  miles southward and south-eastward to the sea, at a point  $4\frac{1}{2}$  miles north-east of the mouth of the estuary of the Urr. It is navigable for vessels of small burden 2 miles from its mouth.

**SOUTRA.** See FALA.

**SPEAN (THE)**, a river partly of Badenoch, but chiefly of Lochaber, Inverness shire. It issues from **LOCH-LAGGAN** [which see]; flows 3 miles west-south-westward through Badenoch; and then runs

17 miles westward through Lochaber to the Lochy in the great glen: see LOCHY (THE). A mile below Loch-Laggan, it receives from the south the large stream emitted by Loch-Ossian; and 6 miles above its confluence with the Lochy, it receives from the north the Roy. Its other affluents, though numerous, are individually inconsiderable. Its path, over the first half of its course, descends a bleak, barren, mountain-screened moor, with just as many straggling birches as serve for a foil to the irksomeness of the landscape. After receiving the Roy, it traverses a well-cultivated glen, and is overlooked by Keppoch, Inch, Dalnupie, and several other good houses.

**SPELDIN'S-TOWER**, the ancient seat of the family of Jardine, Bart., situated on the right bank of the Annan, in the north-east corner of the parish of Lochmahen, Dumfries-shire. On the opposite or Applegarth bank of the river stands Jardine-hall, the elegant modern mansion of the family. Grose and Sir Walter Scott, and a whole brigade of minor literati, have given importance to the old tower by trumpeting it into notice. It is, like many an edifice of its sort, vastly thick in its walls, strongly vaulted, and flanked by round turrets; and it is ivy-grown on two sides, and is surrounded by some fine trees; yet it derives its main, almost its sole interest, from being the reputed scene of a monstrous ghost story, the belief of which has made the mob of the adjacent districts gape and stare for centuries, and has contributed not a little to their being more enthralled by superstition, and less advanced in civilization, than the peasantry of most districts in the Lowlands.

**SPEY (THE)**, one of the principal rivers of Scotland, draining a large portion of the ancient province of Moray, and belonging to the modern counties of Inverness, Moray, and Banff. It is the second Scottish stream for the volume of its water and the territorial extent of its basin; and it possesses fame for rapidity and some other properties of Highland rivers; but it holds only a middle rank for scenic character, and a remarkably inferior one for utility. It rises in the hraes of Badenoch, close on the water-shed with Lochaber, only half-a-mile from Glenroy, and 6 miles from Loch-Laggan. Less than a mile below its source it expands into a tiny lake, called Loch-Spey, whence it is popularly said to have its origin. Its course, for 37 miles, measuring in a straight line, is wholly in Inverness-shire; and over that distance it runs 15 miles eastward, and 22 north-eastward,—receives, on its left bank, the Markie, the Calder, and 6 or 7 other considerable rivulets; and on its right the Truim, the Tromie, the Feshie, and numerous minor streams; and traverses the parishes of Laggan, Kingassie, and Alvie, forming in its glen the seat of by far the greater part of their population. In the second of these parishes it averages from 80 to 100 feet in breadth, varies from 2 to 16 feet in depth, and moves at the mean rate of about 3 miles in the hour; and in the third it expands into Loch-Inch, is partly gentle and partly impetuous, and has a mean breadth of about 150 feet. Over the next 30 miles of its course, still measuring in a straight line, its direction continues to be north-easterly; and over the last 15, or from Craigellachie-bridge to the Moray frith at Garmouth, it is toward the north. Over 21 miles of these 45, it chiefly flows between Inverness-shire and Moray-shire, yet runs across wings and intersecting parts of both counties; and over the remaining 24, chiefly divides Morayshire from Banffshire, yet cuts off considerable wings of the former, and at one place is touched by a tiny detached part of Nairnshire. It receives, on its left bank, the Dulnain, 2½ miles above Grantown; and, on its right, the Nethy, at Aher-

nethy,—the Avon, at Ballindalloch,—and the Fiddich, below Craigellachie. Its entire length, measured in straight lines, is about 82 miles; but measured along the curvatures of its channel, cannot be less than 120. Dr. Macculloch has written a description of the Spey so very suitable for a Gazetteer, and so free from his usual parade of topographical criticism, and so well-recommended by his minute personal inspection of the scenery, that it must be peculiarly acceptable to our readers. "As soon as we approach Aviemore,"\* says he, "we become sensible that we have entered on a new country; a wide and open space now intervening between the hills that we have quitted and the distant and blue ridge of Cairngorm. Through this lies the course of the Spey; and here, principally, are concentrated such beauties as that river has to show. I have traced it from its mountain-well to the sea; and, whatever the Strathspey-men may boast, it would be a profanation to compare it, in point of beauty, with almost any one of the great branches of the Tay, as it would equally be to name it as a rival to the Forth, and, I must add, to the Dee, and to the Isla, and to the Earn. In point of magnitude I believe it must follow the Tay; and in beauty it may be allowed to follow the Earn; preceding alike the Tweed and the Clyde and the Don, but being still inferior to many of our larger rivers, in the important particular of not being navigable, and in being, therefore, nearly useless. The small lake, or rather pool, whence it originates, is its unquestionable head; since, unlike the Tay, none of its subsidiary streams, not even the Truim, can pretend to compete with this primary one. It is one decided Spey from its very spring; receiving numerous accessions, but no rival. Its course is almost everywhere rapid; nor does it show any still water till near the very sea. It is also the wildest and most capricious of our large rivers; its alternations of emptiness and flood being more complete and more sudden than those of any of the streams which I have named. The causes of this are obvious, in considering the origin and courses of its tributary waters; while the elevation of its source, amounting to more than 1,200 feet, accounts for the rapidity of its flow. Though inferior both to the Tweed and the Tay in its produce of salmon, it must be allowed the third rank in this respect; and the single fishery at its mouth, belonging to the Duke of Gordon, is rented for more than £6,000 a-year. From the spring its course displays little beauty till it reaches Clunie and Spey-bridge. Hence, it increases in interest as it approaches Kinrara, whence, for a few miles, it is attended by a series of landscapes, alike various, singular, and magnificent. If, after this, there are some efforts at beauty, these are rare, and offer little that is new or striking; while near its exit from the mountainous country, it loses all character, and continues from Fochabers to the sea, a wide and insipid sheet of water." The valley or strath of the Spey, except after the debouch from among the mountains, has been but recently touched by the hand of man, and might, not very many years ago, have been described as a long band of natural forest occasionally laid open by the sinuosities of a large river; and even yet, over a stretch of 12 miles, which is visible from Aviemore, it is so extensively covered with the pine, the birch, and the alder, and so limitedly subjected to cultivation, as forcibly to suggest an image of Caledonia at the epoch of the Roman invasion, or of a pristine forest solitude in the western wilds of America.

**SPEYMOUTH**, a parish at the north-east corner

\* Very nearly at the middle of the river's course, or about 3 miles after it begins to touch Morayshire.

of Morayshire; bounded on the north by the Moray frith; on the east by the Spey, which divides it from Bellie; on the south by Rothes; and on the west by Urquhart. Its greatest length, from north to south, is  $6\frac{1}{2}$  miles; its mean breadth is about  $1\frac{1}{2}$  mile; and its area is nearly 10 square miles. The ground, at the distance of about half-a-mile from the sea, shoots suddenly up in a small hill; it thence, for  $3\frac{1}{2}$  miles by  $1\frac{1}{2}$ , forms a terrace faced by a steep bank, from 40 to 50 feet high toward the river; and it then gradually ascends to the southern boundary, and there sends aloft a considerably elevated bill. A belt of haugh between the terrace and the Spey, expanding in one place to  $\frac{2}{3}$  of a mile in breadth, is prime land, and produces excellent crops. The soil of one-half of the rest of the area is a light loam on black earth or clay; and of the other half is partly sandy, but chiefly a thin sharp gravel, on a hard gravelly subsoil. About one-half of the area is moorish, pastoral, or woodland; about 50 acres are moss; and about 110 acres along the river and the frith are pebbles or bare beach. An extensive moor, called the Common, in the vicinity of Garmouth, was nearly all planted about the year 1800, and is now as ornamental as it formerly was bleak. About 300 acres previously waved with plantation. The villages are Garmouth, Kingston, and Boat-of-Bog. Garmouth, the chief, is separately noticed. Kingston, situated between Garmouth and the sea, and peculiarly entitled from its position to bear the name of the parish, has, with the exception of three or four houses, been built since 1810. Population, in 1831, 200. Boat-of-Bog is a mere hamlet nearly opposite Fochabers on the Spey. The parish is traversed westward by the great north mail-road, and southward by a turnpike from Garmouth up Strathspey. Population, in 1801, 1,236; in 1831, 1,475. Houses 310. Assessed property, in 1815, £409.—Speymouth is in the presbytery of Elgin, and synod of Moray. Patrons, the Earl of Moray and Cumming of Altyre. Stipend £135 2s. 10d.; glebe £20. Schoolmaster's salary £29 18s. 10d., with £19 3s. 6d. fees, and £3 other emoluments. The present parish consists of the suppressed parishes of Essil and Dipple.

**SPINNINGDALE**, a once prosperous but now completely ruined manufacturing village, on the kyle of Dornoch, and in the parish of Criech, Sutherlandshire. A cotton manufactory was established here, in the latter part of last century, by Mr. Dempster of Dunnichen; and it employed 100 hands, and seemed to be rapidly raising the place to importance. But in 1809 the factory was accidentally destroyed by fire; and it now stands spectrally among the ruins around it,—the ghost of cotton-manufacture in the north,—and the phantasmagorical type of what cotton-manufacture seems likely to become, under the pressure of the present evil times, in even highly favoured districts.

**SPITTAL**. See **HALKIRK**.

**SPOTT**, a parish in Haddingtonshire, consisting of two detached districts. The larger, and greatly the more valuable district, is bounded on the north-west and north by Dunbar; on the east by Dunbar and Innerwick; on the south by Dunbar common; and on the west by Stenton. It is, in a general view, an oblong stretching north and south, and measuring  $3\frac{3}{4}$  miles by  $1\frac{3}{4}$ ; but it both gives and receives marked though not large indentations. The smaller district lies  $2\frac{1}{2}$  miles south of the nearest point of the other; consists of a stripe  $2\frac{3}{4}$  miles in length, and  $\frac{3}{4}$  of a mile in mean breadth, tapering to a point on the south; and is bounded on the north by Dunbar common; on the east by Innerwick; on the south by Whiteadder-water, which divides it

from Berwickshire; and on the west by the largest detached part of Stenton. This smaller district is entirely and wildly moorland, lies on the southern slope of the Lammermoors, and is all disposed in a single farm. The larger district comprehends about 2,880 acres; which are disposed in arable grounds, moorland pasture, and natural and planted wood in the relative proportions of 28, 10, and 1. The whole surface is an alternation of hill and valley; but, in the north, it is aggregately lowland or undulated plain, and in the south it climbs up to the summit-range of the Lammermoors, about 700 feet above sea-level. Spott-water comes in from Dunbar common; has a connection of  $4\frac{3}{4}$  miles circuitously, but chiefly north-eastward with Spott; trots cheerily along its principal valley, and past its church and village; and, after passing into Dunbar, assumes the name of Broxburn. The other streamlets are unimportant. St. John's-well, in the neighbourhood of the village, supplies the town of Dunbar, through pipes, with water. Greywacke, occasionally dyked and fractured by trap, prevails in the Lammermoor regions; and old red sandstone and conglomerate prevail in the south.—A conglomerate bill, called Doon, situated half-a-mile east of the village, and rising 550 feet above sea-level, is a picturesque object, cultivated to the summit on the one side, and stooping precipitously down, yet covered all over with wood on the other. On this hill General Leslie had his camp before the battle of Dunbar or Doon-hill, fought with Cromwell, on the east side and immediate vicinity of the hill. From this strong post, Leslie was induced, contrary to his original opinion, to come down; and, though Cromwell was just about to embark his troops at Dunbar for want of provisions, the Scottish general was defeated, and pursued with great slaughter. Many memorials of the fight have been found upon the field: see article **DUNBAR**. The slopes of the Lammermoors are finely skirted with natural wood; and among them is a vale traversed by a rivulet which expands into a chain of beautiful lochlets. The village of Spott stands  $2\frac{1}{2}$  miles south of Dunbar, and 4 west-north-west of Innerwick. It has a friendly society, and a branch of the East-Lothian itinerating libraries; and is the site of the parish-church.\* Population, in 1801, 502; in 1831, 612. Houses 127. Assessed property, in 1815, £6,197.—Spott is in the presbytery of Dunbar, and synod of Lothian and Tweeddale. Patron, Spott of Spott. Stipend £272 7s. 8d.; glebe £18 18s. Unappropriated tithes £275 9s. 11d. Parish-schoolmaster's salary £25 13s. 3½d., with from £12 to £18 fees, and £6 6s. 8d. other emoluments. A non-parochial school was attended, in 1834, by 70 scholars.—In 1528, Robert Galbraith, rector of Spott, appeared in parliament as advocate for Queen Margaret, on the forfeiture of the Earl of Angus; in 1532, he was at the head of the 10 advocates who were chosen as general procurators, on the establishment of the court-of-session; in 1537, he was appointed a senator of the college-of-justice; in 1540–1, he appeared in parliament as one of the king's council; and, in 1544, he was assassinated by John Carkettle, a Burgess of Edinburgh. James Hamilton, the next rector, was the natural brother of the Duke of Chatelherault, and was speedily advanced to the see of Glasgow.

\* Spott-hill or loan in the vicinity was the scene of the immolation of many poor women for the alleged crime of witchcraft. So late as under date of October 1705, the kirk-session records have the entry: "Many witches burnt on the top of Spott loan;" and, 7 years previously, or in 1698, they say: "The session, after a long examination of witnesses, refer the case of Marion Lillie, for imprecations and supposed witchcraft, to the presbytery, who refer her for trial to the civil magistrate. Said Marion generally called the Rigwoody witch."

A son of Home of Cowdenknowes was rector at the Reformation. George Home of Spott was tried for the murder of Darnley; sat as a jurymen in the trial of Archibald Douglas for the same murder; and was assassinated by his son-in-law, James Douglas of Spott, one of the accomplices, in 1591, of the Earl of Bothwell, in the attempt against the king and chancellor Maitland.

**SPRINGBURN**, a village in the parish of St. Mungo's, about  $1\frac{1}{2}$  mile north-east of Glasgow. It is chiefly inhabited by weavers. An extension-church has been erected here, for the use of the adjacent villages of Balgray, Springburn, and Cowlaw.

**SPRINGFIELD**, a village in the parish of Gretna, Dumfries-shire. It stands on the right bank of the Sark, where that stream forms the boundary with England,  $1\frac{1}{2}$  mile north of Sarkfoot or the head of the Solway frith, 9 miles east of Annan, and 14 miles south-south-west of Langholm. Its site is a rising ground of dry healthy soil, surrounded by rich fields, beautifully enclosed with quickset hedges and rows of trees. The village was commenced in 1791 by Sir William Maxwell, and had its name from the farm on which it stands. In 1793, it had upwards of 40 houses; and now it has a population of more than 500. Its plan is perfectly regular; its streets are each 50 feet wide; and its houses are built of sandstone or brick, and covered with blue slate. The building leases are for 99 years. The inhabitants are almost all cotton-weavers, in the employment of manufacturers in Carlisle. The place figures in unenviable notoriety, as the scene of the inglorious marriage-trade of Gretna. See **GRETTA**.

**SPRINGFIELD**, a village connected with the paper-mills of the parish of Lasswade, Edinburghshire. It stands on the right bank of the North Esk,  $1\frac{1}{2}$  mile south-south-west of the village of Lasswade, and  $3\frac{1}{2}$  miles south-west of Dalkeith.

**SPOURSTON**, a parish in the extreme north-east of Roxburghshire; bounded on the north-west and north by the Tweed, which divides it from Kelso, Ednam, and Berwickshire; on the east by Northumberland; on the south-east and south by Linton; on the south-west by Eckford and Kelso; and on the west by Kelso. The boundary-line with England, and everywhere, except where formed by the Tweed, is entirely arbitrary or artificial. The greatest length of the parish, from north-east to south-west, is  $4\frac{1}{2}$  miles; the greatest breadth is  $3\frac{3}{4}$  miles; and the superficial extent is about 8,200 acres. The district along the Tweed is flat, and has a very slight elevation above the ordinary level of the river; the interior district is partly a ridgy swell called Hadden-rig, which flanks the low grounds, and partly a parallel vale, which in a few places is marshy; and the south-eastern district is comparatively high but not hilly ground, and largely subject to the plough. Redden-burn rises in the parish, and flows eastward into Northumberland. This and Hadden-stank in its vicinity, are repeatedly noticed in Border history, as the scene of meetings between Scottish and English commissioners for settling the boundaries. Hadden-rig, about the year 1540, was the scene of an action in which a party of Scottish troops defeated about 3,000 English horsemen. The village of Sprouston is situated 200 yards from the Tweed, and  $2\frac{1}{2}$  miles east-north-east of Kelso. It has upwards of 100 houses, with the parish-church on a gentle rising ground in the centre. Its population is 420. It anciently was of much larger extent than now; and, during the incursion of the English under the Duke of Norfolk at the middle of the 16th century, it was destroyed. The village of **LEMPITLAW** [which see] is situated  $2\frac{3}{4}$  miles to the south-east. Redden, now a little hamlet  $1\frac{1}{2}$  mile north-

east of Sprouston, figures in Border history as a town. Hadden, another little hamlet 2 miles east of Sprouston, and the site of a side-school, seems also to have anciently been a place of importance. The celebrated Dr. Andrew Thomson, afterwards of Perth and of Edinburgh, was during six years minister of Sprouston; and is said to have led a volunteer troop of his parishioners to Kelso, on occasion of the false alarm by the fire-beacons of an invasion by the French. The turnpike roads from Kelso respectively to Cornhill by way of Sprouston, and to Wooler, and the vale of Beaumont-water, run eastward through the parish. Population, in 1801, 1,105; in 1831, 1,384. Houses 293. Assessed property, in 1815, £10,710. —Sprouston is in the presbytery of Kelso, and synod of Merse and Teviotdale. Patron, the Duke of Roxburgh. Stipend £243 3s. 8d.; glebe, £25. Unappropriated tithes £104 6s. 2d. Parish-school-master's salary £32 2s. 3d. Two non-parochial schools were attended, in 1834, by 133 scholars — The present parish comprehends the ancient parishes of Sprouston on the north-west, and Lempitlaw on the south-east. The church of Sprouston was given by David I. to the monks of Kelso. Chapels subordinate to it anciently stood at Hadden, and on the manor of Sprouston, and were more or less enthralled to the same monks. The parish of Lempitlaw was at an early period annexed to Sprouston. Its church belonged to the hospital of Soutra,—and not long ago might have been seen in ruin at the village of Lempitlaw.

**SPYNE (NEW)**, a parish in Morayshire; bounded on the north by Duffus and Drainic; on the east by St. Andrews Lhanhride; on the south by Elgin; and on the west by Alves. Its length is 4 miles; its mean breadth is 2 miles; and its area is about 8 square miles. The Lossie, except for cutting off about 50 acres, traces all the southern boundary. The loch of Spynie, formerly a beautiful sheet of fresh water, 3 miles long and 1 broad, and originally a marine bay, stretched along the northern boundary; but, at the expense of nearly £11,000, has been converted into an unsightly morass,—an impregnation of sulphur and iron-ore athwart its bed having ruined the hopes which occasioned it to be drained. In its lacustrine state, it richly ornamented the landscape, and attracted numerous flocks of the wild swan, and drew to the pine woods in its vicinity the capercaillie or cock of the wood, now unknown in Scotland; but at present it shows a mimic hollow wilderness of desolation, and forms a ghastly emblem of the havoc upon natural comeliness which is worked by the love of gold. A naturally moorish ridge, 3 miles in length, stretches along the middle of the parish, and shoots up at the west end into a considerably high hill. All its summit and upper slopes, excepting one small wood-embosomed farm, are covered with plantations of firs interspersed with other trees; and the southern face of its highest elevation, descending in curved and broken configuration of surface, is picturesquely wooded with one of the finest oak forests in the country. The joint woods cover an area of between 1,400 and 1,500 acres. The arable lands, situated around the forest, and comprising upwards of 3,000 acres, possess almost every variety of soil, from the heaviest clay to the lightest sand, and are all enclosed and well-cultivated. The waste or pasture lands, comprising about 470 acres, lie chiefly in the small Spynie section of the drained lake. Bishop-mill, a suburb of Elgin, included within its new burgh-boundaries, and communicating with it by a handsome iron bridge, is the only village. Spynie-palace, the ancient residence of the bishops of Moray, the site of whose cathedral

from 1057 till 1224 was in Spynie, now exists in massive, but irreparable ruin, near the east end of the bed of the once beautiful lake. It formed a quadrangle of about 120 feet, with strong towers at the corners; and was surrounded by a lofty wall, and fortified on two sides by a dry ditch, and entered from the east by a drawbridge and a noble gateway. A square tower on the south-west, which now forms the chief part of the ruins, measures 60 feet in length, 36 in breadth, and about 60 in height; is 9 feet thick in its walls; and has windows which, at the period of the erection, must have been esteemed unusually large. Vaulted rooms were below the palace; spacious state-apartments and bed-rooms with vaulted closets, were above; and cape-houses with surrounding battlements terminated the towers. On the south side of the enclosed area was a spacious tennis-court; parallel to it in the inside, was a chapel; on the north were bed-rooms and cellars; on the east were various offices; and around the court and precincts were gardens and orchards. About £900 have, within the last 15 years, been expended by the barons of the exchequer, in planting and otherwise improving a large extent of circumjacent bishop's lands, now the property of the Crown. The parish is traversed westward by the great north mail-road, and by the turnpike from Elgin to Burghhead. Population, in 1801, 843; in 1831, 1,121. Houses 207. Assessed property, in 1815, £1,533. —New Spynie is in the presbytery of Elgin, and synod of Moray. Patron, Carnegie of Spynie. Stipend £185 4s. 2d.; glebe £10. Schoolmaster's salary £36 7s. 1d., with £14 fees, and a share of the Dick bequest. A private school in Bishopmill was attended, in 1834, by 75 scholars; and 3 schools for girls, by about 60. —Spynie formerly gave the title of Baron to the noble family of Lindsay. The peerage was created in 1590, and became dormant at the death of George, the 3d lord, in 1672.

STACK OF SNALDA. See PAPA-STOUR.

STAFFA,\* a small island of the Hebrides, celebrated for its basaltic pillars and its caves. It lies 5 miles south-east of the Treshinish islands, 3 south of Gometra,  $4\frac{1}{2}$  west by north of the nearest part of Gribon-in-Mull,  $6\frac{1}{2}$  north of nearly the extreme point of the Ross-of-Mull, and  $7\frac{1}{2}$  miles north-north-east of Iona; and forms part of the parish of Kilminian, and county of Argyre. Seen from a distance, it appears a round, lumpish, uninteresting rock; and not till approached within less than  $\frac{1}{4}$  of a mile, does it unfold to a visiter its museum of wonders. It is irregularly oval, extending from north to south, and measuring about  $1\frac{1}{2}$  mile in circumference; and it presents an uneven table-land resting on cliffs of variable height. The greatest elevation occurs in the south-west, and appears to be about 144 feet. The surface, though in some spots bare, is in general covered with a rich soil and luxuriant grass; but seems to produce few or no rare plants. A herd of black cattle browse upon its herbage; but not a house or a hut exists to shelter any one of a thousand visitors from an occasional or sudden storm. The coast, over a considerable portion of its precipitous face, presents a columnar disposition. Its highest point occurs between the Great Cave and the Boat, and is 32 feet lower than the extreme altitude of the island, or 112 feet above high-water-mark. Toward the west, the coast decreases in elevation, and, near MacKinnon's cave, is only 84 feet high; from this it varies in height toward the north, and there subsides into a flat rocky shore but a few feet above the sea; thence it rises, and, after continuing for a short space precipitous, declines into an irregular rocky shore, stretching out

in beaches, and forming the landing-place; and from this it once more gradually rises, till, again becoming perpendicular beyond the crooked cave, it passes on to the point of greatest altitude. The geognostic composition of the coast shows a fundamental ledge of conglomerated trap or tufa, supporting a black, hard, and compact columnar basalt, surmounted by an amorphous basaltic mass, interspersed with small columns. The whole façade of the coast, and the arches, sides, and floorings of the caves strikingly resemble architectural structures, and have been described by architectural terms; and even the spots on the summit-surface, which are bare of soil, present, in several instances, such a compact agglutination of the ends of columns, jutting up from the amorphous basalt, as closely resembles a tessellated pavement. The caves are so numerous, that they may be said to perforate, at brief intervals, the whole face of the island; but those which occur on the south and the north sides are remarkable neither for beauty nor for magnitude; and five on the north-east are distinguished chiefly for making loud reverberations when the surge of the tumultuous sea breaks into them,—reverberations which resemble the distant discharges of heavy ordnance. Proceeding toward the south from the landing-place, the objects of chief interest which challenge the visiter's notice and admiration are, first, the Scallop or Clamshell cave,—second, the Buachaille, or Herdsman,—third, the Causeway and the Great Cave, or Colonnade,—fourth, Fingal's, or the Great cave,—fifth, the Boat cave,—and sixth, the Cormorants or MacKinnon's cave. Aided by these hints as to the order and relative position of the objects the reader will, no doubt, pass with pleasure to the following rich description by Dr. Macculloch:—"At the Scallop or Clamshell cave, the columns on one side are bent, so as to form a series of ribs not unlike an inside view of the timbers of a ship. The opposite wall is formed by the ends of columns, bearing a general resemblance to the surface of a honey-comb. This cave is 30 feet in height, and 16 or 18 in breadth at the entrance; its length being 130 feet, and the lateral dimensions gradually contracting to its termination. The inside is uninteresting.—The noted rock Buachaille, the Herdsman, is a conoidal pile of columns, about 30 feet high, lying on a bed of curved horizontal ones, visible only at low-water.—The Causeway here presents an extensive surface, which terminates in a long-projecting point at the eastern side of the Great cave. It is formed of the broken ends of columns, once continuous to the height of the cliffs. This alone exceeds the noted Giant's Causeway, as well in dimensions as in the picturesque diversity of its surface; but it is almost neglected, among the more striking and splendid objects by which it is accompanied. The Great Face is formed of three distinct beds of rock, of unequal thickness, inclined towards the east in an angle of about nine degrees. The lowest is a rude trap tufa, the middle one is divided into columns placed vertically to the planes of the bed, and the uppermost is an irregular mixture of small columns and shapeless rock. The thickness of the lowest bed at the western side is about 50 feet; but, in consequence of the inclination, it disappears under the sea, not far westward of the Great cave. The columnar bed is of unequal depth; being only 36 feet at the western side, and 54 where the water first prevents its foundation from being further seen. To the eastward, its thickness is concealed by the causeway. Thus, at the entrance of the Great cave on this side, the columns are only 18 feet high, becoming gradually reduced to two or three, till they disappear. The inequality of the upper bed produces the irregular

\* *Staffa* is a Norse term, meaning 'staffs' or 'columns.'

outline of the island. The inclination of the columns to the horizon, in consequence of their vertical position towards the inclined plane of the bed, produces a very displeasing effect whenever it is seen, as it is from the south-west: the inclination of nine degrees, conveying the impression of a fabric tottering, and about to fall. Fortunately, the most numerous and interesting views are found in positions into which this defect does not intrude; and many persons have doubtless visited Staffa without discovering it. Although the columns have a general air of straightness and parallelism, no one is perfectly straight or regular. They never present that geometrical air, which appears in the published views of their aspect. In this respect they fall far short of the regularity of the Giant's Causeway. Very often they have no joints; sometimes one or more may be seen in a long column while, in other places, they are not only divided into numerous parts, but the angles of the contact are notched. They are sometimes also split by oblique fissures, which detract much from the regularity of their aspect. These joints are very abundant in the columns that form the interior sides of the Great cave, to which, indeed, they are chiefly limited; and it is evident, that the action of the sea, by undermining these jointed columns, has thus produced the excavation; as a continuation of the same process may hereafter increase its dimensions. The average diameter is about two feet; but they sometimes attain to four. Hexagonal and pentagonal forms are predominant; but they are intermingled with figures of three, four, and more sides, extending even as far as to eight or nine, but rarely reaching ten. It is with the morning sun only that the Great Face of Staffa can be seen in perfection. As the general surface is undulating and uneven, great masses of light or shadow are thus produced, so as to relieve that which, in a direct light, appears a flat insipid mass of straight wall. These breadths are further varied by secondary shadows and reflections arising from smaller irregularities; while the partial clustering of the columns produces a number of subsidiary groups, which are not only highly beautiful, both in themselves and as they combine with and melt into the larger masses, but which entirely remove that dryness and formality which is produced by the incessant repetition of vertical lines and equal members.—The Cormorant's or M'Kinnon's cave, though little visited, in consequence of the frauds and indolence of the boatmen, is easy of access, and terminates in a gravelly beach, where a boat may be drawn up. The broad black shadow produced by the great size of the aperture, gives a very powerful effect to all those views of the point of the island into which it enters; and is no less effective at land, by relieving the minute ornaments of the columns which cover it. The height of the entrance is 50 feet, and the breadth 48; the interior dimensions being nearly the same to the end, and the length 224 feet. As it is excavated in the lowest stratum, the walls and the ceiling are without ornament; yet it is striking from the regularity and simplicity of its form. But the superior part of the front consists of a complicated range of columns, hollowed into a concave recess above the opening; the upper part of this colonnade overhanging the concavity, and forming a sort of geometric ceiling; while the inferior part is thrown into a secondary mass of broad but ornamental shadow, which conduces much to the general effect of the whole.—The Boat cave is accessible only by sea. It is a long opening, resembling the gallery of a mine, excavated in the lowest rude stratum; its height being about 16 feet, its breadth 12, and its depth about 150. Upwards the columns overhang it, so as to produce a shadow,

which adds much to the effect; while they retire in a concave sweep, which is also overhung by the upper mass of cliff, thus producing a breadth of shade, finely softening into a full light by a succession of smaller shadows and reflections, arising from the irregular groupings of the columns. The upper part of this recess, catching a stronger shadow, adds much to the composition; while the eye of the picture is found in the intense darkness of the aperture beneath, which gives the tone to the whole.—The Great cave is deficient in that symmetry of position with respect to the face of the island, which conduces so much to the effect of the Boat cave. The outline of the aperture, perpendicular at the sides, and terminating in a contrasted arch, is pleasing and elegant. The height, from the top of the arch to that of the cliff above, is 30 feet; and from the former to the surface of the water, at mean tide, 66. The pillars by which it is bounded on the western side, are 36 feet high; while, at the eastern, they are only 18, though their upper ends are nearly in the same horizontal line. This difference arises from the height of the broken columns which here form the causeway; a feature which conduces so much to the picturesque effect of the whole, by affording a solid mass of dark foreground. Towards the west the height of the columns gradually increases as they recede from the cave, but their extreme altitude is only 54 feet, even at low water. The breadth of this cave at the entrance is 42 feet, as nearly as that can be ascertained, where there is no very precise point to measure from. This continues to within a small distance of the inner extremity, when it is reduced to 22; and the total length is 227 feet. These measures were all made with great care, however they may differ from those of Sir Joseph Banks. The finest views here are obtained from the end of the causeway, at low water. When the tide is full, it is impossible to comprehend the whole conveniently by the eye. From this position also, the front forms a solid mass of a very symmetrical form; supporting, by the breadth of its surface, the vacant shadow of the cave itself. Here also, that intricate play of light, shadow, and reflection, which is produced by the broken columns retiring in ranges gradually diminishing, is distinctly seen; while the causeway itself forms a foreground no less important than it is rendered beautiful by the inequalities and the groupings of the broken columns. Other views of the opening of this cave, scarcely less picturesque, may be procured from the western smaller causeway; nor indeed without bestowing much time and study on this spot, is it possible to acquire or convey any notion of the grandeur and variety which it contains. The sides of the cave within are columnar throughout; the columns being broken and grouped in many different ways, so as to catch a variety of direct and reflected tints, mixed with secondary shadows and deep invisible recesses, which produce a picturesque effect, only to be imitated by careful study of every part. It requires a seaman's steadiness of head to make drawings here. As I sat on one of the columns, the long swell raised the water at intervals up to my feet, and then, subsiding again, left me suspended high above it; while the silence of these movements, and the apparently undisturbed surface of the sea, caused the whole of the cave to feel like a ship heaving in a sea-way. The ceiling is divided by a fissure, and varies in different places. Towards the outer part of the cave, it is formed of the irregular rock; in the middle, it is composed of the broken ends of columns, producing a geometrical and ornamental effect, and at the end, a portion of each rock enters into its composition. Inattention has caused the various tourists to de-

scribe it as if it were all columnar, or all rinde. As the sea never ebbs entirely out, the only floor of this cave is the beautiful green water; reflecting from its white bottom those tints which vary and harmonize the darker tones of the rock, and often throwing on the columns the flickering lights which its undulations catch from the rays of the sun without." Sir Walter Scott, contemplating the wondrous symmetry and grandeur of the Great cave, penned the following beautiful lines:—

"Where, as to shame the temples deck'd  
By skill of earthly architect,  
Nature herself, it seem'd, would raise  
A Minster to her Maker's praise!  
Not for a meaner use ascend  
Her columns, or her arches bend;  
Nor of a theme less solemn tell  
That mighty surge that ebb'd and swell'd,  
And still, between each awful pause,  
From the high vault an answer draws,  
In varied tone prolong'd and high,  
That mocks the organ's melody.

"The stupendous columns" adds the Poet, "which form the sides of the cave—the depth and strength of the tide which rolls its deep and heavy swell up to the extremity of the vault—the variety of tints formed by white, crimson, and yellow stalactites, or petrifications, which occupy the vacancies between the base of the broken pillars which form the roof, and intersect them with a rich, curious, and variegated chasing, occupying each interstice—the corresponding variety below water, where the ocean rolls over a dark-red or violet-coloured rock, from which, as from a base, the basaltic columns arise—the tremendous noise of the swelling tide, mingling with the deep-toned echoes of the vault,—are circumstances elsewhere unparalleled."

Staffa appears to have remained almost entirely unnoticed till a very recent period. It is not so much as named by Martin in his account of the Western Isles, published in the beginning of last century. Its existence was first made generally known by Sir Joseph Banks, who visited it in August, 1772, and whose account was printed in the second volume of 'Penant's Tour in Scotland.' Banks, in the course of a voyage to Iceland, in company with Dr. Uno von Troil—afterwards Archbishop of Upsal—was induced to put in at a port in Mull, where he was hospitably received by Mr. Maclean, the principal proprietor of the island. At Mr. Maclean's the travellers met with an Irish gentleman, who told them that the day before he had fallen in with what, in his opinion, was one of the greatest wonders in the world,—though none of his Highland acquaintances seemed ever to have had their attention attracted to it. His account so greatly excited the curiosity of Banks and his friend, that it was resolved forthwith to make an expedition to the island: they reached it, and found it to be by far the most stupendous example of that striking production of nature, basaltic architecture, of which they had ever heard.

STAFFIN (Loch), a marine bay, sometimes called Altivaig-hay, on the east coast of the parish of Kilmuir in Skye. The hills which environ it rise with surpassing magnificence, in basaltic colonnades, to the height of 1,000 or 1,500 feet, enclosing a large sweeping valley. Long columnar ranges crown their summits, and increase in elevation as the hills recede in ascending tiers; and they combine with similar colonnades below to produce a variety and sublimity of basaltic formation, which, though surpassed in simplicity and beauty of detail, is nowhere in Britain equalled in either extent or power. Had not Staffa made a previous monopoly of fame, this spot would have been more than a rival, and might have frowned the celebrated islet into comparative insignificance.

STAIK, or STAKE (HILL OF), a height on the borders of Renfrewshire and Ayrshire, in the parishes of Lochwinnoch, Largs, and Kilbirnie. It is the highest hill in the district, and was one of the points of observation in the general trigonometrical survey of the kingdom. On Thomson's map of Renfrewshire, published in 1826, it is neither laid down nor named: on that of Ayrshire it is laid down, but in a wrong situation.

STAIR, a parish a little west of the centre of Kyle, Ayrshire. It stretches north-eastward and south-westward along the left bank of the river Ayr, and is pent up for some distance, on the south and west, and brought to a tapering point by the Coyle, or Coila, a tributary of the Ayr; and it measures about 6 miles in length by 2 in mean breadth, but is completely cut in two by an intersection of the Ochiltree. The parishes which lie around it are St. Quivox and Tarholton on the north-west, Tarbolton on the north, Mauchline on the north-east, Ochiltree on the east and south, and Coynton on the south-west and west. The whole parish is richly improved, highly cultivated, and of a pleasing and embellished appearance. The Ayr, as it courses along the boundary, is alternately beautiful and picturesque in landscape; and possesses an abundant shading of wood. The grounds of Barskimming in the east, with their elegant mansion, their extensive plantations, their improvements along the river, their bridge spanning the Ayr in a single arch from perpendicular rocks of upwards of 40 feet high, and their numerous elements and groupings of romantic beauty, form a series of minute prospects of unusual and almost profuse opulence. The grounds of Gadgirth-castle, of Stairhouse, and of Drogan, and the mansions which superintend them are also pleasingly ornamental. The soil in the small valleys along the rivers is, in general, a stiff clay. The raising of grain and the productions of the dairy are both prime objects of attention. Coal abounds and has long been worked; the well-known Water-of-Ayr stone has been very largely exported; plumhago or black-lead, answering all the purposes of that found in Cumberland, occurs in considerable plenty; and some veins of copper and of antimony exist. The village, or rather hamlet, of Stair, the site of the parish-church, occupies a romantic situation on the Ayr, 2½ miles south of Tarholton, and 5 miles south-west of Mauchline. Two turnpikes traverse the parish, the one southward and the other westward. Population, in 1801, 563; in 1831, 737. Houses 98. Assessed property, in 1815, £5,645.—Stair is in the presbytery of Ayr, and synod of Glasgow and Ayr. Patron, the Earl of Stair. Stipend £214 13s. 5d.; glebe £25. Unappropriated teinds £369 17s. 4d. Schoolmaster's salary £30, with about £20 fees, and £2 10s. other emoluments. There is a non-parochial school.—The parish anciently formed part of Ochiltree, and, in 1653, was made a separate erection by the influence and for the accommodation of Dalrymple of Stair, whose seat was 5 miles distant from Ochiltree church. Of a stipend of six chalders which was settled on the minister, one-half was engaged for by Dalrymple, and the other half was allocated from the old parish of Barnwell, then suppressed and annexed to Tarholton and Craige. In 1709 some lauds of the original erection were disjoined; but they were compensated by some annexations. The district has given successively the titles of Viscount and Earl to the noble family of Dalrymple; created Viscount Stair and Baron Glenluce and Straunraer in 1690, and Earl of Stair, Viscount Dalrymple, and Baron Newliston in 1703. John William Henry, the 7th Earl, succeeded his cousin John in 1821.

STANLEY, a *quoad sacra* parish and a large vil-

lage on the right bank of the Tay,  $4\frac{1}{2}$  miles above the junction of the Almond, Perthshire. The parish was disjoined from Auchtergaven and Redgorton in 1834, by authority of the General Assembly. Its greatest length is 2 miles, and its greatest breadth 1 mile. Its population is nearly all collected in the village. The church was built, in 1828, by Messrs. Denniston, Buchanan, and Co., at an expense of £4,000, chiefly for the accommodation of the people employed in their factory. Sittings 1,150. Stipend £150. A large school is maintained by the Stanley company, and provided with a suitable school-house. Schoolmaster's salary £20, with fees, and a house and garden. There are two Sabbath schools. Population, according to a census taken by the minister, in 1836, 2,249,—of whom 1,916 were churchmen, 321 were dissenters, and 12 were nondescripts. The number belonging, *quoad civilia*, to Auchtergaven, was 1,649, and to Redgorton 600.—The village of Stanley occupies a pleasant site within a fine bend of the Tay, and is split in two by a small intersecting stream; and it stands  $6\frac{1}{2}$  miles north of Perth, and  $8\frac{1}{2}$  north-east of Methven. Though begun only in 1784, and in a state of utter stagnation and almost abandonment from 1814 till 1823, it has now a population of not far from 3,000. The grounds around it were, at the date of its origin, waste and heathy; but are now in fine cultivation, and contribute to the formation of a pleasant landscape. The church of the village surmounts a considerably elevated bank overlooking the Tay; lifts up, from the north end of a substantial, commodious, and handsome pile, a tower of 85 feet in height; and forms a conspicuous and ornamental object within view of a great district of country. A very large proportion of the inhabitants are employed in two extensive cotton-factories; a considerable number are hand-loom weavers; and the rest are principally shopkeepers and labourers; see AUCHTERGAVEN. The village has a small public library, not very greatly in request; a savings' bank, not very much appreciated; a benevolent society; and a funeral society. Stanley-house, an old mansion repaired and modernized, stands a little north of the village, in the midst of beautiful and brilliant scenery, and surrounded with a phalanx of fine stately trees. Inchhervis, or Inchbervie, also on the Tay, a little north of the village, is an old circular tower, asserted by tradition to have been some sort of ecclesiastical out-post of the abbey of Dunfermline.

STAR. See KENNOWAY.

START-POINT, the termination of a narrow peninsula which extends  $1\frac{1}{4}$  mile eastward from the north-east corner of the island of Sanday in Orkney. In 1802 a lofty stone-beacon was erected here for the guidance of mariners, but was found ineffectual; and in 1806 transmuted into a lighthouse, and, in that form, has served to prevent a repetition of the numerous shipwrecks which formerly occurred on the adjacent low coasts. This lighthouse is situated in North lat.  $59^{\circ} 20'$ , and long. West of London  $2^{\circ} 34'$ ; and the Sand-head of Stronsay is 15 miles south-west of it, and the tower of North Ronaldshay lighthouse 8 miles north-north-east  $\frac{1}{2}$  east. Its light, in favourable weather, is visible from all points at the distance of 15 miles.

STAXIGOE, a fishing village, 2 miles north-east of Wick, Caithness-shire. It has a tolerably good natural harbour for boats; and takes an active part in the stirring and prosperous fisheries of Wick. The village is of some antiquity, and still has, in a state of good preservation, two storehouses which were used by the Earls of Caithness for the reception of grain, in the times when rents were paid in kind. Population 260.

STENHOUSE, a hamlet or small village, in a

gentle hollow,  $\frac{3}{4}$  of a mile north of Gilmerton, in the parish of Liberton, Edinburghshire.

STENHOUSEMUIR. See FALKIRK.

STENNESS, a parish, a lake, and a celebrated Druidical monument, in the Mainland of Orkney. The parish is united to FERRIS; which see. The lake is situated in the western district of Mainland; and divides Haray and Stenness on the east, from Sandwick and Stromness on the west. It consists of two parts, or is very nearly bisected by a peninsula on the west side, which is  $3\frac{1}{2}$  miles long, and gradually diminishes from  $1\frac{1}{2}$  mile in breadth to a sharp point. The southern division of the lake extends from east-south-east to west-north-west; is  $3\frac{1}{4}$  miles long, and from  $\frac{3}{4}$  to  $1\frac{1}{2}$  mile broad; and has a tidal communication with the sea so narrow as to be spanned by a bridge. The northern division is connected with the east end of the former by a strait which is so narrow and shallow that it may at any time be forded, and which is crossed by a rude bridge, or a low mound of stones with openings for the passage of the unimportant tide; and it extends from south-south-east to north-north-west, and measures  $4\frac{1}{2}$  miles in length, and 6 or 7 furlongs in mean breadth.—The Druidical monument is 'the Standing Stones of Stenness,' long and everywhere known to antiquarian fame, and second in their class only to the famous monument of Stonehenge. These stones once consisted of two distinct clusters, a semicircle, and a circle, respectively on the south-east and the north-west sides of the strait which connects the two divisions of the lake. Of the semicircle only three stones remain; one of them prostrate, and measuring 18 feet 4 inches in length, 5 feet 4 inches in breadth, and 1 foot 9 inches in thickness; and the other two perpendicular, and measuring respectively 17 feet in height, 4 feet 2 inches in breadth, and 1 foot 3 inches in thickness; and 17 feet in height, 5 feet in breadth, and 7 inches in thickness. A pillar pierced with a hole, and a horizontally placed stone, which are known to have been situated in the centre of the semicircle, are believed to have been respectively the stone to which the victims of the horrid Druidical sacrifices were tied, and the altar on which they were offered. A mound of earth, still partially traceable, fenced round the semicircle, and was 96 feet in diameter. The circle is about a mile north-west of the semicircle, and stands on the tongue of the peninsula which so nearly bisects the lake. Its stones are smaller and more weather-worn, and have a more antique appearance than those of the other group; they appear to have been originally about thirty-seven in number, but now consist of sixteen erect pieces of from 3 to  $14\frac{1}{2}$  feet high, and seventeen fragments, each less than 3 feet; and they are encircled with a ditch from 31 to 33 feet wide, and so filled up as now to be nowhere more than 6 feet deep. The circumference, measured along the outer edge of the ditch, is 1,071 feet. At one end of the bridge across the strait of the lake stands a solitary stone 16 feet high,  $5\frac{1}{4}$  feet broad, and 16 inches thick. The stones are all without inscription or sculpture, consist of the common schist of the country, and are hoarily covered with long lichens. The Messrs Anderson, after quoting a long detail of one of those theories respecting these Druidical remains in which antiquaries have luxuriously indulged, but to which we have not space to advert, say, in a beautiful spirit: "We have loitered long in a heathen temple; but if we compare, for a moment, the horrors of those human sacrifices which were probably offered here, with the light and liberty which we enjoy since that which was offered for us on Calvary, we may the more readily be induced to offer that 'living sacrifice,' which is both an 'acceptable and a reasonable service.'

**STENNESS**, an isle and a holm on the coast of the parish of Northaven, Shetland. They cover a small bay where there is a good fishing-station; and abound with kettywakes, which fill every crevice and projection.

**STENSCHOLL**, an Hebridean *quoad sacra* parish in the district of Trotternish, Skye, Invernesshire. Its greatest length is about 14 miles; its greatest breadth is 4 miles; and its area is about 15,000 Scottish acres. It was, in 1833, by authority of the General Assembly, divided from Kilmuir and Snizort; and consists of portions of these parishes in the proportion to each other of 11 to 4. Its population, in 1836, was about 1,800, all belonging to the Establishment.—The parish is in the presbytery of Skye, and synod of Glenelg. Patron, the Crown. Stipend £120; glebe £1, with a manse. The church was built in 1828 at the expense of Government. Sittings 350. An itinerating school of the Gaelic Society, and a school supported by the General Assembly, have an average attendance respectively of 43 and 72.

**STENTON**, a parish in Haddingtonshire, consisting of four detached parts. The largest and greatly the most important part, called the inland division, is bounded on the north by Preston and Dunbar; on the east by Spott; on the south by Dunbar-common; and on the west by Whittingham and Preston. It is, in a high degree, irregular in outline; yet, in a general view, may be regarded as an oblong stretching north and south, and measuring  $3\frac{1}{2}$  miles by 2. The second part lies  $2\frac{1}{2}$  miles south of the nearest point of the former; is situated wholly among the Lammermoors, and is altogether upland and moorish; has the form of a triangle, of 4, 3, and 2 miles along its sides, the shortest side facing the south, and the longest on the north-east; has Whitadder-water 4 miles for its boundary-line, and on the south is divided by that stream from Berwickshire. The other two parts are little moorland peninsules, lying near each other,—the one surrounded on three sides by Dunbar-common, and the other wholly by Innerwick. The main body or inland district of the parish is one of the most beautiful sections of the brilliant county in which it lies. Its surface, on the whole, rises by a gradual ascent; partly a luxuriant hanging plain, and partly a richly wooded skirting of the Lammermoor acclivities; but it is finely diversified both by natural fractures and undulations, and by artificial culture and embellishment. Belton-water—a very pretty stream, but, like all the Lammermoor streams, much subject to freshets—has 2 miles' connexion north-eastward with the parish; and, in its progress, drinks up two tributaries which enliven other vales. Presmanian lake—in a deep ravine in the south—was formed by the construction of a strong dam or breastwork between the hill-screens of the ravine near the point where they stoop gradually to the plain. The bill-screens here are undulating and richly wooded; they come down in steep and high banks upon the margin of the water; sweep along in sinuous parallels, so as to render the configuration of the lake serpentine; and are cut by walks, and gemmed with attractions, which render them, jointly with the lake, one of the most delightful clusters of close landscape in Scotland. Boats are kept for excursions on its glassy bosom; and, with a singular liberality, these, and the adjacent walks in the plantations, are allowed to be used by the numerous summer-parties who are attracted to feast on the scenery. Another great ornament to the parish are the grounds and mansion of Buil, situated on Belton-water. Three beautiful tiers of flower-terraces rise from the margin of the stream, and are encompassed with a tastefully ar-

ranged demesne, and overlooked by the spacious mansion, partly ancient, but chiefly modern, and one of the most superb in Scotland. Its proprietrix, and at the same time the patroness of the parish, and landowner of nearly its area, is Mrs. Nisbet Ferguson of Dirleton and Belhaven.—The picturesque village of Stenton stands  $3\frac{1}{2}$  miles south-east of East Linton, and  $5\frac{1}{2}$  south-west of Dunbar; and the small village of Petcox stands  $1\frac{1}{2}$  mile farther north-east. Both are on the road between Dunbar and Gifford. Population, in 1801, 620; in 1831, 686. Houses 142. Assessed property, in 1815, £7,356.—Stenton is in the presbytery of Dunbar, and synod of Lotbrian and Tweeddale. Stipend £295 10s. 1d.; glebe £21. Unappropriated tithes £614 10s. 3d. The church—situated in the village of Stenton—was erected about 12 years ago, and is an elegant structure, in the modern Gothic style, with a fine tower.—The parish was originally and long called Petcox, from the village of that name; and seems to have acquired the designation of Stenton or Stonetown, from the stoniness of the ground in the district round the church. In ancient times it was first a chapelry, and next a prebend of Dunbar, and a rectory. Schoolmaster's salary £34 4s., with £40 fees, and £8 other emoluments.

**STEVENSTON**, a parish on the coast of Cunningham, Ayrshire. It is bounded on the north by Ardrossan and Kilwinning; on the east by Kilwinning and Irvine; on the south-east by Dundonald; on the south by the frith of Clyde; and on the west by Ardrossan. The river Garnock forms, for about 3 miles, the boundary on the east; and the expansion after its confluence with the Irvine, called Irvine-harbour, forms the boundary with Dundonald. The greatest length of the parish from east to west is 5 miles; its greatest breadth is 3 miles; and its superficial extent is  $6\frac{1}{2}$  square miles. The 5 miles line of shore is quite a sandy beach, toward which the sea shoals so very slowly as, in a high westerly wind, to fling up a strong and dangerous surf, and occasion to embayed vessels the imminent peril of striking the ground at a considerable distance from the shore. Evidence of various kinds exists,—geognostic, topographical, traditionary, and documentary,—that both the Garnock and the Lugton at one time flowed through the parish, each as an independent stream, the former to a point immediately east of Saltcoats, and the latter to one about half-way thence to the mouth of the Irvine. Proofs of the changes, and of their comparatively modern date, are quite apparent upon even a cursory examination of the locality, and may be seen fully stated in both the Old Statistical Account and the New. The extent of the sandy wastes is about 1,200 acres. Stevenston-burn, the only stream now connected with the interior, ploughs up a pretty glen, and makes a beautiful little cascade on the lands of Grange, and enters the sea  $1\frac{1}{2}$  mile east of Saltcoats. Ashgroveloch, from which it issues, is situated on the northern boundary, and covers between 30 and 40 acres. A hard trap rock occurs, and is quarried as road-metal. Sandstone of prime quality, and celebrated as 'Stevenston-stone,' abounds, and is extensively quarried as a large article of commerce. Excellent 'Osmond-stone,' and a peculiar variety of schist occur, and are in request as material for furnaces. Coal-mines and limestone-quarries are very extensive, are largely and vigorously worked, and contribute primarily to the employment of the population and the prosperity of the district. Ironstone exists between the coal strata, but in a comparatively thin seam. The mansions of the parish are Grange, Sea-Bank, Ardeer, Mayville, Hullerhirst, and Hayocks; and in their own forms, and with their plantations

and pleasure-grounds, they altogether redeem the general landscape of the parish from the menaced destruction of it by its bald and monotonous seaboard.—On the grounds of Grange stands the ivy-grown ancient castle of Kerilaw, formerly one of the seats of the Earls of Glencairn. At some period in the 15th century it was sacked by the retainers of Montgomery of Eglinton; and nearly half-a-century afterwards, retaliation was made by burning Eglinton-castle to the ground. The parish is traversed by two lines of turnpike and by the Ardrossan and Kilwinning railway. Part of the town of SALTCOATS [which see] is in the parish. An ancient village—now extinct—stood on the lands of Ardeer, bore the curious name of Piper-Keugh, and was famous for the manufacture of the Jews' harp.—The village of Stevenston stands about 1 mile north-east of Saltcoats, and 2 miles south-west of Kilwinning. It consists principally of one long winding street, about half-a-mile in length; and is inhabited chiefly by persons employed in the neighbouring collieries, and by cotton-weaving in the employment of the manufactures of Glasgow. Its site commands a fine view of the magnificent scenery of the frith of Clyde, and its Ayrshire and Arran screens. The place is of so high antiquity as to be mentioned in a charter of the year 1240. The inhabitants are distinguished for their love of music, and high rustic proficiency in its alluring art. The village is the site of the parish-church, of two schools, and of an excellent grain-mill, of high antiquity, and has a small subscription-library, two Sabbath schools, and several friendly societies. A fair, or rather a series of revelries and follies, is held here on the 30th October, and bears the name of St. Monoch's fair. Population of the village about 2,000. Population of the parish, in 1801, 2,146; in 1831, 3,544. Houses 492. Assessed property, in 1815, £5,897.—Stevenston is in the presbytery of Irvine, and synod of Glasgow and Ayr. Patrons, Hamilton of Grange, and Cunningham of Auchinharvie. Stipend £250 9s. 3d.; glebe £20. Unappropriated teinds £239 7s. 3d. The parish-church was built in 1832–3. Sittings 1,175. In the Stevenston part of Saltcoats are three dissenting places of worship. The Relief chapel—belonging to a congregation established in 1780—was built in 1832, and cost £484 15s. Sittings 650. Stipend £106. The United Secession chapel—belonging to the earlier congregation of the body, one established about 1790—was built in 1792, and cost about £700. Sittings 556. Stipend £180, with £4 4s. at each sacrament. The Scottish Baptist place of worship is a large hall attached to an inn, and rented at £7 a-year. Sittings from 250 to 300. Stipend, the monthly collections, and from 10s. to £2 of the door collections. According to a census taken by the parish-minister in 1835–6, the population was then 3,681; of whom 2,232 were churchmen, 781 were dissenters, and 668 were persons not known to make any profession of religion. In 1834 the parish-school was attended by 45 scholars; 8 non-parochial schools by 328; various evening schools by 79; and the aggregate Sabbath-schools by 345. Parish-schoolmaster's salary £34 4s. 4½d., with about £15 fees, and 16s. 7½d. other emoluments. The ancient parish was a vicarage under the monks of Kilwinning. The village, and through it the parish, had their name from a person called Stephen or Steven, who, in the 12th century, obtained a grant of the lands from Richard Morville.

STEWARTFIELD, a considerable village in the parish of Old Deer, in Aherdeenshire, 3 miles from the post-town of Mintlaw. See article OLD DEER.

STEWARTON, a village on the west side of Lochryan, in the parish of Kirkecolm, 5½ miles north

of Stranraer, Wigtonshire. The population is partly agricultural; but in almost every house, muslin-webs are embroidered by young men for the Glasgow manufacturers. The earnings of an embroiderer range between 8d. and 1s. 4d. a-day. Population 430.

STEWARTON, a parish in Cunningham, Ayrshire; bounded on the north by Renfrewshire; on the east by Fenwick; on the south by Kilmaurs and Dreghorn; and on the west by Irvine and Dunlop. Its greatest length from north-east to south-west is nearly 11 miles; its greatest breadth is 4 miles; and its superficial extent is about 10,145 acres; and the surface has a flat appearance, yet gradually declines from the houndary with Renfrewshire toward the south-west or the sea, and swollen or tumulated into numerous small hills. Though its eminences are in no instance considerable, they almost all command rich views of the county and of the gorgeous scenery of the Clyde. The northern division is naturally moorish, and is still bare and of a chaurish soil. The central and southern divisions are in high cultivation. The roads from Glasgow to Irvine and from Paisley to Kilmarnock, pass respectively south-westward and southward through the parish. Population, in 1801, 2,657; in 1831, 4,503. Houses 541. Assessed property, in 1815, £15,067.—Stewarton is in the presbytery of Irvine, and synod of Glasgow and Ayr. Stipend £280 19s. 2d.; glebe £9. Unappropriated teinds £291 11s. 2d. The parish-church was built in 1696, and altered and greatly enlarged in 1825. Sittings about 1,400. There are three dissenting places of worship, all situated in the town. The United Secession chapel was built in 1775. Sittings 592. Stipend £100, with a house and £9 for sacramental expenses. The Original Burgher place of worship was built in 1828, and cost £436 14s. Sittings 505. Stipend £60.—The Congregational place of worship is the Town-house, the private property of Mr. Cuninghame, the patron of the parish, by whom the congregation assembling in it was formed in 1827. Sittings 396. No stipend. The population of the parish, as stated by the parochial minister in 1836, was then 4,712, and consisted of 3,708 churchmen, 867 dissenters, and 137 nondescripts. Parish-schoolmaster's salary £34 4s. 4½d., with fees, and £5, as well as the receipts for the office of session clerk, other emoluments.—The parish was anciently a vicarage under the monks of Kilwinning. On the lands of Lainshaw, at a place now called Chapel, and formerly called Chapelton, anciently stood a chapel dedicated to the Virgin Mary.

STEWARTON, a small hut thriving manufacturing town in the cognominal parish, Ayrshire. It stands on the right bank of the Annock, 2 miles south-south-east of Dunlop, 3 west-north-west of Fenwick, 5 north by west of Kilmarnock, 9 north-east of Irvine, and 18 south-west of Glasgow. The stream which washes it makes, just when abreast of the town, a beautiful semicircular sweep of such scope as to measure half-a-mile along the chord; and it is spanned by three bridges, respectively at the ends and in the middle of the sweep. One street extends along the chord of the semicircle, and is prolonged upon the margin of the stream; and this street extends from north-east to south-west, and carries along the Glasgow and Irvine turnpike. Another street opens from the bridge at the middle of the semicircular sweep, cuts the former street at right angles, and carries along the road between Kilmarnock and Paisley. Some minor thoroughfares belong to the body of the town, and considerable clusters of buildings form suburbs. Stewarton may vie with any town of its size in the west of Scotland for regularity, beauty, and general attractions. But though

a place of considerable antiquity, it was for centuries a mere obscure village; and, not till about 60 or 70 years ago did it decidedly assume the healthful, growing, and energetic appearance by which it has since been distinguished. Its prosperity has nearly all been connected with the woollen manufacture. The making of tartan and other woollen bonnets has very long been carried on; the making of regimental caps and bonnets, in particular, has been a staple manufacture. Upwards of 400 persons, residing principally in the localities called Townhead, Darlington, and Kirkford, construct the fabrics in their own houses, and are aided by public mills whose chief departments are simply the carding and the spinning of the wool. A great impulse was given, and much increase to trade and population was occasioned, about 20 years ago, and have since been perpetuated by the introduction of carpet manufactures and worsted mills. Other employments are the Ayrshire needle-work;—silk, muslin, linen, and damask weaving,—clock-work for foreign markets,—and the making of spindles for cotton and woollen mills. The town has a branch-office of the Glasgow Union bank; a savings' bank; a ladies' boarding-school; 7 private schools, besides the parish-school; 2 insurance offices; a gas company; and a parish library. Annual fairs are held on the last Friday of April, old style; on the last Tuesday of May, old style; on the last Thursday of June; on the first Friday after the 12th of November; and on the Thursday, or 6th day after the last of these dates. Coaches run daily in transit between Kilmarnock and Paisley; two caravans go daily, and two carriers twice a-week, to Kilmarnock; two carriers twice a-week to Glasgow; and one carrier twice a-week to Paisley.—Stewarton has never been erected into a burgh, and is not the seat of any merchant-guild or trades' corporations. The ground on which it is built holds feu of William Cuninghame, Esq. of Lainslaw; and that on which the suburbs stand holds, for the most part, of Sir James Montgomery Cuninghame of Corsehill, Bart. As superior, Mr. Cuninghame has right to levy a custom on meal and other articles, and to exact certain rates on stands or booths at fairs; but the right is so gently wielded, or intrinsically so inconsiderable, as to have been let for £5 a-year. There are no local taxes or assessments. The only magistracy are the justices-of-peace of the county, and Mr. Cuninghame's baron-bailie. A justice-of-peace court is held on the first Thursday of every month; and superintends not only the town itself, but the three parishes of Stewarton, Dunlop, and Fenwick. A lock-up-house, and a justice-of-peace court-house in the town, are the private property of Mr. Cuninghame, and are maintained wholly at his expense. Population, in 1833, 2,969; of whom 735 resided in the suburbs, and 2,234 in the town.

STIRLING,\* a small parish in the north of Stir-

\* The name is written *Strevelyn* by Barbour; *Strevelyn*, *Strivelyne*, and *Strivelyne*, by Wytoun; *Strivelyne*, by Belandeu; also *Striveline*, *Striveling*, *Strevelyne*, *Strevelyng*; in English deeds of the reigns of Edward I. II. and III. most commonly *Strivelyn*, sometimes *Estrivelin*; as, in the translation of Froissart, it appears in the form of *Estrivelyn*; and, by a strange misnomer, of *Estarnelyne*. The name is most probably of Celtic origin. As, from its situation, this fortress formed a sort of boundary to the possession of different hostile nations, it has been conjectured, with considerable plausibility, that it had derived its name from being the object of frequent contention. "*Striveling*," it has been said, "which was the ancient name of the plain, signifieth 'the hill' or 'rock of strife,' to which the Monkish writers seem to allude, when they give it the Latin name of *Mons Dolorum*." In Irish and Gaelic, *strith* undoubtedly signifies 'strife.' But if we view this as forming the primary part of the word, we must be at a loss for the termination; unless we trace it to *linn*, which, in the Irish, denotes 'a straight,' or narrow entrance,—as if referring to the position of this rock, between which and the river there is only a narrow passage. Macpherson, while he

lingshire; bounded on the north by Logie, and on all other sides by St. Ninian's. Its greatest length is about 3 miles, and its greatest breadth about 1½ mile. The Forth is the boundary-line over most of the north. St. Ninian's, in several places, makes deep indentations; and it even comprises part of the town. The entire landward part of the parish comprehends not more than 200 acres; and the population is, in consequence, almost all collected in Stirling, and in the villages of Raploch and Abbey. The king's park or royal domains, and the castle, with its constabulary, comprising a small portion of land formerly annexed to the office of constable, belong to the parish only *quoad sacra*, and since the castle ceased to have a resident and officiating chaplain, and they are exempted from all parochial assessment. The barony of Cambuskenneth, lying east of Stirling within a link on the north bank of the Forth, and understood to have anciently constituted a separate parish, is now so far comprehended in Stirling, that while subject to the poor's rates in Logie, and to the jurisdiction of the sheriff of Clackmannan, it pays part of the stipend of the first minister of Stirling; and has an allocation of sittings in the church for the inhabitants of its village of Abbey. The landward district of what in every sense belongs to the parish, includes some parks on the south of the town, but lies principally on the north, stretching eastward along the river from Kildean, about a mile above Stirling-bridge. The soil is excellent, and the climate healthy. Population, in 1801, 5,271; in 1831, 8,556. Houses 785. Assessed property, in 1815, £10,695.

Stirling is the seat of a presbytery, in the synod of Perth and Stirling. The charge is treble. Patron, the Town-council. Stipend of the first minister £348 17s. 10d., with a glebe worth £21, and an allowance of £40 for a manse; of the second minister £250; of the third minister £200. That of the second and the third is derived from the town's funds; and that of the first from the teinds from fishings on the Forth, and from two beaves furnished by the town. Unappropriated teinds £440 15s. 8d. The church was built in 1494, and is now divided into two, the East and the West, the former of which was repaired in 1808, and the latter in 1818. Sittings in the East church 1,187; in the West church 1,177. The churches were at the Reformation granted by Queen Mary to the corporation of the burgh; and since that period they have, as to their area or the space for pews and galleries, been so extensively sold to public bodies and private individuals that, in 1833, only 616 sittings belonged to the burgh, 43 of which were retained for the use of the Town-council, 64 set apart for the poor, and 509 set apart for letting. One of the ministers officiates regularly in the East church; another in the West; and the third alternately in the two; and they singly or jointly maintain two week-day evening lectures, one Sabbath evening lecture, and a Sabbath evening class.—There are in the town 9 dissenting places of worship. The First United Secession congregation was established in 1740. Their present meeting-house was built in 1826, at a cost of £3,100; and occupies ground which is supposed to be worth about £800. Sittings 1,417.

admits the general idea as to the origin, gives the Gaelic word in a more simple form. "That tract of country," he has remarked, "between the firths of Forth and Clyde, has been, through all antiquity, famous for battles and reconquests, between the different nations, who were possessed of North and South Britain. Stirling, a town situated there, derives its name from that very circumstance. It is a corruption of the Gaelic name *Strila*, i. e. 'the hill, or 'rock of contention.'" Baxter views the Roman station of *Alauna* as *Stirling* or *Strivelm*; resolving it into British, *Es Tree Alaun*, i. e. *Oppidum Alauna*.

The charge is collegiate. Joint stipend of the two ministers £400. This congregation, and each of the three next named, has attached to its place of worship a religious library.—The Second United Secession congregation was established about the year 1747. Their place of worship was built in 1752. Sittings 610. Stipend £150, with £14 for communion and synod expenses.—The Reformed Presbyterian congregation was established in 1775. Their place of worship was built in 1783, and cost about £300. Sittings 250. Stipend £80, with £5 for sacramental expenses, and £15 in lieu of a house.—The Independent congregation was established in 1804. The place of worship—the upper story of a building, the lower story of which is let as a dwelling-house and cellar—was purchased, in 1812, for £210, and, jointly with the dwelling-house, fitted up at an additional cost of nearly £290. Sittings 400. Stipend £70.—The Baptist congregation was established in 1826, and have the gratuitous use of the Guildhall as their place of meeting. Sittings about 150. Stipend £48, but variable.—The Scottish and English Episcopalian congregation has existed since the establishment of Presbyterianism. Their chapel was erected about 43 years ago, and cost about £600. Sittings 200. Stipend £150. In 1838, subscriptions were entered for another sum of £150, as a retired annuity to a minister who had resigned, the Right Rev. Bishop Gleig.—The Original Burgher congregation was established in 1799. Their place of worship was built in 1801, and cost £1,600. Sittings 800. Stipend £130, with a mause and gardens, jointly valued at £20.—The Scotch Baptist congregation was established in 1802 or 1803. Their place of meeting is the Trades' hall, rented at £2. Sittings about 100. No stipend.—The Roman Catholic congregation was established about 18 years ago. Their chapel was erected in 1833; and, jointly with a house for the minister, cost about £1,500. Sittings 350. Stipend, derived hence and from the chapels of Alloa and Campsie, under the charge of the same officiate, about £100.—According to a survey made in January 1836, under the direction of the parish ministers, the population then consisted of 4,523 churchmen, 3,055 dissenters, and 199 nondescripts; in all, 7,777 persons. But the population of the Causeyhead, the garrison of the castle, and the inmates of the jail, amounting respectively to 129, 354, and 33, were not included.

Stirling is singularly rich in the number, variety, and good qualities of its schools. Three are strictly burgh schools, a fourth is so far a burgh school as both to be partially salaried by the town, and to be under the patronage of the magistrates; three others are more or less aided and directly patronized by the burgh; three are hoarding-schools for females; one is an infant-school; one is a charity-school for girls too far advanced to be fit attendants at the infant-school; and the rest are all schools on private adventure. They amounted, in 1834, to 21 in number; and were then conducted by 33 teachers, and attended by 940 scholars. At 15, English, writing, and arithmetic are taught,—with history at one of the burgh schools, and French, music, and kindred branches at the boarding-schools; and at three others only English reading and spelling, with, at one of them, the addition of sewing and knitting. The four wholly under the patronage of the magistrates and council, are the grammar or high school, the writing and mathematics school, the first English school, and the second English school,—the last commonly called Allan's Hospital school, owing to its being that at which the boys on Allan's charitable foundation are educated. The grammar-school

affords tuition in Greek, Latin, French, geography, and ancient history; has an average attendance of 40 scholars; and yields its rector, in addition to fees, £50 of salary, and an assistant £20. The writing school affords tuition in writing, arithmetic, book-keeping, geography, navigation, and the various departments of mathematics; has an average attendance of 150; and yields £50 of salary, with fees. The English schools yield each a salary of £50, besides fees; have an average attendance respectively of 100 and 135; and afford tuition, the one in English, elocution, geography, and drawing; and the other in English, history, geography, writing, and arithmetic, and occasionally in book-keeping and practical mathematics. Three of the school-houses belong wholly to the burgh, and that of Allan's Hospital school, was erected partly at the burgh's expense, and is considered in the largest sense a public building. The salaries of all the teachers are paid in certain proportions, and according to a fixed scheme, out of the town's funds, and by Cowan's, Spittal's, and Allan's hospitals. There are in the burgh two important mortifications for the purposes of education, the one under the management jointly of the magistrates and council, and the second minister of Stirling, and the other under the management solely of the magistrates and council. The older of the two originated, in 1724, in a bequest by John Allan, writer in Stirling, of a sum which he appointed to accumulate till it should amount to 40,000 merks, and to be then annually applied in maintaining, educating, and putting out to trades, boys belonging to members of the trades' incorporations of the burgh; and it now yields a free annual income of about £300, and, in 1833, maintained 23 boys. The more recent mortification originated, in 1808, in a trust settlement by Alexander Cunningham, merchant-burgess in Stirling, conveying the residue of his means and estate for maintaining, educating, and putting out to trades, boys belonging to members of the gildry incorporation, or of the society of mechanics of Stirling; and, in 1822, it exhibited a fund of £5,724 11s. 2d., and, in 1833, maintained 20 boys. The children on these mortifications do not live in public or hospital buildings; but are maintained with their parents or natural guardians on an allowance of 2s. 6d. weekly for each; they are yearly supplied with clothing,—and they receive their general education at the second English school, and are occasionally, or according to circumstances, transferred for the higher branches of education, to the writing and the grammar schools. They are limited, as to the period of their education to 5 years; and, in the event of any of them distinguishing themselves at the grammar-school, they may,—though only one at a time on each foundation—be sent to college, and assisted there during 4 years with an annual sum for their maintenance and education as university students.

The parish of Stirling was anciently in the diocese of St. Andrews; but being comprehended within the archdeaconry of Lothian, it followed the fortunes of that district in the erection of it by Charles I., in 1633, into the diocese of Edinburgh, and then entitled its minister to a prebend's stall in the cathedral church of St. Giles. Soon after the Reformation—before the charge was yet made collegiate, an event which did not take place till 1651—Mr. Robert Montgomery was deposed by the General Assembly from the pastoral charge of the parish on account of a simoniacal compact with the Duke of Lennox about the archbishopric of Glasgow; and he afterwards, in 1587, became minister of Symington in Ayrshire, and was reduced to great poverty, or, as Keith says, to "great misery." Mr. Patrick

Symson, another minister of the parish, published about the year 1600 a folio Church history of the preceding 15 centuries. Mr. Henry Guthrie, a third minister of the parish, was afterwards bishop of Dunkeld, and then lived retiredly at Kilspindie; and he wrote, probably while at the last of these places, *Memoirs of Scottish affairs* from the year 1627 till the death of Charles I. in 1649. Mr. James Guthrie succeeded him, and was the celebrated minister of that name whom the persecuting tyranny of Charles II. brought to the block in 1661. After his death, Henry, the retired bishop and quondam minister, was invited back to his charge in Stirling; but, on account of bad health, he declined. Various other ministers after the charge had been rendered double and treble, are mentioned; but, for the most part, they were undistinguished. In 1731, Mr. Ebenezer Erskine was settled as third minister; and, 7 years afterwards, he jointly, with the other three fathers of the Secession, seceded from the Church of Scotland, and formed the community of what they called "the Associated Brethren,"—the illustrious germ of the large, evangelical, and highly useful body of the modern United Secession, as well as of several homogeneous offshoots. From the date of Mr. Erskine's secession till about 23 years ago, a period of 80 years, the third charge was never filled, but made to lie in abeyance. Various ecclesiastical notices might be added, but will find more appropriate places in our outline of the town's general history, or in our account of its existing and extinct public buildings.

STIRLING, an ancient town, a royal burgh, the capital of Stirlingshire, and one of the most attractive seats of population in Scotland, is situated in 56° 12' north latitude, and 3° 50' longitude west from London; 6 miles south of Dunblane, 7 west of Alloa, 7 north of Denny, 11 north-west of Falkirk, 28 north-east of Glasgow, 33½ south-west of Perth, and 35 west-north-west of Edinburgh. The site of the ancient and still the larger part of the town is the face and sides of a wedge-like bill, which begins on the south-east to rise from the centre of a rich and gorgeously dressed plain, and ascends with an almost regular gradient over a distance of between 5 and 6 furlongs to the north-west, and then breaks precipitously down in an almost perpendicular crag of basaltic rock. It thus, not only in the romance of its peculiar locality, but in the specific element by which the romance is formed, closely resembles Golconda, Athens, and the old town of Edinburgh. Its resemblance to the last, in particular, is so intimate as to have been noticed by Dr. Clarke, and by every tasteful writer on its topography; yet, in consequence of wanting the accompaniment of a circumjacent sea of city, it has the appearance of being a miniature resemblance, while, by wanting such grand and nobly attractive physical tutelage as that of Salisbury-crags and Arthur's-seat, and possessing a vast command of distant as well as of near scenery in almost every style of brilliance, it has attractions of its own which render it in many respects quite a rival with the metropolis. Edinburgh, indeed, has a profusion of rich urban landscapes, and of magnificent city foregrounds to its landward scenery, not one copy or even remote imitation of which can be found in Stirling; and it offers to the view, from various points of each of its four great heights, as well as from several places on its lower grounds, such a diversity of groupings, as amounts to a series of entirely distinct landscapes, while Stirling exhibits a commanding panorama from only one hill, and exhibits it with effect in only one grouping, and from only one spot,—the summit of the hill. Yet the one panorama is so great, so furnished all over

with glory, so lit up both with the displays of the Creator's beneficence in his physical works, and with his smiles upon the rightly directed efforts of man, that we must not dare more than attempt a mere etching of its outline. The ground in the immediate neighbourhood of the wedge-like and entirely edified hill, is, with two or three exceptions which just relieve it from monotony, quite flat; and it either exhibits interesting vestiges of antiquity, or is streaked and studded with gay modern extensions and suburbs of the town, or, more generally, is disposed in rich arable fields. On the south, rising woodlands, the two basaltic heights of Gillies-hill and Sauchie-hill famous in connexion with the battle-scenes of Bannockburn and Sauchie, and the commencements in general of the Lennox or Campsie chain of eminences, speedily close up the view, or render it interrupted and unwelcomely broken. Yet the two hills of Gillies and Sauchie, the hill of Stirling itself, and the Abbey-craig immediately north of the Forth—all rocky heights rising gradually from the east, and stooping precipitously down on the west—form a chain of great bold rocks which awe and yet solemnly delight the mind by picturing to it the vast convulsion which must have flung them up from the plain; and, along with Craigforth, a fifth basaltic rock in the vicinity, they appear, when illuminated by the rays of the setting sun, almost like craggy islets of gold looking up from a calm sea of luxuriant verdure. On the south, too, immediately under the eye, from the castle or summit of the hill, the rocky and rapid declivities are clothed with wood,—they exhibit from end to end of the overhanging town a shelving and umbrageous thicket,—and, along the very brow of the rock and elsewhere, they have noble walks, the result of very many years' labour and of large expense, which possess an amount and a peculiar style of embellishment not easily to be paralleled. On the east, the eye, after being lifted over the town and the Abbey-craig and the ruins of Cambuskenneth-abbey, wanders amidst vast mazes of beauty, labours to follow the long and graceful manipulating sweeps of the Forth amidst the broad and luscious curves, and, on a clear day, is carried over a region seemingly as rich and odoriferous as a garden all the way to the romantic castle-rock and Arthur's-seat of Edinburgh. On the north-east are the broad, lofty, and picturesque commencements of the Ochil-hills. But on the north, the north-west, and the west, who shall describe what lies unfolded to the eye,—the vales respectively of the Allan, the Teath, and the upper Forth, leading away through expanses of the most ornate lowland loveliness to such scenery as that of the Trossachs, and to the combinedly grandest and most graceful forms of highland landscape? All the foreground and the middle view are of surpassing loveliness; and all the back-ground towers aloft at a great distance in peaks, which are clad in snow or wreathed in clouds, and which aggregately rest like a vast blue rampart against the sky. The view here is the cultivation and the magnificent artificial productions of art spread out upon a nobly expanded or brilliantly undulated surface, and blended into harmonious keeping, with a view sufficiently near to be clearly depicted of the majestic natural scenery of one of the finest sections of the Highlands. "But," says the querulous Dr. Macculloch, completely fired for once into a blaze of enthusiasm, "it is not Stirling of which I need to speak, the glory of Scotland; for who does not know its noble rock, rising the monarch of the landscape, its majestic and picturesque towers, its amphitheatre of mountain, and the windings of its marvellous river: and who that has once seen the sun descending here

in all the blaze of its beauty beyond the purple hills of the west, can ever forget the plain of Stirling, the endless charm of this wonderful scene, the wealth, the splendour, the variety, the majesty of all which here lies between earth and heaven!"

The principal accesses to Stirling are by the Burgh-port on the south, toward which all the roads from the west, round by the south to nearly the east, converge, and the bridge on the north, which brings in all the thoroughfares from the north-east round by the north to the south-west. The road which conducts from St. Ninian's to the former is, in a sense, all town, and, as well as St. Ninian's itself, is all comprehended within the parliamentary boundaries. Only 250 yards north of St. Ninian's commences the continuous villages of Bellfield and Newhouse, jointly about  $\frac{1}{4}$  of a mile in length; and between them and the commencement of compact town, a distance of upwards of half-a-mile, the road is lined on both sides with beautiful villas, and shaded with lofty trees, while, over more than half of the distance, it has a fine regular line of modern buildings, called Melville-place, and farther on is winged on the west by a sort of square called Allan-park. The compact town now commences with Port-street, which runs 220 yards northward on a line with Melville-place, and is very broadly winged on the east by the suburb called Craigs, bringing in the thoroughfare from Airth. The main body of the town, that which runs up the gradual ascent of the hill, and forms the great seat of population, and contains most of the local objects of antiquarian and public interest, extends 3 furlongs north-westward from the north end of Port-street. In its lower part of less than 200 yards it is a spacious and airy single street, called King-street; the site of various neat private houses, of two very ornamental public buildings, and of the Exchange and other markets; in its central part, or over a distance of about 500 yards, it is slenderly split into two parallel and less airy thoroughfares, called Spittal-street and Baker-street, which communicate with each other by a lane about mid-distance between their ends; and in its upper part it again becomes a single spacious thoroughfare, which takes the name of John-street, and has among its structures the parish-churches, and some other interesting public buildings. These streets, including the Port, have all an appearance of modernized antiquity, or present a curious minglement of the antique and the modern, now an old-fashioned building mouldering down to decay, now an antiquated edifice partly remodelled to the taste of a later age, and now a building altogether and elegantly new, but everywhere the evidence of recent improvement, and the frequent recurrence of good shops. Baker and Spittal streets, in particular, are curiosities: they are steep as well as narrow; they are largely edified with tenements belonging to a taste which has long since perished; and they long were ribbed from end to end with the rude abutments of 'outside stairs,' the removal of which has occasioned a kind of mongrelism in the general style—if style it may be called—of the street-architecture. Friars-wynd, which goes off for 200 yards northward from near the foot of Baker's-street,—St. Mary's-wynd, which goes off 350 yards in the same direction from the head of it, or from the foot of John-street,—these and some minor streets and alleys are narrow, irregular, winding, and generally unprepossessing. Broad-street, a thoroughfare of 160 yards in length, leading off from St. Mary's-wynd, and running or climbing nearly parallel with John-street, is spacious and of imposing appearance, and largely partakes of modern improvement. The streets, called Upper and Lower Castle-hill, hang in the north-east face

of the higher end of the hill; and diverging from a point which is immediately overhung by the castle, they fall at their lower ends respectively on the head of Broad-street, and on the north end of St. Mary's-wynd. The principal new or entirely modern streets are Bridge-street, leading out on a line with St. Mary's-wynd, over a distance of 750 yards to the old bridge,—a street opened only in 1840, and giving great promises of elegance, leading from the lower part of the main body of the town away toward the new bridge; Cowan-street, on a line with Friar's-wynd, and falling at an acute angle upon Bridge-street; and Queen-street and Irvine-place running parallel to each other, but in an oblique direction between Bridge-street and Cowan-street. These thoroughfares are, in a general view, but partially edified, yet regular and neat, or even elegant; they have occasionally connection with handsome modern villas; they are numerous inhabited by annuitants or gentlemen of fortune, who have sat down to luxuriate in a position which combines town advantages with salubrity of climate and exquisiteness of landscape; and while the old and close parts of the town are in many places ill-paved, and in all more or less mean, these new and open parts have flag-pavements for foot-passengers, and are maintained in freshness and fine order.

A few objects in the immediate vicinity of the town are so intimately connected with either its landscape or its history as to require separate notice. South-west of the castle or summit of the hill lies the King's-park, about 3 miles in circumference, once the wooded walk of flocks of deer, and the scene of many a royal hunt, but now almost wholly divested of wood, and chiefly disposed in arable grounds and artificial pastures. A wall of great antiquity surrounds it, and may be seen running along the base of the basaltic pillars which colonnade the western and southern precipices of the hill. The park is now encroached on by the modern race-course, and traversed by the road from Dumbarton, as well as by a short branch-road from the suburban village of RAP-LOCH [which see]; but, so late as about 50 years ago, it was maintained inviolate, and continued untouched by any road. At the east end of the park lay the royal gardens. Though, from long neglect and the natural wetness of the soil, they have become marshy and desolate, they still have a few stumps of fruit-trees, some vestiges of walks and parterres, a series of polygonal but quite regular concentric mounds, and various other indications of their ancient configuration and arrangements. About three acres still remain as an orchard. A few months ago there was growing in it a pear-tree said to have been planted by James VI.; it was named the King's pear or Carnock pear. For a number of years past it was rapidly decaying, one branch falling-off after another, and the trunk also mouldering away; but it was still respected, and surrounded with props to keep it from falling. It could not, however, be preserved; and a short time ago, the tree that was planted by that "most high and mighty prince" lay prostrate on the ground. Rising from the centre of the concentric mounds, is an octagonal mound in the form of a table, which bears the name of the King's Knott, and is traditionally said to have been the scene of fetes champetres, or of some forgotten species of recreations practised by the royal court. Barbour, in his account of the battle of Bannockburn, speaks of a round table as, at the date of that event, existing at the foot of the castle; and says that, when Edward of England was told by Moubray, the governor, not to expect safety by being admitted into the castle, "he took the way beneath the castle by the Round table." The mound is of great antiquity, and

probably existed before the gardens were formed; and the pastime celebrated on it may, without much violence, be conjectured to have been that called the Knights of the Round Table,—a pastime of which several of the Scottish monarchs, particularly James IV., are said to have been fond.—Along the line in the park from north to south, now traversed by the public road, were not long ago vestiges of a canal on which the royal family and court aired in barges.—On the south face of the castle-hill, a little below the esplanade, in front of the castle, is a hollow, called the Valley, now about an acre in area, but formerly much more extensive, having the appearance of an artificial work, and anciently used for joustings, tournaments, and other feats of chivalry. Closely adjoining it on the south is a small rocky pyramidal mount, called the Ladies' Hill, whence the females of the court surveyed the feats. In Lent, 1449, a celebrated tournament was fought in the Valley between three Frenchmen and three Scotchmen, in the presence of James II. as umpire; and about 1503-7, an Italian, who as a pretended alchemist had won the confidence of James IV., and got himself promoted to be abbot of Tongueland, attempted, with the aid of wings of his own making, to fly from the Valley, or from the neighbouring battlements of the castle, and ludicrously accounted for his tumbling down and breaking his thigh-bone, by saying that "the wings were partly composed of the feathers of dunghill fowls, and were by sympathy attracted to the dunghill, and that had they entirely consisted of eagles' feathers they would, for the same reason, have been attracted toward the heavens!"—On a line with the castle on the north-east extends for a brief way a rugged rising ground, called Gowlanhill; and at the extremity of it near the bridge, is the Moat-hill of the feudal times, a small mount on which executions usually took place:—

"Thou, O sad and fatal mound,  
That oft hast heard the death-axe sound."  
LADY OF THE LAKE.

The mount is encircled at the summit with a parapet of earth, and has several other remains of artificial works. On this eminence, within sight of their castle of Doune, and much of their extensive estates, Duncan, the aged Earl of Lennox, his son-in-law, Murdoch, Duke of Albany and Ex-regent of the kingdom, and the latter's two sons, Walter and Alexander Stuart were beheaded in 1425. The execution of Walter Stuart took place a day before that of the others, and is, with much probability, supposed to be the groundwork of the pathetic ballad of 'Young Waters.' On the same hill, at an earlier date, Sir Robert Graham and several associates were executed for the assassination of James I. The hill now bears the uncouth name of Hurley-Haaky, and is said to have got it from the odd circumstance of James V., when a boy, having been used to slide on the skeleton of a cow's head from top to bottom of the bank,—the word *Haaky* being a sort of generic name, in Scotland, for a cow, and James being known to have practised on the hill some sliding-stool amusement under the name of Hurley or Hurley-Basket.

The public buildings of Stirling are numerous and interesting. The parish-churches, situated at the head of John-street, are one edifice and of one date. The structure was built by James V., in 1494, for the accommodation of a convent of Franciscans or Grey Friars; and, previous to 1656, when a dead wall was run up across its centre to divide it into two, it was strictly one church. It is a magnificent Gothic fabric, all of hewn-stone, with an arched roof supported by two rows of plain massive pillars. The western half appears to have had at each corner a

projecting square building. One of these is now an aisle, and one has on an arch—which now spans a window but formerly overhung the entrance—the rose of England and the thistle of Scotland; and it seems to have been of beautiful architecture, and figures in tradition as the chapel of Margaret, daughter of Henry VII., and wife of James IV. The eastern half of the church received from Cardinal Beaton the addition of a chancel, one which added greatly to both the internal and external beauty. The west church, though apparently less magnificent than the east, really exhibits more elegant specimens of architecture; and, besides being fitted up within in as superb a style as comports with simplicity and purity of ecclesiastical taste, and having the interior of its walls studded with some fine monuments, it is surmounted by a square tower of 22 feet each way, and about 90 feet in height. In 1543, the Earl of Arran, Regent during Mary's minority, publicly renounced in the church of Stirling the Protestant religion; and here, on the 29th of July, 1567, James VI., then an infant of 13 months, was crowned, John Knox preaching the coronation-sermon. In 1651, General Monk took possession of the tower, and raised batteries in the churchyard for assailing the castle; and, in consequence, drew on the spot some showers of bullets, many marks of which still remain in the tower. In 1746, the Highlanders occupied the tower after the battle of Falkirk, and celebrated their victory by the ringing of its bells and the discharge of fire-arms.—A church and convent of Dominicans or Black Friars, anciently stood on the outside of the walls on the north-east; but they have been entirely erased, and their site converted partly into garden-ground. The church was the chief place of worship for the inhabitants of the town previous to the founding of the Grey Friars' convent; and it contained on the south side of the great altar, "with their figures and arms depicted," the mortal remains of the Earl of Lennox and his kinsmen, who were executed on Hurley-Haaky. The cemetery was in comparatively modern use, and seems to have been cut through the middle by the newer part of Friar's-wynd, where many human bones have been dug up in comparatively recent excavations.—An ancient chapel, dedicated to St. Ninian's, stood near the South Port; and still exhibits some prosaic and vulgarized remains. A very copious and pure spring in its vicinity, is called St. Ninian's Well, and, till 1774, furnished the inhabitants of Stirling with the greater part of their necessary supply of water.—Cowane's hospital, situated beside the parish-churches, was founded, in 1639, by John Cowane, a merchant of the town, for the support of 12 decayed guild-brethren. The funds, originally £2,222, were laid out on lands which, so far back as 1816, yielded a rental of £4,363; and they afford a competent support to a great number of persons, including widows and daughters of members of the guildry. The house, though not large, is a handsome fabric; but is not occupied by its stipendiaries, few of whom it could accommodate, and who are allowed to have their dwellings where they please.—Spittal's hospital, in connexion with which various houses seem to have been built, though in no instance occupied by the stipendiaries, was founded, at what precise date is not known, by Robert Spittal, tailor to James IV., for the relief and support of decayed tradesmen. The original endowment is not known; but, in 1816, the annual proceeds of lands in rental was £1,089 16s. One house is said to have been built at the foot of St. Mary's-wynd; another at the south end of the opening above the flesh-market, bears Spittal's name and scissors; and a third, in the back row, has the following inscription, with

the scissors en saltier:—“THIS : HOVS : IS : FOVN-  
DIT : FOR : SVPPORT : OF : THE : PVIR : BE : RO-  
BERT : SPITTAL : TAILLYOVR : TO : KING : JEMES  
: THE : 4 : IN : ANNO : 1530. R. S.”

North of the parish-churches, and at the head of Broad-street, stand the haggard-looking remains of a palace, begun in 1570 by Regent Earl Mar during his regency, but never finished. It was originally a hollow quadrangle; but survives only in remains of the front part of the square. In the centre are the royal arms of Scotland; and on projecting towers, one on each side, are the arms respectively of the Earl and his Countess. The edifice was constructed out of the ruins of Cambuskenneth abbey, and still exhibits some rhyning inscriptions in allusion to the fact, and a variety of carved stones, inserted apparently at random; and, in its turn, it was used as a quarry for rebuilding a churchyard wall at St. Ninian's, and protected from utter rasure only in consequence of its conveniently sheltering the main-street or market-place from the fury of the west winds. Sir Robert Sibbald says, that “the Earl lived splendidly here.” The ruin is popularly called Mar's-wark. — On the north side of the street, which leads from the head of Broad-street to the castle, stands a spacious quadrangular edifice, built in the aspiring style which prevailed in the time of James VI. and Charles I. It bears the name of Argyle's lodgings; it was built by Sir William Alexander of Menstrie, who became first Earl of Stirling; it afterwards passed into the possession of the Dukes of Argyle; and, in 1779, it was purchased by government, and has since been used as a military hospital. In February, 1681, the Earl of Argyle entertained here the Duke of York, afterwards James VII., under whose reign he was put to death. The principal apartment then used, was, in 1715, the scene of the councils of war held by the Earl's son, the first Duke of Argyle, against James VII.'s son, whose troops he encountered on the field of Sheriffmuir.—Another building, in the vicinity of Mar's-wark, belonged to the Argyle family. An old house with a projecting turret, not far from Argyle's lodgings, is said to have been built by George Buchanan, and occupied by him while tutor to James VI.—The cross of Stirling, accordantly with the general barbarous policy in old burghs, has long since been removed: it had its site in Broad-street, and was a pillar resting on four steps, and surmounted by a lion holding a shield.

The town-house, situated in Broad-street, is an old hut spacious edifice, surmounted by a lofty tower in which is a set of music bells. In the council-house is kept the pint measure popularly called the Stirling Jug, and appointed by law, four centuries ago, to be the standard for liquid measure in Scotland. It has the form of a hollow cone truncated, is made of brass, and weighs 14 lbs. 10 oz. 1 dr. 18 grs. Scottish Troy. Outside, and opposite the handle, it has two shields in relief; the one of which, near the mouth, has the lion of the Scottish arms, while the other has a rudely-designed quadruped, in a horizontal position, so ill-defined that it may be called, either in the language of blazonry, an ape passant gardant, or in the language of domestic life, a playful child on all fours. The handle is fixed with two brass nails; and the entire appearance indicates the crude condition of the arts at the time when it was fabricated. This jug is mentioned in acts of parliament as being here before the reign of James II.; and an “act anent settling the weights and measures of Scotland,” passed in February 1618, ordains that “the wheat firlo shall contain twenty-one pints and a mitchkin of the Stirling jug,” and that “the firlo for hear, malt, and oats, shall contain thirty-one

pints of the same.” The original jug—now a mere antiquarian curiosity, but so long and till so recent a period an object of grave importance and utility—was, for a considerable period lost, and basely substituted by a pewter vessel of no authority; and, in 1752, was found in an obscure garret among rubbish, after an ingeniously conducted search of two years, by the Rev. Alexander Bryce of Kirknewton, a gentleman of erudition who was zealous to apply his science to matters of common life.—Behind the town-house stand the jail and the county buildings, jointly a large pile of edifice, the former constructed upon what, at the time of its erection, was an approved plan of prison-arrangement, and the latter containing a spacious and elegant hall for the circuit and the sheriff-courts.—In King-street stands the office of the bank of Scotland, an elegant building.—At the head of the same street, looking down its area, and forming the commencement of Baker and Spittal streets, is the Athenæum, a handsome edifice, with a fine lofty spire. The front has the form of the segment of a circle, and is well-suited to the site; the ground story is fitted up in shops; and the upper story contains a public reading-room, and a very extensive and well-selected public library.—In the vicinity of this building is a large, commodious, and well-attended corn-market.—Drummond's agricultural museum, finished in 1840, is a commodious and interesting edifice, connected with a valuable institution. The museum was originated, in 1831, by Messrs. Drummond and Sons, nursery and seedsmen, and established, on an extensive scale, at their own expense; it is open every lawful day for inspection, and the obtaining of accessions; and it already comprises a vast collection of labelled specimens of seeds, grains, roots, fruits, plants, minerals, soils, manures, models, machines, implements, drain-tiles, stacks, Scottish rocks and minerals, clan-tartans, and many other objects of interest connected with rural economy. The building is 160 feet in length, and from 20 to 25 feet in width: the two uppermost flats forming noble exhibition-rooms.

Among the most interesting structures of Stirling, existing and extinct, are its walls, its ports, and its bridges. From the remotest ages, the easiest and most common communication between the divisions of Scotland south and north of the Forth, has been by the fords and bridges in its neighbourhood. Ferries lower down—particularly those at Newhaven, at Queensferry, at Kincardine, and at Alloa, which now carry across such multitudes of passengers, cattle, and carriages—are all of modern origin; and fords and other passable points higher up, either occur in an alpine country, or, at best, require nearly all persons in transit between the two great divisions of the island to make a vast detour from the proper line of their route. Stirling, in consequence, was, during all the stirring periods of history, the key to the Highlands, and a place of such commanding influence that the possession of its strengths and of its means of communication across the river became all but quite essential to the mastery of Scotland. Besides, the natural fortification formed at a small distance on two sides by the Forth, and on another by the precipitousness of the hilly site, the town has, on every side, been artificially fortified.—On the north-west is the castle; on the north and north-east, are vestiges of a great ditch; on the east, ran anciently a wall, passing a little eastward of the present Athenæum; and, on the south, where no protection is obtained from the river, a strong wall runs along the brink of a steep rock.—The South-port, previous to an enlargement of the town toward the east, which took place in the time of James VI., stood 100 yards west of the line of the present Port-street.

The latest built port was erected about the year 1591; and it was taken down a little after the middle of last century to render the entry to the town more commodious.—A wooden bridge across the Forth, at Kildean, a point a little west of the longitude of the castle, and about half-a-mile above the old stone-bridge, existed at a very early period, and was the scene of the notable exploit of Wallace with the English army which is noticed in our article on St. Ninian's. Its site is still a ford, and exhibits, at low water, some vestiges of the ancient structure. At this spot, Montrose, in 1645, conducted his army across the river when on his march to the battle-field of Kilsyth. The wooden bridge appears to have been the place at which, in ancient times persons south of the Forth, who were accused of having in their possession goods stolen from persons north of the river, were appointed to produce their warrants within six weeks.—The old stone-bridge is of unknown date; but figures, in 1571, as the scene of the public execution of Hamilton, archbishop of St. Andrews, by the King's faction under the Regent Lennox. It has four arches, is narrow between the parapets, and high in the centre, and presents altogether a very antique appearance. As represented in a picture of it over the door of one of the rooms in the town-house, it formerly had two small flanking-towers near the west or Stirling end, two similar towers near the east end, two low towers in the centre, and two gates connected respectively with the towers near the ends. Its eastern gate continued to stand many years after the gate of the South-port was taken down; and, while the latter stood, formed jointly with it, the only public point of access to the town. Two silver keys, each about 7 inches long, and of the ordinary shape, the one belonging to the gate upon the bridge, and the other belonging to the South-port, are hung upon a massive silver ring and preserved in the town-house; and they were used to be presented to the King, or any member of the royal family, who had occasion to pass or visit Stirling, and were last in requisition, in 1746, when presented to His Royal Highness the Duke of Cumberland. The south arch of the bridge was, in 1745, destroyed by General Blakeney, the governor of the castle, in order that recruit-parties from the north might be intercepted from reinforcing Prince Charles Edward, who had then passed to the south, and that desertion parties from his army might be cut off in their retreat to the north. Hence, when in February of next year, the royal army under the Duke of Cumberland marched in search of the retrograding Jacobites, they had to halt at Stirling till the place of the deficient arch was supplied by wooden logs and boards; and, mainly in consequence of this detention, they failed to overtake the foe till they had gone far north to the vicinity of Culloden.—The old bridge being found increasingly inconvenient, a commodious new one has been erected about a hundred yards farther down the river.

Stirling-castle, by far the most attractive object connected with the ancient burgh, is approached by Broad and Upper Castle-hill streets. A stranger, on emerging from the street-way at the top of the hill, passes a spacious esplanade or parade-ground, and finds himself at the entrance of the fortress. Two walls of defence, each strengthened in front by a deep fosse, were, with some other but unfinished works, constructed in the reign of Queen Anne, as an external fortification. A drawbridge conducts across the first fosse; a portcullis formerly commanded the second; and two arched gateways perforate respectively the first and the second walls. Of four circular towers which anciently adorned the

inner entrance, two remain, but are much reduced in height. Immediately within this gateway, which is surmounted by the flag-staff, a battery, called the over or upper port battery, extends to the north-east, and commands in all its amplitude and gorgeousness the surpassingly brilliant panorama from Benlomond, Benvenue, Benledi, and Benvoirlich, through the Trosachs, the vales of the Forth, the Teith, and the Allan, and the plains of Lennox and the Lothians, to the clearly seen heights of the Scottish metropolis. The ground immediately overhung by the battery, and overlooking the nearest sweep of the Forth, is not precipitous, but breaks gradually down in the little rocky range of the Gowan hills, stretching away to their termination in Hurley-Haaky near the bridge. On the brow of the nearest eminence are remains of a low rampart, extending in a line parallel to the battery,—the vestige of works constructed against the castle, in 1746, by Prince Charles Edward. Between this rampart and the castle-walls a road or narrow path comes up the acclivitous hill from the village of Raploch, and passes on to a point where formerly there was a large gateway through the exterior wall, conducting to an esplanade on which the magazines are now situated, and, across it, to a low-browed archway, called 'the Laird of Ballangeich's entry,' and alleged to have once been the main entrance to the castle. This wild path, thus anciently terminating at a point of such prime importance, is called the Ballangeich road, from two words which signify 'the windy pass;' and, having furnished James V. with his well-known fictitious designation of the Guidman of Ballangeich, figures as to name, at least, in many curious and old-told anecdotes of that monarch's incognito roving as a gallant, and an eccentric superintendent of the public justice of his kingdom.\* The interior of the

\* The two comic songs, 'The Gaberlunzie Man,' and 'We'll gang nae mair a roving,' are said to have been founded on the success of the Guidman of Ballangeich's amorous adventures, when travelling in the disguise of a beggar. The following anecdotes respecting him are given by Sir Walter Scott: "Another adventure, which had nearly cost James his life, is said to have taken place at the village of Cramond, near Edinburgh, where he had rendered his addresses acceptable to a pretty girl of the lower rank. Four or five persons—well-attached or lovers of his mistress is uncertain—beset the disguised monarch as he returned from his rendezvous. Naturally gallant, and an admirable master of his weapon, the king took post on the high and narrow bridge over the Almond river, and defended himself bravely with his sword. A peasant, who was threshing in a neighbouring barn, came out upon the noise, and, whether moved by compassion or by natural gallantry, took the weaker side, and laid about with his flail so effectually as to disperse the assailants, well threshed, even according to the letter. He then conducted the king into his barn, where his guest requested a basin and towel to remove the stains of the broil. This being procured with difficulty, James employed himself in learning what was the summit of his deliverer's earthly wishes, and found that they were bounded by the desire of possessing, in property, the farm of Braehead, upon which he laboured as a bondsmann. The lands chanced to belong to the Crown; and James directed him to come to the palace of Holyrood, and inquire for the Guidman (i. e. farmer) of Ballangeich, a name by which he was known in his excursions, and which answered to the bondsmann of Haroun Alraachid. He presented himself accordingly, and found, with due astonishment, that he had saved his mistress's life, and that he was to be gratified with a crown-charter of the lands of Braehead, under the service of presenting at ever, basin, and towel, for the king to wash his hands, when he shall happen to pass the Bridge of Cramond. In 1822, when George IV. came to Scotland, the descendant of this John Howison of Braehead, who still possesses the estate which was given to his ancestor, appeared at a solemn festival, and offered his Majesty water from a silver ewer.—Another of James' frolics is thus narrated by Mr. Campbell, from the Statistical Account. 'Being once beighted when out a-hunting, and separated from his attendants, he happened to enter a cottage in the midst of a wood, at the foot of the Ocul hills, near Alloa, where, unknown, he was kindly received. In order to regale their unexpected guest, the guide-man (i. e. laird, farmer) desired the guide-wife to fetch the hen that roosted nearest the cock, which is always the plumpest, for the stranger's supper. The king, highly pleased with his night's lodging and hospitable entertainment, told mine host, at parting, that he should be glad to return his civility, and requested that the first time he came to Stirling he would call at the castle, and inquire for the guide-man of Ballangeich. Donaldson, the laird, did not fail

castle is distributed into two courts; and, besides other buildings, has a palace, built by James V., the remains of an older palace, the parliament-house, now used as a barrack, and a splendid chapel, now used as an armoury. The palace of James V., begun by that monarch and finished by Mary, is a curious hollow quadrangular edifice, in a fantastic style of architecture neither Grecian nor Gothic, exhibiting, on three ornamented sides which are open to the view of the spectator, emblematical figures standing on wreathed balustrade pillars with pediments, supported by grotesque figures, under something like Gothic arches, and in the pediments of the windows. The eastern side looks toward the court-yard or esplanade of the Ballaugeich entry; and is the most wildly or curiously elaborated. The pillars on each of the ornamented sides are five or six in number, and rise close to the wall within slight recesses. The images are everywhere much defaced, yet continue sufficiently distinct to evince the mingled opulence and perversity of taste which presided over the construction of the edifice. Those on the eastern side are, for the most part, mythological; and seem intended to represent Diana, Venus, Omphale, Perseus, and other fabulous personages of the base and bewildering superstition of Greek and Roman antiquity. Those on the northern side, which confronts the chapel-royal, are a strange assemblage of the real and ideal; but, as they include statues of James V. and his daughter, and a figure of Cleopatra with the asp upon her breast, they possess, though rudely executed, a kind of sadly romantic interest. The statue of James represents him as a small-bodied man, with a bushy beard, wearing a frock-coat and a hat, overhung by an allegorical personage who holds over

to call on the gude-man of Ballaugeich, when his astonishment at finding that the king had been his guest afforded no small amusement to the merry monarch and his courtiers; and, to carry on the pleasantry, he was thenceforth designated by James with the title of King of the Moors, which name and designation have descended from father to son ever since, and they have continued in possession of the identical spot, the property of Mr. Erskine of Mar, till very lately, when this gentleman, with reluctance, turned out the descendant and representative of the King of the Moors, on account of his majesty's invincible indolence, and great dislike to reform or innovation of any kind, although, from the spirited example of his neighbour tenants on the same estate, he is convinced similar exertion would promote his advantage."—The following anecdote is extracted from the genealogical work of Buchanan of Auchmar, upon Scottish surnames. "This John Buchanan of Auchmar and Arnprior was afterwards termed King of Kippen, upon the following account. King James V., a very sociable debonaire prince, residing at Stirling, in Buchanan of Arnprior's time, carriers were very frequently passing along the common road, being near Arnprior's house, with necessaries for the use of the King's family, and he having some extraordinary occasion, ordered one of these carriers to leave his load at his house, and he would pay him for it; which the carrier refused to do, telling him he was the King's carrier, and his load for his Majesty's use; to which Arnprior seemed to have small regard, compelling the carrier, in the end, to leave his load; telling him, if King James was king of Scotland, he was king of Kippen, so that it was reasonable he should share with his neighbour king in some of these loads, so frequently carried that road. The carrier representing his usage, and telling the story, as Arnprior spoke it, to some of the King's servants, it came at length to his Majesty's ears, who, shortly thereafter, with a few attendants, came to visit his neighbour king, who was in the meanwhile at dinner. King James having sent a servant to demand access, was denied the same by a tall fellow with a battle-axe, who stood porter at the gate, telling, there could be no access till dinner was over. This answer not satisfying the king, he sent to demand access a second time; upon which he was desired by the porter to desist, otherwise he would find cause to repent his rudeness. His Majesty finding this method would not do, desired the porter to tell his master that the good-man of Ballaugeich desired to speak with the king or Kippen. The porter telling Arnprior so much, he, in all humble manner, came and received the King, and having entertained him with much snuffiness and jollity, became so agreeable to King James, that he allowed him to take so much of any provision he found carrying that road as he had occasion for; and, seeing he made the first visit, desired Arnprior in a few days to return him a second at Stirling, which he performed, and continued in very much labour with the King, always thereafter being termed King of Kippen while he lived." The last King of Kippen, we may add, was hanged in 1746, at Carlisle, for fighting in the rebel army of Prince Charles Edward.

him a crown and a scroll of his kingly title, and attended by the royal lion and a cup-bearer, the former crouching at his feet, and the latter a heedless youth holding forth a cup. The hollow or small interior square court of the palace is called the Lion's den, and is said to have been the place of the royal menagerie. The apartments of the palace, now sectioned off and arranged, on the ground-floor, into a barrack for private soldiers, and, on the upper-floor, into lodgings for the officers, were originally very spacious and ornate. A lofty hall on the north side of the ground-floor is still called the King's room, or the presence, and was formerly adorned with multitudinous figures, carved in basso relievo in oak, long venerated and justly admired by the inhabitants of Stirling, and generally supposed to represent James V., Mary of Guise, and various members of the royal family and the court. A small part of the ceiling having, in 1777, fallen down and struck a soldier, the whole of the figures were immediately torn from both ceiling and walls, flung together in a rubbish mass, and barbarously condemned to become common spoil, and common firewood. By a curious accident the jailer of Stirling—who proved himself to possess some irradiations of a taste, every spark of which was extinct in the Goths of the fortress—happened, just at the available crisis, to see one of the figures carried off by a little girl toward the town; and, learning the impending fate of its fellows, he promptly busied himself in collecting as many of them as he could obtain, and carrying them away for conservation in the jail. Others of them went eventually into the possession of Henry Cockburn, Esq., advocate, and various other persons of taste, and were, of course, carefully preserved. Those which were removed to the jail remained in that outré reception for works of art during upwards of 40 years; and then were transferred to the adjacent judiciary-court room, and absurdly daubed and disfigured with what a coarse taste intended to be embellishing paint. In an elegant volume, published about 25 years ago by Mr. Blackwood of Edinburgh, and entitled 'Lancaster Strevilinese,' masterly etchings, by Mr. W. H. Lizars, are given of most of the figures which were preserved,—whether those of the jail or those of private collectors.—The buildings which adjoin the palace, and occupy the western side of the main court, are of a comparatively plain and antique character, and, with the exception of repairs and renovations, are all supposed to date higher than the reign of James II. They contain, in their north end, the early or original royal apartments, now or recently disposed, in part, as the residence of the fort-major. One of the apartments, known both as the King's closet and as Douglas' room, and indebted for the latter name to its having been the scene of James II.'s assassination of the Earl of Douglas, is a small room very elaborately and antequely decorated. A large star with iron radiations appears in the ceiling; and two inscriptions, respectively 'J. H. S. Maria salvet rem pie pia,' and 'Jacobus Scotor. Rex,' are traced around the cornices.—James III., who made the castle his principal residence, and closely shut himself up in it with his favourites, erected in it several new structures, besides repairing and embellishing such as had fallen into decay; and, in particular, built a very spacious parliament-hall, which is still entire, and known under the name of the parliament-house. This structure occupies the eastern side of the principal court; and, though now defaced and rendered plain by the processes of transmuting it into a barrack, it was originally a noble piece of Saxon architecture, and was for ages deemed a magnificent fabric. The interior hall was 120 feet in length, and had a splendid oaken roof; and it was the scene of many

meetings of parliament. A chapel-royal or collegiate church was founded by James III. on the northern side of the principal court; and had appointed to it two sets or series of functionaries and officiates, each consisting of a dean or provost, an archdean, a treasurer, a sub-dean, a chanter, a sub-chanter, as well as other officers usual to such establishments. The annexation to this institution of the rich temporalities of the priory of Coldingham, thwarted the interests of Lords Home and Hailes, and, by giving exacerbating offence, remotely occasioned the ruin of James III. at Sauchie: see COLDINGHAM and NINTAN'S (ST.). Yet James IV. subdued all opposition, completed the establishment, and added to it the temporalities of Dundrennan abbey, Inchmahome priory, Dunbar parsonage, four prebends, about fifteen parish-churches, and various chapelries and lands. The deans of the chapel, who were first the provosts of Kirkheugh in St. Andrews, afterwards the bishops of Galloway, and eventually the bishops of Dunblane, possessed in their capacity of deans an episcopal jurisdiction. James VI., in 1594, demolished the original chapel, and built on its site a more elegant one for the baptism of his eldest son, Prince Henry. This edifice is of hewn stone; and, though, like every other building of the place, turned into a common or comparatively degrading use, has suffered less damage in its exterior than any other of the castle's structures. The ceremonial which followed the completion of the new chapel, and accompanied the event of the Prince's baptism, was one of oriental magnificence and the most extraordinary cost, and harmonized with James's pedantic and king-craft notions of what was due to the heir presumptive of three great monarchies. The roof of the chapel, previous to the transmutation of the place into an armoury, was a species of comparatively plain panelling; and it had suspended from its centre a clustered wooden model, still preserved in the building, of the castles of Stirling, Edinburgh, Dumharton, and Blackness, surmounted by a crown.—A strong battery, with a tier of guns pointing to the bridge over the Forth, was erected during the regency of Mary of Lorraine; and it bears the name of the French battery, probably from having been constructed by French engineers.

Stirling-castle,\* if not as to any of its existing buildings, at least as a military strength, is of such high antiquity that its origin cannot be satisfactorily traced. Agricola is said to have raised fortifications upon the rock; and his successors not improbably found them necessary for overawing the country

\* Pinkerton says, that "the royal palace at Stirling was called *Snowdoun*;" adding, "near it was an eminence termed Arthur's Round Table. The fame of Arthur in books of chivalry gave rise to such names in the Middle ages. One of the heralds of Scotland is termed *Snowdoun-herald* in this day." William of Worcester, indeed, who wrote about the middle of the 15th century, gives the name of *Snowdoun-castle* to Stirling-castle; and Chaucer follows in the same tract; observing, that *Snowdoun* is "an ancient name of Stirling-castle." He makes this remark in relation to the language of Sir David Lyndsay:

A dew fair *Snowdoun*, with thy towris hie,  
Thy chapel-royall, park, and tabill round;  
May, June, and July, wald I dwell in thee,  
War I ane man, to leir the herdis sound,  
Quilk doth agane thy royall ruche redound,

COMPLAINT OF THE PAPINGO.

But there is no satisfactory proof that Stirling-castle was ever thus generally denominated, even as Sibbald asserts, by the people in its neighbourhood. That it might occasionally and playfully receive this name from the adherents of the Court, is not improbable; and this will sufficiently account for the adoption of it by Lyndsay. The name, as Sir Walter Scott has remarked, "was probably derived from the romantic legend which connected Stirling with King Arthur, to which the mention of the Round Table gives countenance." The title of *Snowdoun-herald* seems to have no connection with Stirling; but was borrowed from the principal tower in Kildrumny-castle, which bore the name of *Snowdoun*, as early as the age of Barbour.

north of the Forth. The Roman military causeway comes hither from the south, and passes hence to the north; and seems fully to indicate that the usual perspicacity of the Romans was not asleep when they were in the vicinity of so advantageous and commanding a spot for a station. The strength must have been a frontier-fortress from the 5th till toward the end of the 10th century; and probably was in the alternate possession of the neighbouring and belligerent powers. About the middle of the 9th century, if we may believe a monkish and indifferently authenticated tale, the Northumbrians having taken possession of territories and fortresses suddenly won by conquest and cession from the Scots, rebuilt Stirling-castle, planted it with a strong garrison, and threw over the Forth a stone-bridge surmounted by a cross, with an inscription, part of which is still the legend of the ancient burgh seal:

"Anglos a Scotis separat crux ista remotis.  
Hic armis Bruti: Scoti stant hic cruce tuti."

But in these remote times, the edifice of the castle, as to size and form, was probably no more than a structure similar to those which the English and the Scottish barons erected on their estates, to serve the double purposes of residences and of strongholds of defence; and as such a rude and limited fabric it figures in the armorial bearings of the burgh. Before the close of the 9th century, the Scots, if they really lost temporary possession of the fortress, regained it on condition of assisting the Saxons against the Danes. Near the close of the 10th century, Kenneth III., informed of a Danish invasion, appointed Stirling-castle the rendezvous of his army, and marched thence to the victorious field of Lunenburg. In 1175, this fortress was one of the places impignorated to Henry II. for the ransom-money of William the Lion; but it was afterwards freely restored by the noble Richard Cœur de Lion, and was the seat of one of William's parliaments, and the scene, in 1212, of his death. Some laws of Alexander II., annexed to the *Regiam Majestatem*, were enacted in the castle, particularly the celebrated one which established trial by jury. Here, too, were held several conventions and parliaments during the short reign of John Baliol; and here was dated the epistle which, with the advice of the states, he wrote, in 1295, to the king of France, proposing a marriage between a French princess and his son. In 1296, when Edward I. poured his army like a torrent upon Scotland, and swept before him the strength of its greatest fortresses, Stirling-castle was deserted by its garrison, and made no resistance. Next year, after the battle of Stirling, it was left by the repulsed and retreating English under the charge of Sir Marmaduke de Twenge; but it was speedily captured by Sir William Wallace, who, after the battle of Falkirk, dismantled and destroyed it. The castle was repaired by Edward II.; and, only a year afterwards, was taken by the Scots. In 1300, after a stiff siege of three months, during which it was defended by Sir William Oliphant, the English obtained it by capitulation; and they kept possession till 1303, when they were compelled by the Scottish leaders to surrender, and to let the place pass once more under the governorship of Sir William Oliphant. So nobly did this hero maintain his trust, and so stoutly did he hurl defiance from his post to England, that when Edward careered up Scotland to Kinross, and almost seemed to have the kingdom at his feet, he was obliged to bold a great council of English and Scottish barons at St. Andrews, and get them to perform the exploit of pronouncing outlawry upon Sir William Wallace, Sir Simon Frazer, and the garrison of Stirling-castle! Though gunpowder was yet unknown, he despoiled the cathe-

dral of Scotland's ecclesiastical metropolis of its leaden roof, in order to have the means of pithily besieging the only fortress of the kingdom which defied his power. During three months he vainly employed every expedient to reduce it, and, in the warmth of his zeal, freely exposed his own person, and sedulously superintended the operations; but, at length, he succeeded to carry the place by storm, and, having like a craven or a tyrant, thirsting for blood, previously rejected an offer which they made of capitulating, he sent the brave garrison to various jails in England, and the heroic governor to the Tower of London. The castle was now held for a series of years by the English, who had quite enthralled Scotland, and by the help of a traitor and of a hireling-executioner deprived it of its indomitable champion, Wallace; in 1314, it was fought for, but vainly, in the field of Bannockburn; in 1333, it yielded to Edward Baliol; in 1336, after being repaired by Edward III., it sustained a siege from the friends of David Bruce, but was relieved by Edward in person; next year, it was blockaded by the same assailants, and again relieved by Edward; and, in 1339, it was captured by the friends of Bruce. In 1360, Sir Robert Erskine was appointed governor of the castle by King David Bruce, and, besides ample grants for the maintenance of the garrison, obtained a grant of all the feus and revenues in Stirlingshire belonging to the Crown, with the wardships, escheats, and other emoluments annexed to them; and he bequeathed his high and very lucrative office to his descendants, the Erskines and the Earls of Mar, till their forfeiture for Jacobitism in 1715. When the Stewart dynasty succeeded to the throne, Stirling-castle became one of their stated residences; and from successive kings of that house, as we have seen, it received its present form. James II. was born here; he was here put under the government of Sir Thomas Livingstone, immediately after the murder of James I.; and here he perpetrated that deed which fixes an indelible stain upon his memory, the assassination with his own hand, and in violation, as is said, of his safe-conduct, of William, Earl of Douglas. The chief of the too-powerful family of Douglas had, at the period, a revenue equal perhaps to his sovereign's; and, rising to the office of Lieutenant-general of the kingdom, which gave him the command of the army, he exceedingly annoyed James II., almost unseated him from the throne, and eventually, when the lieutenant-generalship passed from his possession, entered into a league with the Earls of Crawford and Ross, obliging the parties to mutual defence in all cases, and forcing into an engagement of attendance even against the Crown, the greater part of his vassals. A select council having been called by the king to deliberate on the case of Douglas, recommended that he should be induced, by the promise of friendship on condition of future good obedience, to come to the court. Douglas was prevailed on to visit the castle; and, after supper, was conducted by the king into a secret chamber, where only some of the privy-council and the guard were in attendance, and there informed that his treasonable league with Crawford and Ross was known. Douglas, now entreated to break the league, peremptorily refused, and upbraided the sovereign with having driven him to the measure. "If you," at last exclaimed the king in a rage, "will not break this league, I will!" and, drawing his dagger, he sheathed it in Douglas. Sir Patrick Gray, captain of the guard, followed up the king's thrust, with a blow from a battle-axe. The body is said, by tradition, to have been thrown over the window of the chamber into the court-yard behind, and there buried; and was, not many years ago, supposed to be iden-

tified in the skeleton of an armed man then found inhumed on the spot. A paper, dragged at a horse's tail through Stirling soon after the assassination, was said by Douglas' friends to be a safe-conduct granted under the great seal to the deceased; but, for any evidence that appears from history, it may have been but a fictitious document. James III., whose mildness of temper did not harmonize with the turbulent spirit of his nobles, shut himself so closely up in Stirling-castle as his favourite and secluded residence, that few of the nobility or barons were admitted within its precincts to witness his retirement. James IV. gave this fortress, along with that of Edinburgh, to his queen, Margaret of England, as her jointure-house; and he frequently resided here during Lent, that he might attend the neighbouring church of the Franciscans, and there fast and perform genuflexions, and do other penance, for the part he had acted in his father's death. A poem of Dunbar, entitled "A dirge to the king bed-and-oure lang in Stirling," and alluding to the great length and multiplicity of the monarch's papistic devotions, may be seen in Sibbald's Chronicle of Scottish poetry. James V. was both horn and crowned in Stirling-castle; and by the eccentricities of his conduct while residing in it, he has, more than all other kings united, permanently made it figure, if not directly at least by allusion, in ballad, drama, popular anecdote, and light history. In 1543, Queen Mary was crowned here when scarcely nine months old, the Regent Arran carrying the crown and Lennox the sceptre; and a numerous assembly of the states present on the occasion, appointed the fortress to be the royal minor's residence. The infant-son of Darnley and Queen Mary, afterwards James VI., was conveyed hither soon after his birth in Edinburgh-castle; and here, on the 15th December, 1566, he was baptized with great ecclesiastical pomp, and amid a prodigious display of courtly fanfaronade and sumptuous pageantry. English and French ambassadors were for some days afterwards entertained with regal hospitality; and Queen Mary continued for a month to make it the scene of her personal luxuriation, or the central point of pleasure-excursions through the adjacent country. James, after having for a brief period been sent to Edinburgh, was fixedly lodged in Stirling-castle, and made to pass in it the period of his infancy and childhood till he was 13 years of age. After his coronation in 1567 in the church, a gorgeous procession returned with him to the castle, Mar carrying his person, Atholl the crown, Morton the sceptre, and Glencairn the sword of state. The apartments which he occupied under the care of his preceptor, George Buchanan, and which are popularly regarded as the place where that celebrated man wrote his History of Scotland, are still shown, but in a very degraded condition, in the palace. The king's person was under the charge of the Countess of Mar and Sir Alexander Erskine of Gogar; and his education was conducted, not only by Buchanan, but by David Erskine, commendator of Dryburgh, Adam Erskine, commendator of Cambuskenneth, and Peter Young. The first parliament, after James had taken the government into his own hands, met in 1578, in the great hall in the castle; and the place of meeting was so distasteful to the opponents of the late Regent Morton, who still continued with the king, that they protested against it, and nearly precipitated the country into a civil war. James now elung to the place as his residence in spite of the wishes of the numerous party who hated the favourites who were around him; and he began also to indulge freely in those field sports of which he was afterwards so fond, and which comported so ill with

the rigid spirit of the period. "Here," says a private letter still preserved in the Cottonian library, and dated "at Straveling, April 4th, 1580,"—"Here is greate myslykinge that the king is no bettere accompanied with counsellors, an that he frequents the fields and hunting too moche." In 1651, General Monk besieged the castle; and, by firing from batteries in the hurgh hurrying-ground, reduced it. The ornamental parts of the palace exhibit many fractured memorials of the effects of his shot. The national registers had been lodged in the castle on the preceding year, and were seized by him, and, in compliance with an order from Cromwell, sent to London. They remained in the Tower till the Restoration; and when restored, they were, by an absurd piece of economy, sent back by sea, and in consequence were lost,—85 hogsheads of them having been on board of one vessel, and an unknown bulk on board of another, both of which went to the bottom in a storm. In 1689, Graham of Claverhouse, Viscount Dundee, and other partisans of the dethroned James VII. formed a scheme which proved quite abortive, for rescuing the castle from the partisans of the Revolution. At the union of the kingdoms, in the reign of Queen Anne, it was declared one of four Scottish fortresses which were to be ever afterwards kept in repair. In 1715, it formed an excellent support to the Government forces under the Duke of Argyle, when, small in number but resolute in courage, they lay encamped in the park, and defended the passage of the Forth against the Jacobite forces under the Earl of Mar. In the beginning of 1746, the Highland army of Prince Charles Edward raised against the castle a battery of two 16 pounders, two 8 pounders, and three 3 pounders, between the church and Mar's-wark; but they were dislodged by the artillery of the garrison. On the 27th January, they erected a battery of three pieces, which we have incidentally noticed, on the nearest of the Gowlan hills, and, another of similar power on Lady's hill; but here they were completely exposed and seen, and, while unable to make any impression on the fortress, they suffered great damage and much loss of numbers from its fire. Yet, but for the Duke of Cumberland's approach, and the consequent retreat of the Highlanders, the castle must have surrendered for want of provisions.

The manufactures of Stirling are various. Rope-making is carried on to some extent. The manufactures of malt, leather, soap, and candles, is considerable. Trades and manufactures of a miscellaneous kind are sufficiently extensive to supply the usual articles of consumption both to the town and to an extensive part of a large and populous neighbourhood. Cotton goods began at the end of last century to be largely produced for manufacturers in Glasgow; and they still employ a noticeable proportion of the old and young of both sexes of the population. The dyeing of yarns, home-made cloths and silks, and other fabrics, is somewhat prominent. The manufacture of shalloons was considerable so far back as the end of the 16th century; but it was conducted chiefly for the supply of the Netherlands; it early suffered a severe shock from an unwise and hardly bonest debasing of the quality of the fabrics; and since that period it has experienced alternations of considerable revival and proximate extinction. During the decay of the shalloon manufacture, and not long after the beginning of last century, that of tartan started up; and though more than once it has very seriously fluctuated, it now, with the kindred branches of tartan-shawls, carpets, and yarns, forms the chief and almost characteristic manufacture both of the town itself and of the villages in its vicinity. Till about the year 1760, it flourished; a few years

afterwards it so greatly decayed, that several hundreds of the weavers were compelled to betake themselves to other employments; about 1792, though the department of carpets flourished, that of tartans was very nearly extinct; after the publication of the Waverley novels, which suddenly blew tartans into popular favour throughout great part of the temperate climates of Europe, it sprang aloft to a high pitch of prosperity; and it has ever since continued to be important and energetic. Dr. Harding's Report in 1839 to the House of Commons exhibits all the woollen manufacture north of the frith of Forth and the Forth and Clyde canal in a cluster, but states that "the manufacture is principally carried on at Stirling and its immediate neighbourhood, and at Aberdean," and estimates the number of looms employed on it at 2,500. The carpets are woven in factories, and hard and soft tartans and tartan-shawls are woven generally in the weavers' own cottages. Wages have, for many years past, been very steady; employment is generally constant; and the working hours may be stated at about 70 per week. The nett weekly income of a carpet-weaver cannot average less than 12s., and may be 15s. or more; that of a skilful steady weaver of hard tartan, whether man, woman, or a girl of 16, is about 8s. 6d.; and that of a weaver of shawls or soft tartans, man, woman, boy, or girl, may on the average be 9s. "The woollen weavers," says Dr. Harding, speaking specifically of Stirling, yet stating that he conducted his inquiry there under very disadvantageous circumstances,—“The woollen weavers, with the exception of those employed on hard tartans, did not seem at all desirous of giving evidence before me as to their condition, probably having no complaints to make. I did not observe that their higher wages had any effect in improving their moral or intellectual state. Intemperance was by no means uncommon amongst them; the education of their children was not well attended to; embezzlement prevailed to a certain extent; nor did they seem by any means more intelligent or contented than other weavers earning much lower wages.” Both the weavers and the dyers of the town and its neighbourhood have, for a long period, been reckoned eminently skilled.

The commerce of Stirling traffics principally in home and foreign wood, coals, bricks, tiles, lime, wool, and grain. The wool is exported to England; and grain, besides being in considerable quantities imported, is the subject of an extensive trade at the public markets. About 100 vessels are said to be engaged in the trade up the Forth to Stirling; and two steam-boats ply daily, the one up and the other down between Stirling and Newhaven, calling at Alloa, Kincardine, Bo'ness, Limekilns, and North Queensferry. Vessels of 70 tons come on stream-tides up to the harbour; but vessels of larger burden are in hazard of taking the ground on the fords and shoals of the river. The numerous windings of the Forth so greatly embarrass the navigation that a vessel sailing between Stirling and Alloa requires varying winds from all the points of the compass: see FORTH. A curious specimen of the river's windings occurs immediately above the harbour; the direct distance thence on a practicable line to the west end of the new bridge, being only 700 yards, while that along the hither margin of the stream is 4,200 yards. The harbour is sufficiently unpretending, and bears the humble name of Stirling-shore. The projected branch to Stirling of the Edinburgh and Glasgow railway will remedy great inconveniences, and probably give a smart impulse to commerce.

Stirling has offices of the bank of Scotland, the National bank, the Commercial bank, and the Glasgow Union bank; a horticultural society, established

in 1812; a general agricultural association, instituted in 1834; a fraternity of writers; a gas-light company; a school of arts; a subscription library; a subscription reading-room; a commercial reading-room; a Stirling and Bannockburn Caledonian society, instituted in 1823, for educating destitute children, and for other and kindred objects; a dispensary, instituted in 1830; a Sabbath-school society; and the various additional and important institutions which we have incidentally noticed in our accounts of the parish and of the public buildings. In spite of the rich and numerous charitable institutions of the town, and probably in connexion with their economics, more paupers and indigent persons may be seen in Stirling, proportionately to its population, than in almost any other town of Scotland; and not being allowed to beg in the town itself, they, on the one hand, cling to it as a well-endowed seat of eleemosynary funds, and, on the other hand, sally forth periodically or daily in quest of alms without its walls, to the great annoyance of a considerable circumjacent country. Two newspapers are published in the town,—the Stirling Journal every Friday, and the Stirling Observer every Thursday. The Glasgow and Perth mail-coach, and stage-coaches, are daily in transit; a mail-coach and a stage-coach daily run to Edinburgh; stage-coaches run three times a-day to Glasgow; a coach runs to Callander daily during summer, and thrice a-week during winter; a coach runs daily to Falkirk; a car runs every Friday to Kippen and Bucklyvie; and coaches communicating with the canal. Passage-boats to Glasgow run 5 times a day during summer, and 4 times a-day during winter. A weekly market is held on Friday; and annual fairs are held on the 1st Friday of February, the last Friday of May, the 1st Friday of August, the 3d Friday of September, the 1st Friday of November, and the 2d Friday of December.

Stirling is governed by a provost, two bailies, a treasurer, a dean-of-guild, and 14 councillors. Municipal constituency, in 1840, 386. The property of the burgh, though at one time considerable, has, to a large extent, been alienated. In 1832-3, the revenue was £2,295 3s. 6d., of which £1,720 16s. 8d. was for customs, impost, and market and shore dues; the expenditure was £2,308 0s. 6½d; and the debt, after deducting debt due to the burgh, was £10,278 19s. 2d. The debt, though partly apologized for by extensive expenditure on important public works, would probably not have become so large but for the opportunity afforded the council of making use of the sun mortified in trust to them by Mr. Cunningham, the whole of which they borrowed. In 1841, the revenue was returned at £5,350; of which, however, £1,359 was borrowed money, and £211 voluntary subscriptions for street-improvements. The expenditure, in 1841, was £5,011. The assessments levied under the authority of the magistrates comprise cess, petty customs, flesh-market dues, multure, impost on ale, and hurgess-entries. The jurisdiction of the magistrates extends not only over the town itself but over a considerable landward district, part of which lies on the north side of the Forth. This territory is all within the burgh, and included in its charter. Yet there are lands belonging to the Government, to the town, to Cowane's and Spittal's hospitals, and to Allan's mortification, which, though close to the walls of the burgh, and all included within the parliamentary boundaries, and the seat of part of the town's population, are neither within the royalty nor under the magistrates' jurisdiction. The limits of the lands lying within the burgh are so irregular, and so intersected by these other lands, that it is scarcely possible to describe the exact boundaries. The parliamentary limits

exclude the portion of the royalty which lies on the north side of the Forth, a portion on the south side of the river detached by the parish of St. Ninian's, and a portion lying on the burgh-moor; but they include, besides the lands already mentioned, a considerable extent of lands within the parish of St. Ninian's, and the villages of St. Ninian's, Bellfield, Newhouses, Torbrex, and Raploch.—In consequence of the town having, about the year 1500, purchased from Cunningham of Polmaise the heritable sheriffship of the burgh, the provost and bailies, in summonses before the town-courts, are styled respectively high sheriff and sheriffs. The magistrates claimed a private jurisdiction within burgh, and, about a century ago, raised an action against the heritable sheriff of the county to have it so declared; but he proving that his deputies used to entertain cases within burgh, they were found to have only a cumulative jurisdiction. They act directly, and have the town-clerk as assessor; and, besides daily sitting in turn for the disposal of matters of police, they hold a court twice a-week for civil and criminal causes. The civil causes average about 100 in the year; but the criminal causes average little if any more than one, crimes of any magnitude being taken up by the procurator-fiscal of the sheriff's court. The council's patronage extends to the burgh-officers, the hospitals, the endowed schools, and the parish-churches. A burghess, in the dog and cat lingo of the place, is either a burghess qua neighbour, and pays £2 of entry-money, or a burghess qua hammerman or qua some other corporation, and pays to the burgh a fee applicable to the character in which he enters. In 1833, the number of burghesses qua neighbour was 17, and of resident burghesses of all the sorts of quas, 444. The corporations consist of the guildry, 7 crafts, and 4 bodies called tolerated communities, one of whom has the quizzical name of omnegatberum. In 1833, their respective numbers, and the entry-fees payable by strangers respectively to themselves and for each to the burgh, were as follow:—Guildry, 402, £50 and £5; hammermen, 34, £31 10s. and £2; weavers, 133, £20 and £2; tailors, 20, £30 and £2; shoemakers, 36, £32 and £2; fleshers, 8, £50 and £2; skimmers, 11, £15 and £2; bakers, 18, £50 and £5; maltmen, 54, £6 and £5; mechanics, 125, £1 6s. 8d. and £2; barbers, 4, £1 6s. and £2; and omnegatberum, 65, 10s. and £2. A general feeling pervades all classes in the town, that the exclusive privileges of these bodies, by opposing obstacles to the increase of population, trade, and prosperity, are detrimental both to the community at large and to the interests of the crafts themselves.—The police of the burgh is under the direction solely of the magistrates. All the householders are bound to serve in turn as watchmen, and are called out in regular rotation to the number of 8 each night; and individuals, unable or averse to act personally, easily find able substitutes each for a shilling a time. Besides the nightly guard thus provided, there are 4 town sergeants, and a body of respectable shopkeepers and tradesmen, 36 in number, called the high-constables. The streets are cleaned by contractors annually engaged at a public roup; and they are lighted partly with gas and partly with oil. Water is brought in pipes from a distance of from 2 to 3 miles, but is distributed only at public wells, there being no private pipes.—Stirling unites with Dunfermline, Culross, Inverkeithing, and South Queensferry, in sending a member to parliament. Constituency, in 1840, 471. Population of parliamentary burgh: inhabitants 10,580. Families 2,399. Inhabited houses 1,803. This return, in addition to the whole of the town part of the parish of Stirling, comprehends also a portion of the parish of St.

Ninian's. The following is the population of the parish of Stirling, exclusive of the rural part:—Inhabitants 8,592. Inhabited houses 1,387. Families 1,908. The following is the population of that part which constitutes the royal burgh of Stirling:—Inhabitants 7,963. Families 1,761. Inhabited houses 1,289.

Stirling's armorial bearings, as exhibited on its ancient seal, are, on one side, a bridge with archers at one end and spearmen at the other, and with a cross in the centre, circumscribed with the legend,—"Hic armis Bruti, Scoti stant hac cruce tuti;" and on the reverse, a fortalice surrounded with trees, representing the castle and forest of Stirling, and inscribed, "Continet hoc nemus et castrum Strivilense." The wolf—an inhabitant of the ancient Scottish forests—makes part of the arms, and, on a separate seal, is represented standing on a rock, with the motto, "Oppidum Sterlini."—The town's most ancient charter was granted by Alexander I., and bears date, Kincardine, 18th August, 1119. But it merely confers some additional privileges on the burghers and freemen, and is not a writ of erection. The exact date of its being constituted a royal burgh is of unknown antiquity. It was—as we have seen—the seat of an important fortress and a royal residence as far back as our records reach; and, in addition, it constituted one member of the court of four burghs, whose collected laws and customs are usually ascribed to David I. With the exception of the other three burghs of that court,—Edinburgh, Roxburgh, and Berwick,—it is probably the most ancient royal burgh in Scotland. Numerous charters granted to it by successive kings, confirming and extending its privileges, and conferring on it considerable property, are all ratified in one—the last and governing charter—given by Charles I. at Holyrood-house on the 17th November, 1641. The preliminary recital of this charter shows that Alexander, besides giving the town the usual privileges of a royal burgh, granted to the burghesses, by one charter, the privileges of a merchant-guild, and, by another, exemption from all tolls and customs on their goods and chattels in all parts of the kingdom. Both these charters are said to have been confirmed by David II. in a parliament held at Scone in the 31st year of his reign. Robert II., by a charter of feu-farm, granted them fishings upon the water of Forth, and the small customs of the burgh. James IV. conferred the customs upon salt and leather, and the office of sheriff within the burgh and territory; and Mary granted them all the lands, tenements, buildings, churches, duties, &c., belonging to the churches, chapels, and colleges, founded within the liberties of the burgh, and to the Dominicans and Franciscans, and all emoluments and other duties in use to be drawn out of the burgh of Stirling by other churches. The charter of Charles recites and confirms a mortification in favour of Spital's hospital, by Adam, commendator of Cambuskenneth, and ratified by John, Earl of Mar, and a contract between the provost, bailies, and council of the burgh, and the heir and executor of John Cowane, of the mortification called Cowane's hospital. The charter then proceeds to erect the burgh of new into a free royal burgh, with all its former privileges, and disposes especially various lands, particularly described, with fishings both of salmon and other fishes on the water of Forth. It grants two market-days in the week, and four annual fairs, with power to levy the tolls and customs used and established from the persons frequenting the fairs, and other liberties and privileges belonging to a free fair, in the same way as enjoyed by the burghesses of Edinburgh or Perth. It further grants the office of sheriff within the burgh, and the right of holding

courts, appointing officers, fining, punishing, even with death, and drawing escheats. It especially conveys the small customs paid by unfreemen upon all goods brought into and carried out of the burgh, by its ports and hridge, with the dues of weighing and measuring, all as specified in the charter. But power is given to double the customs at the four fairs, and generally to draw all customs that have been in the use of being levied, both within and without the burgh, in the same way, and as freely as belonged to Edinburgh, Perth, or any other royal burgh. It gives right to harbours on the water of Forth, with customs, haven silver, shore silver, anchorage dues, and various other duties particularly mentioned, and the amount specified. Then follows a grant of the customs of Stirling-bridge, with a statement of the customs to be levied, and the amount of each. Power is given to the provost and magistrates to put in execution the acts of parliament and of council concerning the liberties and privileges of the burgh, and to convoke the burghesses and inhabitants for that purpose. Finally, the charter annexes and incorporates the whole lands, fishings, houses, &c., previously conveyed into one free royal burgh. A bye-law of the burgh-incorporation, passed in 1695, obliged the members of the town-council annually to take an oath that they would not take under their management a lease of any part of the public property, nor purchase any part of it, nor receive from the public funds any sum in name of compensation for their trouble in attending to the burgh's affairs. In spite of this apparently self-denying oath, three leading members of the council, in 1773, entered into a combination, unknown to the majority, to avail themselves of a defect in the constitution of the burgh for holding themselves and their friends perpetually in office. An action against so gross an abuse of power was immediately brought by certain of the injured individuals before the Court-of-session, then consisting of one chamber; and the election of magistrates and councillors of the burgh made at Michaelmas of that year was declared, by a casting vote of the court, to be null and void. A vain appeal was made to the House of Lords; and the burgh, in consequence, stood disfranchised, its magistrates being, for several years, appointed by the Court-of-session. But in May, 1781, nearly 8 years after the disfranchisement, a warrant was issued by his Majesty and council restoring the burgh, and appointing the election of magistrates to be by poll of the burghesses; and, at the same time, a new sett was granted to it, which considerably ameliorated its constitution, by rendering it more popular.

We have so freely mixed history with every department of our notice, and especially have appended it at such length to our account of the castle, that very few events remain to be noted. The castle may be supposed to have long, in its rude state, and amid the continual hazards and unsettledness of its site of "strife," remained alone; yet, by affording protection to persons who chose to squat or reside beneath the shelter of its walls, it must eventually have occasioned the origin and early growth of the town; and when it became a royal residence, it attracted, in the first instance, many nobles and state-officers to build in the vicinity, that they might conveniently attend the court, and, in the next instance, not a few merchants and tradesmen, that they might enrich themselves by traffic with the courtiers. Stirling rose into consequence as a town after the settlement of the Scottish government under Malcolm Canmore, at the end of the 11th century; and it ever afterwards, till the union of the crowns, figured prominently in the history of the kingdom. In March, 1244, it was

burnt in the same night with the ancient towns of Haddington, Roxburgh, Lanark, Perth, Forfar, Montrose, and Aberdeen, all the Scottish towns of the period being constructed of wood, and peculiarly liable, at a season of very high wind, to be victimized by the flames. During the struggles for independency in the wars of the succession, the town and its vicinity were the scene of some of the most gallant achievements of Wallace and the other leading patriots, — prime examples of which are narrated in our articles on St. Ninian's and Bannockburn. In 1298, the town was burnt, and the circumjacent country laid waste by Wallace in his retreat from the battle of Falkirk, that the English, if they had pursued, might be deprived of provisions and forage. In 1385, the town was again burnt by Richard II. After the murder of the Earl of Douglas, in 1452, James, the next Earl, marched an army of vassals and friends into the town, and committed various excesses in contempt and defiance of the King; and, finding the court occupying a defensive and redoubtable position in the castle, he departed, gathered additional force, returned, and, still unable to wreak vengeance in the quarter he derived, plundered the town, and laid great part of it in ashes. During the commotions of the Reformation, Stirling was the scene of many considerable transactions, repeatedly the rallying point of Mary of Lorraine, and of her daughter, Queen Mary, and once the chief post of the Lords of the Congregation; it witnessed the demolition of its own two convents of Black and Grey friars, and of the neighbouring abbey of Cambuskenneth, by the sallies of an irregular zeal; and in August, 1559, it became signalized as the place where the Lords of the Congregation entered into their third bond of mutual defence. In May, 1569, four priests of Dunblane who had been sentenced by the Regent Moray to be hanged at Stirling for saying mass contrary to act of parliament, were, as a commutation of their punishment, chained for an hour to the market-cross, wearing their Romish vestments, and bearing their books and chalice; and, after they had been pelted with stones by the mob, and treated with other indignities, their vestments and books were, at the conclusion of the drama, burnt by the common executioner. In September, 1571, while Regent Lennox was holding a parliament in the castle, the Earl of Huntley, Lord Claud Hamilton, Sir Walter Scott of Buccleuch, Sir David Spence of Wormiston, and other persons of rank belonging to the party of the dethroned Mary, marched stealthily into the town at the head of 300 horse, and 80 foot, to surprise what they contemptuously called the Black Parliament; and they instantly surrounded the lodgings of the chief nobility; and, meeting with no resistance, except from Morton, who did not surrender till his house had been set on fire about him, they made the Regent and ten other noblemen prisoners, and marched off in triumph with them for Edinburgh. But Buccleuch's borderers having run athwart the town in quest of plunder, and occasioned an alarm in the castle, the Earl of Mar marched out with a company of musketeers, speedily subdued the plunderers; and, being joined by the townsmen, so hotly pursued the main body, as to make a safe rescue of all their prisoners, except the Regent, who had received a mortal wound, [see LENNOX,] and to capture 26 and slay 6 of their number. The Earl of Mar's party lost 24, among whom the only persons of note were Alexander Stewart of Garlies, and George Ruthven, brother of Ruthven of Ruthven. The most considerable of the invading party among the captured were Scott of Buccleuch, Captain George Calder, and a person of the name of Bell; and of these,

Calder and Bell were, two days after, executed in Broad-street. Drumsy—narrating that the invading party marched without a halt from Edinburgh, late on the evening, to the attack on Stirling at four next morning, and that the force whom they came to defy was numerically so very superior to them—remarks that “the boldness of this enterprise is hardly to be matched in any European history.” During a part of Lennox's regency, Stirling was the seat of the court-of-session; and, in August, 1571, and June, 1578, it was the seat of the General Assembly. In October, 1579, Turnbull, a celebrated schoolmaster, and William Scott, both versifiers, were hanged here for writing a satire on the Regent Morton. In 1584, the Earls of Angus and Mar, the Master of Glamis, and others, who had been concerned in the Raid of Ruthven, took possession of the town and castle of Stirling; and, being obliged speedily to flee, and to lie concealed in England under a sentence of forfeiture, they returned next year with additional force,—found the town and castle, though the King was on the spot, in no state of defence,—and, under the virtual and commanding menace of their position, which obtained the name of the Raid of Stirling, readily procured the restoration of their estates, the reinstatement of their persons in the royal favour, and the concession to them of such enduring advantages as soon afterwards permanently invested them with offices of public trust. On the ferment at Edinburgh, in 1637, raised by the introduction of the new liturgy, the privy-council and the court-of-session, were, by the royal mandate, removed to Stirling, and held here for several months. In February of next year, a proclamation, read at the cross, forbidding any persons to enter the town without a warrant from the council, was publicly protested against by a great number of nobles, barons, ministers, and burgesses, who declared that they should not be precluded from having access to state their grievances to the King, and was treated with such contempt that, in defiance of it, 2,000 armed men took possession, though for only one night, of the town. In 1645, the plague raged in Stirling from the middle of July till October, and obliged the parliament, who had been chased hither by the pestilence from Edinburgh, to adjourn to Perth, and the town-council to hold their meetings in the open fields in an enclosure called the Cow-park, on the south side of the town-wall. Cleansers, as they were called, having been appointed to take charge of the infected, two of their number, called Watson and Murrison, inherited so largely the effects of those for whom they had in vain exerted their humanity, that they became proprietors of about two-thirds of the town,—Watson alone purchasing Greenyards, Thirty-acres, the Inclosure, and the Coffee-house, besides other property. In 1648, the Marquis of Argyle, marching eastward at the head of a small body of Highlanders to join other troops against the army assembled by the Committee of Estates, halted at Stirling, and posted upwards of 100 of his men to guard the bridge, and the rest at the burgh-port and the burgh-mill; and, while he dined with Mar in the castle, and dreamed not of danger being near, the detachment at the bridge were all cut to pieces or drowned by one body of the antagonist army under George Monro, and the detachment at the other posts were preserved from a similar fate only by surrendering to a second body under the Earl of Lanark. After the defeat of the Scottish army at Dunbar by Cromwell, in 1650, Stirling became the retreat of the committees of church and state, the magistrates of Edinburgh, and the remains of the army, to concert a plan for future operations; and, at the same time, the seat of

a parliament which was obliged to adjourn to Perth, and was the last in Scotland in which the sovereign personally presided. When Charles II., who had recently been crowned at Scone, put himself at the head of the new army which rendezvoused at Aherdeen, he marched to Stirling, encamped at Torwood, and, after having there tantalized Cromwell, suddenly took post in the park of Stirling castle, and obliged his foe to remove the seat of war to England,—to the fatal field of Worcester. Many of the officers of Monk—who, as we have seen, took possession of the town and reduced the castle, soon after the departure of Charles—are mentioned in the town register as having been admitted burgesses. In 1681, the Duke of York, afterwards James VII., visited Stirling with his family, including the princess who afterwards became Queen Anne. In 1746, the insurgent Highlanders, before being admitted to the town, promised that no man's person should be harmed, and that every thing demanded should be paid for; yet, according to report, they had not been two hours within the walls, till they had pillaged the houses and shops of such of the inhabitants as were most noted for opposition to Jacobitism.

Stirling gave, at one time, the title successively of Viscount and Earl to the family of Alexander. In 1630, William Alexander was created Viscount Stirling and Baron Alexander of Tullibody; and, in 1633, he was advanced to the dignity of Earl of Stirling and Viscount Canada. In 1739, the peerage became dormant at the death of Henry, the 5th Earl. The proceedings of Mr. Alexander Humphreys, or Alexander, who claims the peerage, were such as to occasion his being tried before the high-court-of-justiciary at Edinburgh in 1839, on a charge of counterfeiting certain documents. The trial excited much interest, and issued in a verdict which, as regarded the documents, found them to be forged, but as regarded the charge against the individual, declared it not proven.

STIRLINGSHIRE, a county lying on both sides of the boundary-line between the southern and the central of the three great physical divisions of Scotland, and on both sides also of the boundary between the Lowlands and the Highlands. Two small districts, consisting of the parish of Alloa, and part of the parish of Logie, lie in detached positions a little way to the north, and are detailed into the marches of Perthshire and Clackmannanshire. The rest of the county is bounded on the north by Perthshire; on the north-east by the Forth, which divides it from Clackmannanshire, and the detached or Culross section of Perthshire; on the east and south-east by Linlithgowshire; on the south by Lanarkshire and the detached or Cumhernauld and Kirkiintilloch section of Dumhartonsire; on the south-west by the main body of Dumhartonsire; and on the west by Loch-Lomond, which divides it from Dumhartonsire. A very large amount of its boundary-line consists of water. A feeder of Loch-Katrine, and that gorgeous lake itself, are the boundary for  $5\frac{1}{2}$  miles; Loch-Arklet for half-a-mile; Duchray-water for 6 miles; Kely-water for 2; the Forth, from the confluence with it of the Kely, for 31 miles, measured in a straight line, but placing on its right bank the Perthshire part of Kippen, and on its left the Stirlingshire districts of Leeropt and Logie; the Avon and one of its tributaries for 16; the Kelvin for 13; the Allander for 4; the Endrick and one of its tributaries for 9; Loch-Lomond for 17; and two or three minor waters for aggregately 5 or 6. The county is situated between  $55^{\circ} 56'$  and  $56^{\circ} 16'$  north latitude, and between  $3^{\circ} 35'$  and  $4^{\circ} 40'$  longitude west from Greenwich. Its greatest length from Lulithgow-bridge on the east to Loch-Lomond near

Inversnaid on the west is 45 miles; its breadth, for the most part, ranges between 11 and 17, but over 12 miles on the north-west does not average 5; and its superficial extent is variously estimated at 489, 645, and 704 square miles, or respectively 312,960, 412,800, and 450,533 statute acres,—the second being the estimate of Dr. Graham in his Agricultural View of Stirlingshire, published in 1812, and the last that of Mr. Belsches, in a Report to the Board of Agriculture in 1796.

A belt along the south-west border, about 17 miles in length, and from less than 1 to about 3 or 4 miles in breadth, consists of the beautiful and almost continuous vales of the Allan, the Blane, and the lower Endrick. Another belt, about 17 miles in length, and between 4 and 5 in mean breadth, extends north-north-westward from the north-west end of the former, and forms, over rather more than the further half, a projection or horn of the county. This second belt is all Highland; it sends aloft from near its centre the sublime summit of BENLOMOND [which see]; it screens over four-fifths or more of the lake's length the eastern side of Loch-Lomond, coming down upon that peerless expanse of isleted waters in a profusion of the hold, rich, features of landscape; and it constitutes, along its summit-range, the water-shed between the streams of the eastern and the western seas. Immediately east of this grandly upland territory—this region of mountains which, though they form a series of their own, have usually been classed with the Grampians, and often represented as the commencement of the long, vast frontier rampart of the Highlands—a prevailingly champaign but partly moorish district, extends between the vale of the Endrick on the south and the rivers Kely and Forth on the north, measuring about 7 miles in length, and from 4 to 7 in breadth. This district is, in a general yet intelligible and proximately correct view, regarded as the commencement of Strathmore, or of a great valley extending hence along the skirt of the whole frontier mountains of the Highlands to the German ocean at Stonebaven; and, though, while connected with Stirlingshire, it has a very variegated surface, and possesses two general declinations respectively to the Endrick and the Forth, it is all comparatively low ground, and may well, in its peculiar position, pass for valley. East of it, and forming its eastern screen, extend, in expansive breadth, and in many forms of picturesqueness, and with numerous fairy nooks and delightful recesses, the LENNOX HILLS: which see. All east of these hills, the country, comprising between one-fourth and one-third of the whole county, consists principally of flat carse-lands, and gently sloping plains, beautiful and occasionally luscious in aspect, one of the gayest and most decorated tracts in Britain, exhibiting a constant alternation of fields in the highest state of tillage, drained and exuberant meadows, plantations, pleasure-grounds, gardens, orchards—all the forms, in short, of tasteful and triumphant culture—in the most luxuriant vegetation.

The waters of Stirlingshire, both running and lacustrine, are aggregately superb in scenic character. Of the streams already mentioned as tracing portions of the boundary, several have some part of their course in the interior. Duchray-water rises on the side of Benlomond, and has a course of  $5\frac{1}{2}$  miles before commencing to be a boundary stream. The Forth, as already hinted, is so far an interior stream as, over a distance of 4 geographical miles, to place a portion of the county on its north bank. The Avon makes two separate stretches on the boundary, and between its origin and the first, and again between the first and the second, runs respectively  $2\frac{1}{2}$  and  $6\frac{1}{2}$  miles in the interior. The Allan leaves the boundary for

the interior, and traverses the latter  $3\frac{1}{2}$  miles to its mouth. The Endrick is an interior stream over about four-fifths of all its sweet and picturesque course. Of the streams which belong wholly to the interior the most considerable are the Carron, famed in ancient Celtic song, and in modern European intercourse,—the Bannock, associated with reminiscences of patriotism and bravery,—the Devon, bounding for  $2\frac{1}{2}$  miles the detached part of the county, and famed for the romance of its banks and water-course,—and the Blane, distinguished by its cataract of Ballagan, and still more by the birth, on its right bank, of the celebrated Buchanan. The last of these streams is tributary to the Endrick, and the other three to the Forth. Loch-Lomond belongs, over nearly one-half of its extent, to Stirlingshire, and contributes to the county its brilliant island of Incheallioch, its pleasing arable islands of Inchfad and Incheruin, and several of its islands of a minor character. Loch-Katrine touches the county over a distance of only 2 miles, and immediately after receiving the feeding-stream at its head. The other lakes are comparatively small, and are principally Loch-Coulter in St. Ninian's, and Loch-Elrigg, Black-loch, and Little Black-loch in Slamannan. Between 9 and 10 miles of the Forth and Clyde canal, and nearly 8 of the Union canal, are within the county, while about 18 additional of the former are close upon its frontier; and they send through it a current of traffic quite as great as if they were navigable rivers. Various medicinal springs send up their waters; among others, one at Boquhan, somewhat resembling those of Pitcaithly.

Stirlingshire competes with all the rich districts of Scotland in the quantity, variety, and utility of its minerals. The north-western boundary of the great coal-field which extends from Kintyre to Fifeshire, appears to run along the base of the Lennox hills; and the field itself lies beneath all the belt of country which intervenes from New Kilpatrick to Denny between these hills and the Kelvin, and also beneath all the expanse of carse and lowland which forms the eastern and uniformly luxuriant division of the county. In most of the latter and much the larger district the coal is excellent and abundant, and is mined in large quantities for exportation; in Baldernock it resembles the coal of Newcastle, and occurs from 3 to  $4\frac{1}{2}$  feet thick, between strata of limestone; in Campsie it has much sulphur, runs into a mass, and is slow or prolonged in combustion; and in Kilsyth it is partly akin in character to that in the adjoining parishes, and partly a blind coal, which, being well-adapted to metallurgical operations, is exported to England, Ireland, and Russia. The fuel of Stirlingshire, about two centuries ago, is thus curiously noticed in Bleau's Atlas: "In the eastern parts they use, instead of wood, black stones full of sulphur, which they dig with great labour in the bowels of the earth, and call 'du cbarbon.' Almost all the rest of the province use pieces of black earth, and moss formed of trees, which have remained long buried in the earth." Limestone, in many instances, accompanies coal in two strata, the one above and of the best quality, the other below and of inferior quality. Various lime-works have long been celebrated for both the quality and the quantity of their produce. At Ballagan, in Strathhlane, nearly 200 alternate strata of limestone and earth appear in the face of a hill, excavated by a lofty and precipitous cataract, which is subject to vast floods. Freestone, very various in aggregate character and appearance, abounds both in the region of the coalfield and in that north-west of the Lennox hills. What accompanies coal is, in general, an excellent building-stone; and in Kilsyth is prevalently of a beautiful white,

fine in the grain and in great request, but what occurs in the north-western district is of a reddish colour, easily wrought, and displeasing to the eye. Ironstone occurs in inexhaustible quantities, and occasioned Dr. Roebuck, after he had examined the greater part of Scotland, to select the east of Stirlingshire as the most advantageous site for the now magnificent Carron works. The richest variety is found in Kilsyth, and, owing to its occurring in rounded masses in the form of a flat-topped loaf or apple-pudding, bears the name of ball-ironstone. Trap rocks, particularly of the basaltic species, and useful as road-metal, abound north-westward of the coals, and rise up in nodulated hills through various parts of the coal-field. Precipitous columnar cliffs and extensive ranges of basaltic colonnade, inferior only to those of the wondrous Staffa, exist in solitary protrusions or in the broad mass of the Lennox hills: see FINTRY, LENNOX HILLS, and STIRLING. A seam of syenite, from 20 to 30 feet in thickness, traverses part of Kilsyth, and has furnished many thousand tons of paving-stones for the streets of Glasgow. The rocks of the Highland district appear to be prevalently the metamorphic or hard schistose, and chiefly micaceous schist; and those of the monarch mountain are singularly various: see BENLOMOND. A bed of slate, from 4 to 15 feet thick, occurring between coal and the upper stratum of limestone, and lying for years in the coal wastes, and decomposed in a dried state by the circulation of the air, furnishes the Campsie chemical company with material for alum and coppers. Some precious stones occur in a powerfully petrifying streamlet in KILSYTH: which see. Some thin strata of alabaster and some rich specimens of antimony have been seen at the cataract of Ballagan. Copper mines were worked in Kilsyth and Logie, but have been abandoned. No fewer than fourteen or fifteen mines containing, but not in large quantity, iron, lead, copper, cobalt, arsenic, and silver, are possessed by that insulated district, which, lying more than 3 miles from the main body of Stirlingshire, and separated by wings of two counties, forms the parish of Alva.

The soils of Stirlingshire are very various, but may, by the adoption of local phraseology, be classified into carse, dryfield, hill, moor, and moss. The carse soil extends about 28 miles along the Forth from Buchlyvie to the eastern limits of the county, in a belt of about 2 miles in mean breadth, or of from half-a-mile to  $4\frac{1}{2}$  miles, making 56 square miles, or about 35,944 imperial acres. It is composed of the finest argillaceous earth, originally bluish and of a soapy or mucilaginous consistency, but, after cultivation, hazleish in colour, and of a loamy friability; possessing, in some places, a depth or thickness of more than 20 feet; improving in quality proportionately to its approach to the present boundary of the parent ocean; everywhere free from native stones or even pebbles, and interseamed at intervals with beds of shells, particularly oysters and others common to the frith, from a few inches to 4 feet in thickness; and lying generally from 12 to 20 or 25 feet above sea-level at high-water, but descending at parts of the outskirts to such a conflict with tide-mark that considerable pendicles of it have recently been won, and others may again be soon conquered from the dominion of the sea. The dryfield comprehends the lower or arable declivities of the bills, and much the greater part of all the straths, valleys, or low grounds, except what is occupied by the carse; it is exceedingly various in quality and character, and contains some very inferior land; but, in general, it consists of loamy and gravelly soils, both of which are highly fertile, and the latter peculiarly suited to the potato

and turnip husbandry. The hill division is all green pasture, with chiefly an arenaceous soil, mixed with till, and sometimes interspersed with peat earth; and it comprehends the Lennox hills,—themselves nearly a fourth part of the county, and the most valuable pasture tract in Scotland,—the huge sides and shoulders of Benlomond, two small pendicles north of this monarch height, and the greater part of Alva and the Stirlingshire section of Logie. The moorland division, consisting of ground more or less inclined to heath, comprehended, sixty years ago, about one-fourth of the county; but since that period has been largely invaded by the plough, and converted into dryfield, and now Balgair-moor in the south of Kippen, a small pendicle in the south of Killearn and Drymen, and about four-fifths of the Highland district, or an area in it not equal to that of the single parish of Buchanan, in which most of it is situated. The moss division constituted, twenty-five years ago, about one-thirtieth part of the county, but has since been reduced in extent by processes of reclamation; it lies principally in Slamannan, in patches athwart the carse, and in a small pendicle in Alva; it is, in some places, incumbent on a fine clay; and, over the greater part of its extent, it affords pasture for sheep.

Agriculture is in a highly improved and almost model condition; but, owing to the great variety of soil and situation, it is necessarily various in its modes, and, owing to the peculiarity of its carse-grounds, is, to a large extent, common in character only with that of the other limited carse districts of Scotland. The cultivation of the carse is managed by ploughing it into high ridges, and applying to it substances such as lime, marl, ashes, and vegetable manure, which tend to separate its parts and make it penetrable by the atmosphere, the sun's rays, and the roots of plants. Such was the fertility of the cultivated part of this district, so early as the 14th century, that the Crown then drew from the 1,248 Scottish acres of the little parish of Bothkennar, 29 chalders of grain, and the abbey of Cambuskenneth 6. Wet ditches were long peculiar to the carse farmers, as a mode of fencing; many of them being 10 feet wide, and of considerable depth. The practice is supposed to have originated from making large excavations for the purpose of procuring clay for house-holding and brick-making. The moisture of the ditches was found to produce grass with great luxuriance, and was carefully cut for the purpose of being eaten green. But they were not without their disadvantages. In wet seasons, when these reservoirs were liable to be filled with water, considerable damage was frequently done to the cattle, which, allured by the richness and succulence of the grass, often ventured too far, and not unfrequently lost their lives; besides, a large portion of the farm was thus annihilated, which might have been employed to profitable purposes. The practice is now, in a great measure, abolished, and all manner of fences may be seen, from the neglected quick-set hedge to the high and durable wall of stone and lime. In the agricultural districts, in general, wheat, barley, and pulse are largely raised; the turnip and potato husbandry is extensively practised; and artificial grasses have a due place in the system of cropping. The arable farms range in extent between 15 and 100 acres; and the hill farms frequently extend to nearly 4,000. Though some calves are reared upon almost every farm, Stirlingshire cannot, as to cattle, be properly denominated a breeding county. On the richer arable lands the number of cattle kept is barely sufficient for local consumption of milk, and not always adequate to the supply of the local demand for butter and cheese. In the characteristically

grazing or half-upland district the number of calves reared, though large compared to that of the other district, amounts annually to only about one-half the number of milk cows. Cattle are, for the most part, bought in from the Hebrides and from the mainland of Argyshire and Inverness-shire, in the beginning of summer, and, after being fattened during the interval, are, at the end of autumn, sold for the shambles. Almost all the Highland district, or the mountains of Buchanan and Drymen, and also all the upper region of the Lennox hills, are disposed in sheep-walk, and produce a peculiarly fine herbage. The sheep most general are the black-faced, or that variety of the Cheviot which has obtained the name of the Linton breed. Very few horses are bred in the county; those for the draught being brought chiefly from Lanarkshire and Ayrshire, and those for the saddle and the gentleman's carriage being generally procured at high prices from England. Hogs are much less numerously kept than in the more southern counties. Goats abounded about half-a-century ago in the Highland district and in Alva, and were regularly every evening brought in flocks to the pen for a certain period in the summer to be milked; but though great favourites with a bygone generation, they have now almost wholly disappeared, or are to be met with only as stragglers or solitary individuals. Poultry of various kinds are bred in considerable numbers.

A great proportion of Stirlingshire, as well as of all the western parts of Scotland, was anciently clothed with wood. The mosses of Kippen, Gargunock, and Airth, in the carse district, and the still more extensive mosses of the upland and dry-field districts in Buchanan, Drymen, Fintry, St. Ninian's, Polmont, Slamannan, and Muiravonside, all bear evident marks of ligneous origin, or of occupying the sites of ancient forest. All the elevated range of country, too, which extends in a semicircular sweep from Stirling to the neighbourhood of Polmont, must once have been a continued series of woodlands, now very partially commemorated in the vastly abridged woods of Torwood and Callander. Besides the well-known destruction of the Caledonian forest, a wing of which extended far into the interior of this county, demolition seems to have been conducted on economical principles by the stated inhabitants or settlers, both to dislodge the bears, wolves, and wild boars which abounded, and to bring the ground into service for pasture or tillage. About a century ago a new policy began to be adopted; and thenceforth plantations were formed and coppices were protected. For a long series of years great attention was paid on the extensive estates of the Duke of Montrose, Lieutenant-general Fletcher Camphell, and Sir Charles Edmonstone, to the rearing of plantations, particularly of oak, ash, sycamore, beech, larch, and Scottish fir. The plantations of the county, as a whole, are neither extensive enough nor sufficiently well-arranged to serve in a due degree the purposes of shelter and ornament; yet they have imparted very sensible embellishments to the general landscape, and materially aided the attempering of the climate, and the aggregate value of the ground. About 2,900 acres are covered with natural oaks, and afford cuttings every 24 years, and of these upwards of 2,000 belong to the Duke of Montrose, and, about the beginning of the present century, were put under a highly improved system of management. Gardens and orchards, except as the luxurious appendages of gentlemen's seats, draw little attention, and have a very limited or but a mimic existence. Though orchards were anciently cultivated on an extensive scale in the carses of Bothkennar and Airth, which then belonged, for the

most part, to the monks of Cambuskenneth, they have not, as in the vale of Melrose, the vicinity of Jedburgh, and other similar scenes of monastic luxury, survived to regale the corn-eaters of the 19th century.

The climate of the eastern division of Stirlingshire is milder than that of the western division, partly because it is inferior in altitude, and partly because it enjoys a greatly superior shelter from trees and hedges, but principally because, in summer, the German ocean is 5 degrees warmer than the Atlantic. The western division, however, enjoys superior advantages during winter, and then escapes these fogs which, during the prevalence of north-east winds, infest the east coast of Scotland, and act inimically on vegetable and animal life. An almost daily alternation of dry and wet weather prevails over the whole of the county, and seems admirably adapted to the necessities of both the pasturage and the carses.

The manufactures of Stirlingshire are various. Carpets, tartans, and shalloons, are extensively manufactured at Stirling, Bannockburn, St. Ninian's, and adjacent villages. Blankets and serges are manufactured at Alva. Large cotton-mills occur at Fintry, Balfroun, and Milngavie. Printfields exist at Denny, Kincaid, Milngavie, Lennoxton, and Strathblane. A large chemical work exists at Lennoxton. Factories for spinning wool, preparing dye-stuffs, making paper, chipping wood, or conducting other departments of manufacture, occur in Denny and other localities. Distilleries are large and numerous. Nail-making for carpenters' work is extensively conducted in the villages, particularly those of St. Ninian's; but the grand staple manufacture is that of iron-woods, east and malleable, at the stupendous works of Carron. By means of these various manufactures the county has, proportionately to its size, acquired great wealth and importance; and in working them, it exhibits steadiness, makes progressive increase, and enjoys flattering prospects.—The principal commerce of the county is conducted either through the ports of Grangemouth and Stirling, or along the Forth and Clyde canal, or in connexion with the great cattle-trysts of Falkirk. Nearly a full view of it may be obtained by reference to our articles on Grangemouth, Carron, Falkirk, and Stirling.—The principal lines of road are the Edinburgh turnpike from Linlithgow-bridge, through Falkirk to Stirling; the Glasgow turnpike from Castlecary through Denny, to the former line at St. Ninian's; the Edinburgh and Glasgow north road from the former line at Camelon, to the latter line at Denny-Loanhead; the Stirling and Edinburgh north road from Stirling through Airth, to the Edinburgh mail-road a little east of Laurieston; the Stirling and Glasgow north road, from the Glasgow road at Haggs, through Kilsyth, to the Kelvin at Bridgend; the Glasgow and Balfroun road through Milngavie, Strathblane, and Killearn; the Glasgow and Kippen road through Lennoxton and Fintry; the Stirling and Dumbar-ton road through Kippen, Gargunock, Buckleyvie, and Drymen; and several lines radiating from Stirling-bridge or its vicinity to all the north of Scotland, but very speedily passing into the adjoining counties.—In the article PERTHSHIRE we have traced the line of the projected railway betwixt Stirling and Perth.

Stirlingshire comprises 21 entire *quoad civilita* parishes, and parts of other four, 3 of which it shares with Perthshire, and 1 with Dumbartonshire. Of these 25 parishes, 8 are in the presbytery of Stirling, and synod of Perth and Stirling; 3 are in the presbytery of Dunblane, and same synod as the former; 8 are in the presbytery of Dumbar-ton, and synod of

Glasgow and Ayr; 2 are in the presbytery of Glasgow, and synod of Glasgow and Ayr; and 4 are in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. In 1840, it had also 8 *quoad sacra* parishes, 3 of which were in the presbytery of Stirling, 1 in that of Dunblane, 1 in that of Glasgow, and 3 in that of Linlithgow. In 1834, it had 33 parochial schools, conducted by 39 teachers, and attended by a maximum of 2,006 scholars; and 121 non-parochial schools, conducted by 138 teachers, and attended by a maximum of 6,819 scholars. Its towns are the royal burgh of Stirling and the parliamentary burgh of Falkirk. Its small towns and its considerable or noticeable villages, are St. Ninian's, Bannockburn, Airth, Grangemouth, Carron, Laurieston, Grahamston, Denny, Balfroun, Buckleyvie, Gargunock, Fintry, Larbert, Kippen, Drymen, Killearn, Kilsyth, Milngavie, Lennoxton, Campsie, Polmont, Strathblane, Milton, Haggs, Denny-Loanhead, and some 8 or 9 more, nearly all the seats of busy and industrious population. Among a profusion of mansions which, along with their pleasure-grounds, gem two-thirds of the county, may be named Buchanan-house, Callander-house, Bannockburn-house, Fintry-house, Gargunock-house, Kinnaird-house, Kerse-house, Craigforth, Airthrie, Alva, Westquarter, and Dunmore-park. The county returns one member to parliament. Constituency, in 1839, 2,332. The valued rent, in 1674, was £108,509 Scottish. The real property, as assessed in 1815, was £218,761. Population, in 1801, 50,825; in 1811, 53,000; in 1821, 65,374; in 1831, 72,621. Houses 10,459. Families 15,351. The following is an abstract of the population of Stirlingshire in 1841:—

PARISHES.	Inhabited Houses.	Families.	Persons.
Alva, . . . . .	312	461	2,216
Airth, . . . . .	538	338	1,187
Balfroun, . . . . .	361	333	1,966
Baldernock, . . . . .	186	189	974
Bothkenuar, . . . . .	160	183	848
Buchanan, . . . . .	134	134	729
Campsie, . . . . .	1,162	1,199	6,394
Denny, . . . . .	986	986	4,421
Dunipace, . . . . .	317	317	1,577
Drymen, . . . . .	308	308	1,515
Falkirk, . . . . .	1,396	1,429	7,399*
Fintry, . . . . .	188	193	884
Gargunock, . . . . .	179	179	1,773
Kilpatrick (East) . . . . .	309	314	1,508
Kilsyth, . . . . .	1,014	1,014	5,613
Killearn, . . . . .	308	206	1,224
Kippen (part of) . . . . .	297	295	1,289
Larbert, . . . . .	981	981	4,194
Leecroft (part of) . . . . .	69	69	350
Logie (part of) . . . . .	162	174	986
Muiravonside, . . . . .	395	401	2,238
Polmont, . . . . .	678	673	3,551
Slamanau, . . . . .	191	192	978†
Stirling, parliamentary burgh, . . . . .	1,803	2,399	10,580‡
Stirling (that part of, beyond the boundary of the royal and parliamentary burgh), . . . . .	2	2	4.
St. Ninian's (exclusive of that portion lying within the boundary of the parliamentary burgh of Stirling), . . . . .	1,381	1,600	7,658
Strathblane, . . . . .	170	174	894

No district of equal extent in Scotland abounds more than Stirlingshire in antiquarian monuments and remains. Our limits will allow us to name only the chief. Those of the Romans are Antoninus' wall, the Great Causeway from the west of England

\* This return comprehends merely the rural part of the parish, and is exclusive of the parliamentary burgh. The population of the burgh we have not ascertained.

† That part of the *quoad sacra* parish formerly belonging to Falkirk, and annexed to Slamanau in 1729, is not included in this return, being contained in the return from Falkirk.

‡ The population of the royal burgh is 7,963; families 1,761; inhabited houses 1,289. The population of the parish within the town is 8,592; families 1,908; inhabited houses 1,387. The village of the abbey, which lies in the county of Clackmannau, though part of the parish of Stirling, is not included in this return.

to the Grampians, the two stations of Castlecarray and Roughcastle, and various præsidia along the line of the great wall. Circular forts, or the strengths of the Britons, are, in many instances, effaced, and in none so individually considerable as to demand special notice. Of tumuli, those at Dunipace are the finest specimens; of the monuments of the Romanized Britons, Arthur's-oven is the most remarkable example: see ANTONINUS'-WALL, CASTLE-CARRY, DUNIPACE, and ARTHUR'S-OVEN. Various standing-stones occur. Baronial strengths, or the towers and fortalices of the feudal period, are in general so demolished and transmuted, that the older edifices of Stirling-castle must be named, as probably the best specimen, Stirlingshire having, in Roman times, been divided between Valentia and Caledonia, and in the times which followed, suffered distribution among no fewer than four kingdoms;—Pictavia on the north, Northumhria on the east, Cambria or Strathclyde on the south, and the Scottish dominion on the west,—it must necessarily, during ages of turbulence and continual strife, have had many battle-fields; and in times which succeeded the consolidation of all modern continental Scotland into one monarchy, it had the noted fields of Stirling in 1297, Falkirk in 1298, Bannockburn in 1314, Sauchie in 1488, Kilsyth in 1645, and Falkirk in 1746. The chief ecclesiastical antiquities are Camhuskenneth-abbey, Emanuel-nunnery, the Dominican and Franciscan friaries of Stirling, and the collegiate church or Chapel-royal of Stirling-castle.

STITCHEL AND HUME, two parishes in the district of the Merse, the former in Roxburghshire, and the latter in Berwickshire. They were united in 1640. The united parish is bounded on the north-west by Gordon; on the north-east by Greenlaw; on the east by Eccles and Ednam; on the south and south-west by Nenthorn; and on the west by Earlston. Its length from north to south is between 5 and 6 miles; its breadth is between 3 and 4 miles; and its area is about 5,480 imperial acres. Stichel, round five-sixths of its boundary, and on every side except the east, is touched by Berwickshire. The parishes are very nearly equal to each other in extent. The Eden separates Stichel from Nenthorn for about  $1\frac{1}{2}$  mile; and, in its progress, falls over a nearly perpendicular rock of about 40 feet in height. The waterfall is in the vicinity of Newton-Donhouse, and, in a flood or in a hard frost, is a most beautiful object. In Hardie's Mill-place in the west of Hume, is a rising ground called Lurgie-craigs, and faced with a fine basaltic colonnade, whose columns, though small, stand erect and mutually distinct, and are regular polygons of about 5 and 6 feet high, and 16 or 17 inches thick. The surface of the united parish has a prevailing declination to the south, and, for the most part, lies about 600 feet above the level of the Tweed at Kelso, 4 miles distant. The highest ground, and at the same time the site of the most remarkable artificial object, is that on which stands the noted and conspicuous castle of Hume: see HUME. The soil is in some places naturally wet and cold; in most it is clayey and strong; and in all it is highly improved and well-cultivated, and, even 50 years ago, was almost all enclosed and in tillage. Stichel-house, the seat of Sir John Pringle of Stichel, Bart., is an elegant and commodious mansion. The other landowners are Sir H. P. Camphell Hume, Bart., and Mr. Baillie of Mellerstain, whose seats are in adjacent parishes. The village of Stichel is situated  $3\frac{1}{4}$  miles north of Kelso; and that of Hume  $2\frac{1}{2}$  miles north-north-west of Stichel. The parish is well-provided with roads, but is not touched by any great line of turnpike. Population, in 1801, 506; in 1831, 434. Houses

99. Assessed property, in 1815, £4,163.—This parish is in the presbytery of Kelso, and synod of Merse and Teviotdale. Patron, the Crown, and Sir H. P. Camphell Hume, Bart. Stipend £219 14s. 7d.; glebe £27. Unappropriated teinds £517 6s. 7d. There is in the village of Stichel a United Secession place of worship. Salary of the Stichel school-master £25, with £20 fees, and £2 4s. 5d. other emoluments; of the Hume schoolmaster £25, with £24 fees, and £2 10s. other emoluments.

STOBBS, a village and extensive gunpowder manufactory, partly in the parish of Borthwick, and partly in the detached section of that of Temple, Edinburghshire. There are properly two villages, both connected with the powder-mills, both 10 miles south-south-east of Edinburgh, and mutually adjacent;—Stobbs, in the parish of Borthwick, with 70 inhabitants,—and Gorehridge, in the parish of Temple, with about 300. The gunpowder-mills here were the earliest in Scotland, and were erected in 1794 by Hitchener and Hunter. They are situated partly in both parishes, but chiefly in Temple, and on the banks of a stream which divides the districts, and, a mile north-westward, becomes tributary to the South Esk. They have been greatly extended since their original erection, and occur at intervals along the stream over a distance of three-fourths of a mile. The houses appropriated to the more dangerous parts of the process of manufacture, are all situated in detached positions, between either natural abutments of the glen, or artificial mounds crowned with wood; so that in the event of an explosion, mischief is not likely to extend beyond the single and isolated building in which it takes place. Great care and vigilance are exercised to prevent accidents. The company give a gratuitous education to most of the children of the workmen, and have bestowed pensions on families hereof of husband or father by explosion. The workmen employed are between 50 and 60 in number; and they happily are not only free from the recklessness which so generally and perversely characterizes persons employed in a hazardous occupation, but are amongst the most regular and exemplary in conduct of the general community of the parishes. Gunpowder is exported from the mills to almost every part of the world; and, during the continental war, it was supplied by contract to Government. The united village has a savings' bank; Stobbs has a friendly society; and Gorehridge has a United Secession meeting-house, two non-parochial schools, and a subscription library.

STOBHILL, a village in Edinburghshire, partly in the detached district of Temple, but chiefly in the parish of NEWBATTLE: which see.

STOBO, a parish a little west of the centre of Peebles-shire; bounded on the north by the Tarth, which divides it from Newlands; on the north-east by the Lyne, which divides it from Newlands, Lyne, and Peebles; on the east and south-east by the Tweed, which divides it from Manor and Drummelzier; on the south by the Tweed and the Biggar, which divide it from Drummelzier and Glenholm; and on the west and north-west, chiefly by a water-shedding line of heights, which divides it from Broughton and Kirkurd. But beyond these limits, or on the east bank of the Tweed, and interposed between the original parish and Manor, lies a district of  $1\frac{1}{2}$  mile by  $1\frac{1}{2}$ , which formerly belonged to the suppressed parish of Dawick, and was annexed to Stobo in 1742. The extreme length of the entire parish north-north-eastward, is 6 miles; the mean breadth is between 3 and 4 miles; and the area is nearly 18 square miles. The western frontier has a basis of no less than 700 feet higher than the east-

ern, or the level of the Tweed; and from this basis it sends up summits, four or five of which rise upwards of 1,600 feet above sea-level, but all of which necessarily appear, from the low or rather table grounds in their vicinity, to be of inconsiderable altitude. The chief is **PKYED STANE**: which see. All the western division is wildly upland, and fit only for sheep-pasture. The interior heights are on the whole arranged into three chains or ranges, which extend east-south-eastward,—diminish in altitude as they approach the Tweed,—enclose between them two vales, each drained by its own stream,—and overlook, respectively on the north and the south, the vale of the Lync, and that of the eastward course or part of the Tweed. Some of the hills are green; but most are covered with heath. The vale of the Tweed is natural, beautiful, and not a little artificially embellished. **Stobo-castle**, one of the seats of Sir James Montgomery of Stanhope, Bart., is situated here; and both when in the possession of Sir Alexander Murray, Bart., and in that of the late Lord-chief-baron Montgomery, it was a centre whence radiated vigorous and tasteful processes of improvement. On the estate connected with it, and chiefly in its own vicinity, are about 600 acres of plantation. Much scenic beauty is borrowed also from the demesne of New Possa, the property of Sir John Nasmyth, Bart., on the Drummelzier side of the Tweed. The arable grounds amount to about 1,300 acres. Their soil is exceedingly various; yet may be regarded as prevalently a light fertile loam, superincumbent on gravel. The sheep pastured on the uplands are mostly of the Cheviot breed; and the black cattle have been crossed with the Durham and the Ayrshire breeds. Excellent clay-slate of a dark blue colour has long been extensively quarried, and has furnished roofing to the greater part of the New Town of Edinburgh. Greywacke more or less schistose, is the prevailing rock; but has been quarried only where it looked out at the surface. The Sheriffmuir, the scene of the county-militia musters during the distracted period of international animosities, presents various rude antiquities, all apparently of the British period, quite unexpounded by either history or tradition, and all the more valuable on that account to theorizing and visionary antiquaries. The road from Edinburgh to Dumfries or Carlisle, by way of Moffat, runs along the Tweed; and that from Glasgow to Kelso, by way of Peebles, runs along the Lync. Population, in 1801, 338; in 1831, 440. Houses 65. Assessed property, in 1815, £2,557.—**Stoho** is in the presbytery of Peebles, and synod of Lothian and Tweeddale. Patron, Sir James Montgomery, Bart. Stipend £158; glebe £42, with 10 bolls of oatmeal per annum in lieu of half the glebe of Dawick, given up to Sir J. Nasmyth, and 1 boll in lieu of a piece of ground given up to Sir J. Montgomery. The church is a Gothic structure, apparently about 500 years old, but recently repaired and put into good condition. **Stobo** was, in ancient times, an independent parsonage; it had attached to it four chapels or subordinate churches, or those of Dawick, Drummelzier, Broughton, and Glenholm, called the *Pendicles of Stobo*; and it was converted into a prebend of Glasgow, and was the most valuable of the prebends in Tweeddale. Schoolmaster's salary £32, with fees.

**STOER**, a *quoad sacra* parish on the west coast of Sutherlandshire. It was divided in 1834, by authority of the General Assembly, from Assynt. Its extreme length and breadth are computed to be respectively 11 and 10 miles. Its population is collected in a number of small villages and hamlets; and amounted, in 1836, to about 1,500. The Crown

is patron. Stipend £120; glebe £2 5s., with a manse. The church is a parliamentary one, and was built in 1828. Sittings 300. Three schools are supported by respectively the Christian knowledge propagation society, the Gaelic school society, and a society in Glasgow. See **ASSYNT**.

**STONEBYRES**, an estate in the parish of Lesmahago, Lanarkshire, giving name to one of the falls of the Clyde. The fall is broken into three sections of nearly equal height. At first, the river precipitates itself over the rock, almost in one sheet, into a kind of basin. From the edge of this basin it pours itself over obliquely upon the rocks which form the second step of the cascade, where it is broken and whitened. It is then gathered into another basin, out of which it rushes over a rocky declivity for about twenty yards:

Words! ye are powerless—at this scene of power,  
Feebly and idly from the tongue ye fall;  
Heart! bear me witness how I felt that hour—  
The dim lone hour, when, night with veiling pall  
Deep'ning its wildness, Stonebyres met my sight.  
The white foam, flashing through the gulf profound,  
Made e'en stern midnight wear the smile of light,  
And the huge tumbling mass shook all around.  
I look'd below; each hand, a rocky steep  
Guarded the calm'd and wider-bending stream:  
Wild trees, their love revealing e'en in sleep,  
Bent o'er the wave, whose murmurs bade them dream.  
There Peace might joy to watch the peeping flower—  
Above, reigns one sole thought, which speaks in thunder—  
power.

The line of railway from England to Glasgow, recommended by the Parliamentary commissioners, passes through the estate of Stonebyres.

**STONE-CASTLE**. See **IRVINE**.

**STONEHAVEN**—vulgarly **STANEHIVE**—a seaport, a considerable town, a hugh-of-barony, and the capital of Kincardineshire, stands at the north-east end of the great strath of Scotland, 15 miles south by west of Aberdeen, 61 south-south-east of Banff, 13½ north-east of Laurencekirk, 23 north-north-east of Montrose, 34 north-north-east of Arbroath, 51 north-east of Dundee, and 94 north-north-east of Edinburgh. Its site is at the influx of the Carron and the Cowie to the ocean, in a valley almost narrow enough to be called a glen, and flanked by two ranges of heights, the northerly one of which has the reputation of being the eastern abutment of the far-extending range of Grampians. See **INTRODUCTION**, and the articles **GRAMPAINS** and **STRATHMORE**. The town consists of two parts, an old and a new, separated from each other by a well-defined boundary, situated on the estates of different proprietors, and possessing such marked distinctiveness of character as to be in effect two towns under one name. The old town stands on the south bank of the Carron; consists chiefly of two considerable streets; and has an ill-built, irregular, and unpleasant appearance. The new town, greatly more important than the other in wealth, in prosperity, and even in population, stands on a cuneiform peninsula between the Carron and the Cowie; and consists of regular, well-edified, spacious streets, with a square in the centre. A handsome market-house in the square, was built in 1827, and contains a large hall, a public dispensary, and various other accommodations. A bridge across the Carron connects the towns, and carries along the Edinburgh and Aberdeen mail-road. The places of worship are noticed in the account of **DUNNOTAR** and **FETERESSO**, to which parishes the old and the new towns respectively belong. Here are branch offices of the Bank of Scotland, and the Aberdeen town and country bank, a savings' bank, and Donaldson's free-school. A considerable manufactory of cotton and linen goods has almost totally disappeared. A distillery, capable of distilling 3,000 gallons per week, and a large brewery, are in the

vicinity. The fishing-village of Cowie, situated less than  $\frac{1}{4}$  of a mile to the north, and containing a population of about 200, may be regarded as a suburb. The harbour of Stonehaven is a small natural basin a little south of the mouth of the Carron; it is sheltered on the north side by a convenient quay, and on the south side by a projecting high rock, and offers a safe retreat to vessels during storms; and it was a few years ago much improved by the erection of strong piers. A body of trustees, only a minority of whom belong to the town-council, manage the affairs of the harbour, under an act passed in 1825; they borrowed £7,884 to effect improvements, but became involved in an expensive and unsuccessful litigation concerning the right of quarrying from the adjacent ground the materials for the piers, and, in consequence, found the interest of the debt running into arrear; and they exact dues which, though allowed by the act, are complained of as oppressive and unequal, and helieved to operate, in many instances, as a prohibition to trade. The revenue, in 1826, amounted to £604; but, in 1832, it had decreased to £488. The vessels belonging to the harbour, in 1840, were 9; and they are employed principally in exporting grain to Leith, and importing coals and lime. A herring-fishery, during the season, is extensive and prosperous. But the town derives its main support from being the seat of the sheriff-courts, and the chosen home of a number of annuitants. The old town has the reputation and rights of a burgh-of-barony; but can neither show its charter, nor ascertain its date. "By act of parliament 1600, c. 51, the court-place of the sheriffdom of Mernis, or Kincardine, was changed from the town of Kincardine to the Stanebyve, as most convenient to the lieges within the shire; and an act passed 1607, c. 10, in ratifying the preceding statute, ordains 'the said burgh of Stanehive to be in all time coming the head burgh of the sberiffdom of Kincardine.' In the year 1624, William, Earl-marischal, the superior, entered into a contract with the feuars of the town, by which it was agreed that two resident burgesses of the burgh, yearly presented by the inhabitants, and chosen by the Earl, should be bailies, and should have power to choose their own members, and to hold courts, and decern anent their own civil and common affairs. After the forfeiture of the last Earl-marischal no magistrates were appointed, but the affairs of the town were conducted by managers appointed by the feuars; to one of whom the sheriff of the county was in the practice of granting a substitution, to qualify him to act as a sheriff within the burgh, until the late Lord Keith purchased the superiority of the town in 1797, when bailies were again appointed, and were annually chosen from leets presented by the feuars, down to 1812. About that time, a dispute having arisen between the superior and the feuars, no election took place, and the town property was managed by Lord Keith's private agent until his lordship's death. After the death of Lord Keith his trustees restored the old constitution, and since 1823 they have annually chosen two out of a leet of four resident feuars, presented by the whole resident feuars, to be bailies. These receive a commission from the superior, and nominate for the year a council, consisting of three councillors, a dean of guild, and a treasurer; they also appoint a town-clerk, a procurator-fiscal, and two officers." The burgh property yields £27 12s. 6d. a-year of income; a trifling revenue arises from other sources; and the expenditure, in 1833, amounted to £30 ls. The magistrates exercise no practical jurisdiction beyond two or three petty criminal cases a-year. Nearly the whole of that class from which the magistrates ought to be chosen have removed to

the more convenient dwellings of the new town, and are in consequence unconnected with the burgh. The only police, besides ill-paid and inefficient burgh-officers, consists of one constable, paid by private subscription. Water has long been supplied to the old town by public street wells; and, in 1833, it was introduced to the new town by a private company. Lighting was an important desideratum till the recent erection of the gas-works. Cleansing is very defective, owing to a fondness of the inhabitants of the old town for dunghills at their doors, and the want of legal power in the authorities to remove the horrid nuisances. The new town has suddenly risen, and is rapidly increasing. A weekly market is held at Stonehaven on Thursday; and annual fairs are held for cattle on the 2d Thursday of October, and the Thursday before the 22d of November,—for cattle and sheep, on the Thursday before Candlemas, old style,—for cattle and horses, on the 3d Thursday of June, old style, on the 2d Thursday of August, and on the 2d Friday of October,—and for hiring, on the day before Martinmas, and the Thursday before Christmas, both old style. Population, in 1821, about 2,150; in 1833, about 3,050. Houses at and above £10 yearly rent, in 1833,—in the old town, about 21,—in the new town, about 104.

STONEHOUSE, a parish in the Middle ward of the county of Lanark, bounded by Hamilton on the north, Lesmahago on the south, Glassford and Strathaven on the west, and Dalserf on the east. It is about 6 miles in length by nearly 3 in breadth, and is supposed to contain nearly 6,000 Scotch acres, though no actual survey has been made. It is watered by the river Avon, which affords good trouting sport. The land presents a gently sloping surface, and is scarcely surpassed in richness and fertility by any parish of similar extent in the county, being almost entirely arable. Draining has of late years been introduced to great advantage; the Hazeldean moss, which formerly produced ample crops of furze and weeds, now gives a rich return of yellow grain, or thriving green crop; the country is sheltered by beautiful belts and clumps of plantation, and altogether the science of husbandry and rural industry appear here in some of their sunniest aspects. The parish contains abundance of freestone and minerals of the best quality. Coal is also abundant, and used formerly to be worked, but it is now only raised to a very trifling extent, from the cheapness with which the mineral can be purchased at the neighbouring collieries of Dalserf. Ironstone exists in detached round masses above the lime. There is a post-office at the "town of Stonehouse," which is the principal village in the parish, and has been rapidly extending of late from the liberal encouragement given to feuars by Mr. Lockhart of Castlehill, the proprietor. The main street consists of a long and partially detached row of houses, nearly a mile in length, the inhabitants being principally weavers, and tradesmen employed by the surrounding agriculturists. There are three fairs held annually in the village, viz. those of May, July, and Martinmas, principally for the sale of black cattle and wool. The new road from Edinburgh to Ayr passes through the village, and its communication with Glasgow, from which it is 18 miles distant, is easy and frequent. It is 7 miles distant from Hamilton, and nearly the same from Lanark. Population, in 1801, 1,259; in 1821, 2,033; in 1831, 2,359; and, in 1841, 2,471. Houses, in 1831, 412. Assessed property £5,289. —The parish is situated in the presbytery of Hamilton, and synod of Glasgow and Ayr. Patron, Mr. Lockhart of Castlehill, who is at the same time proprietor of the half of the parish. Stipend £250 per

annum, with a glebe of 5 acres, which may be valued at about £25 yearly. The parish-church has a neat spire, and stands in the centre of the village; it will accommodate fully 900 sitters. There is also a thriving church in the village in connection with the United Secession. The salary of the parochial teacher is £28 per annum, with about £18 of school-fees, and £10 annually of other emoluments. There are other schools in the parish, not parochial, at which the ordinary branches are taught.—There is little or nothing of historical or antiquarian interest attaching to this parish. The ruins of the old castles, named Ringsdale-castle and Cat-castle, are still seen on the banks of the Avon, but tradition is silent regarding their former uses or importance. A strong military position, no doubt of Roman origin, existed at the junction of the Avon and Cauder streams, but it is now much dilapidated.

**STONYKIRK**—more properly **STEPHENKIRK**—a parish in the Rhinns of Galloway, Wigtonshire. It is bounded on the north by Portpatrick and Inch; on the east by Old Luce and Luce-bay; on the south by Kirkmaiden; and on the west by the Irish channel. Its extreme length from north to south is nearly 10 miles; its breadth from an extreme of 7 miles near the north end, diminishes to a mean of 3 miles over  $3\frac{1}{2}$  miles at the south end; and its superficial extent is about  $33\frac{1}{2}$  square miles, or 21,420 imperial acres. The west coast,  $6\frac{1}{2}$  miles in length, is in general bold and rocky, and in some places is precipitous; but toward the south it somewhat softens in feature, and receives the indentations of the bays or creeks of Port-Float, Ardwell-bay, and Port-Gill, which afford mooring to the small craft of fishermen. The east coast, 6 miles in extent, is winding and stony, but comparatively low; it has, over  $3\frac{1}{2}$  miles from the north end, reaches of sandy beach of half-a-mile in breadth, left dry at low-water; and where these reaches commence, it offers, in the bay of Sandhead, a sufficiently commodious anchorage and landing-place for coal or lime laden sloops. The surface of the parish, on the west side, rises very rapidly from the sea, but, on the east side, has a slowly ascending gradient: so that the line of water-shed or summit-height, as well in the broadest as in the more narrow districts, is in general distant only about 4 or 5 furlongs from the western shore. The general aspect is tumulated. Poltanton-hurn drains the parish along the northern boundary; and several streamlets, three of which are considerable, drain its interior to Luce-bay. Mills for dressing flax, which were formerly four or five in number, and a bleach-field, which existed in connection with flax-growing, have shared the fate of the discarded raw material on which they depended. A salt manufacture, which once was considerable at two places, has quite disappeared. Kelp-making has also vanished. A codfishery, which might be a source of prosperity, has for upwards of half-a-century been tamely conducted, and now, as 50 years ago, produces nothing for exportation. Ardwell-house and Balgreggan-house are the chief mansions. The village of Stonykirk is situated  $5\frac{1}{2}$  miles south-south-east of Stranraer, and has about 100 inhabitants. The roads of the parish are chiefly three, which traverse it lengthwise, through the middle and along the coasts. Among the antiquities are three conical artificial mounds, the largest of which is situated near Balgreggan-house, measures 60 feet in perpendicular height, and 460 feet in circumference round the base, has on the top a curious excavation, and is defended by a large encircling fosse. On the lands of Garthland in the north is a square tower, 45 feet high, bearing on its battlements the date 1274, and anciently the residence of the Thaness of Galloway.

Port-Float had its name from being the place at which some vessels of the famous Spanish Flota or Armada were wrecked, and at Money-point in its vicinity many dollars were found. Near Port-Float is a cave called the Goodwife's cave, which has a very remarkable echo. Population of the parish, in 1801, 1,848; in 1831, 2,966; in 1841, 3,052. Houses 552. Assessed property, in 1815, £9,424.—Stonykirk is in the presbytery of Stranraer, and synod of Galloway. Patrons, the Crown and Hawthorn of Garthland. Stipend £231 15s. 11d.; glebe £10. Unappropriated tithes £153 17s. 11d. The parish-church, a fine Gothic structure, was built in 1827. Sittings 880. In 1836, a preaching-station in connection with the Establishment was commenced at Ardwell in the extreme south. Since 1822, Ardwell, Sandhead, and Thornhouse, have all been occasional stations of the United Secession. In 1836, a preacher of the Establishment stated to the Commissioners of Religious instruction, that the population, above 14 years of age, was 1,666; of whom 1,355 were churchmen, 194 were dissenters, and 117 did not attend any place of worship.—The present parish comprehends the ancient parishes of Stephen's kirk—transmuted successively into Steenie Kirk, Stainie Kirk, and Stonykirk; Clachshant—signifying 'the holy stone,' and transmuted into Clayshank; and Toskertion or Kirkmaiden—corrupted into Kirkmaidine. The three were united at the middle of the 17th century. The first was anciently a rectory; and the second and the third were vicarages of the canons of Whithorn. Vestiges of Clachshant church may still be seen on the farm of Clayshank; and Toskertion church, under the name Kirkmaidine, is commemorated in its burying-ground, which is still in use, and contains some antequely inscribed gravestones. In 1834, the parish-school was attended by 65 scholars; and 5 non-parochial schools by 381. Schoolmaster's salary £25 13s. 3 $\frac{1}{2}$ d., with £14 fees.

**STORMONT**, a beautiful district of Perthshire, bounded on the east by the Erich; on the south by the Islay and the Tay; on the west by the Tay; and on the north by the frontier mountain-rampart of the Highlands from the foot of Strathdarle to a little distance south of the foot of Strath-Tumel. The district measures 14 miles in extreme length from east to west, and about 7 or 8 in mean breadth; having the rivers Erich and Isla for its eastern boundary; the Isla and Tay on the south and west; and on the north, the barren and mountainous ridge stretching from Blairgowrie to a certain supposed point among the hills, about 4 miles to the northward of Dunkeld. By far the most remarkable natural feature of the district is the extraordinary number of lochs comprehended within its limits—amounting to not less than eleven, some of them very beautiful sheets of water.\* It comprehends the greater part of the parishes of Blairgowrie, Kinloch, Cluny, Caputh, and Dunkeld, all Lethendy, and about a third of Bendochy. For an exquisite combination of land, wood, and water, lowland expanses, and Highland harriers, luscious dales, romantic glens, and picturesque lochlets, this district, though excelled in its turn for other combinations, or for a higher perfection of some of the scenic elements, excels every other in even panoramic Perthshire. The best view of its brilliant surface, and its numerous pretty lakes, is obtained

\* Their names are the Stormont-loch, (the eastmost of the series, lying near the eastern extremity of the district, about half-way between Blairgowrie and Cupar Angus.) Black-loch, White-loch, Fingask, Ardbair or the Rae-loch, Marlee or Drumellie, Cluny, the Lowes, Butterstone, Bendochy, and Loch-Ordie. The two last-mentioned lie among the hills which bound the district on the north-west. The others are distributed along the basin of the tract, and form a connected chain extending from its eastern almost to its western extremity.

from the summit of Benachally, a considerable height in the north of Cluny; and a charming, though a less extensive and commanding one, is obtained from the summit of Crag-Roman, a wooded eminence about a mile west of Blairgowrie. Stormont gave, in 1621, the title of Viscount in the peerage of Scotland to the ancestor of the nobleman who, in 1792, was raised jointly to an earldom and to the peerage of the United Kingdom by the title of Earl of Mansfield.

STORNOWAY, an Hebridean parish, on the west coast of Lewis, Ross-shire. It is bounded on the north-west by Barvas; on the north by Ness; on the east by the Minch; on the south by the Minch and the parish of Lochs; and on the west by Uig. Its greatest length from north to south is 19 miles; its greatest breadth is 10 miles; and its area, including water, is about 160 square miles. One district, called Eye,  $6\frac{1}{2}$  miles long, and from  $\frac{3}{4}$  of a mile to  $2\frac{1}{2}$  miles broad, is almost insulated, extends north-eastward nearly parallel with the main body of the parish, and is separated from it by Broad-hay, which has a mean breadth of upwards of 3 miles. A peninsula commences at the isthmus of less than 200 yards in breadth which connects Eye with the main land, measures  $3\frac{1}{2}$  miles by from half-a-mile to  $2\frac{1}{2}$  miles, and is washed on the north-east by Broad-hay, and on the south-west by Loch-Stornoway. The rest of the parish has nearly the form of the plane of an obelisk, and extends 19 miles north-eastward, with an extreme breadth of  $5\frac{1}{4}$  miles. The coast is greatly indented; and, though occasionally presenting fine sandy heaches, prevailing consists of hold shelving rocks or precipitous cliffs. The Seal cave, though entering from the sea with a breadth of only 10 feet, and afterwards contracting to 4, is about a furlong in length, and terminates in a spacious, semi-circular, arched hall, paved and partly with a fine beach, and partly with a deep tidal basin. Stalactitic formations once exquisitely adorned the roof of the whole long entrance of the terminal hall, and of a beautiful side recess; and, though seriously damaged by the depredations of the curious and the idle, they promise to be speedily replaced by equally splendid successors. Great shoals of seals formerly frequented this vast cave, and, for several years, were multitudinously besieged in it and slaughtered; but, finding the retreat only a snare for their lives, they have almost entirely abandoned it. The coast is perforated with various other but minor caves; and is occasionally torn with fissures. Broad-hay, while very spacious, is rendered unsafe at all times by a sunk reef, and tantalizing in dim light by the lowness and narrowness of the isthmus, which prevents its being converted into a strait. Loch-Stornoway, 2 miles by  $2\frac{1}{2}$ , possesses landlocked recesses of shelter from every wind, and good and safe anchorage for a fleet of 200 sail. The other principal bays are Ure, Tolsta, and Bayhle. The chief headlands are Tolsta, Gress, Vateker, Tong, and Holm, on the main coast of the parish; and Tuimpan and Chicken-heads in Eyc. Fresh-water lakes are numerous, but dreary in aspect, and inconsiderable in size. Streamlets of noticeable bulk, and, in several instances, of comparatively great rapidity and volume, are 9 in number,—2 of them running to the Minch, 5 to Broad-hay, and 2 to Loch-Stornoway. The surface of the parish almost everywhere rises slowly from the sea; and, except in a narrow belt along the coast, presents the uniform and irksome aspect of a flat moor. The highest ground is a round hill, which rises 600 or 700 feet above sea-level, and forms a landmark to vessels steering across the Minch to Stornoway harbour. The soil, though to a small extent sandy, gravelly, or a vegetable

mould, is over the greater part of the area a spongy moss on an almost impenetrable old subsoil. The arable and the uncultivated lands bear the proportion to each other of 1 to 6. Trees are so few that probably there is not one for every 3 square miles. In common with all Lewis, Stornoway is the least agriculturally improved district of the Hebrides, and nearly a century behind the average of Scotland. Except in the vicinity of the town, indeed, real improvement has scarcely commenced. The fishing of cod, ling, and herrings is the chief employment of the male population,—farmers, cottiers, or handicraftsmen. Fishing-boats are to be found, not only at every hamlet, but at every farm; they proceed in considerable numbers to the white fishery on the north coast of Barra; and they take altogether so great a produce that about 120 tons of cured cod and ling are annually exported;—chiefly to the Clyde. Kelp-making, during three months of every year, employs a large part of the population, men, women, and children. On an elevated situation near the town stands Seaforth-lodge, the seat of A. Stewart Mackenzie, Esq., the only landed proprietor. Excepting some brief lines around the town, and a line north-westward thence into Barvas, the parish is quite unprovided with roads; and it knows not the luxury of a stone-bridge. Population, in 1801, 2,974; in 1831, 4,091. Houses 1,035. Assessed property, in 1815, £498.—Stornoway is in the presbytery of Lewis, and synod of Glenelg. Patron, the Crown. Stipend £158 6s. 7d.; glebe £10. The church was built in 1794, and repaired in 1831. Sitings 568. A parochial meeting-house at Back, in the district of Gress, was built about 30 years ago, and cost, in erection and repairs, about £100. The minister officiates on three successive Sabbaths at Stornoway, and on the fourth at Gress. A catechist is supported by the Society for Propagating Christian Knowledge. There are five Sabbath-schools. The district of Eye forms a separate *quoad sacra* parish; and is provided with a parliamentary church, and its usual appendages, of manse, garden, and a stipend of £120.—The present parish comprehends the ancient parishes or chapels of Stornoway, Gress, and Eye. Stornoway old church was dedicated to St. Lennan, and was removed only to make way for the present erection. The chapels of Gress and Eye were dedicated respectively to Aula and Columba, and still survive in ruin. Vestiges exist of a second chapel in Eye, dedicated to Cowstan. All these places of worship had anciently the privilege of sanctuary. Schoolmaster's salary £32, with about £20 fees, and £5 other emoluments. In 1834, the parish-school was attended by 64 scholars; 6 other schools by 268; and 3 schools in Eye or Knock by 151.

STORNOWAY, a sea-port, a burgh-of-barony, and the capital of Long-Island, stands at the head of Loch-Stornoway, in the cognominal parish, 46 miles north-west of Poll-Ewe, 65 north by west of Portree, and 120 north-west by west of Dingwall. The town was founded as a fishing establishment; and, through the exertions and patronage of the former and the present proprietors of the parish, it has rapidly risen to great comparative hulk and importance. A stranger on arriving at it by any route, or from any quarter, is surprised to see so large and flourishing a place in so remote and uninviting a corner. Its broad field of houses, its capacious bay, and spacious piers, its occasional crowd of shipping, and stir of trade and gaiety, and the vicinity to it of the aristocratic mansion of Seaforth-lodge, render it a striking and very welcome relief to the prevailing dreariness, sterility, and inertness of the rude country in which it is nestled. It boasts within the burgh-

boundaries no fewer than 9 or 10 streets, bearing the names of Church, Cromwell, Francis, Kenneth, Keith, Point, Bay-head, North Beach, and South Beach streets; and it has the suburbs of Guirshadir, Laxdale, Bayhead, Sandwich, Inailite, Holm, Cross-street, Stenish, and Culnagrein, which lie either nearly or quite compact with it, and, though rather contrasts to it than rivals in neatness, aggregately double it in population. The church, and an endowed female seminary, are neat buildings. A structure, disposed partly in news-room and public library, and partly in a masonic-lodge and hall for public and festal meetings, is a handsome edifice. A saw-mill, a mill for carding wool, a corn-mill, a very large malt-barn and mill, and an extensive distillery, are all constructed in a style not much inferior to the best buildings of their class in Scotland. An old castle, now in ruins on the beach, was occupied, during the civil war, by a small garrison in the pay of Cromwell; and is traditionally said to have been the scene of their indiscriminate massacre in one night by Macleod, the then proprietor of the island. A lighthouse, erected in 1833, on Arnish-point, at the south side of the entrance of Loch-Stornoway, proved to have some serious defect in situation, has never been lighted, and serves only as a conspicuous landmark. An unsuccessful attempt was not long ago made to introduce to the town the manufacture of straw-plait. The only existing manufactories, additional to the mills mentioned, are two ropeworks. The grand trade of the place consists in the exchange of the produce of the fisheries, and the kelp shores, for British manufactured goods and foreign produce. The fishing-boats registered in the district of the port amount to about 1,500. The vessels belonging to the port range in size from 15 to about 150 tons, and are about 70 in number. A weekly packet plies between Stornoway and Poll-Ewe; and a steam-vessel makes occasional trips in summer between Stornoway and Glasgow. The port has a custom-house, with a collector, a comptroller, and a tide-waiter. On an enclosed moor near the town is held a cattle-market on the second Wednesday and Thursday of July. The town has a branch office of the National bank of Scotland; two friendly societies; four inns, and so many as about a score of dram-shops.—Stornoway was erected into a burgh-of-barony by James VI.; and, in 1825, its feuars and burgesses obtained by charter from the superior the right of electing for its government 2 bailies and 6 councillors. The magistrates share their jurisdiction cumulatively with the baron-bailie of Lewis; but practically they exercise no jurisdiction whatever in criminal cases, and jurisdiction of any sort chiefly in small cases of actions for debt. The annual burgh revenue is £17 3s.; and the expenditure £15 17s. 6d. A person, before he can settle as a trader or manufacturer, must become a burgess, and pay a fee of £1 13s. 4d. The town is the residence of the sheriff-substitute for the district of Lewis; and the seat of sheriff, commissary, justice-of-peace, and excise courts. Population, in 1808, 2,305; in 1833, about 3,500. Houses, in 1833, of the yearly value of £10 and upwards, about 142.

**STOTFIELD**, a small port in the shire of Elgin and parish of Drainy;  $7\frac{1}{2}$  miles north of Elgin. In the Coulard-bill, which here projects into the Moray firth, there are appearances of lead. Mr. Stephenson has recommended a lighthouse to be built on Stotfield-point, with minor auxiliaries at Cromarty-cliff and Chanonyr-point.

**STOURHOLM**, an island in Shetland, about 3 miles in circumference, situated about 2 miles south-east of the north-eastern extremity of Mainland, and

about the same distance south-west of the nearest point of Yell.

**STOW**, a parish partly in Selkirkshire, but chiefly occupying the extremity of the long south-eastern wing or projection of Edinburghshire. It is bounded on the north-west by Heriot; on the north by Fala; on the north-east by Soutra and Channelkirk; on the east by Channelkirk, Lauder, and Melrose; on the south-east by Melrose; on the south-west by Galashiels, Selkirk, and Yarrow; and on the west by Innerleithen. While itself lying in two counties, it is thus, over a large extent of its boundary, in contact with three others. A detached pendicle of it, considerably less than a mile square, lies a mile north of the most northerly part of the main body; and is bounded on the south and west by Heriot. The section of the main body which lies within Selkirkshire measures  $6\frac{1}{2}$  miles in extreme length, and about 2 in mean breadth. The length of the whole parish, from the farm of Nettleflat, or the detached portion, on the north, to Caddonlee on the banks of the Tweed on the south, is 15 miles, but measured along the road is 18 miles; its mean breadth is nearly 4 miles; and its superficial extent is within a fraction of 60 square miles. Its Selkirkshire section consists solely of the vale and hill streams of Caddon-water. Its frontier for 2 miles on the south-west is part of the district of Tweedside, and is washed along the margin by the Tweed. Its Edinburghshire or principal section consists of the whole of the narrow vale of the Luggate, the greater part of the deep, winding, beautiful vale of the Gala, and a small part of the vale of the Arnot, with their crowded hill-screens, rising rapidly up into elevated water-sheds, and laterally furrowed into dells and gorges which bring down little tributaries to the principal streams. Excepting narrow belts along the margins chiefly of the Gala, the Tweed, and the lower Luggate and Caddon, exceedingly little of the area is arable; nor are the tracts extensive which are warmed and beautified with wood. The parish is naturally but finely pastoral. Though heath and bent and coarse grass prevail on the higher grounds, a short green sward generally carpets the approaches to the streams, and a rich and delicate grass, interspersed with a variety of flowers and herbs, flings wealth and verdure down the hilly banks of even the tiniest rills. The whole parish anciently bore the name of Wedale, 'the vale of woe,' and belonged to the bishops of St. Andrews. A residence of the bishops on the site of the village originated the name of Stow; and, under the name of the Stow of Wedale, was the place whence they dated many of their charters. An extensive forest anciently existed in a district partly within Wedale and partly within Lauderdale, and was common to the inhabitants of Wedale on the west, the monks of Melrose on the south, and the Earls of Dunbar and the Morvilles on the east. Wedale early possessed the privilege of sanctuary in the same manner as Tynninghame; and 'the black priest of Wedale' was one of the three persons who enjoyed the privileged law of the clan Macduff. Stow is literally the Anglo-Saxon name for a choice place, a select station, and is the well-known designation of several localities in England. John Harding, when instructing the English king how to ruin Scotland, advises him,

"To send an hoste of footmen in,  
At Lammese next, through all Lauderdale,  
And Lamermore woods, and mossis over-riu,  
And eke therewith the Stow of Wedale."

The village of Stow stands on the left bank of Gala-water,  $24\frac{1}{2}$  miles south of Edinburgh, and 7 north of Galashiels. It is ancient, sequestered, and irregular;

hut, owing to its lying dispersedly over a diversified surface at the opening of a wooded gorge between the hills, and about the middle of the interior side of a long semicircular sweep of the Gala and its vale, it is not without features of attractiveness and interest. Its population, in 1836, was about 330. There are five hamlets. A little south of Stow is the mansion of Torsonce, Pringle, Esq.; and immediately north of the village is Torsonce inn, a principal stage on the Edinburgh and Carlisle road. The post-road, from Edinburgh to the central Border districts and to the west of England, passes down the vale of the Gala and through the village of Stow; a branch-road runs up Arnot-water; and roads go along the Cad-don and the Tweed. Population, in 1801, 1,876; in 1831, 1,771. Houses 284. Assessed property, in 1815, £10,787.—Stow is in the presbytery of Lauder, and synod of Merc and Teviotdale. Patron, the Crown. Stipend £256 9s. 1d.; glebe £27 10s. Unappropriated tithes £82 5s. 7d. The church was built before the Reformation, and was repaired and enlarged in 1819. Sittings about 600. A United Secession congregation was established in the village prior to 1743. Their present place of worship was built in 1821, at a cost of £500. Sittings 430. Stipend £112, with £8 15s. for sacramental expenses and house-taxes, and a house valued in toto at £500, and a garden worth, per annum, £2. In 1834 the parish-school was attended by 83 scholars; and three non-parochial schools by 168. Schoolmaster's salary not known. The church was, in ancient times, of great value; and, during the ages which preceded the Reformation, it was possessed by the bishops of St. Andrews as a mensal church, and served by a vicar.

**STRACHAN**—formerly **STRATHAEN**—a parish in the western part of Kincardineshire; bounded on the north-west by Aberdeenshire; on the north and north-east by Banchory-Ternan; on the east by Durris and Glenhervie; on the south-east by Fordoun; on the south by Fettercairn; on the south-west by Forfarshire; and on the west by Forfarshire and Aberdeenshire. Its greatest length, from north-north-east to south-south-west, is 13 miles; its breadth, in the northern or arable district, nowhere exceeds  $3\frac{1}{2}$  miles, hut, in the pastoral district, extends to a maximum of 9 miles; and its area is 40,230 English acres. On the most westerly part of the western boundary soars Mount Battock, to an altitude of 3,450 feet above sea-level. Two broad ranges of heights, forming over all the south and centre of the parish a sea of wild uplands, slightly diverge at Mount Battock from the great central mountain-range of Scotland, and bear away in the direction respectively of Stonehaven and Girdleness. Their chief summits, Klochnahane and Kerloak, have elevations respectively of 2,370 and 1,890 feet. The arable land lies all in the north, and is tolerably fertile, hut comprehends not much more than 3,000 acres. The river Dee traces the northern boundary. The Dye, with its little affluents, drains nearly all the uplands, and, proceeding northward, receives the Feugh from the west, a little beyond the frontier of the cultivated country; and thence it proceeds north-eastward to seek the Dee in Banchory-Ternan. A hilly ridge divides the joint vale of it and the Feugh from that of the Dee. Blackhall, a pleasant modern mansion, stands near the Dee, and is embosomed in extensive woods. The parish is traversed northward by the road from Brechin to Inverness. Population, in 1801, 730; in 1831, 1,039. Houses 212. Assessed property, in 1815, £2,029.—Strachan is in the presbytery of Kincardine-O'Neil, and synod of Aberdeen. Patron, Sir James Carnegie, Bart. Stipend £153 6s. 5d.; glebe £7 10s. Schoolmaster's

salary £29 18s. 9 $\frac{3}{4}$ d., with £15 fees. Two private schools are kept during winter.

**STRACHUR AND STRALACHLANE**, an united parish along the western border of Cowal, Argyleshire. It is bounded on the west, north-west, and north by Loch-Fyne, which separates it from Glassrie and Inverary; on the north-east and east by Lochgoilhead and Kilmorick; and on the south and south-west by Kilmun, Dunoon, and Kilmodan. Its greatest length north-eastward, along Loch-Fyne, is 18 miles; its breadth, over 8 miles from the north-east end, is 6 miles, and, over the remaining 10, only 3; and its area is about 39,000 Scottish acres. Loch-Eck touches the parish for 3 miles on the east. The rivulet Cur, which has a course of about 7 miles to the head of that lake, drains most of the northern district, is subject to frequent and disastrous freshets, and annually carries away several acres of excellent soil. The low grounds and the hills bear the proportion to each other of 1 to 22. The low grounds are disposed in narrow helts along Lochs Fyne and Eck, and some of the larger streamlets. The hills afford excellent pasture for sheep and black cattle; and, though naturally heathy, have become comparatively verdant since the general introduction of sheep stock. The soil of the arable lands, in a few spots on the banks of the Cur, is a rich mixture of loam and clay; hut elsewhere it is, in general, sharp and thin. Coppices of oak, ash, birch, alder, elm, hazel, and mountain-ash, are cleared every 20 years, and are so extensive that one clearing of the whole would be worth £6,000 or £7,000. Of several curious caves which perforate the hills, one is remarkable for the length of time during which a stone thrown into it continues to roll down, with a noise as if it were rolling over sheets of copper; and another has alternations, so far as it has been explored, of corridors and apartments, each of the former wide enough to admit four men a-breast, and each of the latter capacious enough for fifty men to stand at arms. Two or three standing-stones and natural cones on the hills figure conspicuously in the landscape, and are associated in local legend with grotesquely absurd incidents of superstition. Castle-Lachlane, near the site of an old cognominal building at the side of Loch-Fyne, is an elegant building; and Strachur-house, also on Loch-Fyne, hut 8 miles farther north-east, is a handsome modern mansion. One road runs along Loch-Fyne; another comes in on the south-west from opposite Bute; and another runs across from Loch-Eck to connect Holly-loch on the Clyde, with a ferry at Strachur to Inverary. Population, in 1801, 1,079; in 1831, 1,083. Houses 118. Assessed property, in 1815, £4,176.—This parish is in the presbytery of Dunoon, and synod of Argyle. Patrons, Callander of Ardinglass and MacLachlans of MacLachlane. Stipend £170 4s. 6d.; glebe £7. There are two parish-churches, 6 miles asunder, and both built upwards of 55 years ago. Sittings, in that of Strachur, 400; in that of Stralachlane, 200. An assistant minister is maintained on a subscription salary of £60. There are two Sabbath schools, one parish-school, and five small private daily schools. Parochial schoolmaster's salary £26 13s. 8d., with £8 fees, and £2 8s. other emoluments. The parishes were united in 1650. Strachur lies on the north-east, and Stralachlane on the south-west.

**STRAITON**, a parish in the extreme east of the district of Carrick, Ayrshire. It is bounded on the north-west by Kirkmichael; on the north by Dalrymple; on the north-east by Dalmellington; on the east by Dalmellington and Kirkcudbrightshire; on the south by Kirkcudbrightshire; on the south-west by Barr; and on the west by Dailly and Kirkmichael. Its greatest length, from north to south, is

20 miles; its greatest breadth is 8 miles; and its superficial extent is 82 square miles. The chief head-stream, the lake, and the river of Doon, successively trace the boundary over all the east, the north-east, and the north: See Doon. No fewer than 22 lakes and lochlets occur in the interior. The largest are Lochs Dercleuch, Finlas, Braden, and Lochriccar. The first and the second of these constitute properly one lake, and are jointly  $2\frac{1}{2}$  miles in length; and both they and the third are the scenes of boating excursions for the purposes of angling. Girvan-water drains most of the interior; it forms 3 miles above the village of Straiton a series of immediately consecutive cascades of aggregately more than 60 feet in depth of fall; it rushes away from them into a deep and wooded glen; and thence to the village it flows through a richly cultivated valley, overhung by heights, some of which are bold and precipitous, and others feathered at intervals with natural wood. The Stinchar flows for some distance on the boundary with Barr. Very numerous rills and streamlets trot and leap and tumble along to the principal streams; one of them, a tributary of the Doon, making near Berbeth a sheer fall of 40 feet. The valleys of the Girvan and the Doon, and the gentler acclivities of their hill-screens, are under the plough, and tufted or frilled with wood; and they offer to the eye some fine landscapes. The rest of the parish is all upland and pastoral; and the greater part of it, from the southern and eastern boundaries inward, is a wilderness of heights, not mountainous, but never low and prevailingly bleak, inhospitable, and rocky. Two hills in the vicinity of the village rise above sea-level respectively 1,300 and 1,150 feet; and, as well other heights, command brilliant views of Ayrshire, the frith of Clyde, Arran, Jura, and the Irish coast. The extent of uncultivated land is about 11 times that which owns the dominion of the plough. This parish, like the adjoining one of Dalmellington, is redolent with reminiscences of the Covenanters; and lifts the appealing cry of solitude and ensanguined soil against the murderous oppressors who persecuted confessors to the death. Of four persons who were martyred about one period, one is commemorated by a tombstone in the churchyard. A garrison was stationed during the persecution, in the old castle of Blairquhan now erased. Though some cairns and other kindred objects occur, the chief antiquities are those noticed in our article on Loch-Doon. Blairquhan-castle, built in 1824, situated on the Girvan about a mile below Straiton village, surrounded with a highly embellished demesne, and exhibiting, in its architecture, is a splendid and exact specimen of the style which prevailed immediately before the Reformation. Berbeth is a plain mansion, but beautifully situated on the Doon, and amid fine pleasure-grounds. A shooting-hox of the Marquis of Ailsa overlooks the Stinchar, amid precipitous cliffs and towering hills, and commands a region where the eagle still builds his eyry, and where game of most sorts is profusely abundant.—The village of Straiton stands in the western district, 4 miles south-south-east of Kirkmichael,  $6\frac{1}{2}$  south-east of Maybole,  $6\frac{3}{4}$  south-west of Dalmellington, and  $14\frac{1}{2}$  south-south-east of Ayr. It occupies a rising ground between two hills on the banks of the Girvan; and, uniform in its plan, skirted with wood, and overhung by green declivities, it is one of the most beautiful of Highland villages. A few of its inhabitants—who altogether amounted, in 1836, to upwards of 330—are employed in weaving cotton fabrics and tartan worsted cloth for the manufacturers of Glasgow. In 1695, the Earl of Cassilis obtained an act of parliament for holding a weekly market, and two

annual fairs, at “the kirktooun of Straitoun.” The only other village is PATNA: which see. The parish is traversed, and the village of Straiton intersected, by the road westward from New Cumnock to Girvan, and the new road southward from Ayr to Kirkcudbright. Population, in 1801, 1,026; in 1831, 1,377. Houses 235. Assessed property, in 1815, £6,221.—Straiton is in the presbytery of Ayr, and synod of Glasgow and Ayr. Patron, the Crown. Stipend £135 1s. 11d.; glebe £16. Unappropriated teinds £255 14s. 4d. One part of the church is very ancient; and even the more modern part is of uncertain date, but was altered and improved 40 years ago. Sittings 444. An ecclesiastical survey, made in March 1836, exhibited the population as then consisting of 1,383 churchmen and 34 dissenters,—in all, 1,417 persons. Part of the parish, provided with a church of the Establishment and a United Secession meeting-house, belongs to the *quoad sacra* parish of Patna. There are two parochial schools, situated respectively at Straiton and at Patna; and two non-parochial schools. Salary of the Straiton schoolmaster, £31 10s., with £31 fees, and £3 other emoluments; of the Patna schoolmaster, £11, with £25 fees. The church belonged successively to the monks of Paisley, the monks of Crossraguel, and the royal chapel of Stirling.

STRALOECH. See NEW MACHAR.

STRANRAER, a hurghal or town parish at the head of Loch-Ryan in Wigtonshire. It is co-extensive, not with the town or with the parliamentary burgh of Stranraer, but with the royal burgh; it comprehends about 40 acres; and it is bounded on the north by Loch-Ryan; on the east and south by Inch; and on the west by Leswalt. The parish was erected, in 1617, contemporaneously with the erection of the royal burgh; and was formed out of little portions of Sauleseat or Inch, and Leswalt. Though most is held in hurgage, part belongs to the Earl of Stair, and is either subfeued by Vans Agnew of Sheuchan, or let in leases of 99 and 999 years. Stranraer is the seat of a presbytery in the synod of Galloway. Patron, the Crown. In 1833, the parish-church, which had about 700 sittings, was condemned by the presbytery as ruinous and irreparable; and was thenceforth abandoned. An assessment for a new erection was resisted on the ground of informality, and led to a litigation before the Court-of-session. The congregation met for a year in a dissenting meeting-house, and for two summers in the open air; and, in 1834, were provided by the minister, at his own expense or risk, with a temporary wooden-building, having about 600 sittings. A new parish-church has since been built; and an extension church has also been built at Hillhead, within about 500 yards of the parish-church. Stipend £158 6s. 8d., with £30 for a house, and a glebe of 30 acres in Leswalt, mortified by a former minister, and estimated, in 1821, at £56 a-year. There are 5 dissenting places of worship. The meeting-house of the first United Secession congregation, who were established prior to 1759, was built about 1774, and was enlarged by the erection of a gallery in 1800. Sittings 535. Stipend £120 4s., with a manse and a garden, the former worth £16 a-year.—The meeting-house of the second United Secession congregation was built about 45 years ago, and cost between £500 and £600. Sittings 482. Stipend £126, with £12 for sacramental expenses.—The meeting-house of the Reformed Presbyterian congregation, who were established in 1797, was built in 1824; and, besides the value of its predecessor, which was given over to the contractor, cost upwards of £590. Sittings 752. Stipend £110, with a house and garden worth £20.—The meeting-house of the Relief con-

gregation, who were established in 1818, was built in 1821, and cost £800. Sittings 650. Stipend £140.—The Roman Catholic chapel is one of several, situated in different towns, in which one functionary officiates in rotation.—The parochial school was attended, in 1834, by 109 scholars; and affords instruction in Latin, Greek, French, English writing, arithmetic, and practical mathematics. Schoolmaster's salary £20, with £45 fees. There are 6 non-parochial schools, 3 of them for males, and 3 for females.—The celebrated Rev. John Livingstone was minister of Stranraer during the 10 years which terminated in 1648. Population of the parish, in 1801, 1,722; in 1831, 3,329; in 1841, 4,889. Houses, in 1831, 489. Assessed property, in 1815, £1,413.

STRANRAER, a considerable town, a royal burgh, and the capital of the west of Wigtonshire, is situated at the head of Loch-Ryan,  $6\frac{1}{2}$  miles north-east of Portpatrick,  $9\frac{3}{4}$  west north-west of Glenluce, 50 south of Ayr, and  $68\frac{3}{4}$  west-south-west of Dumfries. One street, which runs with a curvature for 3 furlongs along the margin of Loch-Ryan; another of about equal length, but which commences farther east, and, though on the whole parallel to the former, makes several decided bends from the straight line; and a third of  $3\frac{1}{2}$  furlongs in length, which, while somewhat parallel to the others, begins at a point opposite the east end of the first and nearly the middle of the second;—these, with 7 cross streets, each from 100 to 200 yards in length, which connect them, and with some clustered rows of houses a little inland, constitute the body of both the burgh and its suburbs. The town is divided nearly through the middle by a streamlet, over which are thrown several stone-bridges. Though whole streets of new houses were built toward the end of last century, and though the edifices were in many instances finished in a style which would have done credit to some of the richer and more populous towns of the kingdom, the street arrangement was inconsiderately allowed to take whatever form might be given it by caprice or accident, and the proportion and grouping of the buildings were not, in any instance, made an object of consideration. Stranraer, with a continuance of the same oversight, has, in consequence, come to be a town of good houses, built of fine material, and individually of, for the most part, pleasing exterior, yet whose aggregate or general appearance is tasteless and uninviting. Its site, too, has such inequalities of surface as are quite unfavourable for scenic effect, and even disadvantageous for prosaic utility. An old edifice, originally a castle, and the residence of Kennedy of Chapel, stands in the centre of the town, is built of whinstone, with corners and lintels of sandstone, and is of considerable height and strength of wall. The town-house, situated in George-street, and built about 70 years ago, is a neat structure. In the neighbourhood are several seats, particularly Castle-Kennedy and Culhorn, rich in both natural and artificial charms. The salubrioness of the town, and its capacity of uniting the facilities of a market with many of the advantages of rustication, have rendered it the adopted home of a considerable number of respectable annuitants. The town and the parliamentary boundaries, though not the royal burgh, include the villages of Tradeson in Inch and Clayhole, and Hillhead in Lewsat. These are separated from the burghal district only by an imaginary line; and jointly contain about 1,000 inhabitants. The town has recently been lighted with gas.

Manufactures, owing to the high price of fuel, will probably never obtain here any considerable footing. In 1833, 105 plain looms, and 9 factory-looms were employed on fabrics for the Glasgow

manufacturers, but with such low wages as were half-starving to the weavers. Some tan-yards and nail-making establishments exist in the town; and several extensive nurseries are maintained in the vicinity. The fishing conducted in the loch is chiefly for white fish and oysters. The commerce of the town is considerably steady and prosperous. A harbour, consisting of a long, good pier, of modern erection, has proved a great convenience to shipping; and, when completed by a structure which is designed to form another side, may be expected to occasion an extension of trade. At high spring-tides the water rises at the town 10 feet; and, at ebb, it retires along a gently declining, smooth, sandy beach, to about one-fourth of a mile's distance. Vessels of 60, or even of 100 tons, can come up close to the houses; and ships of 300 tons can come to what is called the Road, about half-a-mile from the town. The anchorage in the vicinity of the pier is everywhere good and safe, and can be endangered only by a strong north or north-west wind, accompanied with a high tide. In 1764, only two vessels belonged to the town, each of 30 or 35 tons. In 1792 they had increased to an aggregate tonnage of about 1,200 tons; and, in 1835, they were 37 in number, and carried 1,789 tons. But a vast increase of the trade was made at the accession of steam-vessels. Two steamers maintain weekly communication with Glasgow, and one sails weekly to Belfast and Whitehaven. Among the exports are cheese, grain, and other farm-produce; cattle, leather, and a considerable quantity of shoes.—The town has a custom-house establishment; two principal inns,—the George and the King's-arms; branch-offices of the British Linen company's bank, the Southern bank of Scotland, and the Glasgow Union bank; a reading-room; a library-society, instituted in 1771; a theological library; a mechanics' institute; a weekly newspaper,—'The Galloway Register and Stranraer Advertiser'; a Stranraer and Rhinns of Galloway agricultural society, established in 1834; a bible society, 1819; and a Sabbath-school society, 1821. The mail-coaches between Portpatrick and Glasgow, and between Portpatrick and Carlisle, daily pass through the town.

Stranraer, though a town of considerable antiquity, figured only as a burgh-of-barony so late as the reign of James, did not receive its charter of erection into a royal burgh till the year 1617, and was not enrolled among the royal burghs till the latter end of the reign of Charles II. Its charter allotted to it the whole royalty which it at present possesses, and conferred upon it the extensive right of harbourage within all the creeks and landing-places of the noble inlet of the sea at the head of which it stands. The sett includes a provost, 2 bailies, a dean-of-guild, a treasurer, and 13 councillors, and requires one-third of them annually to retire. The finances of the burgh are in a very embarrassed state; its heritable property is of little productive value; and it has few resources of revenue. On an average of five years, from 1827 to 1831 inclusive, the annual income was only £149 1s., while the expenditure was £197 6s., thus leaving a deficiency of £48 5s., which was met by a voluntary assessment under the denomination of stent or trade money. In 1833, the revenue was £225 8s., and it has since remained as high or increasing; the expenditure, in the mean time, being less. But the burgh, without funds to pay the principal or even the interest, has to struggle with a debt which, in 1833, amounted to nearly £6,000, by far the greater part of which was incurred in constructing the harbour, under a want of parliamentary sanction to exact from vessels a compensating addition of dues.

There are no incorporated trades; and the entrance-money for burgh-ship varies, at the discretion of the magistrates, from 3 to 10 guineas. No local taxations are authorized by either charter or statute. In 1840 the town was, for the first time, lighted with gas; and previously, it was destitute both of lighting and of a public supply of water. The jail is incommodious and insecure. The magistrates have no patronage except the appointment of the parish-schoolmaster, and the town-officers. Both a bailie and a dean-of-guild court are held; and they jointly tried, during the 10 years which terminated in 1833, 774 civil cases; and the former tried, during the same period, only 11 criminal cases. A sheriff circuit small debt court is held 6 times a-year; and a justice-of-peace small debt court is held on the first Monday of every month. A weekly market is held on Friday; and annual fairs are held for horses on the Thursday before the New year's Ayr fair; on the Friday before Whitsunday; on the last Friday of July at Sandmill; on the 3d and last Fridays of September at Sandmill; for horses on the Thursday before Michaelmas Ayr fair; and on the last Friday of November at Sandmill. Stranraer unites with Wigton, Whithorn, and New Galloway, in sending a member to parliament. Constituency, in 1839, 220; in 1841, 205.

**STRATH**—properly **STRATH-SWORDLE**—an Hebridean parish, in Skye, Inverness-shire. It is bounded on the north by Portree; on the east by the sound which washes the continental district of Applecross, and by the entrances to Lochs Carron and Aish; on the south by Sleat; and on the west by the ocean and by Bracadale. Its length, from west-north-west to east-south-east, is 28 miles; its breadth is 7 miles; and its area is 54,768 acres. It includes the islands of **SCALPA**, **PABBA**, and **LONGA**: which see. The northern district comprehends most of the sublime scenery of **CONRISKIN**, **SCAVAIG**, and **SLIG-CHAN**, and also the magnificent spar-cave of **STRATH-AIRD**: see these articles. All the parish, excepting about 2,100 acres of arable grounds, and 600 acres of woodlands, is upland waste or pasture. The flat or low grounds lie chiefly in the centre. The hills in the north are conical, peaked, soaring, and naked; and those in the other districts are prevailingly heath. Where limestone abounds, the pasture is rich and luxuriant; but where the primitive rocks occur, they are of a kind to yield little soil, and maintain a scanty and inferior herbage. The soil of the arable grounds is partly clay, partly a black loam, and partly reclaimed moss. Sandstone, chiefly of a light blue colour, is quarried for building; and limestone is worked, both as a manure and as a coarse yet ornamental marble. Deep bays and sea-lochs numerous indent the coast, and afford safe and commodious anchorage for vessels of any burden. Of these, the chief, on the east, are Loch-Ainort, Broadford-hay, and Loch-na-Beste; and, on the west, are Lochs Eysort, Slappin, and Scavaig. The herring-fishery, in these bays, formerly employed 60 or 70 vessels of aggregately about 2,400 tons burden; but has so seriously declined as to have become all but a total failure. The cod and ling fishing is carried on during the first third of the year, and continues to be productive. The salmon-fishing is not extensive. A bank of small but excellent oysters lies between the coast and Scalpa. Ruins exist, respectively at Aisk, Kilbride, and Kilmorie, of 3 ancient chapels. Ruins of 7 circular towers, each in sight of the next, and all surmounting rocks, stand in the west; and from the southernmost commences a series in Sleat; and, from these, a series on the opposite shore of Arisaig. A number of tumuli in the east are traditionally said to mark the scene of a conflict with the

Danes. A cave in the north is an object of interest to the curious for having, during several nights, in 1746, afforded shelter to Prince Charles Edward. A rocking-stone, consisting of a prodigious block of granite, and moveable by a single finger, stands on the glebe. Two pleasant modern hamlets, each with an inn, stand at Broadford and Kyleakin. Annual fairs for horses and hlaek cattle are held at Broadford on the Thursday after the last Tuesday of May and July. Within the parish are parliamentary and statute-labour roads, to the extent respectively of 30 and 10 miles. Steam-boats from the Clyde touch weekly in summer, and fortnightly in winter. Population, in 1801, 1,748; in 1831, 2,962. Houses 555. Assessed property, in 1815, £809. — Strath is in the presbytery of Skye, and synod of Glenelg. Patron, the Crown. Stipend £271 2s. 6d.; glebe £20. The parish-church is of unascertained date of erection, and was re-seated about 47 years ago. Sittings about 300. At a preaching-station in Strath-aird, where a cave serves for a pulpit, and the open ground without as a church, the minister officiates every third Sabbath, when weather permits. A Baptist congregation was established in the parish about the year 1824; but the minister officiates only in farm-houses or the open air. Stipend £45, paid by the Baptist Home Missionary society. A catechist makes three circuits of a month each in the year, and annually receives £4 from the kirk-session. In 1834, the parish-school was attended by 138 scholars; and 6 schools, maintained by public societies or subscription, were attended by 158. Parochial schoolmaster's salary £30, with from £6 to £10 fees, and £2 other emoluments.

**STRATHAEN**. See **STRACHAN**.

**STRATHAIRD**, the northern district of the parish of Strath, in the island of Skye. The name properly belongs to a sublime alpine promontory which projects between Lochs Slappin and Scavaig, and is par excellence the 'aird' of 'Strath.' But the Strathaird estate—now the property of Macalister of Loup in Argyshire—comprehends about 16,000 acres. Of the magnificent natural objects which enrich it, and which are indicated in the article on Strath, not the least attractive is Strath-aird cave. This splendid curiosity occurs on the north side of Loch-Slappin, at the head of a long, straight, deep, narrow cut which the sea has made in the face of a lofty and vertical range of cliffs. Its entrance looks like an ordinary fissure; yet conduits to scenes which mock the most elaborate efforts of the arts. "The first entrance to this celebrated cave," says Sir Walter Scott, in a note of his *Lord of the Isles*, "is rude and unpromising; but the light of the torches with which we were provided was soon reflected from the roof, floor, and walls, which seem as if they were sheeted with marble, partly smooth, partly rough, seeming to be wrought into statuary. The floor forms a steep and difficult ascent, and might be fancifully compared to a sheet of water which, while it rushed whitening and foaming down a declivity, had been suddenly arrested by the spell of an enchanter. Upon attaining the summit of the ascent, the cave opens into a splendid gallery, adorned with the most dazzling crystallizations, and finally descends with rapidity to the brink of a pool of the most limpid water, about four or five yards broad. This pool, surrounded by the most fanciful mouldings in a substance resembling white marble, and distinguished by the depth and purity of its waters, might have been the bathing-grotto of a Naiad." "On the inner side of this well," says another writer, "the rock has assumed a fanciful and gigantic resemblance to a human figure, which, in its robes of pure white,

looks like the watchful but motionless guardian giant of this beautiful sparry grotto." Serious depredations have been made on the exquisite stalactitic formations by that class of virtuosos who appear to be a sort of large-sized mischievous school-boys, and who would no doubt delight to pocket the nose of the Venus de Medici; but they have prompted the proprietor to protect the cave by a gate and padlock, and are in the course of being repaired by the silent and wondrous chemistry of Nature.

**STRATHAIRDLE**, or **STRATHARDLE**, a long, bold, Highland glen in Perthshire, watered by the **AIRDLE**: which see. It extends from Tulloch in Moulin  $10\frac{1}{2}$  miles south-south-eastward to the confluence of the Airdle and the Shee; and comprehends a small part of Moulin and Kinloch parishes, and large parts of Kirkmichael and Blairgowrie. Its mean breadth, measured between the summit-lines or water-sheds of its hill-screens, is nearly 5 miles, but, measured between the bases of its declivities, is very inconsiderable.

**STRATHALLAN**, the beautiful and fertile valley in Perthshire which is watered by the **ALLAN**: which see. It consists chiefly of the main parts of Blackford and Dunblane parishes, and the minor part of Logie. The district gives the title of Viscount to a branch of the noble family of Drummond, created Lord Madderty in 1609, and Viscount Strathallan in 1686. The titles were attained in 1746, and restored in 1824. The seat of the Viscounts is Strathallan-castle.

**STRATHAVEN**, a narrow Highland valley in the south-west of Banffshire. It commences among the Cairngorm alps; extends northward through the parishes of **KIRKMICHAEL** and **INVERAVEN**; and is traversed from head to foot by the river **AVEN**. See these articles.

**STRATHAVEN**, a considerable town in the parish of Avondale, Lanarkshire. It was erected into a burgh-of-barony in 1450, and had an extensive commonalty granted to the burgesses, all of which has long ago become private property. It has a weekly market on Thursdays, and five annual fairs; but, having no public funds, has no other magistracy than a baron-hallie, nominated by the Duke of Hamilton. Strathaven lies  $7\frac{3}{4}$  miles south of Hamilton; 16 south-east of Glasgow; 13 $\frac{1}{2}$  north of Muirkirk; and 13 $\frac{1}{2}$  north-east of Newmills. Population nearly 4,000, who are chiefly supported by weaving. The ecclesiastical statistics have been given under the head **AVONDALE**.

**STRATHBEG (Loch)**, a lake on the boundary between Lonmay and Crimond, and  $1\frac{1}{2}$  mile west of Rattray Head, near the north-east extremity of Aberdeenshire. It extends parallel with the coast; measures  $2\frac{1}{2}$  miles in length, and 550 acres in area; and is separated from the sea by a ridge of sand-hills, about half-a-mile broad. It formerly had a tidal communication with the ocean, and was navigable by small sea-horne vessels; but about the year 1720, a strong east wind blew a mass of sand into the channel, and stopped the communication.

**STRATHBLANE**, a parish in Stirlingshire; bounded on the west and north by Killearn; on the east by Campsie; on the south by Baldernock and the Stirlingshire part of New Kilpatrick; and on the south-west by the Dumbartonshire part of New Kilpatrick. Its form is oblong, stretching north and south, and measuring 5 miles by 4. The parish has its name from the river Blane, and comprehends the upper and larger half of the beautiful valley which that stream traverses, and of the valley's picturesque hill-screens. Strathblane, in a large sense, or one which includes the whole basin of the Blane, is a depression or cut across the breadth of the Len-

nox-hills, separating the Campsie, or rather the strictly Lennox range, from the range which, running along the two Kilpatricks, bears their name. A swell or low broad-based ridge across the head or south end of the strath serves slenderly to connect the two great hilly detachments, and at the same time forms a water-shed between the feeders of the Blane and those of the Allanton, and constitutes the boundary between Strathblane and Baldernock. The parish consists of the valley and its screens,—the latter boldly hilly on the east, and comparatively soft and gentle on the west. The valley widens, and the heights recede as the river advances to the north. The loftiest hill in the parish is Earl's-seat at the north-east extremity, which towers above the rest of the range, and has a conical top. The Blane has here its source; and running south-south-westward hence for 3 miles, is precipitated over several very high and picturesque falls, and then bends suddenly round, and flows toward the north-west: see **BLANE**. Six lakes or lochlets, the largest of them not more than 4 furlongs in length, and 2 in breadth, are situated in the gentle uplands in the extreme south, and, with the aid of wood, render a naturally bleak and dull moor part of a cheerful and fine landscape. The lochlets are frequented by numerous aquatic fowls, and, as well as the Blane, furnish ample sport to the angler. A basaltic colonnade, of about a furlong in extent, stretches along the precipitous face of part of the eastern screen of the valley. The columns are quadrangular, pentagonal, and hexagonal; they measure 30 feet in height, and from 2 to 3 in diameter; and they rise with a little inclination from the perpendicular, and, in some instances, are apparently bent into the segment of a curved line. A tourist entering the parish from the south, supposes, for a brief distance, that he has exchanged a region of fertile fields for one of dull moor; but he speedily passes among cultivated grounds, smiling lochlets, and pleasant woods; and, descending into the valley, he is charmed with a general joyousness and luxuriance,—he sees the hills gemmed along their base with neat villas, and occasionally streaked upon their sides with a carcering cascade,—he marks how hanging expanses of wood grandly terminate in bold declivities, or abrupt precipices of rock,—he sees before him the insulated hill of Dumgoiac in the north-west, lifting up from the plain a huge cone feathered all over with forest,—and between this and a shoulder of the eastern hills which projects at the place like the pedestal of an arch, he looks away as through a vast vista, along the rich and beautiful plains beyond, till the view is pent up, at 14 miles distance, by the Lomond mountains. Duntreath-castle, the property of Sir Archibald Edmonstone, Bart., is of high but unknown antiquity, and seems to have been a place of considerable strength. Mugdock-castle, now a ruin, and also of unascertained antiquity, is strengthened on two sides by a lake, the waters of which were anciently drawn along the other sides in ditches, and it must have been inaccessible to any force which could be brought against it in the old times of rude warfare: its square tower, of peculiar construction, is still nearly entire. Three hundred yards distant from the tower is an echo which repeats, in exact tone and accent, any word or phrase of six syllables, and reverberates even a whisper. Mary, Countess of Angus, daughter of Robert III., and wife of Sir William Edmonstone, lies interred in the parish-church. The village of Strathblane stands on the left bank of the Blane, 3 miles north of Milngavie,  $3\frac{1}{2}$  west of Campsie, and 4 south-east of Killearn. Some of its inhabitants are weavers in the employment of the Glasgow manu-

facturers. Bleaching has long been extensively conducted in its vicinity, and is aided by great softness, purity, and abundance of water from the Blane, and some rills. There is also a printfield. Population of the parish, in 1801, 784; in 1831, 1,033. Houses 115. Assessed property, in 1815, £4,899. Strathblane is in the presbytery of Dumbarton, and synod of Glasgow and Ayr. Patron, the Duke of Montrose. Stipend £231 16s. 5d.; glebe £12 10s. In 1834, the parish-school was attended by 35 scholars; and there were 3 private schools, conducted by 4 teachers. Schoolmaster's salary £34 4s. 4½d., with £15 fees. In 1450, the church, along with those of Fintry and Bonhill, was given by the Duchess of Albany to the collegiate church of Dumbach.

**STRATHBOGIE**, a district in Aberdeenshire. Geographically, it consists simply of the small vale of the river Bogie, extending near the western frontier of the county from the centre of Auchindoir to the town of Huntly [see **AUCHINDOIR**]; but, politically, it constitutes one of the five divisions of Aberdeenshire, anciently called lordships or thanages, consists of the whole original estate conferred by King Robert Bruce on the noble family of Gordon, and comprehends over hill and dale, and on both sides of the Bogie, an area of 120 square miles. In 1424, when its proprietor was one of the hostages for the ransom of James I., its rental was estimated at one-half of that of the estates of the high-constable of Scotland. The name of the district, as almost every Scotsman knows, is intimately associated with Scottish lyrics and music. The presbytery of Strathbogie belongs to the synod of Moray, consists of twelve parishes, chiefly within the limits of Aberdeenshire and Banffshire; and has acquired no little notoriety in connexion with the curious proceedings in the case of Marnoch. See **MARNOCH**.

**STRATHBRAN**, a picturesque valley in Perthshire, in the parish of Little Dunkeld. See **BRAN**.

**STRATHBRORA**. See **ROGART**.

**STRATHBUNGO**,\* a village in the south-east angle of that portion of the parish of Govan which is situated in Renfrewshire. It is about 2 miles south of Glasgow, and stands on both sides of the turnpike road. A neat chapel in connection with the establishment was recently erected on the east side of the road;—patrons, the subscribers. In title-deeds this place is usually called Marchtown, obviously from its being situated on the *march* or boundary of the parish and county; and under that name it is set down on Thomson's Map of Renfrewshire. The population is about 300.

**STRATHCLYDE**. See **INTRODUCTORY ARTICLE**, and **LANARKSHIRE**.

**STRATHCONAN**, a district of country in Ross-shire, about 15 miles long and 13 broad, situated at about 12 miles to the westward of Dingwall on the Cromarty frith, and consisting of about 70,000 acres of sheep-pasture, and 1,000 of arable land. It is intersected by the rivers Conan, Meig, and Orrin, and the Parliamentary-road from the east to the west of Scotland runs along the north side of it. There are grouse and ptarmigan shootings here, and good fishing. The strath is also noted for its honey.

**STRATHEARN**, a district partly in Nairnshire, but chiefly in Inverness-shire. It consists of all the Highland section of the basin, or glen and hill-screens of the river Findhorn; and extends north-eastward from near the sources of that river, to about the point where it passes into Morayshire. See **FINDHORN (THE)**.

\* The first syllable of this name may have reference to a small *strath* or hollow close to the village; the remainder may be a corruption of the name of Mungo, the patron-saint of the neighbouring city.

**STRATHDON**, a parish on the western frontier of Aberdeenshire. Its main body is bounded on the west, north-west, and north by Banffshire; on the north-east by Glenbucket; on the east by Migvy and Logie-Coldstone; and on the south by Glenmuick and Braemar. A detached part, consisting of Glenkindy, lies from  $\frac{2}{3}$  of a mile to 3 miles to the north-east; and is surrounded by Cahrach, Kildrummie, Towie, Migvy, and Glenhuckct. The main body embosoms a part of Tarland, which measures 6½ miles by from 1½ to 3½. The whole parish, measured so as to include the intersecting parts, extends 16 miles from north-east to south-west, and 9 miles in the opposite direction. The south-western district cradles the Don amidst a mass of mountains, and forms the territory of a mission of the Establishment: see **CORGART**. Two mountain-glens commence near the western boundary, extend respectively along the north and the south sides of the embosomed district of Tarland, converge at the east end of that district, and thence form one valley to the eastern boundary. That on the north brings down the rivulet **NOCHTIE**, [which see]; and that on the south, and away eastward, carries along the Don. Glenkindy, or the detached part of the parish, is a hilly valley, extending southward; and brings down the rivulet Kinty to fall into the Don a little above the kirk of Towie. The arable land lies all in these glens, and most of it in that of the Don; it consists of considerable haughs of belts of hanging plain, and of the skirts of pastoral heights; and it possesses, in general, a light, sharp, and somewhat fertile soil. Hilly ranges of considerable height and breadth flank the glens, and render the general aspect of the parish upland, wild, and Highland. The hills are prevalently heath-clad; and in their loftier altitudes, are covered with a black spongy soil, inclining to moss; yet, in many parts, they are good sheep-walk, and, in most, they abound with game. Natural woods are of small extent; but several fine plantations of fir fling their shadows over the Don. Granite, limestone, and a coarse slate abound. The Douu of Invernochty, situated near the church, is a beautiful, oval, artificial mound, terminating in a platform of half-an-acre in area, and once fortified by a wall round the summit, and a ditch round the base; but it exists only in topography, and is unknown to either history or tradition. The mansions are Glenkindy and Achnach. The parish is very limitedly penetrated by roads. Population, in 1801, 1,354; in 1831, 1,683. Houses 344. Assessed property, in 1815, £2,672.—Strattdon is in the presbytery of Alford, and synod of Aberdeen. Patron, the Crown. Stipend £191 8s. 7d.; glebe £2 12s. 6d. The church was built in 1757, and re-seated in 1808 or 1809. Sittings 504. In 1834, the parish-school was attended by 93 scholars; and six other schools by 361. Three of the non-parochial schools are supported by the Society for Propagating Christian Knowledge; and a fourth is for females. Parochial schoolmaster's salary £28, with about £10 fees, and £1 5s. other emoluments.

**STRATHEARN**, the basin of the river Earn and its tributaries in Perthshire, and one of the richest and most exquisitely scenic tracts of country in Scotland. It extends nearly 40 miles almost due east and west, from the head of Loch-Earn to the mouth of the river Earn below Perth, and has a mean breadth, including its flanking heights, of between 6 and 8 miles. The parishes, either wholly or partially, comprehended in it, are mentioned in the article **EARN**: which see. The district, during the existence of hereditary jurisdictions, constituted a stewardry. Strathearn has such a profusion and va-

riety of rich pictures and features of landscape as to smile derision upon any attempt at succinct description. Its lower division expands into flat grounds of several miles in breadth, beautifully enclosed and planted, powdered all over with mansions and villages, adorned with demesne and every form of culture and artificial embellishment, and perpetually refreshing a traveller with the disclosure, throughout its exultant plain and its sloping hill-screens, of new and thrilling beauties. In this division, Abernethy, Duplin-castle, and Auchterarder draw attention; and in the upper division, Drummond-castle, Ochertyre-house, Lawers, and above all, Dunira, offer, in their immediate grounds, and in the prospects which they command, a complete banquet of the delights of landscape. The scenery from Crieff to Loch-Earn, a distance of 10 or 11 miles, is in the highest degree romantic and fascinating; and, as to its salubrity, has been termed by travellers, the Montpellier of Scotland. Over the upper half of this distance, and round Loch-Earn itself, pictures of ruggedness and romance arrayed in forest are presented of a character hardly, if at all, inferior to those of the Trosachs. At Dunira, 2½ miles below the lake, the valley becomes narrowed; the rugged Grampians seem threatening an invasion; the immediate flanking heights appear to close and to send up their summits to the clouds; yet oaks and other wood run in brigades up the bold acclivities, and are repelled at intervals only by pinnacles of naked rock, towering aloft in defiance; copse-wood spreads out in tufts upon the sides and summits of insulated hills which straggle in the plain; verdure and foliage, or the mellowing crops, have full possession of the intervening fields; the river Earn winds in a meandering course among the wooded and diversified grounds, spanned by a Chinese bridge; and the lawns, and walks, and hovers, the curious retreats, and the numerous embellishments of Dunira, themselves a study, preside over the many-tinted and magnificent scene.—The Grampians, which close up and screen the higher part of the strath, with the exception of a patch of granite between Benichonie and Loch-Earn, and of a stripe of clay-slate which comes within about 2 miles of Crieff, consist chiefly of micaceous schist, with occasional beds of quartz and hornblende schist. The isolated hills, which contribute such picturesque to the upper valley, are composed now of a red sandstone in almost vertical beds, and now of a very coarse red conglomerate, chiefly consisting of hornblende porphyry, and sometimes resembling the common greywacke. The lower division of the strath, and all the low grounds among the isolated hills, from 2 miles below Comrie eastward, lie upon the old redstone, which for the most part is quite, or nearly horizontal, but as it approaches the Ochils, is thrown up so as to dip, from a few degrees to upwards of 70 toward the north or the north-east. Strathearn anciently gave the title of Earl to a branch of the royal family of Stewart; and it gave the title of Duke in the Scottish peerage to his royal highness the Duke of Kent, and father of Queen Victoria.

**STRATHERRICK**, a district of Inverness-shire. It extends along the south-west side of Loch-Ness, but is, for the most part, separated from that lake by a narrow range of hills; and it forms an upper table-land, cut across by the rivers Foyers and Farigag. The strath is broad and open, and expands on the north into a wide elevated plain; it is occasionally tumulated with hills, and is variously in meadow, arable grounds, and moorland; and it has a cincture of granitic heights which shoot aloft in numerous naked summits.

**STRATHFARRAR**, the ancient name of all the basin of Loch-Beaully, and the rivers Beaully and Farrar, from Inverness to the head of Glenstrath-farrar. The Romans, most probably Latinizing a name which they found already in use, called Loch-Beaully and the inner Moray frith *Æstuarium-Varrar*.

**STRATHFILLAN**, a glen of about 10 miles in length from west to east, in the extreme west of the parish of Killin and of Perthshire. It is, as to scenery, of uninteresting character. Its west end is the source of the remotest waters of the Tay, and, of course, lies at a vast height above sea-level. In 1836, Strathfillan, comprehending the glen properly so called and some adjacent territory, was erected, by authority of the presbytery of Weem, into a *quoad sacra* parish. The district was long before a station of the Society for propagating Christian knowledge, who still appoint and chiefly support the minister; and in ancient times it was the site of a chapel dedicated to St. Fillan, and associated with monstrous popish superstitions. But a bell and a pool shared more largely than even the chapel in the confidence of absurd credulity.

**STRATHFLEAT**. See **ROGART**.

**STRATHGLASS**, a district, comprehending the basins of the rivers Glas and Beaully, on the northern border of Inverness-shire. The lower part of the strath comprehends the superb scenery around the town of Beaully,—a nearly circular plain, zoned with high-terraced banks, screened with densely wooded ascents, and overhung by brown, rugged and rocky heights. A little farther up are the exquisite combinations of Highland landscape around the falls of **KILMORACK**: which see. Above the gorge of these falls opens a broad and flat valley, resembling the forsaken bed of an ancient lake, and retaining the Beaully in sluggish motion. A little below the confluence of the Glas and the Farrar stands Erchless-castle, “belonging,” says Miss Sinclair, “to the descendants of that old chief, who said there were but three persons in the world entitled to be called ‘The,—the King, the Pope, and the Chisholm.’ This place is heathy personified; and you would fall in love with it at first sight. The castle is a venerable white-washed old tower, so entirely surrounded by a wreath of hills, that the glen seems scooped out on purpose to hold the house and park.” The upper strath, or that traversed by the Glas, is straight, thoroughly pastoral, and everywhere winged with coppices of birch. Behind these coppices were formerly noble forests of pine, extending in unbroken sheets to the summits of the hills; and they made the strath famous for its timber and for impulse which the exportation of it gave to a scanty commerce; but, with the exception of a few solitary trees, they have been wholly swept away by burnings, and the system of sheep-pasturing.

**STRATHGRYFE**—the valley of the Gryfe—the ancient name of the district of Renfrewshire traversed by that river, and probably also extended to the greater part, if not the whole, of what now forms the county of Renfrew. The name repeatedly occurs in deeds dated in the latter half of the 12th century, but without affording any means of ascertaining the precise limits of the district: see *Crawford’s Renfrewshire*, pp. 9, 10, 99, and 133. Principal Dunlop—evidently having in view the deeds referred to—said, in his *Description of the County*, written in the end of the 17th century,—“This Gryfe gave name to the northerly part of the shire, which was called Strathgryfe about the year 1180.” In our day, the author of *Caledonia* says,—“The country which is drained by the river Gryfe and its tributary streams, forming the larger and western division of the shire, was called, in the ancient language,

Strathgryfe, and by popular abbreviation, Stragyfe. The district of Strathgryfe was bounded on the east by the river Black Cart, and comprehended the country lying westward to the Clyde," vol. iii. p. 762. On the other hand, Crawford, who was a contemporary of Dunlop, makes no such limitation, but states, in general terms, that "the ancient denomination of this country—meaning Renfrewshire—was Strathgryfe, so called from one of its principal rivers (p. 9); and Wilson expresses himself to the same effect in his Survey, published in 1812 (p. 1). The name has long been out of use, and is only preserved in the charters of some of the landed proprietors.

**STRATHLACHLAN**, anciently **KILVORRIE**, a parish now united to Strachur in Argyshire. It is 11 miles south by west of Inverary. Machlachlan is an elegant building, near the old tower of Castle-Lachlan, and in the centre of a noble estate, 11 miles in length, and at an average a mile-and-a-half in breadth, stretching in one continued line along the eastern side of Loch-Fyne. The name of the parish is partly derived from Lachlan,—a family of considerable distinction among the Highland clans, and whose residence has been in Strathlachlan for time immemorial.

**STRATHMARTIN**. See **MAINS**.

**STRATHMASHIE**, a gleu about  $4\frac{1}{2}$  miles long, in the most mountainous part of Badenoch, Inverness-shire. It brings the rivulet Mashie from a point within  $3\frac{1}{2}$  miles of the head of Loch-Erich down to the Spey; and it carries up, for 2 or 3 miles from Strathspey, the excellent new road by way of Loch-Laggan to Fort-William.

**STRATHMIGLO**, a parish in Fifeshire, about 7 miles long, and  $3\frac{1}{2}$  broad, lying on the small water of Miglo, one of the tributary streams of the Eden; bounded by the main body of Aherneby on the north; Auchtermuchty and Falkland on the east; Portmoak and Orwell on the south; and Arngask on the west. The population of the parish has more than doubled since 1790, when the first statistical account was written. In 1801, it was 1,629; in 1831, 1,940. The population at present is rather above 2,000. In 1837, the population of the old burgh, and 1,000 yards around, was found on a census being taken by the burgh-feuars to be rather above 1,300. With the exception of the upper portion of the West Lomond-hill, which altogether may contain about 1,128 acres, partly planted and partly in pasture, the whole of the remaining portion of the lands of the parish are either arable or under wood. There are altogether under wood about 270 acres, of which about 30 acres on the lands of Drumdiel is natural wood, chiefly oak and hazel, and supposed to have at one time formed part of Falkland-forest, which, according to tradition, skirted the north-west of the Lomonds to Kinnesswood. The soil differs considerably on the south and north sides of the Miglo, but in both cases is abundantly fertile. The rent of land varies from £1 to £3 per acre; but there are some fields near the town which let as high as from £4 to £5 per acre. The valued rent of the parish is £7,068 3s. 4d. Scots. The real rent in 1792 was £2,926 sterling. The annual value of real property, in 1815, was £8,353 sterling. The linen manufacture is the chief employment of the inhabitants of Strathmiglo, and the other villages in the parish. The weavers are employed, through agents, in weaving dowlas and sheeting for the manufacturers of Dundee, Newburgh, and Cupar; stripes and ticking for the manufacturers of Kirkcaldy; and, of late, in weaving diaper, damask, and towelling, for the manufacturers of Dunfermline. A few are employed also in weaving cotton goods for the manufacturers of Glasgow, and soft woollen

shawls for Tillicoultry. Altogether, there are about 500 looms employed in the parish in these different branches of manufacture. There is one spinning-mill in the parish, driven by a water-wheel of six horse-power. There is also a lint-mill for the preparation of lint for spinning, likewise driven by a water-wheel of six horse-power; and between Edenshead and Courston there is a wool-mill driven by a water-wheel of the same power. In the immediate vicinity of the town, and upon the water of Miglo, there is a bleachfield at which linen-yarn is bleached, and where there is a water-wheel of the same power. Besides these there are four corn-mills, one flour-mill, and a barley-mill, all driven by the water of Miglo or Eden. The whole amount of power for which this river and its small tributary streams are made efficient within the parish, is calculated at 90 horse-power. There are two malting-barns and two breweries within the town. On the south side of the river there are quarries of red freestone, which are pretty extensively worked.

This parish is interesting as having been the scene of at least one great battle, at some very remote period. The numerous cairns and tumuli, with which its surface is covered, and the stone-coffins enclosing skeletons, pits containing quantities of skulls, ancient weapons, and various other remains, which have from time to time been discovered here, all indicate the locality of a battleground, and tradition confirms the fact, that a great battle was fought near a ford on the Eden called Merlsford, in which the slaughter was so great that the river ran red for twenty-four hours afterwards. It has been conjectured that this is the long disputed site of the great battle of Mons Grampius, described by Tacitus as having been fought between the Roman army under Agricola in his seventh campaign after his arrival in Britain, (supposed to have been in the summer of the year 84 or 85,) and the Caledonians under Galgacus.\*

The burgh of **STRATHMIGLO**, with its several suburbs, is pleasantly situated on the level ground which forms the banks of the Miglo, at the east end of the parish. The burgh, and the suburbs called Kirklands, Stedmoreland, and Templelands, occupy the north bank; and the feus of Wester-Cash, and the town-feus, the south bank of the stream. Strathmiglo consists of one principal street, of rather an antique and picturesque appearance, running parallel to the river, with four or five wynds running at right angles to it, and a lane called the East and West Back Dykes, passing at the head of the gardens of the feus on the north side. The Kirklands are situated on the south side of the principal street, at its eastern extremity; the Templelands are also on the same side of the street, about the middle of the town; and the Stedmoreland-feus are situated at the western extremity on both sides of the street. The feus of Wester-Cash form a street rather more than one-quarter of a mile in length of well-built tradesmen's houses, also running parallel with the river; and the town-feus, called Eden-street—which is only of recent erection—lie in the same direction to the south-west of the western extremity of the Cash-feus. The burgh is distant from Cupar 11 miles;

\* The Rev. Mr. Small, who for some time resided at Edenshead, was the first, we believe, who suggested this idea. In the winter of 1823-24, Colonel Millar read an essay on the subject before the society of Antiquaries in Edinburgh, which has been since published in their Transactions. Colonel Millar having the advantage of long military experience, acquired in active service, being well-acquainted with the whole localities, and having carefully examined the various Roman and British antiquities in Fife, has certainly made out a very strong case in favour of this parish having been the scene of this battle; and we believe that no attempt has yet been made to overturn his reasoning upon the subject.

from Falkland 3; from Perth 12; and from Kinross 8 miles. In 1509, Sir William Scott of Balweary, whose ancestors had long held the lands of Strathmiglo, obtained a crown-charter from James IV., uniting certain lands possessed by him to the barony of 'Strameglo,' and erecting the whole into one barony, to be called the barony of Strathmiglo. In this charter he also received power to erect that town or village into a burgh-of-barony; but no advantage was taken of this power for 100 years afterwards. In 1600, however, Sir James Scott, the 4th in descent from Sir William, granted a charter to 19 different feuars who held of him, erecting them into a burgh-of-barony; and by three subsequent charters granted immediately afterwards, he included three other feuars who held of him in the burgh. The whole of these charters were confirmed by a crown-charter from James IV. under the great seal, of date 26th June, 1605. By the charters the feuars obtained the usual powers and privileges of burghs-of-barony, of holding courts, exacting fines and customs to be applied to their own use, &c.; and the liberty of "having and holding within the said burgh ane tolbooth, and ane pair of gallows, and ane weekly market on Fridae, and twa public fairs yearly, to witt.: at the feast of Sant Cyralus, being the 9th day of Junij, and the feast of Sant Crispian, the 25th of October."\* Immediately after the granting of the charter, the bailies, who were two in number, were appointed by the superior, a procurator-fiscal was also appointed, and courts were regularly held as in other burghs. A jail and town-house had stood at this time on the north side of the street, immediately behind the cross, a little west of the Kirk-wynd; and here the jugs or gallows were erected, where criminals were punished by being fixed in them for a certain period. The records of the haron's court are still preserved, and contain many curious cases, illustrative of the habits and manners of the period. About the year 1730, after the superiority had passed into the hands of the Lords Balfour of Burleigh, the burgesses resigned their old jail into the hands of the superior, and purchased the present town-house, which is smaller, but more in the centre of the town. Having obtained a right to the stones of the old castle of Strathmiglo from the superior, they, in 1734, erected in front of the town-house a handsome steeple, consisting of a square tower, terminating in an open balustrade, and surmounted by an octagonal spire 70 feet in height.† The space within the foot of the steeple, which is secured by two doors, one of wood and another of iron, is used as a lock-up-house, when one is found necessary. After the passing of the act, abolishing heritable jurisdictions, in 1748, the superior having the power of nominating the bailies, the burgh of Strathmiglo fell under the sweep of that act, and were consequently deprived of their magistrates, a want which they still continue to feel. Notwithstanding that the burgesses have again fallen into the state of simple feuars, they are still fully

\* At a much earlier period there had been a yearly fair or market held at Strathmiglo on Martinmas-day, which in 1437 was, by charter of James II., ordered to be discontinued, and was transferred to the county-town of Cupar, where it was afterwards held. It is probable that there was no public fair held at Strathmiglo thereafter, till the charter of Sir James Scott was granted in 1600, and confirmed by the Crown in 1605.

† The steeple contains a clock, and a bell measuring 30 inches in diameter at the base, with the inscription, 'Strathmiglo, 1766, Leder and Pack of Loudon,' and the motto, 'Tempus fugit.' In front of the steeple are still seen—very well-executed and in good preservation—the arms of the Lady Margaret Balfour of Burleigh, the superior at the time; and immediately below them, an old stone-dial which formerly surmounted the cross, and is said to have been the work of the last Roman Catholic priest of the parish. Here the jugs or gallows—being an iron collar fixed into the wall on one side of the door by a short iron-chain—remained until very recently.

vested in the property which belonged to the burgh, consisting of the town-house, town-lands, &c. The affairs of the burgh are now managed by a committee of the feuars, elected at an annual general meeting of their body, and consisting of a preses, six members, and clerk. The common muir over which the feuars had the servitude already mentioned, was divided about 1774, between the feuars and the superior, who then purchased back all their shares except two, and disposed back to them, in common, several small pieces of ground in return. When the Lomond-hill was divided in 1818, the burgh-feuars got a small portion *in cumulo*, effecting to their private property. This was afterwards exchanged with the superior for some ground near one of the commons, along with which it is divided among them, according to the extent of their properties, for building. Of the two fairs granted to the town, one has now fallen into desuetude; the fair in June being the only one now held; but no customs are now exacted at it. Strathmiglo is not a post-town, but there is a penny post-office, subordinate to the office at Kinross. No public conveyance passes through either the town or any part of the parish; and the nearest point at which the coach between Edinburgh and the north of Scotland can be met is at New Inn, distant about 6 miles to the south-east. The Kirklands, the suburb to the east of the town, and adjoining the mause and garden, is held in feu of the Earl of Mansfield, as proprietor of Balvaire. It appears to have been the site of the residences of the provost and prebendaries who served in the collegiate church during Catholic times.‡

‡ The lands of Strathmiglo—properly so called—appear originally to have belonged to the Crown, as in 1160, Malcolm IV. granted them, with other lands, to Duncan, 6th Earl of Fife, on the occasion of the marriage of that nobleman with Ada, the king's niece. The superiority of the lands remained with the Earls of Fife till the forfeiture of Murdoch, Duke of Albany, in 1324; but, according to Sibbald, the lands were held under the Earls of Fife by the Scotts of Balweary, from about 1251. After the forfeiture, the lands continued to be possessed by the family of Scott under the Crown; and they were, with other lands belonging to them, erected into a barony called the barony of Strathmiglo. In 1509, Sir William Scott of Balweary obtained a charter of the lands and barony of Strathmiglo, Easter and Wester Pitlour, Kilgour, Drumduff, Pit-cottie, Ceres, Craighall, Demperton, &c., all united into the barony of Strathmiglo, with power to erect that town into a burgh-of-barony. Sir William accompanied James IV. on his unfortunate expedition in 1513, was taken prisoner at Flodden, and obliged to sell part of his lands to pay his ransom. He was repeatedly afterwards chosen one of the lords of the articles for the barons, and was the only individual under the degree of a peer who ever obtained that honour. On the first institution of the College of Justice on 13th May, 1532, Sir William had the honour to be nominated the first senator on the temporal side; but he must have died shortly after his appointment, as his second son, Thomas Scott of Pitgurno, was nominated in his place in November, 1532. He was a great favourite of King James V., by whom he was appointed Justice-clerk in 1535. He died in 1539. The following circumstances are related by Knox:—"How terrible a vision the said prince saw lying in Linlithgow, that night that Thomas Scott, Justice-clerk, died in Edinburgh, none of good credit can yet report; for, afraid at midnight or after, he called aloud for torches, and raised all that lay beside him in the palace, and told that Thomas Scott was dead, for he had been at him with a company of devils, and had said unto him these words:—'O wo to the day that ever I knew thee or thy service; for—erving of thee against God, against his servants, and against justice, I am adjudged to endless torment!' How terrible voices the said Thomas Scott pronounced before his death, men of all estates heard, and some that yet live can witness his voice ever was, 'Justo Dei iusticio condemnatus sum!'" In the person of Sir James Scott, the 4th in descent from Sir William, the barony of Strathmiglo was at its greatest extent; but with him the wealth and dignity of the family came to an end. In consequence of the numerous fines to which Sir James was subjected for the various risings and rebellions in which he had been engaged, he was obliged, from time to time, to sell off various portions of his estate, till towards the year 1600, his whole barony was disposed of, excepting the tower and fortalice with the lands adjoining, and the village of Strathmiglo. Even these small remaining portions were sold, either immediately before or after his death. Sir James Scott is among the few Fife gentlemen who are characterized by John Knox as being "enemies to God, and traitors to their country." His opposition to the Reformation, and his connection

The castle of Strathmiglo stood in the middle of an arable field, a short way east of the village, and about 100 yards north-cast from the farm-steading of the east mill of Strathmiglo, on what was called the lands of Cairney, or Wester-Strathmiglo; but it has now entirely disappeared. The remains of the large moat, however, which surrounded it on all sides, though nearly filled up, sufficiently points out where it stood. It is said to have been erected in the reign of James V., who bestowed upon it, rather unaccountably, the nickname of Cairny-flappet, from its having been very hurriedly erected. At this time the family seem to have left their ancient castle of Balweary, and to have taken up their residence here, probably on account of its being so near the court at Falkland.—The lands of Easter and Wester Cash, which lie south-east of Strathmiglo, formed, for a considerable time, a portion of that extensive barony. Previous to coming into their possession, however, it had had a separate proprietor, as the old tower where the laird resided stood upon the site of the present farm-steading of Wester Cash. Tradition still speaks of the feuds which occurred between the lairds of Cash and the Barons of Balweary; but the greater power, and for a time the better fortune of the latter family prevailed, and Cash was at length added to their extensive possessions. In the middle of a muir at the north part of the Lomonds, south of Barrington, and about half-a-mile west of Kilgour, the well-known Jenny Nettles—who has given name to a lively Scotch air, and forms the subject of an old song published by Herd, beginning, ‘Saw ye Jenny Nettles coming through the market,’—was buried.\* Easter Pitlour, a handsome house, with grounds beautifully laid out, and ornamented with wood, anciently formed part of the barony of Strathmiglo, but was sold by Sir James Scott to a younger son of Pitcairn of Pitcairn, in whose family it for some time remained, till it was purchased by Skene of Halyairds, the ancestor of the present proprietor.—On the banks of the Miglo is Corstoun, the property of John Balfour, Esq., of

with the Popish party, may explain the reason why, notwithstanding his having conferred the honour of a burgh on Strathmiglo, his memory has been so little revered by the inhabitants. The traditions of the place represent him as a persecutor, and the downfall of the family is looked upon as a punishment from heaven for his treatment of the reformers. He is also blamed for his avarice, and his harshness to the poor. An instance of the latter is still handed down. Sir James was looking out of a window, it is said, of his castle of Strathmiglo, while his servants were throwing a great quantity of oatmeal into the moat, it being old and unfit for use. A beggarman came to the outer end of the drawbridge, and requested to be allowed to fill his wallets with the meal; but the mighty baron of Balweary refused this humble request, on which the poor man pronounced a curse upon him, declaring he should be reduced to beg before his death. It cannot be said that the curse, if ever perpetrated, was literally fulfilled; but certainly Sir James saw the ruin of his family; and the tradition still is, that such was his poverty at his death, that a subscription was raised among the neighbouring proprietors to pay the expense of his funeral. William had a son, Walter Scott, who, having been deprived of any portion of the family-estates, through the misconduct of his grandfather, he embraced a military life, and rose to the rank of colonel. He never married, but shortly before his death, which occurred in Flanders during the reign of Charles II., he sent over from Holland, to Sir John Scott of Ancrum, Baronet, the seal of the family of Balweary, acknowledging him to be his heir-male.

\* This unfortunate heroine was a native of the neighbouring parish of Falkland, and was famed through all the surrounding country for her great beauty. When Rob Roy took possession of Falkland palace, after the battle of Sheriffmuir, one of his Highlanders paid too successful attention to the rustic beauty; and she, on being deserted by her faithless lover, in a fit of despair put a period to her existence, by hanging herself on a tree at the roadside about half-way between Falkland and Strathmiglo. Her body was of course, in those days, denied the use of a coffin, or interment in a churchyard. It was conveyed on two rough sticks to the muir already mentioned, and there consigned to the earth. Two other females who had committed suicide, were subsequently interred in the same place. On a recent occasion, 2 ear-rings and 24 beads were found in her grave.

Balbirnie. In the 15th century this was the property of John Ramsay of Corstoun, who was descended from the house of Carnock, one of the most ancient families of the name. His son, Sir John Ramsay, also of Corstoun, was a great favourite with James III., who knighted him, and bestowed upon him the lordship of Bothwell in Lanarkshire. He was the ancestor of the Ramsays of Balmain in the north, and several other families of that name.

STRATHMORE, a valley in the parishes of Edderachylis and Durness, Sutherlandshire. It takes down the stream More to the head of Loch-Hope; and is sublimely overhung, at its lower end, by the lofty BEN HOPE; which see.

STRATHMORE, a small valley in the southern district of the parish of Halkirk, Caithness-shire. In its bosom lies a lake called Loch-More.

STRATHMORE, or ‘the Great Valley,’ the noble and far-stretching band of low country which skirts the frontier mountain-rampart of the Highlands, is flanked along the hither side by the Lennox, the Ochil, and the Sidlaw hills, and extends from the centre of the main bed of Dumbartonshire to the German ocean at Stonehaven: See GENERAL INTRODUCTION. In this large sense it is exceedingly various in breadth, as well as in the features of strath-ground; and comprehends part of STIRLINGSHIRE, all STRATHALLAN, most part of STRATH-EARN, and all the HOW of Angus in KINCARDINESHIRE: see these articles. But the strath is more popularly and limitedly regarded as consisting only of what is flanked by the Sidlaw hills, and as extending from Methven in Perthshire to a point a little north-east of Brechin in Forfarshire; and, in this view, it is somewhat uniform in breadth and feature, and belonging principally to FORFARSHIRE, has been succinctly described in our notice of that county: which see. This great district is, in the aggregate, remarkably beautiful and fertile; it contains numerous towns, villages, and elegant mansions; it is the seat of a great and industrious population; and it is now opened up by railroads, and attracts throngs to survey its wealth of manufactures and of landscape.—Strathmore gives the title of Earl to the noble family of Lyon; who, before 1450, had the dignity of Baron Glamis, and in 1606 were created Earl of Strathmore and Kinghorn, Viscount Lyon, Baron Tannadyce, Sidlaw, and Stradichtie.

STRATHNAIRN, a Highland valley chiefly in Inverness-shire, and, to a small extent, in Nairnshire. It consists of the basin of all the Highland part of the river NAIRN, [which see,] and extends north-eastward between Strathdearn and the great glen. It is screened by barren heathy mountains, possesses little wood, and, with slight exceptions, is wholly pastoral.

STRATHNAVER, the long and beautiful, but depopulated glen, partly occupied by Loch-Naver, and chiefly traversed by the river Naver, in the parish of Farr, Sutherlandshire. See NAVER (THE).

STRATHOIKEL, the long and picturesque glen of the Oikel, between the counties of Ross and Sutherland. See OIKEL (THE).

STRATHPEFFER, a beautiful little valley in the counties of Ross and Cromarty. It extends from Dingwall, at the head of the Cromarty frith, 4 miles due westward; and takes up the great road to the western districts of Ross-shire, and to the ferries to the Northern Hebrides. Its low grounds, not long ago an almost continuous reedy marsh, are now a series of rich and luxuriant corn-fields; its soft northern screen, diversified in its gentle ascent by the parks and woods of Tulloch-castle, and overhung at a brief distance by the huge and alpine Ben

Wyvis; and its southern screen, which divides it from Strathconon, is surmounted by the strong, beautiful, well-featured, vitrified hill-fort of Knock-farrel. Various medicinal springs in the strath, particularly two at its west end, have, of late years, acquired high celebrity for the cure of a great many diseases. Dr. Thomas Morrison of Elsick in Aberdeenshire, who previously visited almost every other spa of the kingdom, declared the Strathpeffer wells to be unrivalled, and usually described the climate as "the balsamic air of Strathpeffer." A handsome pump-room, 40 feet by 20, was, at his suggestion, erected over the lower one of the two chief wells in 1829; and it has since been adorned with a fine portrait of him by George Watson, Esq. of Edinburgh. Lodgings for visitors were for a time scarce; and though now numerous and neat, they are still incompetent to the demand, and are let at high prices. Many new villas combine with the respectable lodging-houses to fling over the place an air of warmth and opulence. A comfortable inn stands near the wells; and a new hotel, equal to any in the country, is situated within half-a-mile of the pump-room. A large hospital, benevolently built for the use of poor invalids, and capable of accommodating 50 at a time, was opened in 1839. The season for most beneficially drinking the waters extends from the beginning of May till the middle or end of October. The medicinal properties of the wells are derived from bituminous rocks and sbales impregnated with sulphuret of iron. An imperial gallon of the water of the upper well, as analyzed by Dr. Thomson of Glasgow, contains 26.167 cubic inches of sulphuretted hydrogen gas, 67.77 grains of sulphate of soda, 39.454 of sulphate of lime, 24.728 of common salt, and 6.242 of sulphate of magnesia; and an imperial gallon of the water of the lower well contains 13.659 cubic inches of sulphuretted hydrogen gas, 52.71 grains of sulphate of soda, 30.686 of sulphate of lime, 19.233 of common salt, and 4.855 of sulphate of magnesia. A comparison of the contents of these waters with those of the spa waters of Moffat, will show that the grand watering-place of the south is likely, though long ago divested of novelty, to keep pace in fame with that of the north.

**STRATHSPEY**, the long vale of the river Spey through the ancient province of Moray. It is celebrated for its forests, the rapidity of its great river, and the music and military spirit of its people. See **SPEY** and **MORAY**.

**STRATHTAY**. See **TAY (THE)**.

**STRATHTUMMEL**, the glen of the **TUMMEL**: which see.

**STRATHY**, a *quoad sacra* parish on the north coast of Sutherlandshire. It consists, *quoad civilia*, of the eastern part of Farr, in the presbytery of Tongue, and synod of Sutherland and Caithness. Patron, the Crown. Stipend £120. The church is a Government one; and was built in 1826. The water of Strathy issues from two small lakes; and runs a northerly course of about 14 miles to the sea. Strathy-bay, which receives the river, is a triangle, with sides of  $2\frac{1}{2}$  and  $1\frac{3}{4}$  miles along its shores, and a side of  $2\frac{1}{2}$  miles toward the sea. Strathy-head runs out in a narrow promontory along the west side of the bay. Strathy village stands at the head of the bay, 20 miles east-north-east of Tongue, and 24 west by south of Tburso. It is a populous fishing-hamlet, is the site of the parish-church, and has a small neat inn. Beside it are quarries of good limestone and sandstone.

**STRELITZ**, a neat modern village in the parish of Cargill, Perthshire; 4 miles south-east of Cupar-Angus, and  $1\frac{1}{2}$  north-east of Perth. It stands upon a streamlet, a tributary of the Isla, finely sheltered

by belts and stripes of plantation. It was built in 1763 as a retreat for discharged soldiers at the conclusion of the German war, by the Commissioners for managing the annexed estates; and it consisted, immediately after its origin, of 80 neat dwelling-houses, built on a regular plan, and each provided with a garden and about three acres of land. Its name was given it in honour of Queen Charlotte.

**STRICHEN**, a parish in Buchan, Aberdeenshire. It is bounded on the north by detached parts of Aherdour and Fraserburgh; on the north-east by Rathen; on the east by Lonmay; on the south by Old Deer; on the south-west by New Deer; and on the west by Tyrie. Its greatest length, from east to west, is  $6\frac{1}{2}$  miles; its mean breadth, over two-thirds of its extent, is 2 miles; its greatest breadth is  $3\frac{3}{4}$  miles; and its area is about 8,000 acres. The Ugie runs  $1\frac{1}{2}$  mile along the northern boundary, and then 2 miles across the interior, cutting the parish into two nearly equal parts. On the northern border rises **MORMOND HILL**: which see. The general surface inclines to the Ugie, yet is pre-vaillingly hilly. One of the hills shows a face of white stone, and figures curiously as seen from a distance; and on the same hill is a hunting-lodge with the whimsical inscription, "This hunter's lodge Rob Gib commands." The face of the country, especially west of the Ugie, was long ago much improved by plantations. Some fine trees around Strichen-house were large enough, or probably happened at the moment to be so bathed in an effulgence of sunshine, as to attract the notice of the blind and bigotted Dr. Johnson. "I had now," says he in his precious Tour, "travelled 200 miles, and had only seen one tree not younger than myself; but at Strichen I saw trees of full growth, and worthy of my notice." The little village of Leeds stands near the eastern boundary. The village of Strichen stands on the left bank of the Ugie, in the centre of the parish, 9 miles south-south-west of Fraserburgh, 15 north-west by west of Peterhead, and  $33\frac{1}{2}$  north by west of Aberdeen. It is neatly edified; and has a town-house, erected in 1816 at the cost of £2,000. The linen manufacture has long been the chief support of its inhabitants. Annual fairs are held here on the first Tuesday of January; the last Tuesday of February, old style; the Wednesday after the second Tuesday of May and August, old style; the Wednesday after the Huntly July fair; and the Wednesday after the first Tuesday of November, old style. The extremities of the parish are briefly traversed by the roads from Aberdeen to Fraserburgh, and from Peterhead to Banff. Population, in 1801, 1,520; in 1831, 1,802. Houses 407. Assessed property, in 1815, £2,350.—Strichen is in the presbytery of Deer, and synod of Aherdeen. Patron, Lord Lovat. Stipend £153 7s. 8d.; glebe £6. Schoolmaster's salary £34 4s. 4 $\frac{1}{2}$ d., with £21 fees, and a share of the Dick bequest. Four private schools are all taught by females.

**STRICKATHROW**, a parish in the northern division of Forfarshire; bounded on the north by Edzel and Kincardineshire; on the east by Logiepert; on the south by Dun and Brechin; on the south-west by Meimuir; and on the west by Letbnot. It forms a belt of  $7\frac{1}{4}$  miles in extreme length, and 2 in mean breadth, stretching from north-west to south-east. West-water, afterwards continued for a mile by the North Esk into which it falls, traces the western and northern boundary; and it is joined across the interior by Crook-water—a rivulet which rises in the upper end of Fearn, and has a run of 14 or 15 miles,—and by three other and inferior streams. The parish is low in the middle, and rises at the ends; and, in the low part, lies

across Strathmore, and forms a section of that fine fertile district. At its north-west end rises the conspicuous hill of Lundie. The whole landscape is pleasant; several points command extensive and beautiful prospects; and the face of the country has been greatly improved by culture, and, in some places, much beautified with plantation. The soil in the south-east is clayey and deep; in the centre is a sharp, black earth on gravel; and on the north-west is either clay or loam, but becomes thin, and towards the frontier is carpeted with heath. Limestone abounds, and has been extensively worked. The churchyard, according to some writers, was the scene of John Baliol's abject surrender of the Scottish crown to Edward I.; and it contains three graves which tradition asserts to be those of three Danish generals. The parish is traversed by the north road from Dundee to Aberdeen, and by the roads from Brechin and Montrose to Glenesk. Population, in 1801, 693; in 1831, 564. Houses 117. Assessed property, in 1815, £3,315.—Strickathrow is in the presbytery of Brechin, and synod of Angus and Mearns. Patron, the Crown and the Earl of Kintore. Stipend £170 9s. 5d.; glebe £16 10s. In 1834, the parish school was attended by 58 scholars; and two non-parochial schools by 69. Schoolmaster's salary £30, with £10 fees. The present parish comprehends the old parishes of Strickathrow and Dnmlappie, which were united in 1618. The church of Strickathrow was, in popish and episcopal times, the church of the chanter of the cathedral of Brechin.

**STROMA**, an island in the Pentland frith, politically included in the parish of Canishay, Caithness-shire. It lies opposite Gill's-bay; and, at two points, is  $1\frac{1}{2}$  mile distant from the continent. It forms an oval of  $2\frac{1}{2}$  miles by  $1\frac{1}{2}$ , the longer axis extending from north-east to south-west. Its name is said to be of Scandinavian origin, and to mean 'the Island in the current'; and expressively describes its position among the careering and tumultuous tides of the frith. Its coast, all around, but especially on the west, is a series of precipitous and lofty rocky cliffs; and, during a storm, it maintains a conflict with the waves truly sublime, and baffling description. Excellent crops of corn can be raised from its soil; but are liable to be damaged by the sea-spray. On the island are ruins of a castle and an ancient chapel. In some caverns were found, at one time, and in a state of great preservation, several human bodies which had lain there 60 or 80 years. Smuggling formerly prevailed to a great extent on the island, and was singularly favoured by the geographical position; but, in consequence of active exertions of the excise, it has, for three or four years past, entirely ceased.

**STROMAY**, an Hebridean island  $1\frac{1}{4}$  mile long, and half-a-mile broad, separated by a narrow strait from the north end of North Uist, and flanking the east side of Loch-Mhicfail.

**STROMNESS**, a parish in the south-west corner of Pomona, Orkney. It is bounded on the north by Sandwick; on the north-east and east by Loch-Stenness, which divides it from Haray and Stenness; on the south-east and south by the sound of Hoy; and on the west by the German ocean. Its greatest length, from north to south, is about  $5\frac{1}{2}$  miles; its greatest breadth is about  $3\frac{3}{4}$  miles; and its superficial extent is about 14 square miles. A chain of hills, whose summit-line is everywhere about a mile from the western coast, extends southward from the northern boundary, and subsides at the distance of about  $1\frac{1}{2}$  mile from the sound of Hoy. A tract of fertile fields, agreeably disposed in meadow and arable grounds, extends all along the south; and every-

where commands a picturesque and sublime view of the hills of Hoy, and the mountains of Sutherland, as far as to Cape Wrath, with the intervening expanse of waters, often tumultuously roused into the grandest aspects of marine landscape. All the west coast is nearly mural, rising sheer up from the sea to various altitudes between 100 and 500 feet; and, during storms, it opulently shares the impressive and almost awful grandeur of scenery noticed in our article on ORKNEY. The soil of the arable lands is variously a black earth, a sandy black earth, a stiff clay, and a mixture of clay and sand. There are two small mosses. The climate in the fine district along Hoy-sound, is less damp and more genial than that of many other parts of Orkney. A mineral spring in the vicinity of the town has some fame for possessing antiscorbutic properties. Limestone abounds; roofing-slates are extensively quarried; and there are appearances of lead and iron ore. Stromness is the most interesting geological locality in Orkney; and also offers some rare plants to the inspection of the botanist. Brackness-house, near a cognominal headland at the entrance of the sound of Hoy, was built in 1633, as an episcopal residence, by George Graham, the last bishop of Orkney; and it bears an inscription of its date, and a sculpturing of the episcopal arms. Cairstone-house, situated on the coast in the south-east, is the seat of Mr. Pollexfen, the proprietor of the eastern district. West of the town are the ruins of the old parish-church, surrounded with the cemetery and the remains of an old monastery; and, in other places, are ruins of ancient chapels whose history is lost. Two roads commence at the town, and traverse the parish, the one northward, to make a tour of the island, and the other eastward in the direction of Kirkwall. Population, in 1801, 2,223; in 1831, 2,944. Houses 515. Assessed property, in 1815, £1,418.—Stromness is in the presbytery of Cairston, and synod of Orkney. Patron, the Earl of Zetland. Stipend £158 6s. 7d.; glebe £6. The parish-church was built in 1816. Sittings 1,200. An United Secession meeting-house was built in 1806, at a cost of about £600. Sittings 643. Stipend £120, with a house and garden, and an allowance for specified purposes of £14 2s. The population appeared, by ecclesiastical census in 1836, to be then 2,987; of whom 2,080 were churchmen, 864 were dissenters, and 53 were nondescripts. In 1834, two parish schools were attended by 400 scholars; and 8 other schools—6 of which belonged to the Establishment, and 2 to Seceders—were attended by 383. Salary of each of the parochial schoolmasters £15, with fees.

**STROMNESS**—originally **CAIRSTON**—a hugh-of-barony, and a considerable town and sea-port, on the south coast of the cognominal parish, 14 miles west by south of Kirkwall, 23 north-west of Duncansby-head, and 29 north-north-east of Thurso. The town occupies the sloping skirts of high ground along the west side of its beautiful bay. It is nearly a mile long, and very irregularly built. Its streets appear to a visitor from any of the polished districts of Scotland mere miserable lanes, and are in many parts so wretchedly paved that a horse can scarcely pass along in safety. The principal street runs in a zigzag direction, from end to end of the town; is nowhere wider than 12 feet, and in some places so narrow as 4 or 5; and is ill-paved with flag-stones of unequal sizes, and usually very filthy. The houses between it and the bay are, in numerous instances, built within high-water mark, and provided with tiny bulwarks, quays, and jetties, which, though they have a whimsical appearance, serve the double purpose of protecting the houses from the tide, and affording the inmates accommo-

dation for mooring their boats, and for seeking a supply of sillocks, the young of the coal-fish. An inn which stands on the side of the harbour may compete with the best in almost any sea-port of Britain for agreeableness of situation, and excellence of arrangement. There are also two other good inns. At the north end of the town is a very extensive warehouse. The hay or natural harbour excels in safety and commodiousness the great majority in Britain; it extends upwards of a mile from south to north, and is entered by a passage  $\frac{1}{2}$  of a mile wide, but expands in the interior to a width of half-a-mile; and it has a firm clay bottom, and sufficient depth of water for vessels of 1,000 tons burden, and is sheltered from the violence of every wind. The pier has 18 feet of water in spring tides. A substantial patent slip admits a vessel of 500 tons burden. The American vessels in the rice trade formerly unloaded here their cargoes for the different ports of Britain, but were afterwards induced to prefer the Isle of Wight. Many vessels, owing to the excellence of the harbour, call at Stromness for shelter, provisions, or men; and among them are annually the Hudson-hay vessels, a considerable number of whalers, and a Labrador missionary brig. The average annual number of vessels is about 320; and their average aggregate tonnage about 45,000. An agent of the Hudson-hay company resides in the town. A considerable number of vessels belong to the port; and many boats are employed in the local fisheries. Boat and ship building is carried on to a noticeable extent; and the making of straw-plait employs a large number of females. A weekly market is held on Wednesday; annual fairs for cattle are held in May and October; and a great annual fair, commencing on the first Tuesday of September, continues upwards of a week, and is attended by small merchants from places so distant as Glasgow. Here are a branch office of the National bank; and a public subscription library. The town is governed by two bailies and nine councillors, elected by the burghesses. The number of burghesses in 1833 was 81.—Stromness, at the beginning of last century, consisted of only half-a-dozen slated houses and a few scattered huts, the former inhabited by two gentlemen of landed property, and two or three small traders, and the latter by a few fishermen and mechanics; and it had then only two vessels, each of 30 tons, and both employed in catching cod and ling at Barra, and making an annual voyage to Leith or Norway. Its rising importance, from the visits of the American rice-ships, drew the attention of the burghers of Kirkwall, and brought upon it a persecution whose origin and upshot form an interesting chapter in the history of Scottish burghs. Founding on an obscure act of William and Mary, 1690, which declared that the exporting or importing of native or foreign commodities, with some exceptions which are named, belongs only to freemen inhabiting royal burghs, and on a subsequent act in 1693, which declared that the benefit of trade allowed to royal burghs might be communicated to other places on condition of their paying cess, Kirkwall made exactions upon Stromness with inequality of distribution, and with most vexatious, unrelenting, and illegal severity. The people of Stromness complied with the exactions from 1719 till 1743; but, writhing under their effects, and seeing ruin coming on their trade, they then resisted, and entered a successful litigation against their oppressors before the convention of royal burghs, the Court-of-session, and the House of Lords. In 1754, they obtained from the second of these courts a declaration that "there was no sufficient right in the burgh of Kirkwall to assess the village of Stromness, but that the said village

should be quit thereof, and free therefrom, in all time coming;" and, in 1758, after their relentless persecutors had dragged them to the House of Lords, they obtained from that court of last resort a decision affirming the declaration of the Court-of-session. By this decision, all the villages in Scotland became free and independent of the royal burghs. A royal charter erecting the town into a burgh-of-barony was obtained in 1817.—The most influential inhabitants of Stromness, not being Orcadians, are locally called ferry-loupers. Gow, or Smith, the hero of Sir Walter Scott's tale of the Pirate, belonged to the town; and, on the east side of the harbour, may still be seen the garden of his father's house. Whoever feels interest in his iniquitous fame will find some curious details respecting him on pp. 212—224 of the first volume of Peterkin's Notes on Orkney. The "Torquil, the nursling of the northern seas," who is the hero of Lord Byron's "Island," also had intimate connection with the town; he was a George Stewart, the son of Stewart of Masseter; and, though a midshipman with Bligh at the date of the notorious mutiny, is exculpated, in 'the Family Library,' from having taken any part in that nefarious transaction.—The view of Stromness from a point two miles distant on the road to Kirkwall, is regarded as the most varied and magnificent in Orkney; and the view near the same place of the long bridge of Waith, across the strait between the sea and the Loch of Stenness, is interesting and curious.

STRONFERNAN. See KENMORE.

STRONSAY, an island in Orkney,  $2\frac{1}{2}$  miles south of Spurness in Sanday,  $2\frac{3}{4}$  east of Veness in Eday,  $4\frac{3}{4}$  north-east of Foot in Shapinsay, and  $6\frac{1}{2}$  north-north-east of Moul-head in Pomona. It is so deeply and continuously indented by bays as to consist of three large connected peninsulæ, two of which are subdivided into smaller peninsulæ; and it is winged at brief distances by 6 or 7 pasture-islets or holms. Its greatest length from north-west to south-east is  $7\frac{1}{2}$  miles; its greatest breadth is  $6\frac{1}{2}$  miles; and its superficial extent, including the holms, is about 14 square miles. No part of the interior is more than a mile from the sea. Three chief bays with sandy beaches, situated respectively in the east, the south, and the west, are so powdered with low sunk rocks, as to be, on the one hand, unsafe for shipping, and, on the other, advantageous for the growth of the kelp plants. The commodious and safe roadstead of Ling-sound on the west, is sheltered from westerly winds by the islet of Meikle Ling, and from all other winds by the coast or headlands of Stronsay; and the roadstead of Papa-sound on the north-east, is completely landlocked and thoroughly sheltered, but has entrances the one of which is intricate, and the other narrow and dangerous. The Stronsay frith is simply the open sound which washes Stronsay on the east, and Eday and Shapinsay on the west. A narrow lake nearly a mile long lies in the centre of the island; and three or four lochlets lie near the coast. The principal headlands are Huipsness in the north; Griceness and Odness in the north-east; Burrow-head in the east; Lamhness in the south-east; Torness in the south; Rothesholm or Ronsum-head in the south-west; and Linksness in the north-west. Two of these headlands, Torness and Odness, seem to bear in their names a memorial of the ancient Scandinavian devotion to the heathen gods, Thor and Woden. A hilly ridge extends nearly from end to end of the island; and exhibits on its summit and sides, either sheets of short heath, or patches of naked earth, which has been shaven of its dress for the supply of fuel. The soil of this ridge is a dry, black, friable blackish earth; and is incumbent either on clay mixed with small stones, or on a shal-

low gravel. A long belt of pasture ground on the east of the ridge is carpeted with poor grass, but has a deeper soil than the upland, and a subsoil of tough clay. The soil of the other districts is various, and almost all capable of much improvement. A vein of lead ore was discovered last century on the estate of Huiip; but did not prove rich enough to encourage mining. Three mineral springs, situated on the east coast, viewed as one well, and called the well of Kildinguic, are traditionally said to have been in such high repute while Orkney was subject to Denmark, that Danes of the first rank used to cross the German ocean in order to drink their waters. Some tumuli, some Picts' houses, and a building at Lambness, with thick circular walls, are the chief antiquities. In the north-east stands the village of PAPA-SOUND: which see. Population, in 1837, 1,207.

STRONSAY AND EDAY, an united parish in the Orkney Islands. It comprehends the islands of STRONSAY, EDAY, PAPA-STRONSAY, and FARAY, [which see.] and nine holms or pasture isles. Its greatest length is 17 miles; its greatest breadth is about 8 miles; and its area, exclusive of intersecting seas, is about 26 square miles. Population, in 1801, 1,642; in 1831, 1,827. Houses 171. Assessed property, in 1815, £664.—This parish is in the presbytery of North Isles, and synod of Orkney. Patron, the Earl of Zetland. Stipend £210; glebe £14 10s. Unappropriated tithes £20 16s. There are two parish-churches. That of Stronsay was built in 1821; that of Eday, in 1815. Sittings, respectively 500 and 300. A missionary is employed on the royal bounty, and officiates regularly in Eday. Salary £50, with a house, and some other emoluments.—An United Secession congregation in Stronsay was established in 1799. Their meeting-house cost about £400. Sittings 391. Stipend £85, with a manse and garden worth upwards of £10.—An United Secession congregation in Eday was virtually formed in 1828, but had not a meeting-house till 1831. Sittings 308.—A Wesleyan Methodist congregation in Stronsay was established in 1835. Their chapel was built in 1837, and cost about £270. Sittings 418. Stipend £60, nearly all paid from the Wesleyan Conference fund.—The parish-school is in Stronsay; and was attended, in 1834, by only 24 scholars. Schoolmaster's salary £25 13s. 3d., with about £5 fees. A school in Stronsay, supported by fees and by a salary of £15 from the Society for propagating Christian knowledge, was attended, in 1834, by 41 scholars. Other schools are occasionally kept in Stronsay. Two schools for Eday and Faray have an attendance of about 70; and one of them has attached to it a salary of £25 from the General Assembly's committee on education.—An ecclesiastical survey, made in 1837, showed the population of the united parish then to be 2,168; of whom 971 were churchmen, 1,177 were dissenters, and 20 were non-descripits.—The present parish comprehends no fewer than five ancient parishes; Eday and Papa-Stronsay, each consisting chiefly of its cognominal island; and St. Peter's, St. Nicholas, and Lady, consisting respectively of the northern, the southern, and the western sections of Stronsay. Additional to the kirks of these parishes, there were anciently so many as 10 chapels; 4 in Stronsay, one of which was called St. Margaret's kirk; 2 in Papa-Stronsay, dedicated respectively to St. Nicholas and St. Bride; one in Eday; and one in each of the pasture-isles of Linga, Meikle Linga, and Auskerry. The ruins of the majority of these chapels still exist. The old statist, after flinging some interest around St. Nicholas' chapel in Papa-Stronsay, and stating that the edifice was almost entire twelve years before he wrote, says,

with a simplicity which amounts to quaintness and sarcasm, "But the chapel hath been lately demolished by the tenant, in order that he, with the stones of it, might build a new barn."

STRONTIAN, a *quoad sacra* parish in the north of Argyleshire. It belongs *quoad civilia* to the parishes of Ardnamurchan and Morven; and was erected, in 1833, by authority of the General Assembly. Its greatest length is 25 miles; its greatest breadth is 10 miles; and its area is 40,099 acres. Its inhabitants are chiefly small crofters, miners, shepherds, farm-servants, and a few handicraftsmen, all very poor; and they, for the most part, reside in the valley of Strontian. Of this district, says Dr. Macculloch, "I have little to say; the country is wild and uninteresting, though there is grandeur in one scene, in a deep valley which is terminated by the fine form of Scuir-Donald." A chief feature is LOCH-SUNART: which see. Population, in 1836, 1,200. The parish is in the presbytery of Mull, and synod of Argyle. Patron, the Crown. Stipend £120; glebe about £5. The church was built in 1827. Sittings nearly 500. The village of Strontian stands at the foot of its cognominal valley, on the north side of Loch-Sunart,  $\frac{1}{4}$  mile from the head of that loch, 21 miles east-north-east of Tohermory, and 24 south-west of Fort-William. In the vicinity stands Strontian-house, the residence of Sir J. M. Riddell, Bart. of Ardnamurchan, surrounded by dressed and planted grounds. The neat slated cottages of the village, substantially built of granite, and sometimes adorned with parasitic plants, contrast strongly with some turf huts with which they are intermingled, and indicate the neighbourhood of a resident proprietor. These cottages were erected for the use of the miners employed in the celebrated Strontian mines; and the huts previously in existence were purged of their offensiveness, and dressed into comparative beauty. "A complete moral change," says the Inverness Courier, in 1828, "has been introduced into the village. Sir James and his lady insisted mainly on the article of cleanliness, both in and out of doors; and as the hand readily obeys what the heart dictates, the girls soon caught the spirit of the lesson, and were not only neat and tidy themselves, but carried the same principle into their fathers' homes. Dung-hills were speedily displaced from their ancient prescriptive station in front of the door; 'dubs' were filled up; light and air were not wholly excluded; besoms were in constant requisition; and, in short, the huts of Strontian, from being almost literally what Johnson called 'murky dens,' have become neat habitable abodes, almost rivalling the cottages of Goldsmith's beloved Auburn." About the date of this agreeable revolution, the manufacture of straw-plait was introduced by the proprietor, as a means of usefully employing the female, and improving the condition of the whole population; hut, though it seemed for a time to prosper, and employed about 50 females, it proved a failure, and was several years ago discontinued.—The lead mines are situated between 2 and 3 miles up the valley, and northward of the village. They have been of vacillating value, never very profitable, and at times entirely neglected. Yet, whenever they barely paid expenses, they have been of much practical consequence in yielding work and wages to a people whose means of subsistence are few and scanty; and they have, at the same time, occasioned much improvement of small lots of land which, but for them, would have remained in pasture. The mineralogy of the mines is interesting and celebrated: it embraces a great variety of the most rare calcareous spars, with splendid specimens of the staurolite; and it revealed, for the first time to naturalists, the car-

bonate of Strontian, or rather the peculiar elementary earth itself to which the locality has given name. Strontites, or carbonate of Strontian, was discovered here in 1790; and analyzed by Drs. Kirwan and Hope. The colour of the mineral is whitish or light green; its lustre, common; its transparency mediate between semitransparency and opacity; its fracture, striated, presenting oblong distinct concretions, somewhat uneven and bent; its hardness, moderate, resisting being scraped, but easily admitting of being scratched, its brittleness very great; and its specific gravity from 3.4 to 3.644. It tinges flame with a blood-red colour; and disagrees with barytes in its order of chemical attraction, holding a medial rank between that mineral and lime. An hundred parts of it yield by analysis 60.21 of pure Strontian, 30.20 of carbonic acid gas, and 8.59 of water.

**STROWAN**, a parish in Perthshire, united to Blair-Athole. See **BLAIR-ATHOLE**.

**STROWAN**, a parish in Perthshire, united to Monivaird. See **MONIVAIRD**.

**STUIC-A-CHROIN**, a mountain in Perthshire, in the parish of Callander.

**SUDDY**. See **KNOCKFAIN**.

**SULISKER**, a rocky isle of the Hebrides, solitary situated amid a wide waste of waters. Its position seems never to have been accurately ascertained; but is usually said by topographers to be 4 leagues east of North Rona, and 13 leagues north-west of the Butt of Lewis. It appeared to Dr. Macculloch, who sailed close to it, but could not land, to be about half-a-mile in diameter, with a grassy slope toward the north, and a bluff face of 300 feet or upwards toward the south; and to be composed of gneiss traversed by veins of grey and reddish granite. It is inhabited only by sea-birds, principally gannets; and is visited once a-year for the feathers.

**SUMBURGH**, a soaring headland and a whirling sea, at the southern extremity of Dunrossness. The headland is noticed in our article on **DUNROSSNESS**. The sea is called the Roost,—a Scandinavian term for a powerful and tumultuous collision of tidal currents. At Sumburgh-head the rapid tides from the opposite sides of Shetland meet; and even during a calm, and as seen from the headland, produce a tumbling current, careering away toward Fair Isle, at first about 2 or 3 miles broad, and afterwards gradually narrowing to a point, and softening into kindred features with the adjacent glassy waters. The sea, thus always heavy, runs mountain-high during a storm; and in consequence of the rapidity and power of its flood as well as its ebb, has been known, during a calm, to carry a vessel for five successive days in constant alternations between Fitful and Sumburgh heads, all the while washing its deck with almost a continuous stream of waves. There is a lighthouse here in N. lat. 59° 51', and W. long. 1° 16', showing one light, at the height of 300 feet above high water, and visible at the distance of 24 miles.

**SUMMER-ISLANDS**, a group of isles and islets at the entrance of Loch-Broom, on the west coast of the counties of Ross and Cromarty. They amount to about 30; yet only one, Tanera-More, is inhabited, and only 9 or 10 are of sufficient size to be occupied as pastures. They lie at from one-fourth of a mile to 7½ miles distance from the coast; and extend a little upwards of 7 miles from north to south. Tanera-More is about 2 miles long, and 1 broad; and shows an irregular and rocky surface, rising to the height of 400 or 500 feet above sea-level. The other isles are all similarly rocky, but of much less elevation. The whole group are bare; and except where their bluff coasts are worked into caverns and points by the incessant action of the sea,

they possess not one feature of picturesqueness or beauty. "Why they are called the Summer-Islands," says Dr. Macculloch, "I know not; as they have a most wintry aspect, as much from their barrenness and rocky outlines, as from the ugly red colour and the forms of their cliffs." Excepting Carnisker, which is composed of gneiss, they all consist of old red sandstone, whose finer strata irregularly alternate with gravelly and conglomerate beds. The larger isles afford excellent winter-pasturage.

**SUNART**, a district in the extreme north of Argyleshire. Its length is 12 miles, and its breadth 6. It is bounded on the north by Loch-Sbiel; on the east by Ardgour; on the south by Loch-Sunart; and on the west by Ardnamurchan. See **ARDNAMURCHAN**, **SUNART (LOCH)**, and **STRONTIAN**.

**SUNART (LOCH)**, a long inlet of the sea, from the northern entrance of the sound of Mull, eastward to within 5 miles of near the upper end of Loch-Linnhe, in the north of Argyleshire. It separates Ardnamurchan and Sunart on the north from Mull and Morven on the south. Its west end is for 7 miles identical with the sound of Mull; and is described in our article **MULL (SOUND OF)**. Its length inward from the line of identity with the sound is 7 miles; and its breadth, for 5 miles, is generally upwards of 2 miles, but afterwards varies between 3 and 11 furlongs. It contains a number of islets, the chief of which are Oransay, 1½ mile long,—Carnich, nearly 1½ mile long,—and Riska, Dungallan, Garve, and More, all of inconsiderable size. Glen-Tarbert—a rough pastoral valley—extends from its head to Loch-Linnhe, and brings down to it a parliamentary road from Coranferry, whence the communication is continued to Fort-William. About a mile from the head of the lake, and in the vicinity of **STRONTIAN** [which see], stands the inn of Sunart, a good slated house; and at Salin, 5 or 6 miles farther down, occurs another inn. The loch, though little visited, displays along its sides some beautiful scenery. Verdant hills of considerable height rise up from both margins; and bear upon their skirts and lower declivities a large aggregate extent of fine oak-woods, through which, in continuous miles, passes the public road.

**SUTHERLANDSHIRE**, a Highland county, in the extreme north-east of the continent of Scotland. It is bounded on the north by the North sea; on the east by Caithness-shire; on the south-east by the Moray frith; on the south-south-west by the counties of Ross and Cromarty; and on the west by the Atlantic ocean. Its boundaries on three of its five sides are thus, in the highest sense, natural or geographical; and on the east side they consist of a continuous and often lofty mountain-range, which, from end to end, form a water-shed. The county lies within 57° 53', and 58° 33' north latitude, and between 3° 40' and 5° 13' longitude west of London. Its sides, measured in straight lines, give a circumference of 215 miles; the north side extending 50 miles, the east side 37½, the south-east side 32½, the south-south-west side 52½, and the west side 42½. Its area is 2,925 square miles, or 1,872,000 English acres. This area—which is that assigned by Captain Henderson's General View of the Agriculture of Sutherland, published in 1812—is distributed by the same authority into 18,125 English acres of arable land,—43,750 of meadow and green pasture, with some shrubbery,—1,170 of plantations,—1,571,400 of heathy and rocky moors and mountains,—176,100 of peat-moss,—31,360 of sea-lochs,—and 30,080 of fresh-water lakes. Though the relative proportions of arable land, green pasture, and planted woodland, have undergone some change, these measurements may probably be regarded as indicating, with proximate

correctness, the real condition of the county. A modern popular Annual makes the area only 1,754 square miles, or 1,122,560 acres; and manages to distribute it into about 150,000 acres cultivated, 600,000 uncultivated, and 372,560 unprofitable.

Excepting a very narrow and interrupted belt of low ground along the coasts, and some ribbony stripes of alluvium along the banks of the principal streams, the whole county is boldly upland, and lies upon a basis of probably 1,500 feet of mean altitude above sea-level. The mountains along the east are a towering and well-defined chain,—and those along the south-east rise, in every place, within a distance of not more than 2 miles from the sea; and, in both cases, they stretch away, in innumerable ranges and masses, quite to the German ocean. A sort of central chain commences at Ben-Griam-Morc and Ben-Griam-Beg, about 14 miles from the north-eastern extremity, and extends south-westward to Ben-Suilven, very nearly at the south-west extremity; and this chain divides the county into almost equal parts,—forms over its whole length a water-shed between the streams which flow to the north and west, and those which flow to the south-east,—and lifts up numerous summits of from 2,500 to nearly 3,300 feet in altitude, and of remarkable and singular varied contour. The ranges and masses which agglomerate with this, or which wander away in compact or straggling detachments over the rest of the area, are so irregular and mutually dissimilar as to defy the uniting of force and succinctness in any attempt to describe them. Some are solitary, sharp-featured, abrupt and soaring heights with picturesque and occasionally curious outlines; more are broad-based and lumpish masses, spreading their huge bulk in long, broad lines, over a large area; some are so melted and flattened into one another as to form widely-extended stretches of alpine table-land, drearily covered with heath and moss, and unrelieved by a single feature of picture or variety; and most, though at different and sometimes wide intervals, are cloven through their centre, or separated from their fellows; by rugged glens and hollows, by bold passes and openings, or by beautiful and romantic valleys. The western district, comprising Assynt, Edderachylis, and part of Durness, is one of the most remarkable in the kingdom for constant inequality and ruggedness of upland surface, and for a profuse and rapid interlacing of rocky heights and fresh-water lakes. The northern district, comprehending part of Durness, all Tongue and Farr, and the Sutherland part of Reay, possesses to some extent a similar character to the former; but goes off in the interior into broad, smooth, and moorish upland expanses, and is relieved along the coast by an open tract of arable land in Durness, by the exquisitely scenic semicircular vale of Tongue, by the long and beautiful valley of Strathnaver, and by the green and bounteous though tame valley of Strath-Halladale. The south-eastern district, while exhibiting more or less of the various features which we have ascribed aggregately to the county, possesses a large extent of rich pasture-ground, and, in a general view, is cut into five somewhat parallel elongated sections of high hills by the long and pleasant valleys or glens of Helmsdale, Broca, Shin, and Oikel. The south-east sea-board, over a breadth of from one-fourth of a mile or less to 2 miles, is an opulent tract of low ground, luxuriant in produce, beautiful in cultivation, and exultant in embellishment.—The chief mountains of upwards of 2,000 feet in altitude, are Ben-More-Assynt, 3,431 feet high; Ben-Klibreck, 3,164; Ben-Hope, 3,061; Fionaven, 3,015; Ben-Hie, 2,858; Ben-Spiunne, 2,566; Ben-Laoghal, 2,508; and Ben-Armin, 2,306.

The principal bays and sea-lochs on the western coast, enumerating them from the south northward, are Loch-Inver, Loch-Row, Clashneslie-bay, Loch-Assynt with its offshoots, Loch-Nedd, Loch-Ardvare, Kyle-Seow, Loch-in-Ohan, and Edderachylis-bay, Scourie-bay, Loch-Laxford, Loch-Dougel, Loch-Inchard, and Sandwood-bay. The principal on the north coast, reckoning eastward, are the Kyle of Durness or Grady, Loch-Eriboll, the Kyle of Tongue, the bay of Torrisdale, Farr-bay, Armadale-bay, the bay of Strathy, and Port-Skerry. The only noticeable indentations on the south-east coast are a small creek at Helmsdale, and the large inlets of Loch-Fleet, and the Dornoch frith.—The coast along both the west and the north presents beadlands and numerous cliffs of the boldest character, often picturesquely grand, and sometimes highly impressive and even terrific. Ru-Store and the Point of Store, in near vicinity to each other, are the chief beadlands on the west; Cape-Wrath forms the north-west point of Sutherlandshire, and, at the same time, of the continent of Scotland; and Far-Out-head, Whiten-bead, and Strathy-head, are the chief promontories on the north. The south-east coast, except at the boundary with Caithness, where the stupendous Ord falls precipitously down from mountain-altitude to the depths of the sea, is all flat, with a prevailing sandy shore, and, in general, departs from the straight line only in brief and gentle curvatures.—The sea-girt islands belonging to the county lie all within the sea-lochs, or along the western and northern coasts, nowhere at a distance of more than 2 miles; and, though very numerous, and in some instances inhabited, they are all so small as aggregately to possess a very inconsiderable area. Handa, which is the largest, is also the most remarkable; see HANDA. This island, though composed chiefly of old red sandstone, presents the appearance, at a little distance, of columnary basaltic cliffs, whose columns are disposed in horizontal lines parallel with water-level, and possessing all the regularity of artificial formation.

The streams of Sutherlandshire are very numerous; but as they are all indigenous, and, excepting those on the southern boundary, receive no other affluents than such as rise and flow like themselves in the interior, they possess, in dry weather, but a small body of water. Only the Oikel and the Fleet, and these but for short distances, are navigable; but all the larger ones are valuable for their salmon-fishings. Those which flow westward to the Atlantic have short courses through wildly broken districts, and along shelving and disrupted beds, and are remarkable chiefly for their turbulence, impetuosity, and display of cataract and cascade. The principal are the Kirkaig on the boundary; the Inver in Assynt; and the Laxford and Inchard in Edderachylis. The streams which run northward to the North sea are more various in character; and in the instances which we shall name, they perform runs of from 12 to 30 miles,—the Dionard or Grady, and the More or Hope in Edderachylis and Durness,—the Borgie or Torrisdale, between Tongue and Farr,—the Navver and the Strathy in Farr,—and the Hallodale in Reay. The streams in the south-east, flowing to the Moray frith, drain very nearly one-half of the county; and, in several instances, are comparatively large and long, and not a little beautiful. The chief are the Helmsdale, with its affluent the Ellic; Broca, with its grand tributary formed of the united streams of Skinsdale and Strathbeg; the Fleet, opening into the cognominal sea-loch; and the Oikel, swelled by the rival river Shin, and by the large affluent, the Cassley.—The lakes of Sutherlandshire are very numerous; several are large; many are romantic,

picturesque, beautiful, or otherwise scenic; most are well-stored with trout,\* and a few are curious either from position or from traditional association. Those of the first class as to size are Lochs Shin, Hope, Laoghal, Assynt, More, and Naver;—those of second class size, or of length from 2 to 4 miles, are Lochs Vattie, Faun, Cama, Merkland, Stack, Maddie, Ullaball, Na-Cayn, Baden, Furan, and Brora. A chain of these lakes, consisting of Shin, Merkland, More, and Stack, together with a smaller lake called Griam, almost continuous with Shin, extends north-westward from a point within 10 miles of the navigation of the Dornoch frith, to a point within 3 miles of the head of Loch-Laxford; and as it leaves intervals of land, none of which measures more than 2 miles, and at the same time sends off a large connecting stream with the navigation of the Dornoch frith, it forms a deep water-line between the eastern and the western seas quite similar in character to that which occupies the Glenmore-nan-Alhin, and forms the natural and chief part of the Caledonian canal. Assynt alone contains about 200 lakes of noticeable size, besides numerous ponds and tarns; and most of the other districts of the county abound more with them than almost any other part of continental Scotland. The most scenic of all the lakes are Assynt, Brora, Hope, Shin, Maddie, and some small ones in the district of Assynt. A remarkable subterranean lake occurs in the great and wondrous cave of Smoo: see DURNESS.—In every part of this rocky county are numerous springs of pure, limpid, salubrious water. The most singular hursts from the mountain Glasvein, on the north side of Loch-Assynt, 500 feet above the level of the lake; it never freezes, and discharges, all the year round, a nearly uniform volume of water; and it emits, even at midsummer, a rapid current 15 inches deep, and 3 feet wide.

Though Sutherlandshire is so wildly mountainous, and lies three degrees farther north than East Lothian, it almost bears comparison, in some properties of its climate, with that genial and hainy county. The spring may be a fortnight later in commencing, and the autumn may terminate a fortnight earlier; but the summer is quite as warm, if not warmer, and the winter is not colder. The south-east coast, not only along the sea, but up the Dornoch frith and the lower Oikel, is so well-sheltered by the frontier Highland hills from northerly and westerly storms, and so amply protected by the stupendous umbrella of the whole uplands from the moistures of the North sea and the Atlantic, that the inhabitants complain, during the summer-months, of having too little rather than too much rain, and see their crops growing up with such little atmospheric disturbance as often to attain an insufficient height of stalk for the free operation of the sickle. The interior of the county, and the western and northern coasts, are exposed to frequent rains and storms from the oceans, and have a raw coldness proportionate to their humidity. The prevailing winds blow from the north-west and west, and bring rain to the districts which they first sweep, but dry weather to the great seat

\* The trout differ from each other so much in the various districts, as to warrant the suspicion that more than one species is included under the common name of trout. By many ichthyologists, the different appearances of trout are all referred to *S. Entis*, with a most extensive range of variation; but the subject appears yet to require investigation. Many of the trout in these lochs are of very fine quality. In most of the larger lochs, particularly in the district of Assynt, the great lake trout, *S. Ferax*, was found. This fish is noticed by several of the British writers upon fish, but only as a variety of the common trout. It is distinct, and with good characters. It reaches a weight of 25 pounds. It inhabits only the larger Scottish lochs,—Loch-Awe, Shur, Loyal, Assynt, &c. Its food is almost exclusively fish; the flesh very coarse, of a yellowish white colour.

of the population, the south-east sea-board. Winds from the Moray frith, as they blow in the opposite direction, make a reverse distribution of humidity and drought.

Granite is a comparatively scarce rock in Sutherlandshire; and occurs rather in dikes and veins than in independent masses. Its presence occasionally, as at Cape-Wrath, is part of a singular lapideous compound, in which a schistose or stratified rock, akin to gneiss, is intersected in all directions with granite veins of probably different ages. Syenite, though more frequent and less subordinate, is not plentiful. Hornblende rock and hornblende schist occur in the west; and, besides being there beautiful substances in themselves, contain such interesting minerals as tremolite, actynolite, tourmaline, shorl, and garnet. Gneiss is greatly the prevailing rock throughout the uplands; and, in general, it forms the great chains of round-headed and broad-based mountains, yet shoots out on the north-west coast into bold and precipitous headlands. Micaceous schist is extensively developed in Tongue and Durness. Primary granular limestone abounds in Assynt and Durness, and exists, in considerable quantities, generally in the west. The marbles here formed by this rock display a considerable variety of colour, streak, and cloud; yet have not obtained much reputation among marble-cutters. Quartz rock forms detached mountains in the west; and, as well as the gneiss and the micaceous schist, is occasionally veined with granite and porphyry. Primary or old red sandstone extends in a wildly rugged hand along the west coast to near Cape-Wrath, forming stupendous mural-faced heights, or hugely-volumed broken mountains; and, after being cut off for a brief space by gneiss, it immediately reappears on the north coast, shoots ruggedly up at several points along the broken line of that coast, and, after becoming united at Port-Skerry to a coarse conglomerate, passes on the confines of Caithness into continuous fields of stratified sandstone,—the basis of the Caithness geognostic formations. The primary, or old red sandstone, also constitutes some of the loftiest mountains in the interior, and imparts to them a sharpness, ruggedness, and holdness of contour, which contrast picturesquely with the prevailing gneiss heights in their vicinity. A series of oolitic and lias deposits commence immediately south of the Ord of Caithness, and extends along the south-east sea-board; and a great mass of them have been so upraised by immediately subjacent granite, while neighbouring masses lie upon brecciated old red sandstone, as to indicate a priority in the date of their own formation to that of the upheaving of the granite. These deposits occupy a tract of about 20 miles in length, and 3 miles in extreme breadth; and are cut into three sections, in the valleys respectively of Navidale, Loth, and Brora, by the advances upon them of the mountains which skirt their landward side, and consist partly of red conglomerate, and chiefly of unstratified porphyritic granite. More geological interest attaches to this tract, especially to that part of it which lies in the south, and has obtained the name of the Brora coal-field, than probably to any other in Scotland; and a series of interesting papers descriptive of it, were written by those eminent geologists, R. J. Murchison, Esq., and the Rev. A. Sedgewick, and published in the Transactions of the Geological society.

The soils of Sutherlandshire are less various than those of most territories of its size in Scotland. Loam, as a primitive earth, or in any other sense than as a vegetable mould, occurs only on the farms of Dunrobin, Skelbo, and Skibo. A deep bluish clay carpets part of the vale of Loth; clay of various complexions and depths occurs in small patches in

several low lying farms; and clay, covered to the depth of a foot with dry, barren sand, occurs in many parts of Strathfleet. A purely alluvial or haugh soil carpets some low grounds upon the margin of streams; and, in general, is light and sandy. A reddish gravel, a light hazely vegetable mould, a shallow gritty sand, an ochre-coloured unproductive clay, a diluvium of gneiss mixed with peat, and a moorish or sandy peat earth, all differing less from one another than these designations might seem to imply, and reducible in classification to sandy and light hazel loamy soils, variously cover the low grounds of the interior straths and glens. Sand, with or without a mixture of small pebbles, and worked by culture and manuring into a dark-coloured vegetable mould, is the prevailing soil on the thickly-peopled south-eastern sea-board. Moss or peat, from 18 inches to 10 feet deep, all covered with heath, and lying at too great a height upon the levels and hollows of the mountains to admit of much or any georgical improvement, covers no less than 580 square miles, or 371,200 acres. A very large proportion of the vast mountain-district may be regarded as an irretrievable Highland wilderness. A band, 10 miles broad, and situated next the south-eastern belt of lowland, is covered with a stunted brown heath, slightly intermixed with ling or moss, and has, in general, a subsoil of gneiss or conglomerate; but, on some of the declivities skirting the straths, it has such a subsoil of sand, or of a gravelly kind of clay, as might sufficiently bear plantation. A broad band along the south, going off at right angles from the former, and extending far to the west, and also a large part of central districts of the county, have a considerable proportion of coarse grass, esculent heaths, ling, and grass, among the coarse strong heaths, and afford good pasture for sheep and cattle. The greater part of the west is so rugged, rocky, and stern, that, except in the wild ravines and glens, very little vegetation of any sort can be discovered; and, in particular, 300 square miles or upwards, in the south-west, are a tract of all but utterly naked mountains, so torn in themselves, and so intersected by rocky gorges and hollows, that they look as if they had been shattered by some great convulsion of nature, and consigned to terrific and perpetual sterility. The northern mountains, though less naked, are often bare near the summit, and exhibit elsewhere a studding of crags among their heath. The 18,125 English acres, or 14,500 Scottish acres, which Captain Henderson estimated as arable in 1812, are distributed by him into 190 Scottish acres of clay, 1,120 of sandy soil, 100 of peat-moss, and 13,090 of a mixture of sand, gravel, and black earth, which may be deemed a light hazel loam.

We have stated, in our article on the HIGHLANDS, [Vol. I. p. 792,] at how late a date agricultural improvements were commenced in Sutherlandshire, how energetically they were carried on, and how speedily they were brought to a noble maturity. The county's total want of roads, the excessive ruggedness of its surface, its frequent intersection by dangerous friths, and by rapid flood-bearing rivers, its nearly total encompassment by strong natural boundaries, and its position in the far north, away from every point of landward access, rendered it greatly more secluded than any other Highland county, and at once repelled the approach of strangers, and greatly limited the internal intercourse of its own people. The feudal power which elsewhere lingered long in the Highlands, and was with difficulty subdued, had necessarily superior energy and wider scope in Sutherlandshire, and continued to be unbroken long after some other Highland districts were totally revolutionized. The Earls of Suther-

land and Caithness, though fiercely and often engaged in their own particular feuds, seldom and slightly, during the early periods of Scto-Saxon history, took part in the kingdom's concerns, or seemed to be affected by its excitements and changes. The abolition of hereditary jurisdictions, the diffusion of the English language, the introduction of manufactures, the encouragement of fisheries, the dissemination of enlightened views on sheep and field husbandry, the drafting of population as emigrants to foreign countries, the opening up of territory by roads, the introduction of carts and improved implements of culture, and the diffusion of general knowledge and sound principles of social order, which had effected complete ameliorations in some parts of the other Highland territories; and were in the course of effecting them in the rest, continued, for some years after the commencement of the present century, to be quite or nearly as far from affecting Sutherlandshire as in a comparatively remote age. When the Earls of Sutherland no longer required to levy troops for prosecuting feudal contests, they raised for the service of Government one of those corps which have been aptly designated family regiments; and being far from the seat of royal or ministerial influence, and all but totally inaccessible by its instruments, they continued, from the very necessity of their position, to be the feudal, or at least the patriarchal chiefs of their people. A superabundant population continued, in consequence, to be maintained and fostered; the cessation of feuds, and the reign of peace and social security, greatly quickened the ratio at which the native population increased; and the enlargement of farms, and conversion of arable grounds into sheep walk, in the Highland counties on the south, drove hither as refugees not a small extraneous population, who were averse to emigrate, and possessed in the aggregate much less than the mean proportion of industrious and enterprising habits which characterized their countrymen. The county could not fail, from these causes alone, to be very rapidly and quite destructively over-peopled; and, in addition, it became the retreat of numerous Highlanders from the south, who were expatriated for idleness or misdemeanours, and of numerous tenants in Ross-shire and other adjoining counties, who dishonourably removed in order to escape the payment of due or arrear rent. Exactly those evils which had for centuries half-harsharized the Highlands, thus became rampant and violent in Sutherlandshire at the very time when they were elsewhere becoming tamed or subdued. A hardy but indolent race swarmed up the straths and over the mountain sides; they lacerated and scourged almost every spot of earth which could be made to yield a miserable crop of oats for the support of life, or a stunted crop of hear for the distillation of whisky; they lounged lazily on the heath or around their stills, leaving to their wives and daughters most of the heavy work of both house and field; and, except in building a hut, in breaking ground for the reception of seed, in cutting turf for fuel, and in doubtfully pursuing the moorland game, they were unserviceable to their families, and mere incumbrances to themselves and their country. Misery, in its most squalid and haggard aspect, could not fail to make the speedy and thorough acquaintance of such a people. Even the cultivation of the potato, which might have seemed to promise valuable aid by the abundance of the root's produce, and the facility with which it adapts itself to poor and bleak soils, only for a time provoked a greater density of population, and a more reckless indulgence of idleness, and then, shrinking beneath the early frosts of the mountains, or driven into sterility by skilllessness and

excess of culture, frequently failed to fructify, and entailed on the multitudes who chiefly depended upon it the appalling disaster of a general famine. The noble family of Sutherland and Stafford—who may be said to own the county, and at least possess by far the larger and more valuable part of its lands—afforded munificent relief to starving thousands during various years of famine; but they felt that, till a radical and sweeping change should be effected in the ruinous social system on their lands, they were only soothing misery with stimulants which would eventually increase it, and they boldly conceived, and energetically carried into execution, the plan which we have noticed in our article on the Highlands. Yet they drove to foreign countries and to the Lowlands probably no larger a proportion of the population than most other Highland improvers, and certainly a much smaller proportion than some; and they offered every facility and encouragement to the crowds who were expelled from the interior straths and the mountain sides, to settle comfortably on the coasts, and, at the same time, expended princely sums on the construction of roads, the building of neat houses, the georgical improvement of the warm and low lands upon the sea-shores, and various other means of ameliorating the condition of both the country and the people. The suddenness of the change, the disregard of private feeling with which it was accomplished, and the all but entire depopulation of many a fine glen which figured in the fancy of many an ardent constitution in all the brilliant tints imparted by love of country, were perhaps the only circumstances which might have profitably been softened. Though many of the quondam tenants of the hills who now inhabit the coast, still cherish feelings of irritation against the noble family who achieved the revolution, “more impartial judges perceive a want of due consideration by them of all the circumstances of the case, and properly give weight to opposite statements, corroborated as they now unquestionably are, by a kind, liberal, and public-spirited course of conduct.” The change, in its great features and bold character, had as yet affected only the greater part of Sutherland proper, or that which excludes REAY’S COUNTRY: See that article. But in 1829, the Duke of Sutherland, then Marquis of Stafford, acquired by purchase the large estates of Lord Reay; and he promptly reacted in the west and north-west the same great scene which had figured all over the Sutherland estates. The system of agriculture now practised by tenants of the arable farms in any part of the county, is not excelled by that of the most favoured parts of Scotland; and even at an early stage of the Marquis of Stafford’s georgical innovations, results were so rich and indicative of skill, that lessons were carried from them for adoption in England. The improved aspect of the county, however, extends as yet to but a small distance from the coasts. The upland country, and its enclosed straths and glens, are now disposed in large pastoral farms, some of which let for from £2,000 and £3,000 of rent each, and are held by emigrants from the south of Scotland. Cheviot sheep are the staple produce, as to both fleece and carcass; and are variously estimated in number at 170,000 and 200,000. “The new modes of improvement,” say the Messrs. Anderson, in 1834, “have not yet had time to prove their efficacy; and it seems not yet sufficiently understood, whether the system of extensive grazings and sheep-farms have benefited either the landlords or tenants, or whether its present apparent advantages are likely to be permanent.”

The cotton manufacture was at one time introduced to Sutherlandshire; but it failed. See SPINNINGDALE. The importing of dressed flax from the

Baltic, and the spinning of it into yarn, produced for a series of years about £3,000 a-year; but the trade was destroyed by Buonaparte’s continental system. The manufacture of woollen stuffs was conducted to a sufficient extent for home consumption, and the partial supply of Caithness. Kelp was manufactured in the Reay country to the value of about £3,000 a-year. All manufacture, except in a very restricted sense, may be regarded as now extinct. The commerce of the county consists principally in the exchange of sheep, wool, black cattle, and fish, for woven fabrics and colonial produce. The salmon-fisheries at the mouths of most of the rivers are of considerable value, and, in some instances, are particularly noted. The lobster-fisheries of the west have had some repute; the cod and ling fisheries of the north are of growing importance; and the herring-fisheries of Helmsdale are extensive and prosperous. Fairs are held at Dornoch, Torrisdale, Golspie, Brora, Bonar-Bridge, Duilish in Kildonan, Pitentrail in Rogart, and Knockglass in Clyne.—The only town or royal burgh is Dornoch, the capital of the county. The chief villages are Bonar-Bridge, Golspie, Brora, Port-Gower, and Helmsdale, all on the south-east coast. The smaller villages are Inver and Scourie on the west, and Tongue, Torrisdale, Strathly, and Port-Skerry on the north. But burgh, villages, and hamlets are all on a meagre scale.—The chief mansions are Dunrobin-castle, Tongue-house, the seats of the Duke of Sutherland [see DUNROBIN and TONGUE]; Rosehall in Strathoikel; and Criech, Skiho, and Embo on the south-east coast.—The chief antiquities are COLE’S CASTLE [which see]; Dun-Dornadil, or Dornadilla’s-tower, in Durness; vestiges of dunes or Picts’ houses; and some large cairns and assemblages of tumuli. Sutherlandshire, though the last district on the continent of Scotland which was provided with roads, enjoys now the singular privilege of having excellent highways without so much as one toll. One road, sending off various transverse main lines, and numerous small ramifications, extends along the whole south-east coast, and is approached by way of both Meikle-ferry and Bonar-bridge; a second goes from Bonar-bridge, up Strathoikel, and through Assynt, to the west coast at Inver; a third branching off from the second, 3 miles above Bonar-bridge, passes up the Shin, and along the great chain of lakes, to the west coast at Scourie; a fourth, branching off from the third  $1\frac{1}{2}$  mile above the church of Lairg, runs northward to the head of Loch-Naver, and there forks into three lines which run respectively north-westward to Durness-hay, northward to Tongue, and north-north-eastward to Farr-kirk and hay; a fifth runs in the direction of north by east from Bonar-bridge to Port-Skerry, and is joined, in the earlier part of its route, by 4 lines from the south-east coast, and one from the roads in the interior; a sixth goes from Helmsdale, up the strath of Helmsdale river, is joined by a line from Loth, strikes, at 15 miles from Helmsdale, the northerly line from Bonar-bridge, and passes on to a junction with the Farr road in Strathnaver; a seventh comes in from Caithness on the north coast, and runs along to Tongue; and an eighth strikes off from the Durness road near the head of the Kyle of Durness, and passes along the west coast to Kyle Scow. The principal facilities for interior travelling and conveyance are wheeled vehicles for the mail and passengers along the south-east coast, on the Great North road, south to Wick and Thurso; along the north coast, on the road from Thurso to Tongue; and right through the country, between Tongue and Golspie.—Sutherlandshire comprehends the *quoad civilia* parishes of Assynt, Clyne, Criech, Dornoch, Golspie, Kildonan, Lairg, Loth, and Rogart, and the

*quoad sacra* parish of Stoer, which constitute the presbytery of Dornoch; the *quoad civilia* parishes of Durness, Eiderachylis, Farr, and Tongue, and the *quoad sacra* parishes of Kiulochbervic and Strathy, which constitute the presbytery of Tongue; and part of the *quoad civilia* parish of Reay, which belongs to the presbytery of Caithness;—all in the synod of Sutherland and Caithness. The Duke of Sutherland is joint patron with the Crown of Criech, and sole patron of all the other *quoad civilia* parishes in the presbytery of Dornoch, and of the parish of Farr. The Crown is patron of all the other parishes. In 1834, there were 13 parochial schools, conducted by 15 teachers, and attended by a maximum of 1,067 scholars, and a minimum of 430; and 43 non-parochial schools, conducted by 45 teachers, and attended by a maximum of 2,038 scholars, and a minimum of 701.—Sutherlandshire, till some time after the abolition of hereditary jurisdictions, formed part of the sheriffdom of Caithness. The county sends one member to parliament. Constituency, in 1838, 134. Quarter-sessions are held at Dornoch on the first Tuesday of March, May, and August, and the last Tuesday of October; justice-of-peace small-debt-courts are held on the first Tuesday of every month at Dornoch, and the first Wednesday of every month at Brora; and sheriff's small-debt-courts are held in April and October at Tongue, Lairg, and Port-Gower. The valued rent, in 1674, was £26,093 Scottish; and the real property as assessed, in 1815, was £33,878. Population, in 1811, 23,629; in 1821, 23,840; in 1831, 25,518, in 1841, 24,666. Houses, in 1841, 4,821.

The earldom of Sutherland, a title to which that of Duke of Sutherland in the peerage of the United Kingdom was recently added, is asserted to be the most ancient existing peerage in Britain, and at least has for ages been the premier carldom of Scotland. Hugh Freskin, the first undoubted figurant in connexion with it, or with its subsequent possessors, came into Scotland from Flanders, in the reign of David I., and obtained from that prince the lands of Strathbrock in Linlithgowshire. Hugh probably acted an astute and valorous part in subduing the Moraymen at their insurrection in 1130; and, in guerdon of his services, he acquired from his royal master some of the richest lands in the beautiful and fertile plain of Moray. William Freskin, the former's eldest son and heir, received additional grants of land; and Hugh Freskin, William's eldest son, acquired the broad estate of Sutherland, which was forfeited by the Earl of Caithness by his rebellion in 1197. Whether this Hugh obtained, along with the estate, the title of Comes or Earl, seems a matter of dispute. His son, however, "Willielmus Dominus de Sutherlandia, filius et hæres quondam Hugonis Freskyn," unquestionably died Earl of Sutherland about the year 1248; and he is usually reckoned the 1st Earl, and is said to have obtained the peerage from Alexander II., about 1228, for assisting to crush a powerful northern savage, of the name of Gillespie. William, the 2d Earl, was with the Scottish armies at Bannockburn and Brigland, and wore his title during the long period of 77 years. Kenneth, the 3d Earl, fell at the battle of Halidon-hill in 1333. William, the 4th Earl, married the second daughter of King Robert Bruce; and made grants to powerful and influential persons of numerous lands which he held in the counties of Inverness and Aherdeen, to win their support of his eldest son John's claim to the succession to the Crown. John was selected by his uncle, David Bruce, or David II., as heir of the throne; but he died in England, while a hostage there for the payment of the King's ransom. William, the brother of John, and the 5th

Earl, fought at the battle of Otterburn. Of the four succeeding Earls, nothing of public interest is recorded. Elizabeth, the sister-german of John, the 9th Earl, Countess of Sutherland in her own right, and the tenth person who held the earldom, married Lord Ahoynne, and was succeeded by her son, John, who was poisoned in 1567 at Helmsdale. See **LOTH**. The next four Earls were each the son of the preceding. John, the 16th Earl, figured conspicuously both as a statesman and as a soldier, and obtained leave to add to his armorial bearings the double 'tressure circoufeurdire,' to indicate his descent from the royal family of Bruce. Elizabeth, the infant daughter and only child of William, the 18th Earl, who died in 1766, succeeded in that year to the earldom, yet a sharp contest to her right was conducted, on the ground that the title could not legally descend to a female heir, and terminated in her favour by an adjudication of the House of Lords in 1771. The Countess, the nineteenth person in the line of succession, married, in 1785, George Granville Leveson Gower, Viscount Trentham, eldest son of Earl Gower, afterwards Marquis of Stafford, by his second wife, Lady Louisa Egerton, daughter of the 1st Duke of Bridgewater. His lordship succeeded to his father's titles, became the second Marquis of Stafford; and, in 1833, he was raised to the dignity of Duke of Sutherland. The Duchess of Sutherland, Countess in her own right, held the earldom during the long period of 72 years and 7 months, and died in January, 1839; when she was succeeded by her eldest son, George Granville, the present Duke. As Marquis of Stafford, the Duke claims descent, by his father's paternal line, from the Earls of Bath, and the youngest son of Rollo, Duke of Normandy, and, by his father's maternal line, from the princess Mary, the second daughter of Henry VII.

**SUTORS OF CROMARTY.** See **CROMARTY-FRITH**.

**SUURSAY**, a small Hebridean island in the sound of Harris. It lies  $2\frac{1}{2}$  miles south-south-east of Benera, and  $1\frac{1}{2}$  mile north-north-east of Hanbeg in North Uist. It is between 2 and 3 miles in circuit.

**SWANSTON**, a small village on the lower declivity of the Pentlands, in the parish of Colinton, 5 miles south-south-west of Edinburgh. Population, in 1834, 110.

**SWEETHEART-ABBEY.** See **NEWABBEY**.

**SWIN (LOCH)**, an inlet of the sea, on the coast of Argyleshire, opposite the island of Jura. It is  $10\frac{1}{2}$  miles long, and from 5 furlongs to 2 miles broad. It runs up north-north-eastward, in a line slightly divergent from that of the coast, so as to enclose a long and very slender peninsula; and it flings out several long, narrow arms, in lines nearly parallel to its own direction, so as to peninsula various belts of hill-ground on its coasts. At its entrance lies a cluster of islets; on one of which are well-preserved remains of an ancient chapel and vaulted cell, with an elegant and curiously sculptured sarcophagus. A series of abrupt and lofty hills encompasses the loch; and they terminate in rocky and deeply indented shores, and, over much of their declivity, are opulently wooded. The scenery is striking and full of character. On the east shore, about 2 miles from the entrance, stand the fine ruins of Castle-Swin.

**SWINNA**, or **SWONA**, a small island of Orkney, belonging to the parish of **SOUTH RONALDSHAY**: which see. It lies on the north side of the Pentland frith, off the entrance of Scalpa-Flow,  $1\frac{3}{4}$  mile west of Barth-head in South Ronaldshay, and 3 miles south-east of Cantick-head in Walls. It is about  $1\frac{1}{4}$  mile in length, and less than half-a-mile in mean

breadth. Its inhabitants—about 80 in number—are supported chiefly by the fisheries, and by piloting vessels through the circumjacent whirling seas. In its neighbourhood are the whirlpools, called the Wells of Swinna. See **PENTLAND-FRITH**.

**SWINTON AND SIMPRIN**, an united parish in the district of Merse, Berwickshire. It is bounded on the north by Fogo, Edrom, and Whitsome; on the east by Ladykirk; on the south by Coldstream; and on the west by Eccles and Fogo. Its greatest length from east to west is  $3\frac{3}{4}$  miles; its greatest breadth is  $2\frac{3}{4}$  miles; and its superficial extent is about 5,400 acres. The surface is a series of gentle ridgy elevations from east to west, with intervening flats. The soil in general is clayey, deep, and fertile; but, in a few places, is marshy. Excepting about 70 acres which are waste or permanently disposed in pasture, and about 50 acres which have been devoted to plantation, all the area is regularly in tillage, and exhibits the rich agricultural appearance for which the Merse in general is distinguished. The small river Leet flows southward between level banks, and is much subject to freshets. The new red sandstone lies beneath most of the parish, and has been extensively quarried.—The village of Swinton stands a little north of the centre of the parish, on the north road between Kelso and Berwick, and derives importance from being at about equal distances between these towns, and a place of stay and refreshment to travellers. A number of coal-carters and others, who have no connection with the land of the parish, are among its inhabitants. It has a good inn, a friendly society, and two annual fairs. In 1836, its population was 446. The village of Simprin is extinct.—Swinton-house—about a mile south-west of the cognominal village—is an elegant modern edifice, the successor of a mansion of great antiquity. The family of Swinton, the owners of this seat and of the parochial manor, date up for about 800 years to the period of the heptarchy, and at the dawn of record appear as possessors of the soil. They are said—but on evidence little better than traditional tattle—to have originally acquired the inheritance for their bravery in clearing the country of swine; and they afterwards made a conspicuous figure in the reign of Malcolm Canmore, assisting that monarch to recover the Scottish throne, and, in the person of Edulf de Swinton, received from a charter, which was one of the first granted in Scotland, and which is still preserved in the archives of Durham, confirming to them the property of the whole parish of Swinton. Sir John Swinton, one of the harons of the line, and son-in-law of King Robert II., figures in Fordun's history as the chief victor at Otterburn; and he met his death at the battle of Homildon in 1402, after such feats of bravery and amid such circumstances of interest as furnished Sir Walter Scott with a ready and plastic subject for his dramatic sketch of 'Halidon-hill.' Another of the family, the son of the former, signalized himself by deeds of bravery in the wars of France, and is said to have unhorsed the Duke of Clarence, brother of Henry V., at the battle of Berrenger. A second Sir John Swinton, jointly with other barons, subscribed a bond to assist James VI. against the Earls of Bothwell and Hume. The family incurred forfeiture, for a short time, by taking part with Cromwell, but were restored to their possessions immediately after the Revolution. John Swinton, Esq., better known as Lord Swinton, and the predecessor thrice removed of the present proprietor, was distinguished as a patriotic member of the College of Justice, and has the fame of having suggested the division of the Court-of-session into two chambers. Sir Walter Scott's grandmother was a daughter of

this very ancient and celebrated house. The estate, since the era of agricultural improvement, has been skilfully and patriotically attended to by its successive proprietors, and, owing to the disposal of its small aggregate of plantation in rows and belts, it has a finely wooded appearance. The parish is traversed by the north road between Berwick and Kelso, the road between Coldstream and Dunse, and various subordinate roads. Population, in 1801, 875; in 1831, 971. Houses 228. Assessed property, in 1815, £8,700.—This parish is in the presbytery of Cbirnsidc, and synod of Merse and Teviotdale. Patron, the Crown, Stipend £230 16s. 1d.; glebe £50. Unappropriated teinds £654 1s. 10d. The church was built in 1593, altered in 1729, and enlarged by the addition of an aisle in 1782. Sittings 366. A census by the minister in 1834, showed the population then to consist of 783 churchmen, 84 dissenters, and 3 nondescripts,—in all, 870 persons. Schoolmaster's salary £34 4s. 4½d., with £14 10s. fees, and £10 other emoluments. There is a non-parochial school.—The ancient church of Swinton was for some time a vicarage under the monks of Coldingham. In 1296, William de Swinton, the vicar, and probably a brother of the lord of the manor, swore fealty at Berwick to Edward I. Simprin is separately noticed. See **SIMPRIN**;

**SYMINGTON**, a parish in the north-west of Kyle, Ayrshire; bounded on the north by Dundonald; on the north-east by Riccarton; on the east by Craigie; on the south by Monkton; and on the west by Monkton and Dundonald. Its length from east to west is about 4 miles; its breadth is about  $1\frac{1}{2}$  mile; and its superficial extent is about 4,000 acres. The surface is a pleasing diversity of gentle rising grounds and sloping fields, frilled over with enclosures, broadly gemmed with plantation, and finely decorated with gentlemen's demesnes. The higher grounds, including the site of the village, command a prospect of the greater part of Ayrshire and the frith of Clyde. The soil is in general clay, or a rich black loam, on a sandstone bottom. Excepting about 300 acres of plantation, nearly the whole area is in tillage. Sandstone and whinstone are quarried,—the former as building material, and the latter as road-metal. Limestone occurs, but cannot be profitably worked. Coal was at one time mined, but has been abandoned.—The village of Symington, is an irregular but delightfully situated aggregation, of houses on a rocky ground or gentle eminence in the centre of the parish, 7 miles south-east of Irvine, and the same distance north-north-east of Ayr. Its population is about 280. The parish is traversed through the village by the Glasgow and Portpatrick railroad. Population, in 1801, 668; in 1831, 884. Houses 148. Assessed property, in 1815, £6,178.—Symington is in the presbytery of Ayr, and synod of Glasgow and Ayr. Patron, Lady M. Montgomery. Stipend £246 11s. 9d.; glebe £12. Unappropriated teinds £553 5s. Schoolmaster's salary £34 5s. 10½d., with £50 fees, and £2 5s. other emoluments. There is a non-parochial school. The parish-church is old and of unknown date, but has been repeatedly repaired.—Both this parish and the Lanarkshire Symington derived their name, originally written Symonstoun, from Symon Loccard or Lockhart, who held the lands of both under Walter the 1st Stewart, and was the progenitor of the Lockharts of Lee and other families of the same name. The church of the Kyle-Symington was granted to the convent which was founded at Feil or Faile in Kyle during the year 1252, and continued to be a vicarage till the Reformation.

**SYMINGTON**, a small parish in the upper ward of the county of Lanark. It is bounded on the

north and east by the Clyde; on the north-west by the parishes of Carmichael and Covington; and on the south-west by the parish of Wiston. The figure approaches to the oblong, and it is about 3 miles in length by nearly  $1\frac{1}{2}$  in breadth. The arable land lies along the banks of the Clyde, and the pasture reaches to the top of the well-known hill of TINTO: which see. The village is situated at the foot of a rising ground, called the Castle-hill, and is about 30 miles south-west of Edinburgh, and 33 south-east of Glasgow. Biggar is the nearest market and post town. There are about 4 miles of turnpike-roads in the parish, and a stage-coach from Edinburgh to Dumfries passes through it daily. Symington is, in every sense of the word, a quiet, rural parish; but should the Great Western line of railway from England to Edinburgh and Glasgow be carried forward, it may impart a degree of bustle and animation to the district to which it has hitherto been a stranger, for it is here that, according to one plan, the diverging lines from the main trunk are intended to branch-off to these two cities.\* Population, in 1801, 308; in

1811, 364; in 1821, 472; in 1831, 489; and, in 1841, 470. Assessed property, in 1815, £1,984.—The parish is situated in the presbytery of Biggar, and synod of Lothian and Tweeddale. Patron, Sir Norman M'Donald Lockhart of Lee and Carnwath. Stipend £164; glebe 10 acres, value about £15.—The age of the church is not known, but it was extensively repaired in 1761; and an addition was subsequently built, though it is still in a very imperfect state. It accommodates about 300 sitters. The parochial schoolmaster's salary is £34, with about £15 of school-fees. The hill of Tinto, as has been stated, forms the prominent feature in the parish. On the south-east side of it, the remains of an ancient place of strength, named Fatlips-castle, are still seen. Several tumuli have been found in the parish. In one of them, opened some years ago at the base of Tinto, were found the remains of a human body entire, with the exception of the head; and as the grave was unusually short, it has been presumed that the body was interred after decapitation. Urns have been found in others of the tumuli.

\* If Carlisle is made the starting-point, the line preferred is that which runs along the course of the Annan and Clyde by Lockerby, Beatoek-bridge, Symington, Lanark, and Hamilton, to Glasgow. Two plans are proposed for a branch-line to Edinburgh:—One from Symington, near Biggar, along the south side of the Pentland-hills; and one from Thankerton,  $2\frac{1}{2}$  miles north-west of Symington, running by the north side of these

hills to a point in the Edinburgh and Glasgow railway, 7 miles west from Edinburgh. The branch from Symington is considered preferable to the other. The actual distance by this line is 31 miles, 30 chains; the equivalent distance 33 miles, 69 chains. By Thankerton, the actual distance is 37 miles, 41 chains; equivalent distance 44 miles, 24 chains.

RAILWAY VIADUCT OVER THE VALLEY OF THE ALMOND.

*From a Sketch by D. M. Mackenzie.*

## T

TAIN, a parish on the northern border of Ross-shire; bounded on the north by the Dornoch frith; on the east by Tarbat and Fearn; on the south by Logie-Easter; and on the west by Edderton. Its greatest length from east to west is between 9 and 10 miles; its breadth at a peninsula which runs into the frith at Meikle-ferry, is about  $4\frac{1}{2}$  miles; and its mean breadth elsewhere is about 3 miles. The coast, from end to end of the parish, has nearly the figure of a crescent, and encloses the bay of Tain. It is, in general, low and flat, nowhere rising to a greater altitude than 15 feet; it is sandy, curved, and indented; and, suffering constant erosion from the sea, it may be viewed as a broken sand-hank. Along the skirt of its eastern half, a tract of sand, in some places from a mile to 2 miles broad, is alternately dry and covered with the tide. Shoals and sunk banks embarrass the whole frith opposite the parish, and render navigation quite impracticable to strangers, and but limitedly practicable by the most skilful local pilots. The chief bank, called the Gizen-Briggs, runs from coast to coast, with the exception of a narrow and difficult channel through its middle; and, whenever northerly or easterly winds blow, or sometimes even during a calm in frosty weather, it flings up a roaring and violent surge. A small hank in the middle of the frith, 2 miles above the Gizen-Briggs, furnishes very large supplies of mussels, and is notable for having, in 1783, during a great scarcity of bread, furnished such immense quantities of cockles as contributed to the support of multitudes of human beings over the adjacent country. So comparatively recent has been the conquest of these banks and the adjacent sea-grounds from the solid territory both of Tain and of the opposite coast that, in the words of the New Statistical Account, "although the frith now measures several miles across, the remarkable fact has been preserved by tradition, that it was at one time possible to effect a passage over it at low water upon foot, by means of a plank thrown across the channel where narrowed to a few feet" by promontories which have been worn into the long sunken hank of the Gizen-Briggs. MEIKLE FERRY [which see] is at the extreme west. A small trouting stream, absurdly dignified with the name of the river Tain, comes in from the west, and makes a circuit round the burgh to the frith. Springs of excellent water are numerous. The surface of the parish consists of three well-defined districts;—a belt of low flat plain along the coast, about half-a-mile in mean breadth, and partly disposed in public links or downs; a broad sheet of land, of middle character between a terrace and a hanging plain, receding from hank or escarpment of about 50 feet above the level of the plain, and displaying rich embellishments of wood and culture; and a ridge or series of gentle uplands along the exterior frontier, sending up their loftiest summit in the hill of Tain to an altitude of nearly 800 feet above sea-level. The soil is variously deep and light, fertile and barren; and the hills are partly heathy, and partly clad with forests of pine. The geognostic formation of the lowest grounds indicates an alternation of conquests and abandonments by the sea; that of the central district shows a prevalence of red clay with numerous holders of granitic gneiss; and that of the hills is entirely sandstone,—apparently the old red, though principally of whitish colour. The sand-

stone is extensively quarried in the hill of Tain. The chief mansions are Ankerville and Little Tarrel. The fishing village of Inver, with a population of about 150, stands in the extreme east, 4 miles from the burgh. Chief roads diverge from the burgh toward Dingwall and Bonar-bridge; and subordinate ones toward Portmahomack, and in three directions between south-east and west. Population, in 1801, 2,277, in 1831, 3,078. Houses 627. Assessed property, in 1815, £2,293.—Tain is the seat of a presbytery in the synod of Ross. Patron, Mackenzie of Cromarty. Stipend £281 5s. 7d.; glebe £9. Unappropriated tithes £280 4s. The church was built in 1815. Sittings 1,200. A catechist for the parish is supported by the Society for propagating Christian knowledge. Schoolmaster's salary £44 10s. with fees. Additional to the parish-school, there are 6 schools, conducted by 8 teachers, and attended by about 350 scholars. One of these schools is an academy, to be noticed in the article on the burgh; another is a boarding-school for females; another is a society's school in the landward district; another is a private school for females; and two are private English schools.

TAIN, a small but prosperous town, and an ancient royal burgh, stands about  $\frac{1}{4}$  of a mile from the Dornoch frith, in the centre of its cognominal parish,  $11\frac{3}{4}$  miles north by east of Invergordon,  $25\frac{1}{2}$  north-north-east of Dingwall, 47 north by east of Inverness,  $72\frac{1}{2}$  south-west of Wick, and 113 south-south-west of Thurso. It extends along the margin of the terrace or central district of the parish; and is a little upwards of half-a-mile in length, and about  $\frac{3}{4}$  of a furlong in mean breadth. Its plan and its architecture are so irregular, and, at the same time, so tame and unattractive, that any attempt to describe them would be a waste of words. Yet it contains many good new houses; it has a promise of embellishing extension, both from the disposal of a considerable space of ground in building-fees, and from the project of a new street entrance on the south; and it is encompassed with rich and cheerful fields, and overlooks, along the sea-beach, a beautiful promenade of links. A handsome town-house and jail, built in 1825, were accidentally so far damaged by fire as to be rendered useless and unsightly, yet not to an extent to injure the walls. An ancient tower, surmounted by five spires or tall pinnacles, and used as the jail, stands agglomerated with this pile, and forms the principal feature in the burghal landscape. The academy of the burgh, built about 30 years ago, is one of the neatest and most tasteful edifices of its class in the north; and has attached to it a spacious play-ground, ornamented with wood and shrubbery, and enclosed with a wall and iron palisade. This institution is conducted by a rector and two masters; it is enriched with a choice and valuable assortment of chemical and mechanical apparatus; and it imparts so much importance to the burgh as to have attracted a number of families as residents for the sake of their children's education. The church is a heavy but substantial building, without a tower. A previous church, built in 1471, and dedicated to St. Duthus, needs only a little interior repair to be still used as a place of worship, and was abandoned solely on account of its not affording sufficient accommodation. Its form is haudsome, its windows are Gothic; one of its doors is

surmounted by an effigies in bas-relief of St. Duthus; its walls are of great strength, and its interior is enriched with a beautifully carved, though partially defaced, oaken pulpit, presented to the burghers by "the good regent Moray," for some unrecorded display of zeal in the cause of the Reformation. A chapel, also dedicated to St. Duthus, and of very ancient date, stands in ruin on a swell in the sandy plain, which formed the site of the original town. This ruin, though now roofless and neglected for four centuries, is so strongly cemented in its masonry as to remain in a surprising degree of preservation. The edifice enjoyed the privilege of sanctuary; and, in connexion with the fame of its saint, had distant and illustrious visitors. In 1427, Mackay of Creich, who had an inveterate feud with the laird of Freswick, and drove him to take refuge within its walls, scouted the idea of its sacredness, poured derision on its rights, and reduced it by fire to nearly the skeleton which it remains. In 1527, just a century after its destruction, James V. made a pilgrimage on foot to it from Falkland; and travelled with such expedition that he paused to recruit his strength only a short time at the priory of Pluscardino. A rough footpath across the moor in the uplands of the parish is traditionally pointed out as the route by which he approached, and still bears the name of the King's causeway. The only establishments connected in any sense with manufacture, are an iron foundry, a brewery, and 4 mills respectively for grinding, sawing, carding, and dyeing. A small trade by sea is conducted in the import of coal and lime, and the export of fir-props for coal-pits; hut, as it enjoys no better facility than a dry berth for vessels on the broad helt of sand between tide-marks, it very generally gives place to a land-communication with Cromarty and Invergordon. A domestic trade of comparative importance arises from Tain being the market-town for a considerable part of both Easter Ross and Sutherlandshire. The weekly markets are held on Tuesday and Friday; and annual fairs are held on the first Tuesday of January, the third Tuesday of March and October, the Wednesday after the second Tuesday of July, the Wednesday after the third Tuesday of August, and the Tuesday before Christmas. The town has branch-offices of the British Linen company's bank, the Commercial bank of Scotland, and the North banking company; a public reading-room; and three friendly societies; and is the seat of three or four religious and charitable associations for Easter Ross or the county.—The burgh is governed by a provost, two bailies, a dean-of-guild, a treasurer, and ten councillors. Municipal constituency, in 1839, 82, in 1841, 90. The burgh-property consists principally of lands, partly let on lease, and partly feued. About £37 13s. are annually derived from customs and market-dues. In 1833, the total revenue was £314 0s. 8½d.; and the expenditure £495 5s. 0½d. In 1841, the corporation revenue was £296. The only assessments are stent for the land-tax and the statute-labour money; the former nominal, or paid out of the common good, and the latter amounting to £60. The town-officers are eight, elected by the town-council, and aggregately salaried on £83 7s. The town-council elect also the teachers of the parish-school, an English school, and the female hoarding-school; and pay to them respectively £22 4s. 5d., £10, and £20 of salary. There are no trades' corporations; and no burghs derives private advantage from the public good. Fees for burghs-ship arbitrarily vary from £1 10s. to £5 5s. The police is managed by the magistrates, and maintained from the common funds. Tain unites with Wick, Dingwall, Cromarty, Dornoch, and Kirkwall, in sending a member to par-

liament. Constituency, in 1840, 86.—"As a burgh," say the commissioners on municipal corporations, "Tain lays claim to very high antiquity, hut no charter older than 1587 has been recovered. Its claims to antiquity rest upon an inquest dated 20th April, 1439, according to which it was found that the 'immunity' was first founded by the deceased most illustrious King of Scotch, Malcolm Canmore, of blessed memory,—and 'that, afterwards, the foresaid immunity was confirmed by various Kings and illustrious Princes, viz., David the Bruce, Robert, his grandson, and, last, Robert, son of Robert I.; and that the said inhabitants in the town of Tain have and had full and free power and privilege to buy and sell all goods whatsoever within the four angular crosses of the said immunity; and that they have never paid, neither shall they pay, on any account, any contribution to the Kings of Scotland, nor to the Earls of Ross, except the custom to our Sovereign Lord the King; and, lastly, that it is lawful to all the inhabitants within the said immunity to work and navigate, with all their merchandize and goods whatsoever, everywhere at their pleasure, without any contradiction or further demand, by virtue of the privilege of the after-mentioned immunity, as it shall appear most expedient to them.'" The writer of the New Statistical Account, reasoning from this document, and quoting another part of it which states Tain to have been "under the special protection of the apostolic see," conjectures that the town "may have been a chief seat of the hishopric of Ross, after its foundation by David I., the son of Malcolm, in the 12th century." In 1306, the queen and daughter of Robert Bruce, when his fortunes were at the lowest, fled from the fortalice of Kildrummie in Mar for sanctuary in the old chapel of the town; hut were remorselessly dragged thence by the Earl of Ross, and delivered to the English. In 1481, ten years after the erection of the church of St. Duthus, the hishop of Ross, at the instance of James III., rendered it collegiate for a provost, 11 prebendaries, and 3 singing-hoys.

TALLA. See MONTREITH (LOCH OF).

TALLA-WATER, a rivulet of the parish of Tweedsmuir, Peebles-shire. It rises in three head-streams all on the boundary with Dumfriesshire, is fed not far from the source of one of the head-streams and the superfluent waters of Gameshope-loch; and runs 7 miles northward, and northward to the Tweed at Tweedsmuir-church. It is a cold wild mountain stream, yet comparatively sluggish.

TAMINTOUL. See TOMANTOUL.

TANAR (THE), a small river on the south-west of Aberdeenshire. It rises among the Grampians, within one or two hundred yards of the boundary with Glenmark in Forfarshire; and flows 11 miles north-eastward, through the parishes of Glenmuick and Aboyne, to the Dee 1½ mile south-west of Aboyne-castle. Its chief affluent is Gairney-burn. The glen which it traverses takes from it the name of Glentanar; and, over much of its extent, is very richly wooded. An ancient parish, of which the lower half of the glen formed part, and to which it gave name, is now united to ABOYNE; which see.

TANERA-MORE AND TANERA-BEG, two of the SUMMER-ISLANDS; which see.

TANNADICE, a parish a little north of the centre of Forfarshire. It is bounded on the north by Lethnot; on the north-east by Fearn; on the east by Careston; on the south by Aberlemno, Oathlaw, and Kirriemuir; and on the west by Cortachy. Its greatest length, from north to south, is 12 miles; its mean breadth over the northern half is not more than 4 miles; its greatest breadth is 8 miles; and its superficial extent is 60 square miles, or 38,400 acres.

The South Esk, ploughing its way between romantic and beautiful banks, forms, over a great distance, the western and southern boundary-line, and cuts off a wing of the parish on the south. The NORAN [which see] has most of its fine course either in the interior or along the eastern boundary. The southern district is part of the rich and beautiful territory of Strathmore, but is more undulated and otherwise diversified than many other parts of the strata. The central and northern districts rise in hilly and undulating ridges to the lower acclivities of the Grampians, and become over 3 or 4 miles a congeries of heights, whose summits rise 800 or 900 feet above sea-level. St. Arnold's seat, a conspicuous hill in the van of the congeries, has on its top a large cairn, and commands a gorgeous view of all Angus and Fifeshire and most of the Lothians, away to the Pentlands and the Lammermoor hills. The uplands are to a large extent heathy and almost wholly pastoral; and they maintain about 2,400 Linton sheep. The arable grounds have, in general, a good soil, inclined to clay, and are well-enclosed and sheltered with wood. Clay-slate occurs near the northern frontier, but not of such quality as to be productively worked. A coarse marble occurs in thin seams in the west. A red coarse sandstone seems to lie beneath most of the parish, and is quarried at various places, chiefly for building enclosures. A broad dike of trap traverses all the interior from east to west. A stratum of iron pyrites, at the depth of  $1\frac{1}{2}$  or 2 feet from the surface, in a small hollow surrounded with moorish ground, and called the Deil's Hows, has repeatedly exhibited the phenomenon of spontaneous combustion, and thrown out from its vicinity pieces of earth 150 or 160 stones in weight. On the north side of the Esk, near the site of the present bridge of Sheathill, anciently stood Quiech-castle, the residence of the Earls of Buchan. The site, now without a vestige of the castle, and occupied by a plain cottage, is a precipitous rock, looking sheer down through deep and yawning chasms, upon a rush and turbulence of water, and almost isolated and rendered nearly inaccessible, and altogether romantic, by the river. In the vicinity of Achlouchrie, an eminence which still bears the name of Castle-hill, and overhangs a deep gorge of the river, and has round its base a semicircular fosse 12 feet deep and 30 feet wide, was the site of another ancient but extinct castle. There are in the parish two spinning and several splash-mills, worked in subordination to the manufactures of Montrose and Dundee. The village of Tannadice stands on the left bank of the South Esk, near the southern extremity of the parish,  $5\frac{1}{2}$  miles north of Forfar, and  $6\frac{1}{2}$  north-east of Kirriemuir. It is the site of the parish-church, and has a library and a savings' bank. Its population, in 1836, was 140. The parish is traversed by the post-road between Perth and Aberdeen, by two other considerable roads, and by various indifferent subordinate roads; but, in its north end, it has, over a considerable space, no road whatever. Population, in 1801, 1,373; in 1831, 1,556. Houses 282. Assessed property, in 1815, £4,788. Tannadice is in the presbytery of Forfar, and synod of Angus and Mearns. Patron, St. Mary's college, St. Andrews. Stipend £141 10s. 1d.; glebe £16. Unappropriated tithes £23 19s. 7d. The church is of unknown age, and was altered but not enlarged in 1748. Sittings 570. In 1836, all the parishioners, except six, belonged, according to the statement of the minister, to the Establishment. In 1834, there were 8 schools, seven of them non-parochial. Salary of the parochial schoolmaster £34 4s.  $4\frac{1}{2}$ d. with fees, and from £14 10s. to £20 10s. other emoluments; of another teacher £8; of a third, not quite so much; and of

a fourth, meal and milk, with a neat cottage and garden. These three partially endowed schools are for females, and afford tuition only in English and needlework. One of the remaining non-parochial schools is a boarding-school.

TANTALLAN-CASTLE, a noble and celebrated ruin on the coast of Haddingtonshire; 3 miles east of North Berwick, and 8 miles north-west of Dunbar. It stands on a lofty, precipitous, and projecting rock, whose base is washed on three sides by the sea; and on the west side, where alone it is accessible, it was defended by two ditches of extraordinary depth, and by very massively constructed towers. The entrance was over a drawbridge, through a strong and deep stone-gateway. The castle itself is, in its outer structure, still comparatively entire, but wholly unroofed and in a state of desolation. Its interior is a maze of broken staircases, fragmented and ruined chambers, and deep and dismal subterranean dungeons. So strong was the castle in position, and so skilful in construction, that, previous to the invention of gunpowder, it poured derision upon every effort or scheme for its capture; and situated directly opposite to the Bass, at a distance of  $1\frac{1}{2}$  mile across a frequently tumbling sea, its redoubtability of character gave rise to the pithy popular saying, "Ding doon Tantallan? Mak a brig to the Bass." Sir Walter Scott, in his *Marmion*, thus beautifully describes its former condition:—

"Tantallan vast,  
Broad, massive, high, and stretching far,  
And hold impregnable in war.  
On a projecting rock it rose,  
And round three sides the ocean flows,  
The fourth did battled walls enclose,  
Aod double mound and fosse;  
By narrow drawbridge, outwards strong,  
Through studded gates, an entrance long,  
To the main court they cross.  
It was a wide and stately square,  
Around were lodgings fit and fair,  
And towers of various form,  
Which on the coast projected far,  
And broke its lines quadrangular;  
Here was square keep, there turret high,  
Or pinnacle that sought the sky,  
Whence oft the warder could descry,  
The gathering ocean-storm."

*Canto v. stanza 33.*

The date of the castle and the circumstances of its erection are unknown. It comes into notice with the rising and bold fortunes of the family of Douglas, who obtained the barony of North Berwick on the accession of Robert II.; and during centuries it was the principal stronghold of their proud and domineering Earls. In 1479, twenty-four years after the Douglas forfeiture, Archibald, 5th Earl of Angus—the well-known 'Bell-the-cat'—received a grant of it from James III.; and he afterwards so figured in connexion with it, as to have furnished subjects for some of the most graphic delineations of Scotland's national literary linner. The next Earl of Angus, after he had married the queen-mother of James V., and lost influence over the person and councils of that young monarch, shut himself up in Tantallan, and defied for a time the whole hostile force of the kingdom. The monarch went in person to reduce it, sat down before it in September 1528, and borrowed from the castle of Dunbar, to aid him in his operations, two great cannons, called "Thrawn-mouth'd Mow and her Marrow," also "two great bosards and two moyan, two double falcons and four quarter-falcons," for the safe redelivery of which to their owner, the Duke of Albany, three lords were impignorated at Dunbar. Yet, in spite of his great preparations and formidable efforts, James was compelled to raise the siege; and he afterwards obtained possession of it only by Angus fleeing to England, and by a compromise being made with Simon Panango, the governor.

After James V.'s death, the Earl obtained leave to return from his exile; in 1542 he was restored to his possessions, and began to make Tantallan stronger than before; and here, about 1557, he terminated his career. In 1639, the doughty and resolute Covenanters, provoked at its lord, the Marquis of Douglas, making a stand in it for kingcraft and compelled preclacy, at length "dang doon Tantallan," and even garrisoned it against the king. About the beginning of the 18th century, Sir Hew Dalrymple, president of the Court-of-session, bought the castle, along with the circumjacent barony, from the Duke of Douglas, dismantled it, gave it up to decay, and transmitted it as a ruin to his heirs.

TARANSAY, an Hebridean island, of the Harris group, and in the parish of Harris, Inverness-shire. It lies off the entrance of West Loch-Tarbert;  $1\frac{1}{4}$  mile distant from Ru-Grodnish, and also from Aird-Nisibost, in Harris. Its length from east to west is  $4\frac{1}{2}$  miles; and its extreme breadth is upwards of 2 miles. It consists of two peninsulated hills, probably 800 feet in height, and connected by a narrow sandy isthmus. Though inhabited, it has little soil; and its population are supported chiefly by fisheries and the manufacture of kelp. The hills consist of gneiss, traversed by veins of granite. A verdant islet near the coast is frequented by vast flocks of wild geese.

TARBAT, a parish in the extreme north-east of the counties of Ross and Cromarty. It is bounded on the north by the Dornoch frith; on the east and south-east by the Moray frith; and on all other sides by the parish of Fearn. Its greatest length is  $7\frac{1}{2}$  miles; its greatest breadth is  $4\frac{1}{2}$  miles; its circumference is  $19\frac{3}{4}$  miles; and its area is 5,081 acres. Its form, over  $5\frac{1}{2}$  miles of its length, is that of a slender peninsula, extending north-eastward, and diminishing in breadth from  $1\frac{3}{4}$  mile to a point. The coast is 15 miles in extent; and is for the most part bluff and rocky, but not high. A rocky precipice, about 20 feet in height, faces the south-east at Geanies; and extends, thence, with diminished altitude to the entrance of the Dornoch frith. Of five caves which perforate it, one can be entered only on all-fours, but presents in the interior a spacious apartment, naturally henced round with stone; and another is entered by a stately natural porch projecting several feet from the adjacent rock, and conducts a visiter along an extensive corridor to three successive vaulted apartments. Along the coast are six natural harbours, and a number of small creeks. The chief harbour is at the village of PORTMAHOLMACK: which see. One of the creeks, accessible only to a boat, and at high-water, is at the extreme point of the peninsula; and, owing to a tradition that a fort anciently stood on a moat within it, hears the name of Castlehaven. From this place the 1st Earl of Cromarty took one of his titles of nobility, and transferred it to the old family seat of Tarbat, now called Castlehaven. The surface of the interior is a plain, diversified by low rising grounds. The soil is prevaillingly light and sandy; yet, over a considerable extent, is a deep black loam. Plantations cover about 170 acres; and, though old, are stunted and meagre. A weaving and spinning hemp-factory, helonging to a company in Inverness, employs about 300 women and 9 or 10 men and boys. There were formerly six castles, inhabited, till about the beginning of the 17th century, by ancient and respectable families; and one of them, which still survives, and belonged first to the Earls of Ross, and next to the Earls of Cromarty, though it has been abandoned for two centuries, is one of the largest and best preserved structures of its class in the north. The only modern mansion is that of Geanies. For

the state of the roads, see PORTMAHOLMACK. Population, in 1801, 1,343; in 1831, 1,809. Houses 378. Assessed property, in 1815, £2,121.—Tarbat is in the presbytery of Tain, and synod of Ross. Patrons, the Crown and Mackenzie of Newhall. Stipend £251 2s. 10d.; glebe, not stated. Unappropriated teinds £500 12s. There are two parochial schools. Salary of the first master, £25, with £5 fees; of the second, £5 as session-clerk, and £5 fees.—The parish was all in Ross previous to the erection of Cromarty into a separate jurisdiction; but, since that event, it is about equally divided between the two counties. There were anciently three subordinate chapels. The ruin of one exists; and near another, are a copious spring called Mary's well, and a small grotto, entering beneath an ivy-clad rock, and pointed out as the abode of the priest.

TARBATNESS, the point of the peninsula of the above parish,—the headland which splits the waters of the Dornoch frith from those of the Moray frith, sweeping round to form the frith of Cromarty. On this narrow and far-projecting point has lately been erected an elegant lighthouse.

TARBET, or TARBERT, a name applied to numerous places in Scotland, chiefly where there are such narrow necks of land between opposite indentations of sea or lake, as afforded in the primitive state of Scottish navigation an easy portage for currachs and boats.

TARBET (EAST AND WEST), two deep indentations of the sea on the opposite coasts of Harris, approaching each other to within  $\frac{1}{4}$  of a mile. See HARRIS. East Loch-Tarbet is  $5\frac{1}{4}$  miles long, and from  $4\frac{1}{2}$  to nearly 2 miles broad; it forks at the head into two slender bays; and it emhosoms several islets, and has the considerable island of Scalpa at its entrance. West Loch-Tarbet is 6 miles long, and diminishes in breadth from  $4\frac{1}{2}$  miles to nearly a point; it is screened from the fierce west winds by Taransay; and it is overhung by lofty mountains, which stoop precipitously down to its margin. At its head stands the solitary village of Tarbet, the seat of a mission on the Royal bounty.

TARBET (EAST AND WEST), two sea-lochs on opposite sides of the great southern peninsula of Argyleshire, approaching each other to within a mile, and, together with the narrow isthmus between them, separating Kintyre from Knapdale. A stragem of Magnus Barefoot, in carrying a galley across the isthmus, so as to have the appearance of circumnavigating Kintyre, occasioned that district to be included among the Hebrides: see KINTYRE. Three ancient castles are said to have existed for the protection of the isthmus, one in the centre, one at the head of the West loch, and one on the south side of the East loch. The last still survives in stately ruin; and is the subject of fond and eager popular traditions. The West loch opens 13 miles due east of Ardmore point in Islay; extends, in nearly a straight line, north-eastward; and measures 11 miles in length, and about  $\frac{3}{4}$  of a mile in mean breadth. Over all its extent it has the calm and smiling aspect of a fresh-water lake, and is picturesque and lovely. Three islets stud it in its progress; soft and moderately high hills recede in gentle and waving ascents from its margins; woods and enclosures and cultivation fling their images upon its waters; and a profusion of cottages, farm-houses, villas, and mansions, with the villages of Laggavoulin and Kilcalmonell, sit joyously upon its banks. At its head is a pier or quay for the accommodation of the Islay steam-packet. The East loch is of small size,—only about a mile long, and nowhere more than about 3 furlongs broad; but it is a curious and singularly safe and landlocked natural harbour, and is entered by so

narrow and circling a passage between low ridges of naked rock, that a steamer, in sailing through it, appears to a stranger to be irretrievably launched against the crag. On its south side near the head is a steam-boat quay; and both here, and all over the inner space of the loch, may be seen in the fishing-season, a very numerous fleet of herring-boats. The steamers from Glasgow to Lochgilhead and Inverary regularly call at this harbour; and a regular steamer from Islay to the head of the West loch, communicates with them by portage across the isthmus. Behind the quay, and around the head of the East loch, stands the neat, picturesque, and crowded village of Tarbert. So nakedly and tumultuously rocky is the whole encircling scene, that the inhabitants, though numerous and seemingly well-fed, obviously derive none of their subsistence from the arts of husbandry. Tarbert, in fact, is the grand seat of the celebrated Loch-Fyne herring-fishery; and, additional to its own population, it is the resort, during the fishing-season, of several hundreds of stranger fishermen. In the village are two comfortable inns. The district around the village, and the connecting isthmus of the lochs, was, about 66 years ago, erected into a mission by the synod of Argyle. Its extent, within the limits of erection, is about 9 miles in length, 3 miles in breadth, and 25 square miles in breadth. Its population, in 1834, was 1,635; of whom 961 belonged to the parish of Kilcalmonell, and 674 to that of South Knapdale. The chapel is situated nearly in the centre of the district, and was built in 1775. Sittings 400.

**TARBERT**, a boldly sinuous glen, about 9 miles in length, from a point near the head of Loch-Leven, to about the middle of the east side of Loch-Eil, in the south-west corner of Lochaber, Inverness-shire.

**TARBERT**, a glen between Lochs Sunart and Linnhe. See **SUNART** (LOCH).

**TARBOLTON**, a parish in Kyle, Ayrshire; bounded on the north by Craigie; on the east by Mauchline; on the south by Stair and Coylton; on the south-west by St. Quivox; and on the west by Monkton and Symington. Its length is between 7 and 8 miles, and its breadth about 6. It lies about 5 miles from the sea-coast, and has an aggregate elevation above sea-level higher than the medium height of the county. Its ancient condition was rude and wild, bare, heathy, and blotched with marshes. But though naturally churlish, and abounding in inequalities, it has long since received, through the medium of industrious and skilful cultivation, robings of verdure and mellowing grain, and thriving wood, which render it not only pleasant but ornate. The prime department of industry has long been the management of cattle for the uses of the dairy. The river Ayr, trotting along between picturesque and romantic banks, traces the southern boundary. The rivulet Faile flows through the interior to the Ayr, driving mills, and beautifying the landscape. The chief mansions are Coilsfield, Smithstone, Afton-lodge, Drumley, Carnigillan, Enterkin, and Privick. Within the beautifully ornamented grounds of Coilsfield are a traditional battle-scene, and a rude stone held in veneration as the monument of the seemingly fabulous personage, "Auld King Coyle." In the vicinity of the village is a mound called Hood's-hill, which seems to have been a Danish encampment and fortification. The parish is traversed eastward by the road from Ayr to Edinburgh, and southward by that from Glasgow to Kirkcudbright by way of Dalmellington and the Glenkens. Population, in 1801, 1,766; in 1831, 2,274. Houses 367. Assessed property, in 1815, £12,890.—Tarbolton is in the presbytery of Ayr, and synod of Glasgow and Ayr.

Patron, the Earl of Eglinton. Stipend £244 7s. 9d.; glebe £4 10s. Unappropriated tithes £753 10s. 7d. The church, and also a United Secession meeting-house, are situated in the village of Tarbolton. In 1834, the parish school was attended by 40 scholars; and three private schools by 163. Parish schoolmaster's salary £29 18s. 10½d., with about £16 fees.—Though the ancient church was twice granted to the monks of Faile, it did not remain with them, but continued to be a free rectory; and, in 1429, it was erected into a prebend or canonry of the cathedral of Glasgow. The present parish comprehends the larger part of the ancient parish of Barnwell, and the whole of the ancient parish of Tarbolton. Barnwell was a vicarage under the monks of Faile; and, lying between Tarbolton and Craigie, was, in 1653, annexed, in separate portions, to these parishes. The church stood a little north of the old castle of Barnwell, and, after the suppression of the parish, was allowed to go to ruin; but it is still commemorated in the names of a mansion and one or two farms. At Faile or Feil, in the Tarbolton section of Barnwell, and on the rivulet of the same name, a convent of Red or Trinity Friars, who pretended to be canons-regular, was founded in 1252. A ford across the rivulet at the place was called Faileford,—a name now given to a locality near the rivulet's embouchure; and a lake in the vicinity was called Lochfaile. Spottiswoode, misled by this clustering of cognate names round one locality, exhibits in his catalogue of religious houses, three several establishments, under the designations respectively of Faile, Faileford, and Lochfaile, the first of which he makes a cell of Cluniac monks belonging to the abbey of Paisley, and the second and the third convents of Red Friars. The three supposed establishments, however, were, in reality, only one. The chief of this convent bore the designation of "minister;" and he was provincial or head of the Trinity order in Scotland, and, in that capacity, had a seat in parliament. The convent possessed 5 parish-churches, Barnwell, Galston, and Symington in Kyle, Torthorwald in Annandale, and Invercholain in Cowal. In 1562, Robert Cunningham, the minister, gave up as the rental £174 6s. 8d. in money, 15 chalders of meal, 3 chalders of bear, 30 stones of cheese, 10 young sheep, 3 bullocks, and 24 salmon. William Wallace, who was minister during the reign of James VI., died in 1017; and his son William seems to have considered the monastery, and what remained of its property, as his inheritance. In October, 1690, William, Earl of Dundonald, was served heir of his father in the benefice of Faile or Faileford temporaliter et spiritualiter. The ruins of the convent still exist ¼ mile north-north-west of the village of Tarbolton. An old satirical poem says of the friars of Faile, that they "ne'er wanted ale as lang as their neebors' lasted."—On the 15th August, 1581, when Esme Lord D'Aubigny was created Duke of Lennox, one of the titles given him was Lord Tarbolton.

**TARBOLTON**, a considerable village and a burgh-of-barony, stands near the centre of the cognominal parish, on the right bank of the rivulet Faile, at the intersection of the Ayr and Mauchline, and the Kilmarlock and Dalmellington roads; 4 miles west of Mauchline, 7 north-east of Ayr, 8 south of Kilmarnock, and 12 south-east of Irvine. It extends over a considerable area, and contains a number of neat houses. The parish-church, with an elegant spire and neat in its own structure, is not a little ornamental. Weaving, in various departments of cotton, woollen, and silk, is carried on to such extent as to have employed, in 1828, 122 looms,—a number which continued in 1838, and which were all plain. The

village has a subscription library, two mason lodges, several benefit societies, a horse-race in August, and annual fairs in June and October. In 1671, by a charter of Charles II., it was erected into a free burgh-of-barony, with the privilege of holding a weekly market. Population, in 1811, about 750; in 1821, 1,350. Tarbolton, and its immediate vicinity, abound with reminiscences of the poet Burns. On the farm of Lochlea, in the neighbourhood, he resided from his 17th to his 24th year as an inmate of his father's family. In 1780, the village became the scene of a club which he organized. "The Tarbolton-lodge of Free-masons," to which he addressed a well-known "Farewell," inserted among his works, still exists, and derives from his notice of them a notoriety which men of different views will regard as highly flattering, or as deeply the reverse. His extraordinary piece entitled "Death and Doctor Hornbook," is said to have been written after attending a meeting of this lodge, and with the view of burlesquing a person of the name of Wilson, who united the vocations of parish schoolmaster and a vender of medicines. Coilsfield-house,  $\frac{3}{4}$  of a mile south-east of the village, is the "Montgomery-castle" of Burns, the waters around which he pathetically desiderated might "ne'er be drumlie," and it was at the time when the bard wrote, the residence of Colonel Hugh Montgomery, who, in 1797, became 12th Earl of Eglinton; and Mary Campbell, the dairy-maid or "byres-woman" at Coilsfield, was the personage whom, primely with the aid of one of the most thrilling of the rich melodies of Caledonia, and one borrowed from uses of a previous damsel of the name of Catherine Ogie, he sang into notice under the well-known name of "Highland Mary."—The small village of Faileford stands  $1\frac{3}{4}$  mile east-south-east of Tarholton, at the confluence of the Faile and the Ayr; and, commanding an ample supply of the famous Water-of-Ayr stone, is the seat of a considerable manufactory of razor bones and strops.

TARF (THE), a beautiful rivulet of Kirkcudbrightshire. Of two principal head-waters, one called Anstool-burn rises in the parish of Balmagbie, and the other called Glengap-hurn issues from Loch-Whinyeon, on the boundary between Girtton and Twyneholm. These, flowing respectively south-south-eastward and eastward, form the Tarf, 3 and 4 miles below their respective sources; and their united stream, afterwards augmented by seven or eight small burns, runs southward through the interior, and along the western edge of Tongueland, to the Dee,  $1\frac{1}{2}$  mile above Kirkcudbright. The rivulet has at the utmost a run of only 11 miles; yet it possesses some comparative importance as a stream; it has frequent inundations, and brings down enriching deposits to low grounds on its banks; it abounds with trout and salmon; and it is, in many places, adorned along its margins with natural wood and fertile meadows.

TARF (THE), a rivulet of Athole forest, in the parish of Blair-Athole, Perthshire. But for the prevailing usage which designates a stream from any great loch which it may traverse, or any minor loch or lochlet which may send to it a feeder, the Tarf would have been recognised as in reality the Tilt. It rises on the west side of Benrackie, and flows 9 miles eastward to a point 2 miles south of Loch-Tilt; and there it is joined from the north by the brief stream which is misnamed the Tilt, and from the east by a stream of 5 miles run called Glenmore-water. The whole course of the Tarf is among the savage but sublime scenery of the most towering and impervious part of the great central mountain-range of Scotland,—that which extends from Bennevis on

the west to Mount-Battock on the east, and thence forks to the German ocean.

TARFF (THE), a rivulet of about 7 miles length of course, in Inverness-shire. It rises near the great glen between Lochs Oich and Ness, and circles round the south-west end of Stratherrick to the head of Loch-Ness at Fort-Augustus.

TARLAND AND MIGVIE, an united parish, consisting of four detached districts, in the south-west division of Aberdeenshire. The most important district, or that which contains the village, measures  $2\frac{1}{2}$  miles by 2; and is bounded on the north by Cushnie; on the east and south by Coul; and on the west by Logie-Coldstone. The second district lies a mile west of the former, or  $1\frac{1}{4}$  mile north-west of the village; measures 2 miles by 1; and is bounded on the north by Towie, and on all other sides by Logie-Coldstone. The third district lies  $5\frac{1}{2}$  miles north-west of the village; measures  $2\frac{1}{2}$  miles by  $1\frac{1}{2}$ ; and is surrounded by Glenbucket, Towie, Logie-Coldstone, and Strathdon. The fourth district lies 9 miles west-north-west of the village; measures  $6\frac{1}{2}$  miles by  $3\frac{1}{4}$ ; and is bounded on the west by Banffshire, and on all other sides by Strathdon. Owing to contractions in form, and irregularities of outline, the entire area is only about 22 square miles. The first and fourth districts constitute the parish of Tarland; and the second and third, the parish of Migvie. A rivulet, an affluent of the Dee, traces the south side of the first and second districts; and often, in winter, lays extensive low grounds around the village under water. The Don touches, for a considerable way, both the third and the fourth districts; and affluents of it, the Deskry, and the Earnan, respectively traverse them to a confluence with it,—the former imposing on the district the name of Deskry-side. Cushnie-hill is partly within the northern boundary of the first district; and mountains and pastoral heights occupy much of the area of the other districts, thin in soil, heathy in dress, and bleak in aspect. The lands around the village are mostly low and level; and aggregately possess a fertile soil. Plantations are extensive and thriving. The chief mansions are Skellator, Inverearnan, Candacraig, and Edinglassie.—The village of Tarland stands nearly in the centre of the subdivision of Mar, called Cromar, 9 miles north-east of Ballater, and 31 miles west by north of Aberdeen. It is a burgh-of-barony, and has a population of about 340. Here are branch-offices of the Aberdeen Banking company, and the North Banking company. A weekly market is held on Wednesday; and annual fairs are held on the last Wednesday of February, old style, the Wednesday before the 26th of May, the Friday after St. Sairs' in June, the Friday of the week after Old Rayne in August, and the Tuesday and Wednesday after the 22d of November, old style. A fair is held also at Migvie on the 2d Tuesday of March, old style. The Highlanders of Strathspey, Glenaven, and Mar, resorted for centuries to the fairs of Tarland as the grand mart for the sale of their cattle; and they so exacerbated the inhabitants by their cateran propensities, as to provoke numerous bloody encounters with staff and steel. The first district is traversed by the north road from Aberdeen to Ballater and Braemar; but the parish in general has limited facilities of communication. Population, in 1801, 922; in 1831, 1,074. Houses 227. Assessed property, in 1815, £1,943.—This parish is in the presbytery of Kincardine O'Neil, and synod of Aberdeen. Patron, the Crown. Stipend £177 3s. 9d.; glebe £14. Unappropriated tithes £101 13s. 7d. The church of Tarland is situated in the first district, and was built in 1762. Sittings 400. The church of Migvie is situated in the second district, and was

built about 55 years ago. Sittings 200. The minister officiates on two successive Sabbaths in the former, and, on the third, in the latter. Schoolmaster's salary £28, with about £14 10s. fees. The parishes are supposed to have been united about the beginning of the 17th century.

**TARRAS (THE)**, a small hut romantic river in Eskdale, Dumfries-shire. It rises on the south side of Hartsgarth, a height which stands on the boundary between Dumfries-shire and Liddesdale; and runs 9 miles southward and south-south-westward to the Esk, 2½ miles below the town of Langholm. Over 4¼ miles it traverses the interior of Ewis; and over the rest of its run it has Langholm on its right bank, and Ewis and Canoubie on its left. The Taras is remarkable for the ruggedness of its channel, and the romantic character of its banks. So impetuous is its course, so obstructed by rocks, and so precipitated by falls, that any person whom it might sweep away is incomparably less danger of being drowned, than of being dashed to pieces. Hence the old doggerel:

“ Was ne'er ane drowned in Tarras, nor yet in doubt,  
For ere the head can win down, the harks are out.”

Its banks, over a great part of its course, are now picturesquely overhung, and now heartfully flanked and shaded with trees. An old rhyme which celebrates the localities in Liddesdale and Eskdale most noted for game, gives prominent importance to the Taras:

“ Bilhope-braes, for bucks and raes,  
And Carit-haugh, for swine,  
And Tarras for the good bull-trot,  
If he be ta'en in time.”

“ The bucks and roes, as well as the old swine,” says Sir Walter Scott, in a note to the ‘Lay of the Last Minstrel,’ “are now extinct; but the good hull-trout is still famous.” In 1660, the Taras yielded the title of Earl to Walter Scott of Highchester, who married the eldest daughter of Frances, Earl of Buccleuch. See **HARDEN**.

**TARTH (THE)**, a small river, a tributary of the Lyne, in Peebles-shire. During the first 5 miles of its course, it is identical with the **MEDWIN**: which see. At Garwaldfoot, the Medwin, which had flowed chiefly on the boundary between Lanarkshire and Peebles-shire, splits into two streams, the one of which goes off into Lanarkshire and becomes tributary to the Clyde, and the other passes on to the Lyne, and, through it, to the Tweed. The latter, though it continues for a brief space to be called the Medwin, and again is sometimes called near its mouth Newlands-water, is the TARTH, and undisputedly bears that name over the greater part of its course. Its length of run, measured in straight lines from Garwaldfoot, is only 7 miles; and over that distance it flows south-eastward, and has on its left bank Linton and Newlands, and on its right Lanarkshire, Kirkurd, and Stobo. Its tributaries, though 16 or 17 in number, are all very inconsiderable. Compared to the Lyne, it is a deep, dull, and muddy stream; and, on account probably of possessing these properties, its trouts, which abound, are comparatively large and fat. The fact, or phenomenon, that salmon have been caught in the Clyde above the majestic and lofty cataracts of that noble river, is accounted for on the supposition, that, at the spawning-season, some of the fish diverge from the Tweed up the Lyne and the TARTH, till they turn the fork of the Medwin, and then go down the Clydesdale section of that curious stream. The point at which the Medwin splits is, in consequence, popularly called the Salmon leap.

**TARVES**, a parish some miles north-east of the centre of Aberdeenshire. It is bounded on the

north by Methlick and New Deer; on the east by Ellon and a detached part of Methlick; on the south-east and south by Udny; on the south-west by Bourtrie; on the west by Old Meldrum; and on the north-west by Fyvie. Its greatest length, from north-north-east to south-south-west, is 9 miles; its greatest breadth is between 7 and 8 miles; and its area is about 30 square miles. The Ythan, though connected with the interior and the boundaries over only 2¼ miles, drains, with the help of a few small feeders, the whole of the parish. There are several plantations. Scivas-house is the principal mansion. The village of Tarves stands nearly in the centre of the parish, 6 miles west of Ellon, and 5 north-east of Old Meldrum. Annual fairs are held here on the Wednesday after the second Tuesday of March, on the Wednesday after the last Tuesday of April, on the Wednesday after the third Tuesday of July, on the second Tuesday of September, and on the Wednesday after the fourth Tuesday of October, all old style. Craigdam, the site of an United Secession meeting-house, lies 1½ mile south-west of the village. The parish is amply provided with roads. Population, in 1801, 1,756; in 1831, 2,232. Houses 433. Assessed property, in 1815, £3,473.—Tarves is in the presbytery of Ellon, and synod of Aberdeen. Patron, the Earl of Aberdeen. Stipend £191 19s. 10d.; glebe £10 10s. Unappropriated tithes £46 3s. 11d. The parish-church was built in 1798. Sittings 860. The United Secession congregation was established in 1748; and their meeting-house was built about 1806, at a cost of between £400 and £500. Sittings 600. Stipend £100, with a house and garden worth £12. Schoolmaster's salary £28, with £23 fees, and a share of the Dick bequest. There are 5 non-parochial schools.

**TARVET**. See **CUPAR-FIFE**.

**TAY (LOCH)**, a magnificent sheet of water, in Breadalbane, Perthshire, upwards of 15 miles in length, and averaging from fifteen to one hundred fathoms in depth. The united streams of the Dochart and Lochy pour their waters into the head of the loch, a little below the village of Killin; while the noble Tay issues from its lower end at Kenmore. The traveller can visit Loch-Tay either from the east or from the west: a good road is carried along both its shores from the one end to the other. The road along its northern side is the best, however, for carriages, and is that most generally followed by travellers. The scenery by this route, however, is much inferior to that displayed by the southern road. The north road has been carried too high up along the slope of the mountains, and although the lake in almost its whole expanse is before him, the prospect is unvaried and monotonous; the foregrounds are tame or altogether wanting; and there is an almost total want of those delicious close views which are the delight alike of the artist and the connoisseur. Had this road been carried nearer to the margin of the lake, and amid the windings of the beautiful promontories and bays with which it is bounded, the effect of a ride up the north shore of Loch-Tay would have been very different indeed. The man of taste would have selected this line; nor would he have found fault with the additional 2 miles of road which the straightforward views of Marshall Wade has saved. In taking the southern road, however, the case is materially different. This road generally runs near the lake, and follows, in numerous instances, the sinuosities of its margin, and the inequalities of the ground. The declivities of the southern range of mountains are, besides, much more varied and intricate than

those on the north; while the general outline of the northern range, including Ben-Lawers, is more hold and lofty than the south, forming a grand and striking termination to the views from this side. Few roads, therefore, are more productive of a succession of picturesque landscapes, or offer greater temptations to the traveller than this. The landscapes here present an ever-varied foreground; arc rich and full in the middle distance; while the extreme distance is grand and striking. Whether the traveller takes the northern or the southern road, none should leave Loch-Tay without a visit to the top of **BEN-LAWERS**: see that article. This is among the highest of our Scottish mountains; rising from the northern margin of the lake to the height of 4,015 feet above the level of the sea.—Near the east end of the lake, and 200 yards from the north shore, is a small island of a circular form, and about 400 yards in circumference. It is partly wooded with ancient plane and ash trees, and contains the ruins of a priory—as it is usually called—said to have been erected by Alexander I. in 1122. From a charter of Alexander, however, it would appear that there had been a church here before he erected a religious house. The endowment was for an order of nuns; and a fair is still held once a-year in the village of Kenmore, called *Fieil na m'ban maomb*; or the Nim's market. Spottiswoode says that this priory was a cell from the monastery of Scone, and that it was founded by Syhilla, daughter of Henry Beauclerk, king of England, and wife of Alexander I. of Scotland. It would appear, however, to have been founded by the king himself for the repose of his soul and that of his consort. Queen Syhilla, it is said, died suddenly here, and was hurried in the church in June, 1122. The ruins are very inconsiderable, part of the walls of the dormitory and refectory being all that now remain. The Marquis of Breadalbane is sole proprietor of this lake.\*

\* The waters of this lake have frequently, without any apparent cause, undergone singular and violent agitations, occasioned, it may be presumed, from some subterraneous impulse. On Sunday, 12th September, 1794, about 9 o'clock morning, the lake was impetuously agitated; but the agitations seemed to extend only to a small portion of the eastern end of the lake, in the neighbourhood of the village of Kenmore, and between it and the island. On the south side of the village there is a bay 460 yards in length, 200 yards in breadth, and generally from about 2 to 3 feet deep, until where it may be said to form the lake, where it suddenly becomes very deep. On the morning mentioned, the water at the extremity of the bay retired about five yards within its ordinary boundary, and in four or five minutes afterwards it again flowed out. In this manner it ebbed and flowed three or four times in the space of a quarter of an hour, when, all at once, the water rushed from the east and west in opposite currents across the bay, towards the lake, and about the place where the bay suddenly deepens, they rose in the form of a great wave, about five feet above the ordinary level, leaving the bottom of the bay dry, to the distance of about 90 or 100 yards from its usual boundary. When the opposing currents met, they made a clashing noise, foaming upwards; but the stronger impulse being from the east, the wave rolled westward, slowly diminishing as it went for about five minutes, when it wholly disappeared. As the wave subsided, the water flowed back, with some force, four or five yards beyond its accustomed boundary. Again it ebbed about 10 yards, and again it returned, continuing to ebb and flow in this manner for about two hours, when, gradually settling, the water returned to its ordinary level. During this time, the river, which leaves the lake on the north side of the village, was observed to flow backwards; the weeds at the bottom which before pointed in the usual direction of the stream, were turned the contrary way; and the channel of the river was left dry for about 12 feet on each side. Under the bridge, which is about 70 yards from the lake, the stream completely failed in places where there previously had been a depth of 18 inches of water. Nothing particular was observed in the state of the atmosphere at this time. The weather was perfectly calm; and it could barely be perceived that the motion of the clouds was from the north-east. Nor could it be ascertained that any sensible motion of the earth was felt in the neighbourhood, or that the agitation of the water occurred anywhere else but near the village of Kenmore. On the five succeeding days an ebbing and flowing was observed, about the same time in the morning, and of nearly the same duration, but by no means to the same extent as on the first day. A singular agitation was remarked at intervals, till the 15th of October, after which the pheno-

**TAY (THE)**, a river chiefly of Perthshire and partly of Fife and Forfar, the largest and the most variously and exquisitely scenic of all the Scottish streams, and one which pours more water into the ocean than any other river of Great Britain. Popular nomenclature and correct geography differ very widely in assigning its extent of course, and even in fixing part of its identity. The Tay of common topography is the southern one of two great streams which unite  $7\frac{1}{2}$  miles above Dunkeld, and includes no more of even that stream than the portion below Loch-Tay; while the Tay of correct geography must either be the northern one of the two great streams, as both the larger and the longer, or must at least include the southern stream up to the source of its remotest head-water. The northern stream has three successive names,—the **GAUR**, the **RANNOCH**, and the **TUMMEL**; and, in its progress, expands itself into three great lakes,—**LYDOCH**, **RANNOCH**, and **TUMMEL**: which see. It rises at a point about 18 or 20 miles north-north-west of the source of the Fillan, the remotest of the head-waters which find their way into Loch-Tay; and, including its progress through its lakes, but excluding its sinuosities, it performs an entire separate run of about 60 miles. Its direction over the last 14 miles hends from east to south, so as to describe a large demisemi-circle; and, over all the previous part of its course, it is in general due east. After leaving Argyleshire, it cuts Fortingal into two nearly equal parts; hounds a detached part of Logierait; and then has, on its right bank, Dull and the main body of Logierait; and on its left Blair-Athole, Moulin, a part of Dowally, and a wing of Logierait.—The southern one of the two great streams, part of which is recognised as the popular Tay, performs, from its highest source, and measured in straight lines and through lakes, to its junction with the Tummel, a run of about 57 miles. Its direction over by far the greater part of its course is east-north-eastward, and over the remainder is either easterly or north-easterly. Its origin is on the side of Benloy, at the boundary of Killin with Argyleshire, 7 miles in a straight line north-north-west of the head of Loch-Iomond. In its course to Loch-Tay,—a distance excluding curvatures of about 21 miles,—it runs almost wholly in Killin, cutting it lengthwise into two nearly equal parts, expands itself when about third way into Loch-Dochart, and bears respectively before and after this expansion, the names of the **FILLAN** and the **DOCHART**: which see. From the lower end of **LOCH-TAY** [see preceding article] to its junction with the Tummel, a distance of about 14 or 15 miles, it traverses the east end of Kenmore, cuts its way among grotesquely disposed fragments and isolated districts of Dull, Fortingal, Logierait, and Weem, and divides the main body of Logierait on its left bank, from Little Dunkeld on its right. From its junction with the Tummel to its junction with the Earn, where it begins to expand into an estuary, it achieves, irrespective of sinuosities, a distance of 32 miles, in alternate directions of 6 southward and 11 eastward, and of 11 southward and 5 eastward; and over this part of its course, it has on its right bank Little Dunkeld, Kinclaven, Auchtergaven, Redgorton, Perth, and Rhynd,—and, on its left bank, Logierait, Dunkeld, Caputh, Cargill, St. Martins, Scone, Kin-noul, Kinfauns, and St. Madoes. As an estuary, it

menas ceased. These occurred on some days in the morning, and on others in the afternoon, but none were so violent as the first. On the 13th of July, 1794, the waters of the Tay experienced agitations of a similar nature, but neither were these so violent nor of such long continuance. Like other highland lakes, Loch-Tay was for a time supposed incapable of being frozen; but during the intense cold of 1771 it was frozen over, in one part, from side to side during the space of a single night.

extends 26 miles from the mouth of the Earn to Buddonness, the point where it becomes quite lost in the German ocean; has for 16 miles a breadth of from three-fourths of a mile to 3 miles, and the direction of north-east by east; has, over the other 10 miles, a prolonged contraction of from 2 miles to less than 1 mile in breadth, and then an expansion, down to St. Andrew's-hay, of 9 or 10 miles in breadth, and, in both places, a prevailing easterly direction; and separates Ahermethy and the most northerly parishes of Fifeshire on its right bank, from St. Madoes, Errol, Inchture, Longforan, and the most southerly parishes of Forfarshire on its left. Its entire length of course, jointly as a river, and as an estuary, is thus, if measured in straight lines from the head of the Gaur, 118 miles,—if measured in the same way from the head of the Fillan, 115 miles,—and, if measured along its channel from either of the remote sources, between 160 and 200 miles.

The tributaries of the Tay, even excluding the secondary ones, are so numerous, that only the principal must be named. Those of the northern great head-branch are only two,—the Erich, which falls into Loch-Rannoch, and the Garry, which brings along with it the Edendon, the Erochkie, the Bruar, and the Tilt, and falls into the Tummel a little below Killiecrankie. Those of the southern great head-branch are also but two,—the Lochy, which joins the Dochart at the village of Killin, and the Lyon, which brings along with it Glenmore-water, and joins the Tay  $2\frac{1}{4}$  miles below the village of Kenmore. Those of the united stream are the Bran, on the right bank, opposite the village of Dunkeld; the Isla, swollen by the Dean, the Erich, and other streams, and entering on the left bank, a mile south of Mickleour; the Shochie, on the right bank, at Lunarty; the Almond, on the same bank,  $2\frac{1}{2}$  miles above Perth; and the Earn, also on the same bank, at the commencement of the estuary, or  $2\frac{1}{2}$  miles above the village of Newburgh. Those of the estuary, excepting the Eden which drains a large part of Fifeshire, and falls into St. Andrew's-hay,—are all inconsiderable, the largest being the Dighty, which disembogues itself from Forfarshire, 2 miles below Broughty-ferry.

At the mouth of the estuary, from the vicinity of Broughty-ferry on the one shore, and Ferry-Port-on-Craig on the other, to a point  $3\frac{1}{2}$  miles south-east of Buddonness, or over an entire distance of  $8\frac{3}{4}$  miles, there is a sweep of sandbank, called Goa, on the north side, Ahertay on the south side, and the Cross-sands at the connecting or seaward extremity. The opening or breadth of channel beneath the two sides of the sandbank varies from 6 furlongs to 2 miles; and the depth of water is about 3 fathoms, but, higher up the frith, increases to 6. Sandbanks occur elsewhere, especially a large and shifting one opposite Dundee; but they have all been rendered innocuous to navigation by the appliances of dredging, huoyos, lighthouses, and charts. The estuary in general is shallow, and receives such an amount of debris from the steady and large current of the river, as must eventually, and at comparatively no very distant period, drive shipping from its waters. Though it cannot compare in spaciousness and some other properties with the Forth, it is at present not a little commodious, and all the way from Buddonness to past the mouth of the Earn, may be considered as a continuous harbour. Vessels of 500 tons can go up to Newburgh; and vessels drawing 9 feet of water can go up, though with difficulty, and in critical states of tide and freshet, to Perth. The tide from the ocean flows to a point about a mile above Perth, and rises at Perth bar-

hour to a height 10 feet above the bed of the stream. Some recent operations, consisting chiefly of joining islets with the mainland, and throwing up embankments, have increased the rise of the tide at Perth 9 inches, and accelerated the time of high-water half-an-hour, and would, if completed, occasion a still additional rise of nearly three feet, and render the ordinary navigation to Perth harbour practicable for vessels of 300 tons. The level of high-water at Perth, owing to the configuration of the frith, the narrowness of the inlet at Broughty-ferry, and the scope afforded for rolling hack the fresh water current from Newburgh upward, is usually 18 inches higher than the level in the broadest part of the frith, or between Balmerino and Kingoodie.

The extent of surface drained by the Tay and its tributaries is variously computed at 2,396, and 2,750 square miles, and that of the Spey, the entirely Scottish river next to it in size, at 1,300 and  $1,298\frac{3}{4}$  square miles. The geographic positions and character of the district, whence most of the waters are drawn, being in the case of the two rivers very similar, the Tay may be supposed to discharge about twice as much water as the Spey. Dr. Anderson, making a nice measurement for a judicial purpose, determined the quantity of water which, in the mean state of the river, flows through a section of it opposite Perth, to be at the rate of 3,640 cubic feet per second. The river, as represented on a map, or imagined after a survey of the vast district which composes its basin, appears emphatically 'the many-headed Tay;' and, in consequence of its great feeders coming down like the main arteries on a half-moon-shaped leaf, it has less inequality in its stream than occurs in either the Spey or any other of our Highland fed rivers. The variety of its origin, too, affords such a compensation of rain as always, except in seasons of extreme drought, to yield a sufficient hulk and altitude of water for the occupying of its path, and the beautifying of its landscape; while the wide variety in the relative distance of its sources, prevents its floods, however high, from being as sudden as those of the Spey, the Aberdeenshire, Dee, and some other upland streams. Yet, owing to the gradual but great extension of the system of draining, which is prosecuted on arable grounds and on reclaimable mosses and moorlands, the river has become considerably less equable than at a former period; it swells, during great floods, to a magnitude which never in former days belonged to it; it subsides, during a continued drought, to a corresponding diminution of volume; and, in its ordinary or mean state, it has very visibly lost some of its ancient greatness and importance. Though averagely charged at Perth, as we have seen, with 3,640 cubic feet of water per second, it was reduced, in the course of the summer of 1819, to 457 cubic feet, and at the close of the summer of 1835, to a still smaller volume.\*

Much of the country which now forms the sea-board of the estuary, and especially the whole of the Carse of Gowrie, and the lower part of Strathtay, exhibit evidence of having, at a comparatively recent period, lain under the sea, and been gradually raised above its level by depositions from the Tay. After the Carse of Gowrie became dry land, too, the Tay seems, for a long series of years, to have made a circle round its north side, along the foot of the Sidlaw-hills, entering what was then the frith of Earn at Invergowrie, and entirely peninsulating the Carse, or cutting it into a series of islands. [See CARSE OF GOWRIE.] Great modern changes have taken place likewise on all the vale or straths of the Tay, south

\* See New Statistical Account, No. xv. p. 8.

of the confluence of the Tummel. Dr. Macculloch, from close and various observations on cuts of corresponding rocks on the opposite sides of the stream, and on the harmonizing altitude of series of alluvial terraces in the screens of the valley, calculates that the ancient level of the river, from Logierait downward, was about 100 feet above the present bed; and he adds: "And thus, while it is easy to see how far the Tay has sunk, it would not be very difficult to compute the quantity of land or earth that has been removed and carried forward towards the sea. When we look at this enormous waste, we need not be surprised at the formation of the Carse of Gowrie, nor at the deposits which are still augmenting it; shoaling the sea about Dundee, and laying the foundations of new meadows. For this operation is still going on, and must go on as long as the Tay shall continue to flow; though diminishing in rapidity, as the declivity and consequent velocity of the river itself diminish. If it is curious to speculate on the period when Perth, had it then existed, must have been a sea-port, and when the narrow Tay, far above and below it, was a wide arm of the ocean, it is not less so to consider what the aspect of Strathtay itself was, when the present place of Dunkeld was buried deep beneath the earth. Nor is it difficult even to see what it must have been. By laying our eye on any of the terraces, it is easy to bring the opposed one in the same plane, and thus to exclude all the valley beneath, reducing it once more to what it was when the river was flowing above. These speculations, thus pursued, may interest the artist as well as the geologist and the geographer; since, not only here, but in every deep valley of the Highlands, he would, in making such trials, be at a loss to recognise, in the original shallow and rude glen, the spacious and rich valley which is now the seat of beauty and cultivation. Contemplating, in this manner, not only the Highland mountains and valleys, but those of the world at large, we are lost in the magnitude of the changes which have carried the rains of the Himala to the mouths of the Ganges,—which, from the sediments of the Nile, have formed the land of Egypt,—and which have created, out of the lofty ridges of America, the plains that now form so large a portion of its continent." [Highlands and Western Isles.]

The Tay—especially if its chief tributaries be included—is incomparably the most scenic of the British rivers. The parent-stream itself, indeed, has fewer great falls than most streams which rise in a Highland district; yet it possesses several cascades of considerable height and picturesqueness, and, at the linn of Campsie in particular, near the confluence with it of the Isla, it is precipitated over a huge basaltic dike into a pool of great depth; and its tributaries exhibit in the aggregate an absolute profusion of the most varied cataracts, and leaps, and falls, while the Bruar, the Tummel, and the Tilt, present individual cascades which rank, for their combined magnificence and individuality of character, among the most distinguished objects of their class. But, in other features of landscape, the Tay is so uniformly rich, and so exceedingly various, that a large volume might be written in delineation of its picturesqueness. Its estuary, and the lowest 3 or 4 miles of its stream, are a continued expanse of lusciousness, softly screened with heights or swells of the most gentle beauty. Its vale from the romantic hill of Kinnoul, a little below Perth, to the pass of Birnam, 2 or 2½ miles below Dunkeld, is everywhere lively, frequently brilliant, and occasionally gorgeous. Its scenery above this point is so exquisite, so diversified, so replete with attractions, that it can be etched by no one, not even the querulous Dr.

Macculloch, except with dashes of enthusiasm. "The most complete general notion," says the Doctor, "of the portion of Strathtay," which stretches from the vicinity of Dunkeld upward to the mouth of the Tummel, "will be formed from a situation somewhat elevated, near the Duke of Athole's farm, which also affords one of the most splendid landscapes upon this portion of the river. Indeed, with the exception of Stirling, there is scarcely a place in Scotland which presents a view of vale-scenery at once so spacious, so rich, so grand, and so easily admitting of being formed into a picture. The broadest part of the valley, for a space of about six miles, is here detailed before the eye so minutely, that every part of its various ornament is seen in the most advantageous manner; the Tay winding along from its junction with the Tummel, through its bright meadows interspersed with trees, till it rolls along deep among its wooded banks, a majestic and silent stream beneath our feet. On each hand rises a long screen of varied hills, covered with woods in every picturesque form; the whole vista terminating in the remoter mountains, which, equally rich and various, are softened by the blue haze of the distance, as they close in above the pass of Killiecrankie. This general view, varied in many ways by changes of level and of position, forms the basis of the landscape for some miles; but so great are the changes in the middle-grounds, and so various the foregrounds, that although the same leading character is observed, the separate scenes are always strongly distinguished. Many distinct pictures can thus be obtained, and each of them perfectly adapted for painting; so that Strathtay is here an object to charm every spectator,—him who desires to see every thing preserved in his portfolio, and him who seeks for nothing in Nature but beauty, come under what form it may. Nor must I forget to remark, that many minor landscapes, of narrow or close scenery, occur on the roadside among the infinitude of objects, ravines, bridges, rivers, mills, houses, farms, woods, and trees of the most luxuriant growth, which border it through all this span." "Though the western and upper branch of Strathtay," from the junction of the Tummel upward to Kenmore, "is not, perhaps, equal in splendour to the lower and southern one, it still maintains the same character of richness throughout; while, instead of the flat extended meadows which mark the latter, it displays a considerable undulation of ground. Thus the vale of the Tay, from Dunkeld even to Kenmore, a space of 25 miles, is a continued scene of beauty; a majestic river winding through a highly wooded and cultivated country, with a lofty and somewhat parallel mountain boundary, which is itself cultivated as far as cultivation is admissible, and is everywhere covered with continuous woods or trees as high as wood can well grow. It contains, of course, much picturesque scenery; presenting not only landscapes of a partial nature, comprising reaches of the river, or transient views in the valley produced by the sinuosities of the road, but displaying the whole to its farthest visible extremity, under aspects which are varied by the casual variations of level or position, or by the accidental compositions of the fore or middle grounds, where Ben-Lawers is seen towering above all in the remotest distance, these views are peculiarly magnificent; nor is anything ever wanting which the artist could require to give fullness and interest to the nearer parts of the landscape, where, after all, the chief interest must always lie." "I believe it is but just to say, that Strathtay is, in point of splendour and richness, the first of the Scottish valleys." [Highlands and Western Isles.]

TAYENLOAN, a small Highland village in the

parish of Killean, Kintyre, Argyleshire. It stands on the west coast, opposite Gigha, and 20 miles north-north-west of Campbelltown.

**TAYMOUTH-CASTLE**, the splendid mansion of the Marquis of Breadalbane, situated on the right bank of the Tay, about a mile north-east of the village of Kenmore, or of the lower extremity of Loch-Tay, Perthshire. It is a magnificent pile of four stories, with round towers at the angles, and an airy central pavilion. A quadrangular tower in the centre rises to a considerable height above the rest of the edifice; carries up a spacious and ornate staircase; and lets in upon it, from the flanks and the top, a sort of fairy light through richly-stained glass. The apartments in the interior, particularly the Baron's-hall, the drawing-room, the dining-room, and the Chinese-rooms, are splendidly fitted up, and contain paintings by Titian, Rubens, Salvator Rosa, Caracci, Teniers, Vandyke, and other masters, constituting one of the richest collections in Scotland. The edifice is constructed of a dark-grey coloured stone, and was finished only within these few years. Attached to it, or to the right of the great quadrangle, stands a wing of its predecessor, the old castle of Balloch, built, in 1580, by Sir Colin Campbell, the 6th Knight of Lochawe, and called Balloch from a Gaelic word which signifies the outlet of a lake or glen. Taymouth-castle is surrounded by a demesne and a general landscape of uncommon brilliance. Though Dr. Macculloch was in one of his most growling moods when he looked on this superb scene, and, in consequence, lost a fine opportunity of rendering some pages of his hook luxuriously odoriferous, scarcely another person of taste will gaze on the profusion of mixed magnificence and beauty without forgetting that some touches of the artificial embellishment are too stiff and studied, and entirely abandoning himself to the surgy swell of imagery which here sets in upon him with at once the soft flow and the irresistible power of a burnished tide. The castle stands in a semicircular lawn, from all sides of which expanses of wood recede in great variety of disposition and site, and so aggregately great in extent that they almost seem interminable. "The pleasure-grounds are laid out with great taste, and possess a striking combination of beauty and grandeur. The hills which confine them are luxuriantly wooded and picturesque in their outlines; and the plain below is richly adorned with old gigantic trees. The view from the hill in the front of the castle is reckoned one of the finest in Scotland. On the right is Drummond-hill, and behind it the lofty Ben-Lavers, with Ben-More in the remote distance. On the left two hills, partially wooded, rise from the water one above another. In the foreground a portion of the lake is seen, and the village and church of Kenmore, and, to the north of them, the bridge across the Tay, immediately behind which is the little wooded island of Loch-Tay. \* \* \* Along the north bank of the river there is a terrace 16 yards wide, and 3 miles in length, overshadowed by a row of stately heech-trees; and on the opposite side there is a similar walk extending a mile from Kenmore. These promenades are connected by a light cast-iron bridge." [Black's Picturesque Tourist.] —The Deer-park at Taymouth-castle contains seven hundred fallow deer, nearly a hundred red deer, some fine specimens of the black deer, and you can move in no direction without starting the light-footed roe; and in a small paddock to the east of the deer-park are to be seen some fine specimens of moose-deer, which are so tame that they will come up and fawn upon you. There are also some wild Indian buffaloes from the Rocky mountains of the New world.

**TAYNUILT**, a small ill-built village in Argyle-

shire, on the south coast of Loch-Etive, about 6 miles from Bunawe.

**TEALING**, a parish in the southern part of the Sidlaw district of Forfarshire. Its figure is nearly triangular, with its sides facing the east, the south, and the north-west, and its northern angle, to the depth of  $\frac{1}{2}$  of a mile, cut away. It is bounded on the north by Inverarity; on the east by Inverarity, Murroes, and the detached part of Dundee; on the south by Murroes, Mains, and Strathmartine; and on the west and north-west by a detached part of Caputh, and by Auchter-house, and Glammis. A single farm belonging to it lies along the west side of the detached part of Caputh, and is bounded on the other sides by Auchter-house. The main body measures in straight lines along the north  $1\frac{1}{2}$  mile,—the east 4 miles,—the south  $4\frac{1}{2}$ ,—the north-west  $4\frac{3}{4}$ ; and the entire parish has an area of about 4,300 imperial acres. The north-west boundary, except for a mile on the south, is formed by the water-shed of the Sidlaws; and the southern boundary is nearly all formed by the rivulet Fithie. The general surface, excepting the detached farm, is a slope from the summit of the Sidlaws toward the south-east angle. The low grounds or plain lies upwards of 500 feet above sea-level; and Craigowl, the loftiest of the bounding hills, rises 1,100 feet above the level of the plain. Though the summits of the heights are heathy, and their sides profusely send out broom, and struggle hard to be merely pastoral, only one-fourteenth of the whole parochial area is waste or in pasture; and a little more than the same proportion being heartfully disposed in thriving plantation, all the remainder feels the dominion of the plough. The soil, on the ascent of the hills, is light and gravelly; in the central district is black, deep, and rich, sometimes inclining to clay; and, in the south and south-east, is naturally marshy, and fit only for meadow, but has been very greatly improved by draining. Grey slate and sandstone abound; and there are some pavement quarries. The chief mansion is Tealing-house, the seat of Mr. Scrimseour, the principal landowner. There are four or five hamlets, whose united population is somewhat less than 300. A subterranean building, a subterranean cave or passage, several stone-coffins, and some small inhumed Roman antiquities have, at various periods, been discovered. The Rev. John Glass, the founder of the sect of Glassites, or Scottish Sandemanians, was minister of Tealing up to the time of his separation from the Establishment. The parish is intersected by the Dundee and Newtyle railway, and by the west road between Dundee and Aberdeen. Its kirktown is  $5\frac{1}{2}$  miles north of Dundee. Population, in 1801, 755; in 1831, 766. Houses 164. Assessed property, in 1815, £1,793.—Tealing is in the presbytery of Dundee, and synod of Angus and Mearns. Patron, the Crown. Stipend £162 8s.; glebe £10. In 1834, the parish-school was attended by 30 scholars; and four private schools by 100. Parochial schoolmaster's salary £34 4s., with from £8 to £9 fees, and about £5 other emoluments.

**TEITH** or **TEATH** (THE), a singularly romantic and beautiful river of the south-west district of Perthshire. Yet half of its course is run, and far more than half of its scenic attractions are passed before it assumes its proper or distinctive name. What, according to popular nomenclature, forms the Teith, is the confluence about half-a-mile above the bridge of Callander, of two streams of surpassing Highland loveliness, but of very anomalous topographical characters. The streams are partly changeful in name, partly without any name whatever; and, over a very large aggregate space, entirely lost in some of the most celebrated of the Perthshire

lakes. Their head sources are not far from a point at which the counties of Argyle, Perth, and Dumharton meet, or from another point whence waters are shed respectively to the Tay, the Forth, and the lower Clyde. They rise respectively 1 mile and 2 miles due east of the head of Loch-Lomond; but, though so near each other in their origin, and relatively rising in the line of the prevailing direction of their course, they so far mutually recede as to be at one time 9 miles asunder.—The northern stream, starting from the north side of the height called Mealpalan, runs  $6\frac{1}{2}$  miles east by north to Loch-Doine; and, itself as yet a cold mountain-rivulet, drinks up in its progress some 14 rills of kindred character. Issuing from Loch-Doine, it proceeds only about  $\frac{1}{4}$  of a mile eastward, till it is lost for  $3\frac{1}{2}$  miles in Loch-Voil. On egressing from the latter lake, it takes the name of the Balvag or 'smooth-running river;' sweeps past the kirk-town of Balquidder, runs  $1\frac{1}{2}$  mile east by south; makes here, when just  $2\frac{3}{4}$  miles south-west of the head of Loch-Earn, a sudden bend; and flows 3 miles sinuously southward to Loch-Luhnaig. Hitherto it belongs wholly to the parish of Balquidder; but during the  $3\frac{3}{4}$  miles of its passage along that lake it glides into Callander. When issuing from Loch-Luhnaig, it assumes the name of the Garbh-Uisge, or 'the rugged river,' and begins to tumble along the wild romantic PASS of LENY [which see]; and having flowed 1 mile southward, and 2 miles eastward, and washed the skirts of the village of Kilmahog, it unites with its sister stream to form the Teith. Its entire length of course, excluding its sinuosities, but including its lacustrine expansions, is about 23 miles.—The southern stream makes a run of 4 miles from its origin due south-eastward to the head of Loch-Katrine; and, though absolutely nameless, or nameless at least among mapmakers and topographers, it runs amidst a profusion of wood and upland picturesqueness, and approaches Loch-Katrine with a superabundance of attire not altogether unworthy of the majesty of the lake. Identified for 8 miles with the lake of second rank for scenic brilliancy in Scotland, it emerges from its south-east extremity, and immediately begins to traverse over all their length the bosky, hristling, tumultuously wooded Trosachs; and dehouching from among them, is instantly lost for  $1\frac{3}{4}$  mile in Loch-Achray; and egressing thence, makes a run of only  $1\frac{1}{2}$  mile eastward, till it is ingulphed by Loch-Vennacher. On issuing from the latter lake, overhung by Benledi, it assumes the name of the Eas-gohhain, 'the Smiths' cataract;' and, under this wild designation, it careers  $1\frac{1}{2}$  mile east-north-eastward to a junction with the other great head-water of the Teith. Its entire length of run, including its course through lakes, is about 22 miles.—The Teith, or united stream, wants the grand and holdly romantic features of its head-waters; and subsides as to scenery into simple yet often thrilling beauty. Its entire course is south-eastward; and, measured in a straight line, extends only to between 11 and 12 miles. Over two-thirds of the distance it traverses the lowland district of Callander, and the major part of Kilmadock; and over the remaining and last third it has Kincardine on its right bank, and Kilmadock and Lecropt on its left. In Callander, it finely meanders among meadows, arbours, and wooded banks, forming a gentle and warmingly tinted foreground to a Highland background landscape of uncommon power; in Kilmadock, it runs with a trotting and merry current, and sweeps past the town and ancient castle of Doune; and, while in contact with Kincardine, it traverses the finely-ornamented grounds of Blair-

Drummond, and the curiously-embellished demesne of Ochertyre. Its tributaries are numerous; but, excepting the Keltie, [which see,] they are all inconsiderable. The Teith, if either its volume of water or its length of course had been made the ground of decision, would have been regarded as the parent-stream, and the Forth which joins it as the tributary. The point at which they unite is the bridge of Drip,  $2\frac{1}{4}$  miles north-west of Stirling. The Teith is a clear stream, and, for the most part, rapid, and is excelled by none in Scotland for the intrinsic value of its water-power, or its intrinsic adaptation to manufacture; yet, in consequence chiefly of the want of lime and coal, it has a very small aggregate of public works on its banks. It abounds in salmon and trout; and, at a former period, it possessed at Callander some small beds of a peculiar sort of muscels which yielded valuable pearls.

TEMPLE, a parish, consisting of a main body and a small detached district in the south of Edinburghshire. The main body is bounded on the north-west by Pennicuick and Carrington; on the north-east and east by Borthwick; on the south-east by Heriot; and on the south and west by Peebles-shire. Its greatest length from north to south is  $8\frac{3}{4}$  miles; its greatest breadth is 5 miles; and its superficial extent is about 23 square miles. The detached district lies  $1\frac{3}{4}$  mile north-east of the nearest part of the main body; is nearly a square of about 300 acres; and is surrounded by the parishes of Newhattle and Borthwick. Gore-water, a tributary of the South-Esk, runs along one side of the detached district; the South-Esk traces for 6 miles the western boundary of the main body; and Glad-house-water rises in the southern boundary, traverses the whole length of the main body, almost equally bisects it, and falls into the South-Esk at the extreme north. The Moorfoot-hills, ranging from south-west to north-east, occupy the larger part of the area, render it strictly, and even bleakly, pastoral, and send two summits, each upwards of 2,000 feet, and three or four upwards of 1,600 feet above sea-level. The arable land lies almost all in the detached district, and in a space of 4 or 5 square miles in the extreme north; and, in the former, it is principally a strong clay, and in the latter, it is mostly dry and sharp, upon a gravelly bottom, and tolerably fertile. Coal abounds, and is mined in the detached district; and sandstone and limestone are worked in the main body. Greywacke is the principal rock of the hills. The village of Gorehridge, and part of that of Stohill, are in the parish. See STOBBS and STOBHILL. The village of Temple, containing about 200 inhabitants, stands on Gladhouse-water, a little above its confluence with the South-Esk,  $12\frac{1}{2}$  miles south-south-east of Edinburgh. The only mansion is Toxside, W. Tait, Esq. The gardens, and part of the demesne of Arniston, the seat of Robert Dundas, Esq., the principal landowner, lie within the northern limits. The parish is traversed by the turnpike between Peebles and Dalkeith. Population, in 1801, 855; in 1831, 1,255. Houses 238. Assessed property, in 1815, £5,128. Temple is in the presbytery of Dalkeith, and synod of Lothian and Tweeddale. Patron, Dundas of Arniston. Stipend £158 6s. 8d.; glebe £20. The church is a neat structure, built in 1832, and occupying a fine site. The old church, still standing, is part of a series of monastic buildings, erected by David I. for Templars or Red friars. This establishment, originally called Balantradoch, and described in ancient documents as "domus templi de Balantradoch," was the chief seat of the Knights Templars in Scotland, and regarded as the superior of any establishments which the fraternity formed in other parts of the kingdom. On the east

gable, below the heltry, is an inscription which has puzzled antiquarians, and might be worth a whole folio of lore to theorizers.—The present parish comprehends the ancient parish of Clerkington, and the chapelries of Moorfoot and Balantradoch. Clerkington, previous to the Reformation, was a vicarage under the monks of Newbattle. Moorfoot—anciently and properly Morthwait—comprehended the upper half of the vale of Gladhouse-water; and was a chapelry established by the Newbattle monks, to whom the lands had been gifted. The chapelry of Balantradoch, after the suppression of the Knights Templars, passed into the possession of the Knights of St. John. The three districts having been united after the Reformation, assumed their present name from the circumstance of the chapel of the Templars being adopted as their common or parochial church. In 1834, the parish-school was attended by 110 scholars, and two private schools by 135. Schoolmaster's salary £34 4s. 4½d., with £36 fees, and £3 6s. 8d. other emoluments.

TEMPLELISTON. See KIRKLISTON.

TENNANDRY, a district containing about 200 inhabitants, in the eastern part of the parish of Blair-Athole, Perthshire. This district, with certain portions of other parishes, was, in 1836, erected into a *quoad sacra* parish by the presbytery of Dunkeld. The church was built in 1836. Sittings 500.

TERREGLES, a parish on the north-east frontier of Kirkcudbrightshire; bounded on the north and north-east by the Cluden, and on the east by the Nith, which divide it from Dumfries-shire; on the south by Troqueer and Lochrutton; and on the west and north-west by Kirkpatrick-Irongray. Its length, from east-north-east to west-south-west, is 4½ miles; its greatest breadth, in the opposite direction, is 2½ miles; and its superficial extent is nearly 8 square miles. The surface is, in general, low, but has agreeable diversities; and everywhere, especially along the Cluden and the Nith, it is softly but sweetly beautiful. In agricultural capabilities and results, it is rich and ornate. Its soil, naturally loamy and benign, has been highly cultivated, and sends up luxuriant crops of every sort of grain and vegetable raised in Scotland. Terregles-place, and some other fine mansions, gem it with their embellished grounds. The College-loch, on its southern boundary, is a beautiful sheet of water a mile in length; and, in a time of frost, allures numerous skaters and curlers from Dumfries to its bosom. All the parish being situated within from half-a-mile to 5 miles of Dumfries, the greater part of it receives an impress of neatness and taste, and an impetus to industry and improvement, from that beautiful metropolis of the south-west of Scotland. Three of the roads more or less traverse the parish, which diverge from Dumfries toward distant localities; and, among them, those to Glasgow and to Port-Patrick. The parochial antiquities are LINCLUDEN COLLEGE [which see], and the old castle of Terregles, formerly the seat of the Earls of Nithsdale. Population, in 1801, 510; in 1831, 606. Houses 97. Assessed property, in 1815, £3,911.—Terregles is in the presbytery and synod of Dumfries. Patron, the Duke of Buccleuch. Stipend £158 6s. 8d.; glebe £20. Schoolmaster's salary £35, with £16 fees, and £3 other emoluments. The church anciently belonged first to the Benedictine nunnery, and next to the collegiate church of Lincluden. In 1365, Sir John Herries obtained a grant of the barony from David II.; in 1510, Andrew, Lord Herries, got a new charter of his estates,—one which erected the village of Terregles into a burgh-of-barony to be called Herries; and, soon after, the property passed by marriage to the

Maxwells of Nithsdale, with whom the title also continued until their forfeiture in 1715.

TEVIOT (THE), a beautiful river of Roxburghshire, the largest tributary of the Tweed, and a stream of so much importance as popularly to impose its name on the whole of the great county in which it flows. It rises in several short head-waters in the southern extremity of the parishes of Cavers and Hawick, within half-a-mile of the sources of the Megget and the Stennis, tributaries of the Dumfries-shire and Cumberland Esk. The direction of its course for 30 miles, or till it enters the parish of Eckford, half-a-mile above Eckford village, is, with the exception of constant but brief distances, not included in the gross distance, uniformly and almost due north-east; for 5½ miles further, it is north, or north by east; and, for the last three-fourths of a mile, it is east, and nearly parallel to that of the noble river into which it falls. Till 27 miles from its source, or to the point where it receives the Rule, except over 2½ miles where it traverses the interior of Hawick, and over a furlong or two where it cuts off pendicles of Cavers, it forms the boundary-line of parishes; those on its right bank being Upper Cavers, Lower Hawick, Lower Cavers, Bedrule, and Jedburgh; and those on its left bank, Upper Hawick, Wilton, Minto, Ancrum, and Crailing. Over the last 9 miles of its course it forms altogether a boundary-line for only 1½ mile, and mainly bisects the parishes of Crailing, Eckford, Roxburgh, and Kelso. Its principal tributaries on its left bank are Hislop-burn and Borthwick-water in Hawick, and Ale-water in Ancrum; and on its right bank, Frostley-hurn in Upper Cavers, Allawater between Upper Cavers and Hawick, Slitrig-water at the town of Hawick, Rule-water between Lower Cavers and Bedrule, Jed-water in Jedburgh, Oxnam-water in Crailing, and Kail-water in Eckford. The only towns upon it are Hawick, 14½ miles from its source, and Kelso, opposite its junction with the Tweed; and the only villages—though, on the average 3 furlongs from it—are Duncholm in Lower Cavers, Hightown in Roxburgh, and respectively Ancrum, Crailing, Eckford, and Roxburgh, in their cognominal parishes. The river's waters abound with trout and salmon, and are witnesses to many curious poaching scenes. The scenery of the Teviot is everywhere pleasant, generally brilliant, and occasionally superb. Its immediate banks are, for the most part, a charming alternation of rich haugh and variegated, often abrupt, rising ground. Its basin is, for some distance, a comparatively narrow vale, flanked with hold green heights; for a greater distance it is a stripe of alluvial plain, screened by terraced but undulating and tumulated dale, and overhung at from 3 to 8 miles' distance by terminating heights; and, in the lower course, it is a richly variegated champaign country, possessing all the luxuriance without any of the tameness of a fertile plain, and stretching away in exulting beauty to the picturesque Eildons on the one hand, and the array of dome-like Cheviots on the other. A profusion of wood, and rapid alternations of almost every kind of surface, produce a constant succession of distinct and fine pictures. One glowing scene occurs in the immediate vicinity of KELSO: which see. Another, in which some curious caves are prominent, occurs in the parish of ROXBURGH: which also see. And amongst scores of others which might be named is any one of some half-dozen views of a point, where haughs odoriferous and beautiful as gardens arc on the immediate banks, and the bosky and heeþing crags of Minto soar perpendicularly up on one side, foiled by the high adornings of Minto-grounds, and

the fine forms of Minto-hills; while on the other side rise darkly the huge lumbering outline of the Dunian, and the broken, rugged, and towering height of Rubberslaw. We need scarcely hint how much and tenderly 'the silver Teviot' has been celebrated in song.

**TEVIOTDALE**, a name sometimes applied to the whole of Roxburghshire, and sometimes used more definitely to designate the portion of that county which is drained by the Teviot and its tributaries. See ROXBURGHSHIRE.

**THIEF-ROAD (THE)**, a track of road from the border, through Peebles-shire into Mid-Lothian, so designated from its having been the path usually traversed by the plundering banditti of the feudal times, known as moss-troopers, or leviers of black mail. The road has now no very distinct vestiges, yet can still be traced, especially along Peebles-shire. It enters that county near the Birkhill path on the sources of the Yarrow and the Megget; runs north through the middle of Megget parish by Winterhope and Crammalt; passes over Dollar-law and Scrape, on the boundary between Manor and Drummelzier; crosses the Tweed below Stobo; proceeds by Lyne, Newlands, and Linton; and departs through the Cauldstane-slap to the defiles of the Mid-Lothian Pentlands.

**THIRLESTANE**, the seat of Lord Napier of Thirlestane, in the parish of Etrick, Selkirkshire. See ETRICK.

**THIRLESTANE-CASTLE**, the seat of the Earl of Lauderdale, on the right bank of the Leader, Berwickshire. It stands on a fine lawn between the Leader and the burgh of Lauder. It is a large and massive edifice, impressively combining the tastes and marked vestiges of antiquity with stiff and unsuccessful appearances of modernization. Its nucleus, or possibly its predecessor, was a strong tower, called Lauder fort, and built by Edward I. during his invasion of Scotland, as a mean of maintaining his usurped power. Chancellor Maitland, the chief founder of the Lauderdale family, whose residence had formerly been a small tower called Thirlestane, about 2 miles to the east, renovated or rebuilt the fort, or possibly constructed another edifice in its place, and transferred to it the name of Thirlestane. The Duke of Lauderdale added a new front and wings, removed the church and burying-ground which stood between the castle and the burgh, and made great improvements on the interior of the edifice and the extent and arrangement of the grounds; and still further improvements have very recently been made upon the building and grounds. The castle has some stately apartments; it has massive balustrades and cornices, and a multitude of marble chimney-pieces; and in general it is decorated in the best taste of the age of Charles II. Among a large and interesting collection of family-portraits with which it is enriched, are five of the Duke, and one of Secretary Maitland.

**THORNHILL**, a large and beautiful village in the parish of Morton, Nithsdale, Dumfries-shire. It stands on the post-road between Glasgow and Dumfries, 8 miles east-north-east of Minnybive; 12 south-east by south of Sanquhar; 14 north-north-west of Dumfries; and 61 south-south-west of Edinburgh. Its site is the summit of a ridgy or terrace-formed rising ground, between 200 and 300 feet high, from  $2\frac{1}{2}$  to 5 furlongs east of the Nith, and commanding one of the richest views in Upper Nithsdale,—the vale of the Nith luxuriating in beauty over an extent of 8 or 9 miles, the princely pile and noble grounds of Drumlanrig-castle at less than 3 miles' distance on the north, the successive or terraced ascents of the slowly receding, the green

and tufted hill-screens of the valley, and the majestic form of the monarch-mountain, Queensberry, looking up in the distance amidst a fine retinue of soft yet alpine summits. The village is probably the most tidy, neat, and generally attractive of its size and class in Britain. Its streets are very spacious, and always clean, and have broad stripes of verdure between the house-lines and the roadway. The houses are, for the most part, uniform,—neat one-story cottages; or they have their uniformity broken only to admit at intervals trim or elegant two-story structures, to look up like officers in the well-trained ranks. Belts of garden-ground run along the whole back of the house-lines, flinging up clouds of perfume, and rendering all the atmosphere odoriferous and balmy. The principal street runs along the highway, nearly parallel to the Nith. Over its northern half it mounts the face of a slow ascent, the lateral slope of the high bank, which forms the village site, and is not winged with any parallel or cross streets. Over most of the upper half it is subtended on the side next the Nith by three streets, which are arranged in the form of three sides of a square, the principal street itself being the fourth side, and which occupy a tabular expanse on the summit of the high bank. Opposite the more southerly of the two streets which go off at right angles, a brief street runs up toward the parish-church and school-house, both new and ornamental edifices. At the intersection of the principal street, where the last-mentioned thoroughfare commences, stands an elegant pillar, designed to serve as a market-cross, erected by the last Duke of Queensberry, and surmounted by a Pegasus and the Queensberry arms. The village was originally intended to be a market-town, and it acquired authority for holding a weekly market; but it has never acquired sufficient importance even to lift four annual fairs, held on the 2d Tuesday (O. S.) of February, May, August, and November, above the poor character of mere galadys for rustic idlers. An extensive manufacture of hosiery was, for a series of years, conducted in workshops; but has greatly declined, and seems menaced with extinction. A tannery, a brewery, and a few remaining stocking-rooms alone prevent its manufactures from being entirely domestic. A few of its inhabitants are small annuitants; a considerable number are agricultural labourers; and a painfully large number are persons ready to do any one of half-a-dozen kinds of work, and rarely get a piece of any of them to do. The village has a branch-office of the Glasgow Union bank, a subscription-library, several clubs for the purchase of newspapers and periodicals, two stock-societies, a penny-a-week friendly society, a women's friendly society, a freemason's-hall erected in 1834, a spacious bowling-green and quoiting-ground, and two large and very respectable inns. It has recently been lighted with gas. Its places of worship and its schools are noticed in the article MORTON. The village is wholly under the superiority of the Dukes of Buccleuch, and, since 1827, has been very greatly and liberally improved by the present Duke. Population, in 1791, 430; in 1817, 750; in 1831, 1,373.

**THORNHILL**, a village in the *quoad sacra* parish of Norriestown, and lying compactly with Norriestown village, Monteith, Perthshire. See NORRIESTOWN.

**THORNLIEBANK**, a village in the parish of Eastwood, Renfrewshire, about  $1\frac{1}{2}$  mile south of Pollocksbaws, upon the rivulet called Auldhouseburn. It originated in the manufactories and other works established here about the end of the 18th century. The whole village, except three small tenements, belongs to Messrs. J. and W. Crum, and

Co., proprietors of extensive works. Calico-printing, cotton-spinning, weaving by power and handloom and bleaching, are carried on. The population amounts to about 1,500. A preaching-station of the Associate Synod was formed here in February, 1836, and at the same time a building—originally erected for a school-house—was completed as a place of worship. It cost the benevolent proprietors—Messrs. Crum, and Co.—£450, and is held under lease at a nominal rent. Sittings 407. A regular congregation, with a minister, has since been formed. The Messrs. Crum likewise support two free schools here for the children of their work-people.

**THORNTON.** See **DYSART.**

**THORNTON-LOCH,** a small village on the coast of Innerwick, Haddingtonshire, 2 miles east of the village of Innerwick, and 6 south-east of the town of Dunbar. It has an itinerating library; and at Skateraw, in its vicinity, is a small harbour.

**THRIEVE,** an islet and a celebrated ancient castle, in the river Dee, at the point where the parishes of Balmaghie, Crossmichael, and Kelton meet,  $1\frac{1}{2}$  mile west of Castle-Douglas, Kirkcudbrightshire. The islet has an area of about 16 Scottish acres, and is noticeable only as the site of the castle. An ancient castle, the predecessor of the present ruin, was built and maintained on the site by the ancient lords or petty kings of Galloway. The present structure was built by one of the Douglasses; and was the residence and the seat of power of that despotic family during the ages of their making Galloway vocal with the groans of its people. On the ruin of the Douglasses, and the annexation of Galloway to the Crown, the castle went into the possession of the king; but it was afterwards transferred to the family of Maxwell, who became Earls of Nithsdale and hereditary keepers of Thrieve and stewards of Kirkcudbright. During the troubles of Charles I. the Earl of Nithsdale, at his own expense, held this castle for the king, and armed, paid, and victualled a garrison of 80 men; nor did he flinch, till the king, unable to send him any assistance, instructed him to obtain the best conditions he could for himself and his garrison. The Earls, as keepers of the castle, received from each parish of Kirkcudbrightshire, 'a lardner mart cow, or a fattened cow in condition to be killed and salted at Martinmas for winter provision; and, in 1704, when they sold the circumjacent estate, they, for the sake of this perquisite, retained the castle itself. In 1716, at the attainder of the 5th Earl, the levy of the 'lardner mart cow' fell into desuetude; and, in 1747, at the abolition of hereditary jurisdictions, the last vestiges of the ancient power and importance of the castle disappeared. A square tower, built of hard schistose stone, remains of the castle, and is surrounded at a small distance by a wall, which has a strong gate and four round towers.

**THURSO (THE),** a river of Caithness-shire. It rises among the mountains in the south-west corner of Halkirk, near the boundary with Sutherlandshire; and flows  $12\frac{1}{2}$  miles north-eastward, and 14 northward to the head of its cognominal bay, at the town of Thurso. Its course first bisects Halkirk; next for  $1\frac{1}{2}$  mile divides that parish from Thurso; and finally cuts the latter parish into two not very unequal parts. Its tributaries are neither numerous nor large; and its greatest breadth is about 300 feet. Its banks are almost everywhere destitute of wood; but, in other respects, are, in many places, softly beautiful.

**THURSO,** a parish on the north coast of Caithness-shire; bounded on the north by the North sea; on the east by Olrig and Bower; on the south by Halkirk; and on the west by Reay. Its greatest

length from east to west is  $7\frac{1}{2}$  miles; its greatest breadth is 7 miles; and its area is about 35 square miles. The surface gently rises from the shore, and is throughout a slightly inclined plane, interspersed with small eminences, and presenting a rich prospect of pleasant villas and well-cultivated fields. The rivers Thurso and Forss add much to its beauty, and run northward, the former through the interior, and the latter along the western boundary. The coast,  $7\frac{1}{2}$  miles in extent in a straight line, but about 11 along its sinuosities, has a flat and fine hard sandy beach in the vicinity of the town, but elsewhere is in general rocky. **MURKLE-BAY** [which see] is on the east; a small bay, formed by the embouchure of the Forss, is on the west; and the bay of Thurso, about 4 square miles in area, is in the centre. Connected with the last are the roads and the House of **SCRABSTER**: which see. The small headland of Brimness flanks the estuary of the Forss. The magnificent promontory of Holborn-head runs out on the west side of Thurso-bay; and forms a twin object to Dunnet-head, 7 miles to the north-east, at the entrance of Dunnet-bay. The rocks west of Holborn exhibit astonishing scenes of natural grandeur; and an insulated rock, called the Clett, situated about 240 feet from its extremity, rises to the height of 400 feet, is covered in summer by vast flocks of sea-fowl, and often sports sublimely with the wild seas which rush against it with tempestuous power. The whole scenery of Thurso-bay is often a shaking and shifting panorama of very high grandeur. "The lengthened waves, thundering along the shores of the spacious crescent-shaped bay, arrest a stranger's attention, as their curling crests break upon and splash up the sandy slope at his feet. The white streak and the hollow moan of each billow, as it yields up its power, lead away the eye and ear to the sides of the bay; formed of precipitous rocks, and terminated by the high bluff promontories of Holborn and Dunnet, over the top of which, though upwards of 400 feet in height, the spray dashes during storms, and on which even the sea-pink and the short tufted grass hardly obtain a footing. In the distance, the prodigious western precipices of Hoy, which form perhaps the most magnificent cliff-scenery in Britain, with the outlines of the Orkney-bills, compose a most splendid termination to the sea-ward view. The traveller should not fail to walk as far as Holborn-head, where the majestic mural and fissured cliffs, with the Clett, a huge detached rock, the boundless expanse and heaving swell of old Ocean, and the clouds of screaming sea-birds, afford a perfect epitome of this style of scenery." [Guide to the Highlands.] The soil of the parish is principally clay and loam lying on rock. The arable and the untilled lands bear the proportion to each other of 6 to 5. About 3,000 acres are so poor that they could not be profitably improved. Wood covers a less area than 50 acres. Old red sandstone, which is the principal rock, is extensively quarried both for building and for exportation as pavement-flag; between 200 and 300 men being employed in dressing it into flags. A coarse clay-slate abounds; trap occurs principally on the coast; and both are quarried. There are appearances of lead ore. Thurso-castle, the seat of Sir George Sinclair of Ulster, Bart., stands a little east of the town, and on the very brink of the bay. It was built, in 1660, by George Earl of Caithness; passed, in 1718, into the possession of the present owner's ancestor; and possesses much interest as the birth-place and home of the well-known Sir John Sinclair, Bart.,\* the promoter

\* Sir John Sinclair was born on the 10th of May, 1754. He received the rudiments of a classical education at the High school of Edinburgh; carried on his studies at the Universities

of the Old Statistical Account, and the Agricultural Reports, and of his talented daughters Lady Colquhoun, Miss Hannah Sinclair, and Miss Catherine Sinclair, distinguished as elegant and lively writers. "A recent addition," says the last of these ladies in her Northern Circuit, "has been made to Thurso-castle, planned and executed by Burn, the cobble-general of worn-out houses, by whom ancient edifices are mended, cleaned, dyed, and repaired, to look as good as new, or even better. When A— perceived some flaws in the architecture of several old castles lately, he wished they were all 'Burn'd' like ours. Certainly the situation here is somewhat uncommon. In former times showers of spray from the ocean used to dash up to our drawing-room window, when the waves, curling and grating along the shore, sometimes struck at the foundation with animated vehemence, and rebounded among the rocks, till at length a breakwater was raised to defend the wall. You might have imagined that in such a position as I have described, this house was near enough to the sea; but my father liked the peculiarity of being so intimate with the wild winds and waves; so he caused a strong pier to be raised between the old castle and the water, on which Mr. Burn has contrived securely to perch a terrace-walk and an appendix to the building. Several very handsome new apartments are here, from the windows of which I can at this moment count a procession of twenty vessels in full sail, some of which come so close, they are tacking into the very room." The other principal mansions are Murke-house, Sir John Gordon Sinclair, Bart., and Forss-house, James Sinclair, Esq. Harold's-tower, a mile east of the town, was built by the late Sir John Sinclair, over the grave of Harold, Earl of Caithness, and is an elegant monument, exhibiting at a distance a somewhat striking appearance. Earl Harold was possessor of the half of Caithness, Orkney, and Shetland; and fell in battle in 1190, while attempting to recover his property from the usurpation of a tyrannical namesake. The Oswalds of Glasgow were originally from Thurso; and Richard Oswald, one of the plenipotentiaries from Great Britain for settling the peace of 1783, was an unsuccessful candidate for the office of Thurso parochial schoolmaster. Two great lines of road run respectively southward and along the coast. Population, in 1801, 3,623; in 1831, 4,679. Houses 739. Assessed property, in 1815, £8,353.—Thurso is in the presbytery of Caithness, and synod of Sutherland and Caithness. Patron, Sir George Sinclair, Bart. Stipend £203 7s.; glebe £17 10s. Unappropriated teinds £193 12s. 10d. The parish-church

was built in 1832. Sittings 1,540. A catechist is employed by the Society for propagating Christian knowledge.—An Original Associate congregation was formed before the year 1775; and their meeting-house was built in 1777, at a cost of about £400. Sittings 950. Stipend £70, with a house and garden worth £10.—An Independent congregation was formed, and a chapel built, in 1799. Sittings 940. The minister has a house worth £12 a-year.—A Scottish Baptist congregation was established in 1805; and their place of worship was built in 1831. Sittings about 60. Stipend £23 from the Baptist Home Missionary society, and a variable sum from the congregation with a dwelling-house.—The population, according to a survey by the parish minister in 1836, was about 4,800; of whom 4,000 were stated to be churchmen, and 800 dissenters.—In 1834, the parish school was attended by 32 scholars; and 16 other schools—13 of which were in the town, and 3 in the country—were attended by 505. Parochial schoolmaster's salary £35, with £50 fees, and £12 other emoluments.

THURSO, a town and burgh-of-barony, at the mouth of Thurso-water, in the cognominal parish, 20 miles west by south of John-o'-Groat's-house, 20½ north-west of Wick, 29 south-south-west of Stromness, 44 east-north-east of Tongue, 160 north by east of Inverness, and 326½ north by west of Edinburgh. It consists of an old and a new town. The former is irregular, ill-paved, dull, dirty, and disagreeable. The latter occupies a pleasant and elevated situation on the south-west; and, if completed on the regular, elegant, and extensive plan on which it was originally designed, would be a truly fine metropolis of the far north. But the plan has been very partially executed; it has for many years been almost practically abandoned; and it possesses no prospect of being, at any definite period, resumed. The new town, therefore, is merely a handsome suburb, regularly edificed with neat sandstone houses. The parish-church is a splendid edifice, from a design by Burn; and has a tower 140 feet high. "The new church at Thurso," says Miss Sinclair, "the chief expense of building which, in a very superior style of architecture, was incurred by my father, is quite a little cathedral, being the handsomest edifice north of Inverness, partly formed of a very hard stone imported from Morayshire." Its cost was about £6,000. The former church was an old substantial Gothic building. The only other noticeable edifices are a masonic-lodge, a public hall-room, and a large, substantial, elegant stone-bridge across the river. There was, at one time, a town-house; but it fell into decay; and its site was sold to a private person. Linen, woollen, leather, and herring-net manufactures employ about 230 persons; and the manufacture of straw-plait employs about 60 females. The fisheries in the bay are very extensive; and, along with the dressing of flags in the neighbouring quarries, afford the chief employment. Their annual aggregate value is about £5,000; and the salmon-fishery—greatly celebrated, and the only one not free—is let at £1,000. The parish books record that, in 1786, no fewer than 2,560 salmon were caught with one sweep of the net! But the Thurso fishermen experience such excessive vicissitudes of success and failure as defy all foresight, and occasionally wear a dash of romance. "Sometimes," says the lady already twice quoted, "they make ten pounds at a single haul; and often not tenpence in a day. I was particularly sorry for one Caithness fisherman this year, who had caught 60 crans, each equal to a harrel of herrings, at a single draught, worth about £30, but wishing to complete the 100 crans, he tried another successful pull, which sunk his boat

of Edinburgh and Glasgow; and completed them at Oxford. In 1780, Sir John was first chosen to represent his native county; and, with the exception of a short interval, he continued in the House of Commons till the year 1811,—a period of above 30 years. Having succeeded in the establishment of a Board of Agriculture, he presided over this great national institution, without emolument, for many years. In the exertions of the Board this country is indebted, in a great degree, for its rapid progress in the art of husbandry. A spirit of enterprise and of invention was excited among the farming classes, and a dignity attached to agriculture which it never had before acquired. Agricultural associations suddenly sprung up on every side; reports were published, in 50 volumes octavo, describing accurately every county in the United Kingdom, and the substance of the information thus accumulated was digested, by Sir John himself, into his 'Code of Agriculture.' Among the labours undertaken by Sir John, the most arduous, and perhaps the most successful, was 'The Statistical Account of Scotland,'—the foundation of the present work, and the prototype of the New Statistical Account, now in course of publication. So little had the subject been at that time attended to, that the very term "statistics" was of his invention. The work was first commenced in 1790; it was prosecuted uninterruptedly for seven years, during which a correspondence was carried on with all the clergy of the Church of Scotland, amounting nearly to 1,000; and it was brought successfully to completion by the gradual publication of 21 thick octavo volumes, in which a separate account is given of every parish in North Britain.

worth £100, carried away his net, and left the unfortunate speculator with nothing but his life remaining." The harbour, when a bar at its entrance has been crossed, is abundantly safe. A hill has been brought into parliament for constructing in the hay of Thurso a commission-harbour, the trustees to be several of the principal proprietors and leading individuals in Thurso and its vicinity, together with all lenders or holders of stock to the amount of £100. The bay of Thurso lies exactly at the western entrance of the Pentland firth, and is in the direct course of the North Sea trade with our American possessions. It is a capacious and secure roadstead in all weathers, and naturally adapted for the construction of a complete and convenient harbour. In 1840, the number of vessels belonging to it was 14; and the number trading to it about 40. Two of the vessels communicate regularly with Leith. A considerable quantity of grain is exported. A weekly market is held on Friday; and annual fairs for cattle and sheep are held in June, July, and September. A mail-coach runs daily to Wick; and a coach runs three times a-week to Tongue. The town has branch-offices of the Commercial Bank of Scotland, and the Aberdeen Town and Country bank; two reading-rooms; two circulating libraries; five friendly societies; and a society for the relief of the destitute sick. Thurso is a place of great antiquity, and is traditionally stated to have been founded in the 12th century. Sir John Sinclair thinks that it may have been the centre of the early commerce of Caithness; and, from the fact, according to Skene's account of the assize of King David, that the weight of Caithness was made a standard over all Scotland, he thinks that that commerce must have been extensive. In 1633, the town was erected into a burgh-of-barony, by Charles I., in favour of John, Master of Berriedale. During nearly two centuries, it was the chief seat of sheriff of Caithness' courts, and the residence of the sheriff-clerk and procurators; and it was deprived of these honours, which virtually made it the county town, only by the superior and magistrates of Wick raising an action, and proving that they were usurped. The bailies of Thurso continue to be named in all the Supply Acts as commissioners; and the eldest bailie is uniformly appointed a justice-of-the-peace, and a county road trustee. The customary authorities are two bailies, a dean-of-guild, and 12 councillors, who were elected usually by the superior, but occasionally by the old councillors, jointly with the superior or his baron-bailie. A new election seldom occurred, except upon the death of one of the bailies; and, during 7 or 8 years preceding the date of the Municipal corporation inquiry, there was only one bailie. The late Sir John Sinclair, however, allowed the inhabitants to assemble annually and elect six individuals, and out of this list he named the three magistrates. The jurisdiction extends, by charter, over only the old town, but, by agreement, comprehends the new town. The bailie courts, say the Commissioners, "have not been efficient; and, at present, the only regular court held at Thurso is that of the justice-of-the-peace for small debts, which sits once a fortnight." There are no corporations, exclusive privileges, or exactments for burgh-ship; so that trade is absolutely free. No other police exists than that ordinarily exercised in burghs-of-barony, for the suppression of petty delinquencies. There is no burgh property, no revenue, no debt. Peuars pay their proportion of county taxes; and burgh cess and market customs to the superior, amount jointly, to only £24 or £25 a-year. Population, in 1833, about 2,700; rental about £2,640; houses of £10 and upwards 64,—of from £5 to £10, 116.

TIBBERMORE, or TIPPERMUIR, a parish in the south-east division of Perthshire; bounded on the north by Methven and Redgorton; on the east by Perth; on the south by Perth, Aherdalgie, and Forteviot; and on the west by Gask. Its length, from east to west, is 6 miles; its breadth varies between 1 mile and 3; and its superficial extent is about 4,670 Scottish acres. A sluggish brook called the Pow, and the river Almond, trace the whole of its northern boundary, the former for 4 miles and the latter for 2. The surface, without being hilly, is considerably diversified. In the western district it descends in a gentle slope to the north and terminates in a narrow tract of level ground; and, in the eastern district, it, in general, lies somewhat high, above the level of the Almond, and then goes down in a steep descent, and forms a delightful plain along the margin of the stream. The district is in general fertile; and is, to a large extent, especially on the east and the south, heautified with wood. The arable grounds, comprising nine-tenths of the whole area, have a various soil,—a sandy loam along the Almond, an argillaceous earth toward Perth, and a reclaimed substratum of moss in many parts of the west. Paper manufacture was early introduced, and has been extensively conducted. But the district is noted chiefly for extensive and long-established bleaching-works and printfields, particularly that of Ruthven or Huntingtower. These establishments are worked with the aid of an artificial canal nearly 18 feet broad and 3 feet deep, which debouches from the Almond, intersects an extensive meadow called Huntingtower-haugh, and passes on to a distance from its origin of about 4½ miles, and which is of so high antiquity as to be undoubtedly ranked among the earliest works of utility in our country of which we still enjoy the advantage,—so early a monarch as Alexander II. having mentioned it in his charters as his mill-lead, and having, in 1244, granted a pipe from it to the monastery of Black friars of Perth.—Huntingtower-castle, formerly called Ruthven-castle is notable as the ancient seat of the Ruthven or Gowrie family, so remarkable for its singular and mysterious catastrophe. This castle was the scene of the enterprise well-known in Scottish history as the Raid of Ruthven, the enticement of James VI. hither, and the detention of him here by the Earl of Gowrie and others, with the view of dissembling him from the influence of his two early favourites, the lately created Duke of Lennox and the Earl of Arran. An extraordinary exploit of a fair lady has likewise added to the notoriety of the castle, and has given the name of the Maiden's leap to the space between its two towers, which, though long ago united by later buildings, were originally separate. A daughter of the 1st Earl of Gowrie being courted by a young gentleman of inferior rank, and having one evening met him in an apartment of the other tower than that in which her own rooms were situated, heard the footsteps of the old countess approaching to make a detection, ran to the top of the leads, took the desperate leap of 9 feet 4 inches over a chasm of 60 feet, and safely alighting on the battlements of the other tower, crept into her own bed, where her astonished mother found her, and, of course, apologized for her unjust suspicions. The fair daughter eloped the next night and was married. After the forfeiture of the last Earl of Gowrie, the castle and the circumjacent manor were bestowed by James VI. on the family of Tullihardine; and they afterwards passed by marriage to the Athole family, and have since been the property of its Dukes. So great was the change effected by the transference of the property, the introduction of manufactures, and the entirely new spirit of society, that the same castle

in which the proud and powerful Earl of Gowrie once confined his king as a prisoner was yielded up, before the close of last century, to the quiet occupancy of a colony of calico-printers.—Tibbermore, though not so much the field of action as the contiguous parish of Aherdalgie, has given name to the first battle fought between the Marquis of Montrose and the Covenanters; a battle in which the latter confronted about 1,700 Highlanders and Irishmen with about 6,000 foot and 600 horses, but were completely vanquished, and suffered a loss of 2,000 slain and 2,000 captured. The parish is traversed by both the north and the south roads from Perth to Crieff, and by the road from Perth to Muthil; and it derives prime facilities of communication from lying in the immediate vicinity of Perth,—the nearest part being distant only 5 or 6 furlongs. Population, in 1801, 1,306; in 1831, 1,223. Houses 257. Assessed property, in 1815, £7,817.—Tibbermore is in the presbytery of Perth, and synod of Perth and Stirling. Patron, the Crown. Stipend £235 12s. 10d.; glebe £20, and two acres of moss. Unappropriated tithes £66 11s. 1d. In 1834, the parish-school was attended by 39 scholars; and a private school, situated in the vicinity of the public works, was attended by 133. Parish schoolmaster's salary £34 4s. 4d., with fees.—Tibbermore was the residence of several bishops of Dunkeld, particularly of Bishops Geoffrey and Sinclair, who died respectively in 1249 and 1337. Bishop Sinclair is noted in history for an exploit against the English in the reign of Robert Bruce. The original parish-church was the church dedicated to St. Servanus, vulgarly called St. Serf's chapel, and situated on the north side of the Almond, within the present boundaries of Redgorton; and it was abandoned, as tradition says, in consequence of a child of the lord of Ruthven having been drowned in the river on the way home from being baptized. At Tullilum, in the east end of the parish, anciently stood a convent of Carmelites; and beside it Richard Inverkeithing, Bishop of Dunkeld, built, in 1262, a chapel and a house. Here the synods of Dunkeld diocese were held till 1460, when they were removed by Thomas Lauder the bishop to his own cathedral. Alexander Young was the last prior of the convent; and, on his embracing the Protestant religion at the Reformation, he became minister of Tibbermore.

TILlicOUNTRY, a parish in Clackmannanshire, marching over one-half of its boundary with Perthshire and the detached parish of Stirlingshire. It is bounded on the north by Blackford; on the north-east by Glendevon; on the east by Dollar; on the south by the main body of Clackmannan and by Alloa; and on the west by the detached part of Clackmannan and by Alva. Its form is an oblong, stretching north and south. Its length is 6 miles; its breadth is from 1 mile, at the north end, to  $2\frac{1}{2}$  at the south; and its superficial extent is upwards of 6,000 Scottish acres. About two-thirds of the area, from the northern extremity downward, lies among the Ochil hills, and includes some of their highest summits; and the remaining or southern third is nearly all arable, and lies at from 20 to 320 feet above the level of the Forth at Alloa. The entire landscape, whether we view the hills or the plain, is pleasant and beautiful. Bencleuch, the loftiest of the heights, rises 2,300 feet above sea-level. A rising ground, called the Kirkhill and the Cuninghar, which extends south-east from Tillicountry-house and the old church, and closes up a beautiful plain stretching out to it from the Abbey-craig near Stirling, has a strikingly romantic appearance, as approached from either the east or the west, and is supposed to be 'the mount at the back of the country,' the *Tullich-cut-tir*, whence the parish has

its name. The beauty of the plain is greatly enhanced by the windings of the Devon, which resemble, in miniature, those of the gorgeous stream to which it pays tribute. This river—the Devon—when not far from its source, and when running eastward, forms the northern boundary-line; and when it has travelled a further distance of 14 miles, and is running westward it cuts the plain of the parish into not very unequal parts. It everywhere abounds in excellent trout and parr, has pikes and eels in its pools, possesses plenty of salmon in the spawning-season, has whole brigades of delicious white and gray sea-trouts in harvest and spring, and at one time produced small-sized pearls. Trouts of fine quality and flavour abound in most of the hill-burns, and are taken in great numbers after rain; but, neither of good or bad quality, have they ever been found in the Gloomingside-burn, though it has plenty of water and remarkably fine pools, nor, if put into it alive, will they propagate their species, or long survive. The arable grounds of the parish are beautifully cultivated, enclosed, and sheltered with ornamental woods. The rental of the estate of Harviestoun in this parish, containing about 3,830 imperial acres, whereof 1,078 were richly arable land, and 2,450 sound green pasture, was, in 1842, £2,500. The soil, at the foot of the hills, is a fine quick loam, but not very deep; on the haughs of the Devon it is a deep loam mixed with sand; and in other parts it is now loamy, and now argillaceous, on a variety of subsoils. Much of the ground is stony; and, in many fields where little soil can be seen, on account of a thick powdering of quartz nodules, it is, nevertheless, richly fructiferous. The uplands are beautifully verdant, afford excellent pasture, maintain about 3,500 sheep, and are inferior to none in the Ochils for producing excellent mutton and fine wool. Red and gray granites compose the summits of the central and loftiest heights; and they exhibit some very fine varieties, and contain large distinct crystals of black schorl. Clay-slate is a prevailing rock in the King's-seat-chain; and basaltic rocks, in some instances containing curious decomposed masses, occur in the lower heights. Micaceous schist likewise occurs, and contains numerous garnets. Some veins of copper-ore were at one time worked; but, after the expenditure upon them of a very great sum of money, were abandoned as uncompensating. Silver, lead, cobalt, arsenic, and sulphur, also seem to exist, but in small quantities. A rich variety of ironstone, and rich veins of iron-ore of the kidney kind, are in sufficient quantity to be very valuable, and have been an object of marked attention by the Devon company. A stratum of dark-blue clay, suitable for fire-bricks, occurs; and on the banks of the Devon are singular concretions of hardened clay in a great variety of fantastic shapes. Sandstone, of good quality, occurs on the skirts of the hills and in the plain, and has been extensively quarried. Coal, in four workable seams, and of various quality, occurs in the same district as the sandstone, and as the object of extensive mining and traffic. The property of the parish is divided among 9 or 10 landowners. The chief mansions are Tillicountry-house and Harviestoun. The principal antiquities are a Druidical circle on the south end of Cuninghar, and the ruins of a circular building on a basaltic eminence called the Castle-craig. Coalsnaughton and one or two other villages are inhabited chiefly by colliers. The village of Tillicountry is situated on the right bank of the Devon, and on the road from Stirling to Kinross, 2 miles east of Alva, 4 west of Dollar, and 5 north-east of Alloa. It has considerable manufactories of shawls, plaidings, and other woollen fabrics, and,

seated at the foot of the Ochils, with a plentiful supply of coals and pure water, has ample facilities for conducting them. In the village are a branch-office of the Edinburgh and Leith bank, the parish-church, a meeting-house of the United Secession, the parish-school, an excellent private boarding-school, and various institutions ancillary to the purpose of benevolence and social improvement. All the parochial population, excepting a mere fraction, is aggregated in the villages. Lord Colville, who was raised to the peerage by James VI., and who was distinguished for military genius, and figured conspicuously in the wars under Henry IV. of France, spent the latter part of his life, and died in Tillicoultry. St. Scrf or Servanus, who lived in the end of the 6th century, and is absurdly said by tradition to have travelled about the country with a pet goat, figures, in the Romish legends respecting him, as performing in Tillicoultry some of his alleged miracles. Population, in 1801, 916; in 1831, 1,472. Houses 257. Assessed property, in 1815, £4,209.—Tillicoultry is in the presbytery of Dunblane, and synd of Perth and Stirling. Patron, the heirs of R. W. Ramsay. Stipend £240 12s. 7d.; glebe £44, with right of pasturage, and of coals at the hill at 3s. per ton. Unappropriated teinds £199 7s. 10d. Schoolmaster's salary £35, with £10 fees, and £5 other emoluments. In 1834 the parish school was attended by 25 scholars, and 3 private schools by 156.

**TILT (THE)**, a beautifully grand and romantic stream in Blair-Athole, Perthshire. It issues from Loch-Tilt, close on the boundary with Aberdeenshire; and after running 2 miles southward, receives from the east Glenmore-water, and from the west Tarf-water, each of which greatly excels it both in volume and in length of run; and thus augmented, it flows 9 miles south-westward, and 4 southward, to the Garry, a little below the village of Blair-Athole. Over its whole run it holds its way through a valley so narrow as seldom to contain a patch of plain; and over portions of the run it traverses sheer ravines, which have been cut, by its own corroding action, through the solid rocks. The glen is distinguished from every other in the Highlands at once by its extreme depth, narrowness, and prolongation, and by the bold contrast of excessive wildness at the upper end, and high ornamental beauty at the other. Immediately on entering the glen from the vale of the Garry, the river is just seen rushing deep along its dark chasm, overhung by a profusion of graceful birches, which spring from crevices in the rocks; the bills on each side are seen to rise holdly up to a great height, green, or cultivated, or densely wooded, or covered with wild groups and single trees of birch and ash and oak; and in front are beheld the lofty and finely flowing lines of the stupendous Ben-y-gloe, drawn distinctly against the sky, and offering a singular contrast in their nakedness to the splendid opulence of the glen and the variety of the lower declivities. "For some miles along the course of the Tilt the scenery continues equally rich, and still more various; the road passing through dense groves, or skirting the margin of this picturesque and wild stream, or opening into green meadows where the woods are sometimes seen towering in a continuous sheet to the sky, and, at others, scattered over the sides of the hills in a thousand intricate forms. Innumerable torrents and cascades fall along their declivities, adding, with the numerous bridges which cross them, much to the beauty of the scenes; as do the roads which, winding about the hills in various directions, display those traces of human life, the want of which is so often felt in Highland scenery." But at Forest-  
 lodge, 7 miles above the village of Blair-Athole, the

glen "becomes a bare valley, bounded on both sides by steep and lofty hills; and thus it continues for many miles," or to the head, "seeming almost to lengthen as we go. From the upper part of this portion it presents an extraordinary spectacle, prolonged almost beyond reach of the eye, an uniform, deep, straight section of the country,—a ditch to guard and separate a world." [Macculloch's Highlands and Western Isles.]

**TINGWALL, WHITENESS, AND WEESDALE**, an united parish, a little south of the centre of the mainland of Shetland. It is bounded on the north by the sea, and by Nesting and Delting; on the east by Lerwick; on the south by the sea and Quarff; and on the west by the sea and Sandsting. Its greatest length is between 18 and 20 miles, and its greatest breadth is 10 miles; but it is so much and frequently indented with friths or voes, that no part of it is more than 2 miles from the sea. Several small islands belong to it; the chief of which are Oxnor, Trousa, Hildessie, and Linga, all inhabited. The principal voes or harbours are those of Wadhaster, Laxforth, and Deal, on the east, and Weesdale, Stromness, Ustanes, and Scalloway, on the west; and these have an average length of probably 3 miles, and an average breadth of about three-fourths of a mile. A ridge of hills, extending from north to south, divides the united parish into two distinct districts; and each of these districts is disposed in parallel straths, nearly at right angles with the ridge. The soil is either moss or a dark-coloured loam; and the moss generally lies on a ferruginous subsoil, which is naturally impervious to water, and for some years resists the plough, but yields to persevering tillage, and enrichingly mingles with the soil. Though cultivation by the spade and by the old one-sided plough is still extensively practised, agricultural improvements, including a regular system of rotation in crops, have been introduced. Much waste land has of late years been reclaimed. Large crops of coarse grass grow on extensive boggy meadows, and by a new and judicious mode of treatment are converted into good hay. Though fishing, as throughout Shetland, forms a chief employment of the inhabitants, it is practised freely and from choice; no part of rent being now paid as formerly in fish and labour. In each strath is abundance of primitive limestone; the hills on the east side of Tingwall consist of clay and mica schists; near Rova-bead is a bed of good blue roofing-slate; and in several of the meadows are beds of excellent shell-marl. The lakes of Tingwall, Girsta, Asta, Strom, and some others, abound with fish. On an islet called Lawting in the first, the Grand Foud anciently held his court, and heard appeals from other courts; and on an islet in the last is the ruin of a small fortalice, said to have been inhabited by a noble, whose father, an Earl of Orkney, ordered to be put to death. Tumuli, stone-axes, and flint arrow-heads, are numerous. **SCALLOWAY** [which see] is in the parish. Whiteness and Weesdale are quite destitute of roads; but portions of Tingwall are traversed by roads which, considering the locality, are good. Population, in 1801, 1,863; in 1831, 2,797. Houses 44. Assessed property, in 1815, £730.—This parish is in the presbytery of Lerwick, and synd of Shetland. Patron, the Earl of Zetland. Stipend £263 0s. 11d., and 20 lespunds, 7 lbs. of butter, vicarage teinds; glebe £20. There are two parish-churches,—that of Tingwall, built in 1788; and that of Whiteness, finished in 1837. Sitings in each about 570. A church in the village of Scalloway began to be subscribed for in 1838, and was in the course of erection in 1841. A missionary, salaried at £50 on the royal bounty, and pro-

vided with a house, grass, and fuel, regularly officiates at Whiteness. A small chapel, designed to be used as a preaching-station for evangelical preachers of every denomination, but erected chiefly at the expense of Independents, was built in 1837. An ecclesiastical census, in 1836, showed the population then to be 3,096, of whom nearly 2,000 were in Tingwall. Parochial schoolmaster's salary £26, with about £8 fees, and £4 other emoluments. Three schools at Scalloway, Whiteness, and Weesdale, are supported by the Society for propagating Christian knowledge; one at Trandsay, by the General Assembly; and one at Swinister, by the minister and the people. In 1834 the six schools were aggregately attended by 389 scholars. The united parish, consisting of Tingwall on the south, Whiteness in the centre, and Weesdale on the north, seems formerly to have been more extensive than at present. Tingwall, at all events, comprehended the district of Lerwick, which was made a separate erection in 1701, and the parishes of Gulchrwick and Sound, which were annexed to Lerwick in 1722. Tingwall was anciently an archdeaconry; and for upwards of a century after the Reformation, either itself or its village of Scalloway, gave name to the Shetland presbytery. The ancient churches of Weesdale and Whiteness were dedicated respectively to the Virgin Mary and St. Ola; and so powerful was the hold which popery had on the whole united parish, that, as we learn from the New Statistical Account, there are 'remains of a very great many Roman Catholic chapels.'

**TINNIS (THE)**, a rivulet of Liddesdale, Roxburghshire. It rises between the heights of Tinnis and Lockknove on the boundary with Dumfriesshire, and runs south-eastward to the Liddel at Burnmouth, a few yards above where the Kershope enters on the opposite bank. Its length of run is only about 5 miles.

**TINTO**, that is 'the Hill of fire,' a lofty mountain, at the head of Clydesdale, in Lanarkshire, between the parishes of Carmichael, Wiston, and Symington, and stretching above 2 miles from east to south-west. Near the east end of the range there is a cairn of a circular form, the top of which is elevated 2,312 feet above the level of the sea, and 1,740 feet above the Clyde. The upper part of this mountain consists of a flesh-coloured felspar, resting on conglomerate, containing rounded masses of greywacke, iron-clay, flinty-slate, splintery-hornstone, quartz, felspar, mica, &c. Where the rock becomes finer grained, it approaches in some places to greywacke, and in others to those portions of the old red sandstone which are conjectured to alternate with the newer members of the transition series. Over the conglomerate, masses of claystone, greenstone passing into clinkstone, and porphyry-slate, successively appear, till we reach the summit, which, along with the whole of the upper part, is found to consist of compact felspar, and felspar porphyry. The disposition of the rocks in this mountain is conformable to the idea of secondary deposition, by assuming a finer and more crystalline texture as they ascend; and the occurrence of claystone and felspar in a position corresponding to what is observed on the Eildon-hills, the Pentlands, the Ochils, Papa Stour, Dundee, and in other places, seems to favour the hypothesis of a particular overlying formation, in which those substances are prevailing ingredients, extending over a considerable portion of the lower country of Scotland. In the bed of the Clyde to the eastward of Tinto, amygdaloid appears, having nodules of calcedony coated with green earth; also calcspar, and portions of steatite. Towards the north, the conglomerate forming the base of Tinto

passes into the sandstone, of which the whole interior districts of Lanarkshire are composed.

**TINWALD**, a parish lying doubtfully between Nithsdale and Annandale, but belonging mainly to the latter, in Dumfriesshire. It is bounded on the west and north-west by Kirkmahoe; on the north-east by Kirkmichael; on the east by Lochmahen; on the south-east by Torthorwald; and on the south-west by Dumfries. Its greatest length from north to south is  $5\frac{1}{2}$  miles; its greatest breadth is  $4\frac{1}{2}$  miles; and its superficial extent is about 15 square miles. The water of Ae, traversing a flat, broad, pebbly path, runs  $4\frac{1}{2}$  miles along the north-eastern boundary; and the sluggish Lochar begins, not far from its origin, to creep along the whole of the west. A lochlet, once of great depth and considerable size, but now greatly drained, and less than 20 feet deep, bears the appalling name—so much in keeping with the ghost-story-telling character of the district—of Murder-loch. A soft-featured hilly ridge, 2 miles broad, slowly rises from the vicinity of the Ae, extends southward in such a way as to form the central district of the parish, and is afterwards continued, though at a lower altitude, in Torthorwald and Mousewald. The acclivities of the heights are gentle; their table-summit is deeply undulated; their extreme altitude above sea-level is 682 feet; and their surface is nearly all ploughed or verdant. A belt of Lochar-moss on the west, about a mile long and  $\frac{1}{2}$  of a mile broad, has been reclaimed into a remarkably fine meadow. The soil of the arable grounds, including the hills, is to a small extent a sandy gravel; to a small extent, stiff moorish clay; to a very small extent, reclaimed moss; and to a chief extent, a loamy or friable clay, much mixed in some places with small stones. The rocks of the parish are almost exclusively greywacke. The woodlands, meadows, wastes, or pastures, and arable lands are in the proportion to one another of respectively  $2\frac{1}{2}$ , 7, 33, and 148. **AMISFIELD-CASTLE** [which see] is in this parish. Sir Thomas Charteris, of Amisfield, was, in 1280, appointed Lord-high-chancellor of Scotland by Alexander III.; and seems to have been the first layman who held the office. Sir Thomas Charteris, the grandson of the former, was, in 1334, made Lord-high-chancellor by David II.; and he fell at the battle of Durham, on the field where his royal master was taken prisoner. Sir John Charteris of Amisfield held, in the reign of James V., the office of warden of the West Marches; and he received from his eccentric but vigorous and vigilant King a singular incognito visit, which led to the reduction of the family's consequence. Half-a-mile north of Amisfield stands the fine mansion of Glenae, the seat of Major Dalzell, the claimant of a dormant earldom. In the south corner of the parish is Tinwald-house, a seat of the Marquis of Queensberry. The old Roman road from Brunswark may be traced by Traillflat and Amisfield. A British fort crowns the summit of Barshall-hill.—The famous Paterson who originated the project of the Bank of England, and planned the disastrous Darien scheme, was born about the year 1660, on the farm of Skipmire. Dr. James Mounsey, his grand-nephew, and first physician for many years to the Empress of Russia, was born on the same farm. The sister of Dr. John Rogerson, who succeeded the former as first physician to the Empress, and subsequently persons of the name of Mounsey, have held Skipmire. The parish is bisected by the Dumfries and Moffat post-road. Population, in 1801, 980; in 1831, 1,220. Houses 212. Assessed property, in 1815, £7,007.—Tinwald is in the presbytery and synod of Dumfries. Patrons, the Crown and the Marquis of Queensberry. Stipend £155 13s. 7d.;

glebe £26 16s. The church, a prosaic barn-like edifice, was built in 1763.—The present parish comprehends the ancient parishes of Tinwald and Trailflat, the former on the west and the latter on the east, united in 1650. Tinwald was anciently a free parsonage within the deanery of Nith; and Trailflat was a vicarage under the monks of Kelso. Symson, in 1684, represented the church of Trailflat as an excellent structure, the roof of which was famed for its curious workmanship; yet it was then partly ruinous. A little hamlet, long known in the circumjacent district as the seat of a bleachfield, still stands at the place, and bears the name of Trailflat. There are two parochial schools, attended by from 160 to 190 children. Salaries of the masters £51 6s. 7½d., with £30 fees, and £5 14s. 7d. other emoluments.

**TIPPERLIN**, a hamlet in the parish of St. Cuthberts, ¼ of a mile west of Morningside, and 1½ mile south-west of Edinburgh-castle. It was once a summer-retreat of the citizens of the metropolis; but has entirely sunk into obscurity and neglect.

**TREE AND COLL**, an united parish in the Argyleshire Hebrides. It comprehends the islands of **TREE**, **COLL**, and **GUNNA**, [which see.] and several uninhabited islets, the chief of which are the two Soas and Ellen-more. Population, in 1792, 3,457; in 1831, 5,769. Houses 713. Assessed property, in 1815, £7,068.—The parish is in the presbytery of Mull, and synod of Argyre. Patron, the Duke of Argyre. Stipend £346 18s. 7d., burdened with a tack-duty of £22 4s. 5d. to the synod of Argyre for the Crown teinds, and with payments of grain and of Scottish money, amounting to about £62 2s. to the assistant minister of Coll; glebe £4 10s. For the ecclesiastical statistics of **COLL**, see that article. The church of Tirce was built in 1776, and enlarged in 1786. Sittings between 450 and 500.—An Independent congregation was established in Tirce in 1832. Two chapels, both thatched houses, belong to this congregation; the one at Drimbui, and the other at Sliabhdiasg; built respectively in 1833 and 1835, at a cost jointly of about £45. Sittings 400 and 200. Stipend within £50, paid by the Congregational Union. A Baptist congregation, and a United Secession congregation, meet in private houses.—In 1834, two parish schools were attended by 207 scholars; and eleven other schools by 692. Salary of each of the parochial schoolmasters £22 4s. 5d., with about £6 fees, and £6 other emoluments. Of the non-parochial schools two are supported by the Gaelic school society, two by the General Assembly, and one by the Society for propagating Christian knowledge. In Tirce are seven Sabbath schools; and here also a catechist is salaried by the synod of Argyre.—The parishes were united in 1618. In the united parish are remains of no fewer than 15 old churches or chapels; at some of which are still burying-grounds and crosses.

**TREE**, an island of the Argyleshire Hebrides, 2 miles south-west by west of Coll, 15 west by south of Treshinish-point in Mull, and 18 north-west by west of Iona. Its length is 12 miles; and its mean breadth about 4. It appears to have been, in the time of the Culdees, part of the patrimony of the church, and to have supplied the famous seat of learning in its vicinity with considerable quantities of grain; and hence it is supposed to have acquired the name of Tir-I, the country of Iona. Another ancient name, still applied to it in romantic tales, is *Rioghach bar fo thinn*, 'The kingdom whose summits are lower than the waves;' and this aptly describes as the lowest and flattest of the Hebrides, and as so curiously washed by the sea that, from one side, the waves may often be seen on the other rising several

feet above the level of the rocks. The shores have frequent, though not deep indentations, and consist of sandy bays, separated by ridges of rock; and they abound in the fact of the kelp manufacture, and are frequented by cod, plaice, coal fish, and gurnards. The bay of Gett, on the east side, measures about 2½ miles round the head, and has so firm a sandy beach that a horse at full gallop makes an impression not above half an inch deep. Upwards of 20 fresh-water lakes aggregately cover about 600 acres, and swarm with an almost incredible number of eels. From one of the larger lakes egresses the only stream; which, however, is powerful enough to drive a mill. At the northern extremity of the island are considerable accumulations of blown sand. In the south, the rocks look so rarely up from the surface as to form only a few scattered elevations; but toward the north, they become numerous, and at length occupy the greater part of the surface, preventing the cultivation of the soil, and condemning it to perpetual pasturage. A few low heights are formed on the rocky ground, ranging from 50 to 60 feet in altitude, and three separate hills rise near the southern extremity, to a maximum height of about 400 feet. All the rest of the island has a mean elevation above high-water-mark of scarcely 20 feet; and, as it has no tree, and scarcely an enclosure, it is swept with unrestrained violence by the westerly winds, and often so scourged and lacerated by gales that sown seed and loose dry soil are dispersed, and matured crops of corn and potatoes broken down. A remarkable plain, called the Reef, near the centre of the island, and 1,562 acres in area, is as flat as the sea, and has scarcely a swell or even a stone; and, from dread of the effect of the winds should the surface be once broken, it is kept in a state of perpetual pasture, and offers a singular spectacle of richness and verdure. The soil is in general light, consisting of sand, calcareous earth, and moss. The sand very greatly predominates; but, in its general diffusion, it is of a calcareous nature, consisting, together with quartz, of a large proportion of pulverized sea-shells. The island, in consequence, is aggregately one of the most fertile tracts of land in the Hebrides. Its fertility is greatly aided, too, by a regular and constant moisture, occasioned partly by its flatness, and partly by its peculiar climate and exposure. The regularity of the moisture is everywhere proved by the flourishing and unchecked growth in the corn-fields of the yellow Iris, the polygonum viviparum, and other aquatic plants. Such natural pastures as, from their soil and position, have least humidity, are surprisingly rich, and produce white clover in such abundance as almost to exclude the grasses. Marshes are unknown; and bogs are so limited that the inhabitants are under the necessity of importing their fuel from Mull, and, in some instances, have been driven to the ruinous resource of paring the soil down occasionally to the subjacent rock. So wondrously destitute is the island of wood, that, excepting the *salix argentea* or *avicularia*, it may be said not to possess a ligneous fibre. Yet the total want of shelter, while in many respects injurious to agriculture, combines with the level nature of the surface to occasion so equable a distribution of sand-drift by the winds, that, instead of low lands being overwhelmed as in many places throughout the other Hebrides and the Shetland islands, the drift brings a perpetual renewal of calcareous manure, and scarcely anywhere accumulates to such a degree as to suffocate vegetation. At the northern extremity, however, as in the south end of Coll, the protuberating rocks afford local shelter, and occasion the sand to accumulate. About one-half of the island is arable; but

it requires all its natural fertility and fertilizing resources to resist the gross vices of the method of cultivation. Cross ploughing is rarely practised; the seed is sown on the first furrows, and turned down by a light harrow; and, as the intermediate sod is generally occupied by a line of weeds, the seed in springing has the appearance of a drilled crop of alternating weed and grain. Yet wretched as are both the tillage and the system of cropping, a large and good produce of barley, oats, and potatoes is obtained. The chief manure used is drift seaweed. The rock which forms the island, and carries its soil, is gneiss, abounds with veins of granite, and more curiously embedding masses of primitive limestone. One of the limestone masses, long and favourably known for the flesh-coloured marble into which it has been cut for ornamental architecture, is an irregular rock of about 100 feet in diameter, lying among the gneiss without stratification or continuity. In consequence of its hardness, even though cheaper, in spite of that inconvenience, than many foreign marbles of far inferior beauty, it has lost the patronage of public caprice, and ceased to be in request. Its very tint is finely relieved by the dark green crystals of augite and hornblende which are embedded in it. The deposit is quite unstratified. Another mass, ten times the size of the former, and equally irregular, resembles the marble of Iona, in whiteness, texture, and fracture, yet is generally impure, and seems to have been quarried only for the vulgar purpose of building dikes. The most noticeable mineral substances contained in the rocks of the island are sillite, titanite, tremolite, coccolite, and sphene.—The hill of Ceannharra, situated at the south-west point of the island, and presenting a mural face to the sea, is perforated with a great number of caves, some of which are large and thunderingly scoured by the surge, while all are frequented by innumerable flocks of sea-fowls. Remains of no fewer than 39 watch-towers or forts, within view of one another, encircle the coast of Tiree and Coll; and there are 9 or 10 standing-stones, besides minor antiquities. The inhabitants relate many Fingalian and other tales of battles and chieftains; and even affect to point out the graves of the heroes of their legends. On an islet, now converted into a peninsula, anciently stood a square-turretted castle, accessible only by a drawbridge; and, on its ruins was erected, in 1748, a house for the factor of the Duke of Argyle,—the sole proprietor of the island.—The rearing of black cattle is a chief employment; and the exportation of them a principal means of support. Poultry and eggs also are largely exported. Fishing, very contrary to the prevailing practice in the Hebrides, engages little attention. Tiree, proportionately to its extent, is more crowdedly peopled than any other of the Western Islands; and, owing chiefly to the rapidity with which its population has increased, and the ruin of the kelp manufacture on which a large proportion of them depended mainly for subsistence, it has shared to a grievous extent in the distress with which so many of the Hebridean islands have of late years been visited. Its rental, during the time of the kelp trade, was £3,000; but is almost incredibly reduced, no fewer than 400 families paying no rent whatever, and 430 persons pay each no more than from 20 to 40 shillings a-year. One witness before the Emigration Committee said, that 2,000 of the inhabitants ought to emigrate, if a comfortable situation could be assured to them; and another said, that from 3,000 to 4,000 might be well removed. The Duke of Argyle lately spent several weeks in the island, making himself personally acquainted with its condition; and he is understood to be planning, or to have already planned, permanent

arrangements for a better state of things. Annual fairs are held on the island on the Wednesday before the Mull fairs of May and October, and the Monday before the Mull fair of August. Population, in 1808, 3,200; in 1831, 4,453. Houses 949. Assessed property, in 1815, £7,068.

TOBERMORY, a *quoad sacra* parish, and a modern sea-port town on the north-east coast of the island of Mull. The parish belongs, *quoad civilia*, to KILNINIAN: which see. Population, in 1838, 1,520. The church is a parliamentary one. Patron, the Crown. Stipend £120; glebe £1.—The town of Tobermory, in which is segregated most of the population, stands at the head of a sheltered bay,  $3\frac{1}{2}$  miles south-west of Auliston-point, where Loch-Sunart forks off from the sound of Mull, 9 miles south-east of Ardnurchan-point, 30 north-west by west of Oban, 62 north-west by west of Inverary, and 171 west-north-west of Edinburgh. It was built in 1788, at the same time as Ullapool, by the British fishing company, as the site of a fishing establishment, and the rendezvous of the herring vessels. Its name means 'Mary's well,' and was taken from a fountain on the spot, which was dedicated to the Virgin, and had much celebrity in the days of popery. The chief part of the town is arranged in the form of a crescent; and has a customhouse, an inn, a post-office, some large houses used for coopers' stores and other purposes, and upwards of twenty slated dwelling-houses. An upper town surmounts a cliff at the back of the former, and consists almost wholly of poor cottages or miserable butts. The church occupies a prominent site, and is, in most views of the town, a conspicuous object. The harbour or bay is spacious, and almost completely landlocked; and is covered, across the entrance, and at a brief distance, by Calve island. There are two excellent quays, the one having two and the other four feet of water at ebb tide; the latter was commenced in 1835, at the expense of Colonel Campbell of Knock. The town is the seat of a monthly court of the sheriff-substitute, and the polling-place for Tiree, Coll, Eigg, Muck, Rum, Canna, and the smaller islands of the Argyshire Hebrides. As the only town in Mull, and in a large circumjacent district, both Hebridean and continental, it possesses much provincial importance, and is the seat of a considerable domestic trade. In connexion with its customhouse, it is the place where legal forms are attended to respecting the herring-fishing, and, in consequence, the resort of parties from whom the forms are exacted. As a sea-port, it is the natural outlet of the surplus produce of northern Mull; and, being situated on the route of the steam-vessels between the Clyde and both Skye and Lewis, it enjoys as good advantages as if it possessed a steam-boat communication of its own. It has communication with the Clyde by steamers, and overland from Oban by Inverary several times a-week, and also regularly with Inverness and Skye. A small trade is conducted also in boat-building. But, in spite of all these circumstances, which might seem to work powerfully in its favour, it must be pronounced, in the aggregate, the home of inaction, adversity, and indigence. The object of its erection proved a total failure; and the society who built it, though still kept together as a joint-stock company, do not now encourage the fishery, and rather repel than invite new settlers. The original establishment comprehended 2,000 acres of land, which were cut out into allotments, at low prices, to the tenants of the several new houses; and it is alleged to have attracted as settlers, the indolent rather than the industrious, and to have incited them to care for the profits of agriculture rather than for those of the fish-

eries. Even the settlers and crofters, who rent even the cheap houses and lands of the original establishment, live in penury and suffering; and other settlers who have been forced upon the population by pressure in entirely landward districts, and who are accommodated in a part of the town which belongs to Colonel Campbell of Knock, are in such miserable circumstances that many of them can pay no rent, and have only a little potato-ground,—amounting, in some cases, to no more than one ridge of land. The number of ordinary poor, or utter paupers, is usually about 40.—A little south of the town is a beautiful lake, between two precipitous and richly-wooded hills.

**TOFTINGALL (LOCH)**, a circular lake about 5 miles in circumference, and 8 feet in mean depth, in the parish of Watten, Caithness-shire. It is encompassed by dismal moors, and sends off an affluent to the river Wick.

**TOLLIE**, or **TULLA**, a rivulet and a lake, in the parish of Glenorchy, Argyleshire. The rivulet rises at the south-west corner of the moor of Rannoch, close on the boundary with Perthshire, and runs 8 miles south-westward to the lake. The lake measures about 2½ miles in length, and half-a-mile in mean breadth; it sends off from its east side the river Orchy; it is skirted for about 2 miles by the road from Tyndrum to Fort-William, through Glencoe, and has on its shore the public-house of Inverouran; and it presents around its banks several features of picturesque scenery, and some fine specimens of Scottish fir.

**TOMANTOUL**, a *quoad sacra* parish, in the parish of Kirkmichael, and presbytery of Abernethy, Banffshire. It comprehends a portion of Glenavon, where the low ground is narrow and winding, and the flanking heights, though steep, are partially skirted with coppices of oak, and then undulate upwards in patches of cultivated ground, amidst prevailing pasturage. Population, in 1834, 1,020. Patron, the Crown. The church is a parliamentary one. Stipend £120; glebe £2.—The village of Tomantoul stands on the road from Grantown in Strathspey, which forks in Glenmuick into a line down the Dee to Aberdeen, and a line up Braemar and down Strathardle to Perth; and is 14 miles south-east of Grantown, and 23 north-west of Ballater. It stands on a small table-land overlooking the Avon; it consists of a single street and a central square; its houses, with three or four exceptions, are of one story, some slated, and some heath-thatched; and its population amounts to about 600. Annual fairs are held here on the last Friday of May; the last Friday of July, old style; the third Wednesday of August, old style; the Friday after the second Tuesday of September; and the second Friday of November, old style.—The Duke of Richmond has erected a large and elegant schoolhouse in the village.

**TONGLAND**, or **TONGUELAND**, a parish in the centre of the southern division of Kirkcudbrightshire. Its form is triangular, with a side of 5¼ miles on the north, one of 4¾ on the south-east, and one of 6¾ on the south-west; and it is bounded on the north by Balmaghie; on the south-east by the Dee, which separates it from Kelton and Kirkcudbright; and on the south-west by Twynholm. **TARF-WATER** [which sec] drains most of the interior, forms, for nearly 2 miles, the south-west boundary-line, and falls into the Dee at the apex of the parish, where the union of the streams begins in a degree to form an estuary. Both rivers, especially the Dee, are here rapid and romantic, and abound both in fishes and in fine landscapes. A view from Tongueland-bridge, across the Dee, half-a-mile above the influx

of the Tarf, discloses, when the river is in high flood, a beautifully grand train of broken cascades, tearing and roaring over rugged rocks with a tremendous noise. A very fine fall about 20 yards below the bridge, is thus described by an old poet who lived in the neighbouring retreat of Cranston-castle:

“ But as I lukit myne alane,  
I saw a river rin,  
Out'wore a steeple rock of stane  
Syne lichtit in a lin,  
With tumbling, and rumbling  
Among the rockis round,  
Devaling and falling,  
Into a pit profound.”

Bargaton-loch, a triangular lochlet of about half-a-mile each way, lies on the northern boundary. The southern district consists of a hilly ridge running north and south, and of gradual declivities sloping down to the rivers. The northern division is rocky and moorish, and consists of a medley of small hills, rising grounds, valley-land, moss, and meadow. A tract along both margins of the Tarf is fine natural meadow ground, laden with hay in moderate seasons, but liable to floods and damage in a season of rain. The soil of the arable lands is very various; but, in general, especially in the southern and central districts, is fertile in either grain or grass. On a rocky moor-hill, called Barrstobrick, is shown the spot where Mary of Scotland rested to refresh herself in her flight from the battle of Langside to the Abbey of Dundrennan. The event has bequeathed to the farm the name of Queen's-hill. In the moor of Kirkconnel, at a great distance from any house, is a monumental stone on the grave of a martyr of the name of Clemont, who was shot on the spot during the prelatie persecution. In various localities are some sepulchral cairns and vestiges of old encampments. The parish is bisected northward by the road from Kirkcudbright to the Glenkens and Ayrshire, and westward by that from Dumfries to Wigton. Population, in 1801, 636; in 1831, 800. Houses 139. Assessed property, in 1815, £8,467.—Tongland is in the presbytery of Kirkcudbright, and synod of Galloway. Patron, the Crown. Stipend £158 17s. 7d.; glebe £40. Schoolmaster's salary £34 4s. 4½d., with fees. There are three private schools. The present parish comprehends the ancient parishes of Tongland and St. Michael's of Balnacross. Tongland is the southern district, and had its name from the site of its church being, as at present, on the tongue of land which is peninsulated by the Dee and the Tarf. The church was anciently a vicarage of Tongland Abby. Bal-na-cross means, in Irish, 'the Hamlet of the cross;' and in the corrupted form of Barncrosh, continues to be the name of an estate and a mansion in the north-east. The church of St. Michael of Balnacross belonged originally to the Culdee community of Icolmkill; and was given by William the Lion to the monks of Holyrood, and transferred by Robert Bruce to the monks of Tongland. On the west side of the Tarf, toward the north, anciently stood a church, which was dedicated to St. Conel, and has entailed on the district around it the name of Kirkconnel.—Contiguous to the present parish-church are some vestiges of the ancient priory of Tongland. The buildings were of considerable extent; but having from time to time been robbed, by the pilfering and avaricious spirit of the country-people, of some sandstones which were interlaid among harder material, they all fell down in one heap of rubbish. The priory was founded about the middle of the 12th century, by Fergus, Lord of Galloway, and was colonized by monks of the Premonstratensian order, brought from Cockerland in Cumberland. Alexander, the earliest abbot whose name is preserved, swore fealty to Edward I. in 1296,

and was a subscriber to Bagimont's roll. James Herries, an abbot who, in 1430, repaired the monastery, and enclosed the precincts with a high wall, was a Doctor of the Sorbonne, a writer on the validity of indulgences, and a man to whom an ignorant and superstitious age ascribed great learning. An Italian alchemist was made abbot by James IV., and rendered himself memorable by a crackbrained attempt to fly from the hattlements of Stirling-castle: See STIRLING. William Melville, commendator of the abbey, who died in 1613, was made a Lord-of-session in 1587, and often figures, not in a very reputable way, in the history of his times, under the title of Lord Tongland. After his death the abbey was annexed to the bishopric of Galloway; so that its revenues were included in those of that see, and are not stated in any separate rental.

TONGUE, a parish on the north coast of Sutherlandshire; bounded on the north by the North sea; on the east, south-east, and south, by Farr; on the south-west by Edderachylis; and on the west by Durness. Its greatest length, from north-north-east to south-south-west, is 20 miles; its greatest breadth is 10 miles; its mean breadth over the southern half is little more than 4 miles; and its area is probably about 120 square miles. The coast, measured in a straight line, extends 10 miles; and, though hewn in two by the Kyle of Tongue, and indented by several small creeks, has only one considerable headland, that of WHITEN-HEAD: which see. It is, in general, high and rocky,—occasionally mural, grand, and picturesque; and it presents a series of caves, and of such regular arches and pillars, that they almost appear to be works of art. The great cave of Fraisgill, 50 feet high and 20 feet wide at the entrance, and running half-a-mile into the bowels of the earth, but gradually narrowing to a more contracted orifice, is variegated in its walls with a thousand colours so softly and delicately blended as to mock the most exquisite Titianisms of art. On the south side of Eilean-na-naoimb, 'the Island of saints,' an islet off the coast, the sea, after passing for several yards through a narrow channel, spouts up into the air, sometimes to the height of 30 feet, through a circular perforation in a rock; and a few seconds afterwards, there is a discharge of water from the east side of the island, with a noise and appearance resembling the explosion of a cannon. This phenomenon, however, occurs only at half-flood, during a smart north-westerly gale. Eilean-na-roan, 'the Island of seals,' about 2 miles in circumference, has high and precipitous coasts, rent into deep narrow fissures, through which the winds sweep with violence, and presents in one place a magnificent natural arch of 150 feet in span; and in the interior, it is partly hollowed into a circular basin, so protected from the winds, and carpeted with so rich a soil, as to be a curious but profitable retreat for a small population. "About 7 years ago," says the Old Statist, "part of the ground near the middle of this island sunk in without any visible cause; and, to use Milton's words,

— 'left it th' midst a horrid vale.' "

Three islets, just within the entrance of the Kyle of Tongue, and of sandy soil, are tenanted by numerous rabbits, and bear the appropriate name of the Rabbit islands. The Kyle of Tongue strikes off from the sea at Eilean-na-roan, and penetrates the parish  $8\frac{1}{2}$  miles south-south-westward, with a mean breadth of about  $1\frac{1}{2}$  mile: it has shifting sand-banks, and small depth of water; yet offers safe anchorage to even the largest vessels at the Rabbit islands; and there it expands on the west side into the beautiful, well-sheltered, smooth-beached bay of Tal-

mine, one of the chief fishing-stations on the north coast of Scotland,—and, on the east side, into the creek of Sculomy, the retreat of a few fishing-boats, and easily convertible into a good small harbour. At the eastern boundary opens the bay of Torrisdale, or estuary of the Borgie, exposed, tempestuous, and with hardly shelter for a single vessel. Loch-Maddie, in the extreme south, sends its surplus waters by a circuit to the head of Strathnaver. See NAVER (THE). Kinloch-burn runs 5 miles along the eastern boundary to Loch-Laoghal, expanding by the way into Loch-Coolside. LOCH-LAOGHAL [which see] is beautiful and picturesque, with verdant islets, tenanted by flocks of wild fowl; and previous to the sheep-farming depopulation system, it had on its banks a number of the snuggest humble dwellings in the north. Lochs Craggie and Slam immediately succeeds Loch-Laoghal on the eastern boundary,—all abounding in trout, char, salmon, and large pike; and, from the last, Borgie-water runs  $6\frac{1}{2}$  miles to Torrisdale-bay, and has a valuable salmon-fishery. Between the Borgie and the Kyle of Tongue, the streams Skerray and Tongue, each about 3 miles long, run the former to the sea and the latter to the Kyle, imposing on their Highland vales the lofty names of Strathskerray and Strabtongue. Parallel to the Kyle, and about  $2\frac{1}{2}$  miles of mean distance to the west, the Melness runs  $8\frac{1}{2}$  miles along Strathmelness to the sea. Fresh-water lakes and lochlets, additional to those noticed, are nearly 100 in number. Mineral springs are numerous; and the most remarkable, situated at Sculomy, has a strong sulphurous taste and smell, and is said to resemble the spa of Moffat.—A lofty semi-circular range of hills rises holdly and suddenly from the ocean, and sweeps quite round the Kyle of Tongue, forming the large enclosed valley into a stupendous amphitheatre. On its west side it commences with Ben-Hutig, 1,345 feet above sea-level; runs along in the rugged, trackless, hoggly, mountain waste of the Moin; and terminates not far from the head of the Kyle, yet on the boundary with Durness, in the sublime Ben-Hope. See BEN-HOPE and MOIN. On its east side, it consists of a series of rounded and comparatively soft and gentle hills, whose inner declivities and skirts have been extensively tracked and embellished with cultivation. In its transverse part across the head of the Kyle, it consists of the body and arms of Benlaoghal, one of the most magnificent and picturesque mountains in the Highlands. "At the southern extremity of a low extensive valley," the valley of the Kyle, says the writer in the New Statistical Account, "it starts up majestically to the height of 2,508 feet, presenting towards its base an expanded breast of 2 miles in breadth, and cleft at its top into four massy, towering, and splintered peaks, standing holdly aloof from each other. The highest stands proudly forward to occupy the foreground; the rest recede a little, as if each were unwilling to protrude itself, from a conscious inferiority to its predecessor. As a graceful finish to its outlines, it stretches forth an arm on either side, as if to embrace condescendingly the other mountain ranges, which may well acknowledge it as chief, and which may readily be fancied as doing it homage." The summits of this pinnacled and almost perpendicular mountain-mass present to the fancy, at one point of view, the outline of a lion couchant, and, at another, a close resemblance to the outline of the whole royal arms. At its base lies a lake about a mile in length, and a fine wood of birch; and immediately below rises a low hilly ridge from the plain, and extends northward to the shore of the Kyle, at a point  $2\frac{1}{2}$  miles from its head, and there shoots up in a conical, precipitous promontory,

crowned by the picturesque old ruin of Castle-Varrich. About a mile further north, a point or tongue of land runs nearly  $1\frac{1}{2}$  mile right into the Kyle, and almost bisects it. At the commencement of this slender and beautiful peninsula, overhung by the craggy mountain-height of the promontory, stands the fine old baronial mansion of Tongue-house, its garden walls washed by the waves, and its environs shaded with noble old trees. This edifice is an ancient aggregation of successive structures, the work of many generations, a grotesque collection of masonry formed and run together in defiance of all architectural rule or taste; and, though now the property of the Duke of Sutherland, it has all the associations of having been the principal seat of Lord Reay, the chief of the clan Maekay, and he from whom a large section of Sutherlandshire has the name of Lord Reay's country. So rich is the great amphitheatre of the parish in the pictures and power of choice landscape, that even Dr. Macculloch, amidst his general dissatisfaction with the north, desiderates nothing more than wood on the Moir in order to its being one of the richest museums of scenery in the Highlands. Wood, natural and planted, covers about 700 acres. The lands in tillage comprise only about 1,000 acres; but might be profitably extended to 3,000. The soil of the arable grounds is occasionally a light loam, or a rich black loam, but pre-vaillingly a compound of moss, gravel, sand, and clay. Gneiss is the principal rock, and is capped, on some hills, with conglomerate; sienite forms Ben-Laoghal; mica-schist forms part of the range on the western border; and a fine conglomerate and the old red sandstone constitute Eilean-na-roan. The mica-schist is quarried, at two places, into respectively slates and flags. Garnets occur in the gneiss; black manganese ore on Ben-Laoghal; and hog-iron in numerous localities. Moss, capable of being cut for fuel, and imbedding much fir, covers an extensive area. The village of Tongue or Kirkiboll is pleasantly situated on the slope of a hill, about a mile south of Tongue-house, 44 miles from Thurso, 71 from Bonar-bridge, and 83 from Dornoch. It consists of only a few scattered cottages, the church, the manse, and a neat and comfortable inn; but it is the seat of a post-office, and a key-point of communication with all the extreme north-west of Scotland. A mail-coach runs thrice a-week between it and Thurso; and a mail-gig, with seats for three passengers, runs twice a-week between it and Golspie. Parliamentary and county trust-roads traverse the parish to an aggregate extent of about 26 miles. The Tongue road—so named from an inlet of the sea where it terminates on the north coast of Sutherland—has its southern extremity at Bonar-bridge; from which place, passing along the north side of the Dornoch-frith to the river Shin, it ascends to Loch-Shin, and then proceeds up Strath-Tarrie till it attains its summit at a place called the Crask. In its descent to the northward, after touching upon Loch-Naver, it penetrates Lord Reay's Country, near Loch-Layghall or Loyall, and reaches the North sea at Tongue, thus entirely dividing Sutherland by a line almost 50 miles in length. Population, in 1801, 1,348; in 1831, 2,030. Houses 360. Assessed property, in 1815, £1,529.—Tongue is the seat of a presbytery, in the synod of Sutherland and Caithness. Patron, the Crown. Stipend £158 6s. 8d.; glebe £35. The church is supposed to have been erected before the Reformation, and was enlarged in 1680. Sittings 495. A catechist is appointed and paid by the parishioners. A mission in the Melness district is maintained by the Society for propagating Christian knowledge. The church, situated at Tulnive, was built in 1836 at the ex-

pense of the Duchess of Sutherland. Sittings 300, with capacity for an additional 200. Stipend £50, with a manse. In 1834 the parish school was attended by 60 scholars; and 5 other schools by 307. Parochial schoolmaster's salary £34 5s. 6d., with about £10 fees, and £6 10s. other emoluments. The parish was erected, in 1724, out of Durness and Edderachylis. Traces of an old chapel and cemetery exist on the Eilean-na-naoimh.

TORLUM. See MUTHIL.

TOROGAY, an Hebridean islet of probably 2 miles in circumference, between North Uist and Bernera.

TOROSAY, a district and parish in the island of Mull, Argyleshire. The district is comprehended in the parish, gives it its name, and lies along the east coast of the island, opposite Loch-Linnhe and Lorn. The parish extends from north to south 12 miles, by the shortest road, but in consequence of the great sweep which the island here makes to the east, it extends along the coast, irrespective of sinuosities, about 22 miles; and it stretches from east to west quite across the island, measuring in one place  $18\frac{1}{2}$  miles, and in another only  $3\frac{1}{2}$ . The large sea-lochs—Buy on the south, and Spewe and Don on the east—are within its limits. The bays of Duart, Coughnaneach, Macallister, and Penny-gown, also indent the east coast. The long broad bay of Loch-na-Keal washes part of the west. There are 10 or 11 fresh-water lakes; but only 2 of considerable size. The general surface of the parish is heath-clad mountain. The loftiest summit is the grand and far-seeing BENMORE: which see. Bentaluidh, or the prospect mountain, called by mariners 'The Sugar-loaf,' in allusion to its shape, commands on all sides a very extensive view. There are several woods, chiefly hirsch, with some oak and ash. On a lofty promontory overhanging the sound of Mull, stands DUART-CASTLE: which see. On a small eminence near Benmore, and at the head of Loch-na-Keal, stands the mansion of Mr. Campbell of Knock, amidst a considerable extent of cultivated, planted, and embellished ground, which, at a very recent date, was bleak and barren. For topographical, geological, and other details, see article MULL. The chief ferry from Mull to Kerrera and Ohan, has its station at Achnacraig, on the south side of the entrance of Loch-Don; and there are three other stated ferries respectively to Morven, to Lismore, and to Nether-Lorn. One line of good road runs along the whole east and south coast of the parish; and another traverses the interior. Population, in 1801, 1,764; in 1831, 1,889. Houses 321.—Torosay is in the presbytery of Mull, and synod of Argyre. Patron, the Duke of Argyle. Stipend £172 18s. 4d.; glebe £11. Schoolmaster's salary £15, with £5 fees.—Districts of the parish have been erected into the *quoad sacra* parishes of Saleu and Kinloch-Spelvie. SALEU is separately noticed. Kinloch-Spelvie has a Government church, with the usual stipend of £120; and is in the patronage of the Crown. Schoolmaster's salary £15 8s. 10 $\frac{1}{2}$ d., with £8 fees. There is a Society's school.

TORPHICHEN, a parish in the extreme west of Linlithgowshire, projecting, for some distance, between Lanarkshire and Stirlingshire. It is an elongated band of country, stretching from north-east to south-west; and it is bounded on the north-west side by Lanarkshire, Stirlingshire, and Linlithgow; on the north-east end by Linlithgow; on the south-east side by Bathgate and Lanarkshire; and on the south-west end by Lanarkshire. Its greatest length is nearly 10 miles; its greatest breadth is nearly 3 miles; and its superficial extent is 16.3 square miles. Polness-hurn, a tributary of the Avon, and after-

wards the Avon itself, jointly trace nearly the whole of the north-western boundary; and the former expands at one place into a lochlet, about half-a-mile in circumference; Barbauchlaw-burn and Balleucriff-water trace most of the south-east boundary; and, at their union, they form the Luggie, and send it across the narrowest part of the parish to the Avon. A lake,  $1\frac{1}{2}$  mile north-east of the village of Torphichen, and measuring about a mile in circumference, contains pike, perch, and eel. The surface of the parish sends up the highest land in West Lothian; and, compared with the general aspect of that fine champaign county, is markedly tumulated, and, at the north-east end, holdly hilly. The south-west district is naturally moorish; and the north-east district, besides containing other marked heights, sends up Cairn-Naple 1,498 feet above sea-level. Yet, making abatements for cold wet moor toward the west, and some little aggregate extent of hill-pasture on the east, the parish is generally fertile, and has an enclosed, well-cultivated, warm, and wealthy appearance. A judicious distribution of planted trees has materially served both to shelter and to beautify. Five or six mansions, and their envolving lawns and woods, are also embellishing. Coal occurs, but not, as it would seem, in much abundance. Ironstone of good quality occurs in two seams, each 5 inches thick. Sandstone and whinstone are quarried for the construction both of houses and of fences. The village of Torphichen stands on the north-east end of the parish,  $2\frac{1}{2}$  miles north by west of Bathgate, and  $4\frac{1}{2}$  south-south-west of Linlithgow. It is situated on a sheltered plain, away from all post-roads or thoroughfares, and was once a place of great importance, as it is of high antiquity; but it now consists of only a few cottages, and has a straggling and deserted appearance. The village or hamlet of Blackridge stands on the Barhauchlaw-hurn, and on the middle road between Edinburgh and Glasgow, near the southern extremity of the parish,  $5\frac{1}{2}$  miles west by south of Bathgate. Population of the parish, in 1801, 1,028; in 1831, 1,307. Houses 250. Assessed property, in 1815, £5,300.—Torphichen is in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. Patron, Lord Torphichen. Stipend £163 13s. 7d.; glebe £12. The parish-church was built about 1756-8, and has not since been altered. A *quoad sacra* parish-church was built in 1838 at Blackridge, at a cost of £450. Sittings 402. The district, parochially attached to it by the presbytery, includes all within a radius of 2 miles round the village; comprehends parts of the parishes of Shotts, Bathgate, Slamannan, and New Monkland; and has a population of about 900. Torphichen, *quoad civilia*, contained, in 1838, according to ecclesiastical census, 880 churchmen, 414 dissenters, and 5 non-descripts,—in all, a population of 1,299. There are 3 schools, 2 of them parochial, and the other private. Salary of the first parochial schoolmaster £34 4s. 4½d., with £14 fees, and £4 or £5 other emoluments; of the second, £25 11s. 1½d., with £11 17s. 8d. fees.—A little north-east of the village of Torphichen are some remains of the hospital or preceptory of Torphichen, the principal residence of the knights of St. John of Jerusalem. Of the church of the preceptory, the chancel and the nave are entirely gone, and only the choir and the transepts now remain. The nave is traditionally reported to have been of great length; but is now satirically represented by a plain edifice, of the size, form, and appearance, of a barn,—the modern parish-church. The Gothic window of the southern transept makes some wrinkled pretensions to faded beauty, and the four pillars which support the central tower display some architectural grace; but the other parts which remain of

the edifice do not prove it to have been either capacious or very ornamental. The heltry or steeple is ascended by a narrow spiral stair; and has such comparative meanness of altitude and aspect as to be not altogether unsuitably now occupied as a dovecot. Within the choir are the baptismal font, a curious recess where corpses were laid during the celebration of the funeral service, and the monument of Sir Walter Lindsay, the second last preceptor. Fragments of old massive buildings in the village, and the stones in the fences over the face of the adjacent country, indicate how great and magnificent a seat of population once surrounded the church. A stone, resembling a common mile-stone, but with a cross carved upon its top, and situated in the churchyard near the west end of the present church, marked the centre of a privileged sanctuary-ground attached to the preceptory; and similar stones are said to have stood at the extremities or corners of that ground, each a mile distant from the centre. All the space within the circle drawn round these extreme stones, was as much a legal sanctuary as the church at its centre, and afforded protection against the law to every criminal or debtor who entered and remained within its precincts. The knights were introduced to this establishment by David I., and had many possessions conferred on them by him and his successors; and afterwards when the Knights-Templars were unfrocked and put under ban, they inherited the extensive property of that great rival order. In 1291 and 1296, Alexander de Wells, "prior hospitalis sancti Johannis Jerusalemitani in Scotia," swore fealty to Edward I.; and in 1298, he was slain in the battle of Falkirk. From precepts which Edward issued to the sheriffs to restore the property of the knights, the preceptory or the order seems, even at that early period, to have had estates in almost every shire except Argyle, Bute, and Orkney. Radulph de Lindsay was preceptor under Robert I. Sir Henry Livingston was preceptor under James II., and died in 1463. Sir Henry Knolls, the next preceptor, governed the order in Scotland during half-a-century, and was commonly called Lord St. John. He was treasurer to James III. from 1468 to 1470; he joined the party who hunted down that monarch to his unhappy end; he was appointed in 1489-90, to collect the royal revenues in Linlithgowshire; and after being much employed by James IV., he fell fighting by his side on the field of Flodden. Sir George Dundas, his successor in the preceptorship, was the school-fellow of Hector Boece, and is praised for his learning. Sir Walter Lindsay, the next preceptor, was a knight of no small fame, and rose to be Justice-general of Scotland. Sir James Sandilands, the last on the list, joined the Reformers in 1560; and, on his paying down 10,000 crowns, and engaging to pay an annual rent of 500 merks, he received the remaining estates of the order as a temporal barony, and was raised to the peerage under the title of Lord Torphichen. His descendants, whose family-seat is Calder-house, in Mid-Lothian, continue to enjoy the title.

**TORRANCE**, a village in the parish of Campsie, Stirlingshire. Population 672.

**TORRIDON** (ЛОХ), a large inlet of the sea, between Garloch and Applecross, on the west coast of Ross-shire. It consists of three compartments, connected by narrow straits. The outer loch extends  $6\frac{1}{2}$  miles south-eastward, with a mean breadth of about  $2\frac{1}{2}$  miles; the middle loch is identical with SHIELDAG [which see]; and the inner loch extends nearly 5 miles eastward, with a mean breadth of about  $1\frac{1}{2}$  mile. The united loch is, as a whole, the most striking in the magnificent and frequently indented coast which it intersects; but though im-

pressive for its grandeur, and imposing for its extent, it is not remarkable for beauty. In 1840, there were upwards of 3,000 persons employed in the herring-fishery in this loch, and upwards of 10,000 barrels per week were cured while the fishing lasted. Torridon is of easy access both by land and sea. The Great Parliamentary road from Dingwall to the West coast passes through the village of Jeantown of Lochcarron (distant from Dingwall about 50 miles), from which a district-road extends about 15 miles to the village and loch of Shildaig, which communicates directly with Loch-Torridon. There is also a district-road striking off from the main road at Auchnasheen (which is distant from Dingwall about 30 miles), leading direct to the Mansion-house. A steam-packet from and to Glasgow passes weekly through Lochalsh, a few hours' sail or drive from Torridon.

**TORRISDALE.** See **TONGUE.**

**TORRY,** a fishing-village in the parish of Nigg, Kincardineshire. It stands on the right bank of the river Dee, opposite the city of Aberdeen, and  $1\frac{1}{2}$  mile west of the point of Girdleness. It has a tolerable harbour, and a pier for small vessels. Its fishermen carry haddocks and other fish to the market of Aberdeen; but they are now fewer than formerly, and have at present not more than 3 or 4 boats. Population 370.

**TORRYBURN,** a parish in Fifeshire, formed by the union of the baronies of Torry and Crombie; the former anciently belonged to the family of Wardlaw, the other to the Colvilles of Cleish. It is bounded by Culross and Carnock on the west and north; by Dunfermline on the east; and by the Forth on the south. It lies in the western extremity of the county, upon the coast of the frith of Forth, extending about 5 miles in length, and  $1\frac{1}{4}$  in breadth: the soil in general is good, and well-cultivated. Valued rent £5,255 Scots. Assessed property £5,009. In the parish are several seams of coal. Near the village is the mansion-house of Torry, the seat of Captain James Erskine. Population, in 1801, 1,403; in 1831, 1,436.—The village of Torryburn is 9 miles west of North-Ferry, 4 south-west of Dunfermline, and 2 east of Culross. It is situated on the coast, and was once the port of Dunfermline. Making of salt and some cotton-weaving are the only manufactures carried on in it. There is another harbour at Crombie.—This parish is in the presbytery of Dunfermline, and synod of Fife. Patron, Stuart of Carnock. Stipend £179 9s. 4d.; glebe £10 13s. 4d.—The schoolmaster has the maximum salary. There is a subscription-school at Crombie.

**TORSA,** one of the slate islands, off the coast of Nether-Lorn, Argyleshire. It is separated by only narrow straits, from Seil on the north, the continent on the west, and Luing on the east. The strait between it and Luing offers a communication across from ebb till half-tide, by a rocky bar not 100 yards in breadth; and is rendered so intricate and whirling by rocks and rocky islets, that the tide sweeps it with great rapidity, and in a perfect dance of complicated movement. The island is an irregular ellipsoid, the longer axis extending north-east and south-west; and it measures about 3 miles by 1. Its surface exhibits one smooth green bill, scarcely 200 feet high, and a ride of still lower elevation on the west, both descending in gentle slopes to the sea. The whole of its cast side, excepting a few trap rocks, and a little greywacke, consists of the same clay-slate as that for which Luing and Seil are celebrated.

**TORTHORWALD,** a parish in the debatable district between Lower Nithsdale and Lower Annandale, Dumfries-shire. It is bounded on the

north-west and north by Tinwald; on the north-east by Lochmahen; on the east by Lochmaben and Mousewald; on the south-east by Mousewald; and on the south-west by Caerlaverock and Dumfries; and on the west by Dumfries. Its extreme length from north to south is  $6\frac{1}{2}$  miles; its extreme breadth near the north, or over Torthorwald village, is  $3\frac{1}{4}$  miles; its mean breadth over 4 miles on the south, is only about a mile, and there it tapers to a point; and its superficial extent is  $8\frac{3}{4}$  square miles, or 5,600 English acres. The sluggish Lochar traces the whole western boundary; and a sluggish tributary to it, called Wathburn, traces  $4\frac{1}{2}$  miles of the eastern boundary. A belt half-a-mile broad along all the upper part of the Lochar, and the whole of the peninsula ground for 3 miles between it and Wathburn, are sections of **LOCHAR-MOSS:** which see. Stripes of these, immediately upon the streams, have been reclaimed into fine meadow; but all the rest is a hoggy wilderness. The northern and broader district, east of the belt of moss, is part of the western face of a ridge, which runs down from the north of Tinwald to the south-east of Mousewald, and whose summit-line is the boundary with Lochmaben. This brae ascends so gently as to attain an altitude of 600 or 700 feet, only over a base of from 2 to  $2\frac{1}{2}$  miles; and it is finely variegated into hillock, bank, and waving hollow; and, as seen from Dumfries or any point near the Nith, forms a very beautiful part of the fine eastern bill-screen of Lower Nithsdale. Its highest ground, Beacon-hill, on the boundary with Lochmahen, commands, with the single exception of Criffel, the most extensive view obtainable of the brilliant scenery of the southern half of Dumfries-shire, the eastern part of Galloway, the Solway frith, Cumberland, and the Irish sea. Nearly all the braes are in tillage; and the small remainder is verdant. The amount of the parochial area under cultivation is about 2,600 acres; 600 of which are regularly sown with hay. Of the 3,000 remaining acres, about 300 are natural meadow, about the same number are waste ground or upland pasture, only 4 or 5 are under wood, and all the rest are unreclaimed portions of Lochar-moss. Immediately east of the moss is a fine sandy bank of various breadths; along the central declivities of the braes is a rich and fertile soil; and, on its eastern border, the ground becomes cold and moorish. Marl has been found in great abundance. Almost the only rock is greywacke. Vestiges exist of two British camps, each about 90 feet in diameter, and surrounded with, in some places two, and in others three, concentric trenches.—An old castle, surmounting a small bank on the face of the braes, and in the vicinity of the village-church and manse of Torthorwald, is a conspicuous object. Its walls are very thick; its mortar is as hard as stone; its ancient fortifications seem to have been great; and its form as a ruin, especially as seen against some particular back-grounds, is decidedly picturesque. It is traditionally said to have been built by a shoemaker of the parish, named Skrimple or Skriry-hard-scares, by means of a treasure which he found whilst digging his garden; and anciently imhosomed among trees, it seems to have given name to the parish, the Anglo-Saxon *Tor-wald*, signifying 'the Tower in the wood.' There are three villages,—**ROUCAN** [which see], Torthorwald, and Collin. Torthorwald stands half-way up the brae, on the road between Dumfries and Lockerby, 4 miles east-north-east of Dumfries, and the same distance south-west of Lochmaben. It is quite an irregular cluster of cottages, with scarcely 200 inhabitants. Collin is modern, large, and tidy; but occupies low ground on the margin of Lochar-moss. It stands on the Dumfries and Carlisle mailroad,  $3\frac{1}{2}$  miles east of

Dumfries, and  $1\frac{1}{2}$  south by west of Torthorwald. The village was commenced about 40 years ago; and in consequence of the encouragement of building leases for 99 years of small portions of land, and of the cheapness of fuel from the proximity of the moss, it has already a population of upwards of 600. Colinton itself strictly is but the nucleus; the more modern parts being called Oxgang, and other names. A considerable number of the inhabitants of it and the other villages are weavers, principally in the employment of the Carlisle manufacturers, and not in any better circumstances than members of their poor craft in other places. Population of the parish, in 1801, 703; in 1831, 1,320. Houses 252. Assessed property, in 1815, £2,980.—Torthorwald is in the presbytery and synod of Dumfries. Patron, the Marquis of Queensberry. Stipend £220 15s. 10d.; glebe £20. Unappropriated tithes £522 17s. 7d. The church was built in 1782. In 1834, two parochial schools were attended by 167 scholars, and three private schools by 57. Salary of the first parochial schoolmaster £32 2s., with £16 10s. 8 $\frac{1}{2}$ d. fees, and £5 12s. other emoluments; of the second £20, with £22 8s. 7 $\frac{1}{2}$ d. fees. The ancient church was a vicarage of the monks of Faile, in Tarbolton, Ayrshire.—A natural son of the Regent, Earl of Morton, resided in Torthorwald-castle; and, about the year 1590, was created Lord Torthorwald by James VI.

**TORWOOD**, a forest, now small, but formerly of great extent, in Stirlingshire; noted for having given shelter to Sir William Wallace after his defeat in the North, and for having been the scene of Donald Cargill's excommunication of Charles II. and his courtiers. See **DUNIPACE** and **ST. NINIAN'S**.

**TOUGH**, a parish in Aberdeenshire, about 22 miles west by north of Aberdeen. It is bounded on the north by Keig; on the east by Monymusk and Cluny; on the south-east by Cluny and Kincardine O'Neil; on the south by Lumphannan; on the west by Leochel; and on the north-west by Alford. Its length, from north to south, is about 5 miles; and its greatest breadth about 3. Its surface cannot be described as either flat or hilly. A low ridge shelters its interior from the east, the south, and the south-west; and swells and rising grounds elsewhere give it a rolling surface, but are mostly arable. The soil is, in general, light; in many places shallow and stony; but in some very deep, and, though mixed with moss, extremely fertile. Those hills which are not under culture make excellent sheep-walk; and the barren moors and dry soil are mantled with plantations of fir. Several tiny affluents of the Don drain the whole parish: three of them traverse pleasant dells among the woods; and one of these three expands, while in the dell, into a beautiful isletted lake, whose islets lie upon its waters like baskets of shrubbery. A standing-stone, 12 $\frac{1}{2}$  feet in height and 9 $\frac{1}{2}$  in circumference, is traditionally pointed out as the sepulchral monument of one of the sons of Macbeth; and a Druidical temple, crowning a hill, bears the name of the Old Kirk of Tough. There are some other Druidical remains, and two or three cairns. The only mansion is that of Tonley. The parish is traversed north-westward by the road from Aberdeen to Alford. Population, in 1801, 629; in 1831, 828. Houses 173. Assessed property, in 1815, £1,207.—Tough is in the presbytery of Alford, and synod of Aberdeen. Patron, Sir John Forbes, Bart. Stipend £158 12s. 2d.; glebe £7 10s. Schoolmaster's salary £25 13s. 4d., with about £5 fees, and a share of the Dick bequest. There is a non-parochial school.

**TOWIE**, or **TOWIE-KINATTOCK**, a parish in the south-west or Highland division of Aberdeenshire.

It is bounded on the north by Cabrach; on the north-east by Kildrummy; on the east by Cushnie; on the south by Migvy, Coldstone and Migvy; and on the west by Migvy, Strathdon, and Glenbucket. Its length, from north to south, is about 8 miles; and its greatest breadth about 5; but its inhabited part measures only 3 $\frac{1}{2}$  miles by 2. The Don—here of small volume—cuts it westward into nearly equal parts; describes some beautiful curvatures; and is richly stored with trout. The whole surface, except in the narrow vale of the river, is upland and pastoral. The hills are undulating, smooth, and beaty; and those on the south, called the Soccoch, rise about 2,000 feet above sea-level, and are singularly bleak. The arable lands comprise about 2,400 acres; and are partly haugh and partly the steep declivities of the hills. The soil, near the river, is very fertile, and produces comparatively early crops. A little wood occurs in the north-west; but elsewhere there is hardly a tree. A coarse, hard limestone is occasionally worked for manure. There are some mineral springs, though of unascertained properties; and not a few fountains of excellent pure water. The castle of Towie, little more than a rumous quadrangular tower of which now remains, is noted as the scene of a singular catastrophe: its lady, in the absence of her husband, being summoned by a party of soldiers to surrender it, fired upon the leader and wounded him in the knee; and, in revenge, the castle was immediately fired, when she and her family and domestics, amounting to thirty-seven persons, perished in the flames. The other civil antiquities are principally tumuli. The parish is traversed westward by the road from Aberdeen to Strathdon. Population, in 1801, 523; in 1831, 728. Houses 123. Assessed property, in 1815, £1,228.—Towie is in the presbytery of Alford, and synod of Aberdeen. Patron, Leith of Freefield and Glenkenny. Stipend £159 6s. 1d.; glebe £10. Schoolmaster's salary £28, with £12 fees. There are vestiges of five old chapels.

**TOWN-YETHOLM**, a village in the parish of Yetholm, Roxburghshire, situated on the left bank of Beaumont-water, directly opposite to Kirk-Yetholm: which see. Jointly with the latter village it has about 1,000 inhabitants. A neat bridge, erected in 1834, connects the two villages. The parish school-house is probably the handsomest building of its class in Roxburghshire. Town-Yetholm is the site of two meeting-houses belonging respectively to the United Secession and the Old Light Burghers; and it has a public library, two Sabbath-school libraries, a clothing society, a friendly society, and an endowed school. Two annual fairs are held, one of which, in winter, is only nominal, and the other, in summer, is for lambs and wool; and a weekly-market was formerly held, but it has fallen into disuse. A chief trade is the miserable one of smuggling whisky across the border. The peace of the place is watched over by a baron-haillie.

**TRAILFLAT**. See **TINWALD**.

**TRALIG**, a small lake in Kilmiver, Nether Lorn, Argyleshire. It is about 1 $\frac{1}{2}$  mile long; and sends off the rivulet Oude to the head of Loch-Melfort.

**TRANENT**, a parish in the extreme north-west of Haddingtonshire; bounded on the south, the south-west, and the west by Edinburgshire; on the north-west by Prestonpans; on the north by the firth of Forth; on the east by Gladsmuir and Pencaitland; and on the south-east by Ormiston. Its greatest length, from north to south, is 4 $\frac{1}{2}$  miles; its greatest breadth is 3 miles; and its superficial extent is 5,415 imperial acres. The surface has the appearance of being almost level, but really rises with a slow gradient and gentle undulations from the firth to

the southern boundary, and attains an extreme elevation above sea-level of upwards of 300 feet. Excepting about 50 acres of sandy downs on the coast, and about 100 acres of plantation, the whole area is regularly or occasionally in tillage, and has a finely cultivated aspect. The soil is partly light and sandy, partly reclaimed morass, but chiefly a rich loam, inferior to none in Scotland. The coast,  $2\frac{1}{4}$  miles in extent, has two greenstone-dikes, respectively at Cockenzie and east of Portseaton; but elsewhere it is quite flat, and has a beautiful beach of fine sand. The coal-formation, with its attendant strata, but dislocated and intersected by trap-dikes, lies beneath a large portion of the parish. Coal has been worked in five seams, aggregately from 23 to 26 feet thick, and possibly exists in other and lower seams which have never yet been explored. The seams are mutually conformable, and all form a trough, whose centre is beneath Carlavirock, nearly a mile south-south-east of the village of Tranent, and whose rim or lip comes near or quite to the surface at the distance of from 4 to 8 furlongs from the centre. Other and seemingly detached seams occur beyond this range, but whether a continuation of the seams of this thrown down, or a prolongation of seams lower than the discovered ones of this, or whether entirely independent, has not been ascertained. Owing to the edges of the trough cropping out from the surface, coal was mined here as early as anywhere in Scotland: see HADDINGTONSHIRE. Sandstone is worked in several quarries; and trap is quarried for road-metal. The chief existing mines are at Tranent, Elphingstone, Birsley, and St. Germain's; and they send off large quantities through the little seaport of Cockenzie. Some of the villages and the antiquities are noticed in the articles PORTSEATON, COCKENZIE, SEATON, and MEADOW-MILL: which see. St. Germain's, in the north-east, was originally an establishment of the Knights-Templars, and was given by James IV. to King's college, Aberdeen; but is now the property and the site of the family mansion of David Anderson, Esq., the only resident landowner.—Bankton-house, formerly the property of Colonel Gardiner, stands 5 furlongs north-west of Tranent; and is still a pretty fair though not large mansion. This devout and brave officer received his death-wound near the west end of Meadow-mill, within a  $\frac{1}{4}$  of a mile of his own house; and he was carried by his servant to the manse, where he soon after expired. His remains were interred in the parish burying-ground, but have not been surmounted or overlaid by any monument.—Elphingstone-tower, a massive, square, baronial erection, stands near the southern boundary; it is said to have been built about the close of the 14th century; and it is agglomerated with a manse, still inhabited, which was built in 1600.—Falside-castle, situated near the boundary with Inveresk, was an ancient strong fortalice, belonging to the Seaton family, and probably given away to a younger branch, who styled themselves Seaton or Falside. The oldest part of the structure is of high but unknown antiquity, and contains in its stair a curious hiding-place; and even the newer parts are comparatively very old, but are less massive. The castle gave Protector Somerset some trouble on the morning of the battle of Pinkie; and was then burnt, but not very materially damaged. A fierce action was fought by the Scotch and the English cavalry between Falside and Tranent, on the day before the battle of Pinkie; and issued in the discomfiture of the Scotch, and their loss of 1,300 men.—The battle of PRESTONPANS [see that article] was partly fought within Tranent. Sir John Cope's military-chest was found by the victors at the house of Cockenzie, and there divided by the

Pretender among his needy followers.—Half-a-mile north of Tranent, and a little south of Meadow-mill, stands Stiel's hospital. This establishment originated in a bequest by George Stiel, smith and builder in Edinburgh, and a native of Tranent, which yields about £900 a year, and which maintains as inmates a few boys and girls, and educates about 140 children in a free day-school. The building is a handsome edifice, erected in 1821, from a design by Mr. Burn, at a cost of about £3,000. The institution is under the government of the lord-justice-clerk, the county-sheriff, the parish-minister, and a select body of directors. The parish is traversed by the east mail-road from Edinburgh to London, the road from Edinburgh to North Berwick, and the projected line of the Great North British railway by Berwick, Newcastle, and Durham. Population, in 1801, 3,046; in 1831, 3,620. Houses 740. Assessed property, in 1815, £14,239.—Tranent is in the presbytery of Haddington, and synod of Lothian and Tweeddale. Patron, the Crown. Stipend £295 13s. 5d.; glebe £20. The parish-church was built in 1801. Sittings 912. Cockenzie, Portseaton, and the district around them, have been erected into a *quoad sacra* parish. The church, situated in Cockenzie, was built in 1838, at a cost of £589. Sittings 452. An United Secession meeting-house, situated in the village of Tranent, and belonging to a congregation established in 1777, was built in 1826, at a cost of £1,463 16s. 8d. Sittings 637. Stipend £120, with £15 for sacramental expenses, and a manse and garden worth upwards of £10. An ecclesiastical survey, in 1826, exhibited the population as then consisting of 2,980 churchmen, 432 dissenters, and 35 nondescripts,—in all, 3,447 persons.—In 1834 the parish-school was attended by 118 scholars, and five other schools by 416. Among the latter was that of Stiel's hospital, attended by 79 boys and 61 girls. Parochial schoolmaster's salary £34 2s. 2½d., with about £40 fees, after paying an assistant.—The old parish of Tranent comprehended all Prestonpans, and considerable parts of Penceitland and Glads-muir; but did not comprehend the barony or ancient parish of Seaton, which was annexed to it only after the Reformation. The church was a vicarage under the monks of Holyrood.

TRANENT, a large village or small town in the parish just described, is situated on the mail-road between Edinburgh and London,  $1\frac{1}{2}$  mile south-east of Prestonpans,  $7\frac{1}{2}$  miles west of Haddington,  $3\frac{1}{2}$  east of Musselburgh,  $6\frac{1}{2}$  north-east of Dalkeith, and  $9\frac{1}{2}$  east of Edinburgh. It stands along the brow of a rising ground on the south side of a narrow vale, at the bottom of which is a brook; and had its ancient name of Travernent, abbreviated into Tranent, from three British words which signify the habitation or village at the ravine or vale. It consists principally of a street which extends about  $\frac{1}{2}$  of a mile, from east to west, along the public road; and of a cross street which goes off from the former near its middle, and runs about  $\frac{1}{2}$  of a mile down the declivity to the north. But it is built on no regular plan, is all over dingily tiled, and has a very large aggregate of decayed and mean-looking houses. Its appearance is straggling, care-worn, tasteless, and poor,—miserably out of keeping with the rich aspect of the agricultural country, and the exulting brilliances of the extended landscape, amidst which it lies. Prestonpans and it are very suitable neighbours, and sit like two withered and hag-like cronies flinging splanetic contempt on beauties and adornments which they do not share. But Tranent has recently made some efforts at renovation, and possibly may, years hence, put on a dress becoming a town in the Lothians. The inhabitants are principally persons connected as super-

intendents or miners with the neighbouring collieries, shopkeepers, tradesmen, and day-labourers. Population 1,780.

**TRAPRAIN-LAW**, a conspicuous conical hill,  $4\frac{1}{2}$  miles east of Haddington, and in the extreme south of the parish of Prestonkirk, Haddingtonshire. It has an altitude of about 700 feet above sea-level; it contributes a very marked, beautiful, and far-seen feature to the rich champaign landscape amidst which it is situated; and, from its summit, it brings under the eye of a spectator nearly the whole frith of Forth, a wide expanse of the German ocean, and part, it is said, of no fewer than thirteen counties. Its ancient name was Dun-pender, from two Gaelic words which signify a steep hill; and this name is quite descriptive of its character. On the south side it rises almost sheer up from the plain, in one grand perpendicular ascent; and on other sides, though admitting sheep, and affording them excellent pasturage, it is too steep to be a grazing-ground for black cattle. Its composition is a slaty clinkstone, so seemed as to be irregularly columnar, and occasionally merging from a clouded brown to a porphyritic appearance; and towards the summit the clinkstone passes into greenstone, of a bluish grey hue, and slightly granulated with hornblende.

**TRAQUAIR**, a parish in the south-east border of Peebles-shire. It is bounded on the north by the Tweed, which divides it from Peebles and Innerleithen; on the west by Peebles and Selkirkshire; and on other sides by Selkirkshire. But it is so intersected and deeply indented by Yarrow in Selkirkshire, as to have a large wing on the west entirely cut off, so as to be at the nearest point 3 furlongs apart; another wing on the east, smaller but still considerable, cut off with the exception of a connecting belt of a furlong or two broad along the Tweed; and the intermediate district split asunder by a cuneiform insertion down one-half of its length.—These interferences simply render the boundaries intricate, and the outline surpassingly irregular; and are not aggregately large enough to disturb the intrinsic conveniences of parochial arrangement. The greatest length of the parish, in a straight line east and west, is  $7\frac{1}{2}$  miles, but by the road is 10; its greatest breadth, in a straight line, is  $5\frac{1}{2}$  miles, and by the road nearly 7; and its superficial extent is 17,200 acres, or nearly 30 square miles. Except at the indentations, the boundary all round with Selkirkshire is high mountain water-shed, among whose summits are GUMSLEUCH and MINCHMOOR [which see], as well as several others of an altitude exceeding 2,000 feet above sea-level. The surface of the interior diminishes from mountain to hill as it recedes from the water-shed and approaches the Tweed; yet is, for the most part, upland, rocky, and bleak. The heights are of a cumbrous, lumpish form,—generally green on the south side, but heathy and of dark complexion on the north. Glendean's banks, immediately south of Gumsleuch, exhibit a tremendous chasm, upwards of half-a-mile in length, faced with sheer precipices from 200 to 300 feet in height. The haughs on the Tweed are not extensive; they lie from 400 to 500 feet above sea-level; and they are carpeted with a fine loam of considerable depth. The other low grounds, though possessed of but a stony, a shallow soil, are, in general, fertile. Agriculture has reclaimed, improved, and beautified with united energy and skill, and now wields constant dominion over about 3,000 acres. Plantations have been reared over an aggregate area of 600 acres. The upland pastures maintain fine flocks of Cheviot sheep. Greywacke is the prevailing rock; a dike of porphyry occurs, and is cut up for curling-stones;

clay-slate is found, and has been worked in one small quarry, but does not prove of durable consistence; some small lead mines which were once worked have been abandoned. **QUAIR WATER** [which see] is the principal interior stream. Kirk-hurn drains the west wing of the parish, and finds its way into the Tweed. The little village of Traquair—which, though possessing only 20 or 30 houses, sends them out in straggling detachments, each bearing a separate name—stands in the vale of the Quair,  $\frac{2}{3}$  of a mile south of the Tweed, and  $1\frac{2}{3}$  south of Innerleithen. The "Bush aboon Traquair," which once was a considerable thicket of natural birches, is now represented by a few meagre trees a little south-west of the village.\* Several ancient camps or hill-forts are traceable on the summits of eminences. A chain of towers or peel-houses is traditionally asserted to have been drawn at brief intervals across the parish; hut, if it ever existed, it is now represented only by the ancient part of Traquair-house, and by a ruinous tower at Cardrona. Traquair-house stands on the left bank of the Quair immediately above its confluence with the Tweed. The oldest part is a tower of very remote but unascertained antiquity; which was so built as to be defended on one side by the Tweed, and probably was, in hostile times, fortified on other sides. The newer parts were added chiefly in the reign of Charles I. The interior is fitted up partly in ancient and partly in modern style. An avenue leads from the south front to a gateway, decorated with sculptured forms of the bear, the cognizance of the family.† James Stuart, a natural son of the Earl of Buchan, obtained, in 1491, an act of legitimation, and a grant of the lands of Traquair. Sir John Stuart, the 5th in descent from him, was Lord-high-treasurer of Scotland under Charles I.; and, in 1628, he was ennobled as Baron Stuart of Tra-

\* In the south of Scotland, the term *bush*, or *buss*, is not confined to one thick shrub; but is used also to denote a thicket or clump. This is the signification of the word *heret*. Burns, we are informed, "visited the Bush in the year 1757, when he made a pilgrimage to various places celebrated in story and in song; and found it composed of eight or nine ragged birches. It has lately paid a heavy tax to human curiosity, and has supplied nobles and princes with specimens, in the shape of snuff-boxes and other toys. The Earl of Traquair, in anticipation, perhaps, of this rage for reliques, planted what he called 'The New Bush'; but it remains un consecrated in song, and can never inherit the fame, or share in the honours of the old." The old Bush stands on a declivity overlooking the Quair, nearly a mile above the mansion-house; its successor stands higher on the hill, and nearer to Tweed. "The Bush aboon Traquair," says the old Statistical Account, "which in former times might be a considerable thicket of hirc-trees, the indigenes of the soil, is now reduced to five lonely trees, which solitarily point out the spot where love and its attendant poetry once probably had their origin." This tallies, indeed, with the language of the song:—

At the honny bush aboon Traquair,

'Twas there I *trau* did love her.

The very same bush, or rather grove, must have been considered as a remarkable object, not less than two centuries ago. For it is laid down in Pont's maps under the designation of "Traquair Birks." The trees are delineated, indeed, as extending nearly the whole way down to the mansion-house. The name, however, may have been appropriated to a particular clump; beside which, as would appear from the figure in the map, there had formerly been a dwelling-house.

† Dr. Pennicuk celebrates the beauties of Traquair in the following terms:—"Then follows the pleasant Park or rather Palace of Traquair, situate in a large and fertile plain, betwixt the river Tweed and water of Quair; and these two join and mingle waters a little below the noble house itself, of which take the following distichs:—

On fair Tweed-side, from Berwick to the Bield,  
Traquair for beauty fairly wins the field;  
So many charms, by nature and by art,  
Do there combine to captivate the heart,  
And please the eye, with what is fine and rare,  
So that few seals can match with sweet Traquair."

This nearly corresponds with the account given by Beau. "Ad quatuor milia passuum infra Pelham sita est arx Traquairensis ad Traquaria Comitum pertinens, cuius situs venorum umbris, et præterhæntibus fluvii æmניתate valde amabilis." *Descript. Scotia*, p. 34.

quair, and, in 1633, was created Earl of Traquair, and Baron Linton, and Caberston. This nobleman suffered greatly in the cause of fallen royalty, and, in 1659, died in great poverty; but, not having suffered attainder, he bequeathed at once his titles, his property, and his Roman Catholic predilections to his descendants. Traquair-house was the first place at which the Marquis of Montrose rested, and that in which he spent the night, after his signal defeat at Philliphaugh. Cardrona-house, the seat of Captain Ker, and just in the course of erection to succeed a former mansion of the same name, is situated in the west wing of the parish, between the Tweed and the old tower of Cardrona. Kailzie, R. N. Campbell, Esq.; and Glen, W. Allan, Esq., are neat and quite modern mansions. The parish has 14 or 15 miles of turnpike, but no part of any great thoroughfare. A substantial timber-bridge was, a few years ago, thrown over the Tweed opposite the town of Innerleithen, and has greatly facilitated communication. Population, in 1801, 613; in 1831, 643. Houses 105. Assessed property, in 1815, £5,646.—Traquair is in the presbytery of Peebles, and synod of Lothian and Tweeddale. Patron, the Crown. Stipend £216 3s.; glebe £20. Unappropriated teinds £382 8s. 4d. The parish-church was built in 1778, and altered in 1821. Sittings 350. A Roman Catholic congregation is supposed to have existed in the parish since the era of the Reformation. Their place of worship is one of the wings of Traquair-house, and about eleven years ago succeeded one which was situated on an upper floor of the mansion. Sittings 100. Stipend, a private allowance from the Earl of Traquair. An ecclesiastical survey, of 1835, exhibited the population as then 634, of whom 453 were churchmen, and 181 were dissenters. Schoolmaster's salary £34 4s. 4½d., with about £25 fees, and £13 other emoluments. There is a private sewing and reading school for girls.—The present parish comprehends all the ancient parish of Traquair, and that part of Kailzie which lay on the south bank of the Tweed, and which now forms the west wing of the united district. Kirkburn has its name from having been overlooked by the church of Kailzie. The ancient church of Traquair was dedicated to St. Bride or Bridget, and hence was commonly called Kirkbride. The old parish occasionally figures in documents as Strathquair; and it was of so much more comparative importance than at present, as to be for a time a distinct sheriffdom. See PEEBLES-SHIRE.

**TRESHINISH ISLES**, a group of Hebridean islets, 5 miles north-north-west of Staffa, 5½ south-east of Coll, and 3 west of the entrance of Loch-Tua in Mull. They are disposed in a chain of between 4 and 5 miles in length from north-east to south-west; and consist of five principal isles, and some intervening rocks. Their whole coasts, with little exception, present perpendicular cliffs of from 40 to upwards of 60 feet in height; and, as seen from a little distance, they possess a singularly interesting appearance, and give a promise, which they but slenderly realize, of disclosing objects of worth to naturalists and the curious. They are mere uninhabited pasture-grounds, carpeted with rich grass, and attached to the farm of Treshinish in Coll. Cairnbug-more and Cairnbug-beg, two of the principal, are separated by a very narrow strait; and are supposed to have anciently formed the limits, and the advanced post of the Suderey or Southern Hebrides, whose capital was in Man. A fortalice on the former seems to have been constructed by the Macleans, on the site of a more ancient strength which history states to have been in the possession of the Norwegians in 1249; and, as part of it which re-

mains is a wall with embrasures skirting the edge of the cliff, it most probably was mounted with ordnance. Many books and records rescued from Iona at the time of the suppression of its monastery, having been deposited in this fortalice, were destroyed in the course of a siege which the place sustained from a detachment of Cromwell's army. See IONA. A barrack on Cairnbug-heg is still tolerably entire. Fladda, a third of the principal isles, has an uniformly flat and uninteresting aspect; Linga, a fourth, rises from a low plain, by a succession of terraces, into a hill about 300 feet high; and Bach, the fifth, is about equal to Linga in height, is "distinguished by a hill which, in some positions, has the appearance of a hemisphere, from which the whole island acquires the semblance of an ancient shield with the umbo protuberant in the centre." The isles are composed throughout of amygdaloid and basalt,—the latter of perpendicular fracture, but not columnar.

**TRINITY-GASK**—vulgarly **TARNLY**—a parish in Strathearn, Perthshire. It is bounded on the north by Madderty; on the east by Gask; on the south by Auchterarder and Blackford; and on the west by Muthil and Crieff. It lies on both sides of the Earn, but chiefly on the north; the section on the south comprising 1½ square mile; and that on the north extending east and west 5 miles by 3, and comprehending 17 square miles. The surface rises toward the north so as to form a gently sloping bank, commanding a fine view of the magnificent strath and its screens; but elsewhere it is nearly flat, and has but a slight elevation above the least of the river. The soil is very various; but over about three-fourths of the parochial era, is beautifully cultivated and enclosed, and over the remaining fourth promises soon to own the dominion of the plough. The district is richly planted, and has clothing of trees athwart an aggregate area of about 1,000 acres. The Earn meanders along the interior and the southern boundary of the parish, in sinuosities which seem to indicate a reluctance to pass away from its lusciousness. A trap dike runs through the parish, and occasionally rises into elevations. A red, soft, argillaceous rock forms a sort of chasm or ravine for the Earn in the west, hut, becoming mingled with mica, passes into sandstone in the centre and the east,—the "old red," which prevails throughout the strath. The only antiquity worth notice is part of the Roman causeway which runs from Stornont to the celebrated camp at Ardoch. Millearn-house, an entirely modern structure, the seat of J. G. Home Drummond, Esq., encompassed with attractive gardens and pleasure-grounds, is a fine specimen of the style of architecture which prevailed in the age of Henry VIII. Colquhalzie-house, J. S. Hepburn, Esq., occupies a charming site on the south bank of the river. The parish is traversed by the road from Perth to Muthil, and by that from Crieff to Auchterarder. There is here only one bridge across the Earn,—that of Kinkell. Population, in 1801, 796; in 1831, 620. Houses 97. Assessed property, in 1815, £5,231.—Trinity-Gask is in the presbytery of Auchterarder, and synod of Perth and Stirling. Patron, the Earl of Kinnoul. Stipend £149 3s. 1d.; glebe £80, and 11 acres of moor. Unappropriated teinds £63 16s. 3d. Schoolmaster's salary £34 4s. 4½d., with £2 18s. fees, and about £3 10s. other emoluments. There are two private schools.—The present parish comprehends the ancient parishes of Kinkell and Wester-Gask, one of which had a second place of worship at a locality still called Chapel-hill; and the union of the three churches into one parish is said to have given rise to the name Trinity-Gask.

**TRONDA**, or **TRONDRAY**, an island  $3\frac{1}{2}$  miles long, and 2 broad, a short way off the west coast of Quarf, in the mainland of Shetland. It is washed by Sealoway bay on the north; and separated by narrow sounds from Green Isle and Burra on the west, and from House-island on the south.

**TROON**, a promontory, a harbour, a thriving sea-port, and a *quoad sacra* parish, at the west end of the parish of Dundonald, Ayrshire. The town, situated on the promontory, is 6 miles north of Ayr, 6 south of Irvine, 9 south-west of Kilmarnock, 31 south-west by south of Glasgow, and 75 west-south-west of Edinburgh. The promontory is a belt of rock, extending  $1\frac{1}{2}$  mile into the sea, and so curved as to form a large segment of a circle, with the concave side facing the north. Its mean breadth is only about 2 furlongs. In its natural state it was covered with rich pasture toward the land, but became naked rock toward the extreme narrowing point. A continuation of the promontory extends a short distance beneath the sea, so as to be concealed even at low water. The embayed marine space embraced by the bold curvature is by far the best natural harbour in Ayrshire; it affords safe anchorage-ground from every quarter except the north-west; and, at half-a-cable's length from the rock, it has, at half-flood, a depth of 3 fathoms. The merchants of Glasgow, aware of its advantages, made a vain effort, about the year 1700, to purchase the circumjacent property for the erection of a sea-port; and, in consequence of the repulse they met, were obliged to select the very inferior site of Port-Glasgow as the station next in eligibility. After the effluxion of a century, the Duke of Portland, the proprietor, commenced a series of vigorous operations to render the place fully available for commerce. About the year 1817, he constructed a new pier 800 feet long, nearly at right angles with the rock, where the depth is 19 feet at low water, and he afterward constructed a fine wet dock with floodgates, a dry dock for repairing vessels, a light-house, and large store-houses. Due encouragements were offered to make the place a resort of trade and a seat of population; and they were rapidly followed by success. A railway hither from **KILMARNOCK** [which see] was the first public work of its class in Scotland, and brings down vast quantities of coals for shipment to Ireland, Galloway, and other destinations. A new act of parliament was obtained in 1837 to alter and amend this railway, and to raise sufficient funds for the object. A communication is maintained likewise with the Glasgow and Ayr railway, the main line of which passes in the vicinity. During the year which ended on 31st August, 1840, no fewer than 165,850 tons of coals were shipped. In 1837, 1,060 vessels of aggregately 79,291 tons, took part in the port's trade; and, in 1840, upwards of 30 vessels belonged exclusively to the place. The town is built along a large part of the promontory, and forms a conspicuous and fine feature in the broad and brilliant landscape of Ayrshire and the frith, as seen from numerous vantage-grounds, 8 or 12 miles to the south or north. Many of the inhabitants are employed in a large ship-building yard, a rope and sail manufactory, and some other works; and not a few of them draw an entire or partial maintenance from letting lodgings to families of sea-bathers. The town has a branch-office of the Ayr bank. The *quoad sacra* parish consists of the town, and a small district in its vicinity. The church was erected, in 1836, at a cost of £1,100. Sittings 900. A chapel belonging to a United Secession congregation which was formed in 1822, and for some years dissolved, and formed anew in 1839, was built, in 1822, at a cost of £320. Sittings 289. In 1836, the popula-

tion of the town was 1,088, and of the town and a district extending 2 miles from it 1,600.

**TROQUEER**, a parish on the east border of Kirkeudbrightshire; bounded on the north by Terregles; on the east by the river Nith, which divides it from Dumfries-shire; on the south and south-west by Newahhey; and on the west by Lochrutton. Its greatest length from College-loch on the north, to the mouth of Newahhey-Pow on the south, is  $8\frac{1}{2}$  miles; its greatest breadth in a line due west from the mouth of Crook's-Pow is  $4\frac{1}{2}$  miles; but its superficial extent, in consequence chiefly of the southern half tapering gradually away to a point, is only about 19 square miles. The north-east corner lies opposite the hurgh of Dumfries, and contains the large suburban hurgh-of-harony of **MAXWELLTOWN**: which see. The surface throughout the north and the east is prevalently level, yet has some agreeable though gentle diversities. Corbelly-hill, in particular, rising at the south end of Maxwelltown, and opposite the lower part of Dumfries, is a lovely eminence, beautifully embellished, and commanding a delightful prospect. The congregation of hurghal buildings spreads away from the hill's base, sectioned off into two hodies by the river, yet united by two bridges. The steeples, some churches, one or two civic buildings, Burns' mausoleum, and the gorgeous assembly of elegant monuments in the cemetery, look out from among the general mass, and challenge individual attention. A new and elegant edifice, the Crichton Institution, at once the most elegant and the most extensive asylum for lunatics in Scotland, spreads out its wings on an undulating declivity below the town. A profusion of mansions, and villas, and cottages, ornées, are seen powdered over the face of all the gay hurgh's environs on both sides of the river. A broad valley, luxurious in dress, stretches away on the north, and becomes narrowed and shut in by cultivated hills, and overhung at the extremity by the dark conical form of Queensberry. The same valley, flattened down over much of its area into dead level, and cut into a sort of tessellated work of brown and green, by Lochar-moss, is screened at 4 miles' distance on the east, by a range of hills over which the plough yearly passes. The shining, silver-sheeted Nith directs the eye southward among grounds rich as a garden, and points onward to the somhre, cloud-capped Criffel, the far expanse of the Solway frith and the blue dim outlines of Skiddaw, and other Cumberland mountains. In all this there is nothing sublime, or even strikingly picturesque; yet there are a calm beauty and a certain rich fulness which completely win the heart and live most soothingly in the imagination. Several hills, as Craighill, Little Malhorn, and Hollandhush, rise in the south-west. A large proportion of the parochial area has a rich and embellished aspect, quite in keeping with its relative position to the beautiful metropolis of the western marches. Mansions are so numerous that mention of them seriatim would be insufferably tedious. Agriculture made such singular achievements between 1752 and 1790 as, in that brief space, to give a five-fold increase to the rental. Considerably upwards of 5,000 acres are arable, though not all in tillage; and at least 550 are under wood. The south-west or billy district, amounting to about a fourth of the whole, is of moorland character, covered partly with heath and partly with coarse grass. The soil of the arable grounds is various, but generally light. "There are," says one of our chief authorities, "few rocks;" they lie too deep, we suppose, for superficial observation. There is a good head of clay and a tile-work at Ryedale. The parish is traversed westward by the Dumfries and Portpatrick

mailroad. Population, in 1801, 2,774; in 1831, 4,665. Houses 580. Assessed property, in 1815, £1,334.—Troqueer is in the presbytery and synod of Dumfries. Patron, the Crown. Stipend £350 7s. 2d.; glebe, 10 acres, but not valued. Unappropriated tithes £91 16s. 5d. The larger section of the population belongs to the *quoad sacra* parish of MAXWELLTOWN: which see. There are three parochial and two private schools, and the former have attached to them only £32 of salary.—The ancient church belonged, till the reign of James V., to the monastery of Tongland; in 1588, when the property of that establishment was alienated, it was granted for life to William Melville, the commendator of Tongland; and in 1605 it was given to the bishops of Galloway. The ancient parish of Kirkconal, which was suppressed in the reign of Charles I., was divided between Troqueer on the north-east, and Newabbey on the south-west. The parish-church stood in the Troqueer section,  $1\frac{1}{2}$  mile north-east of the village of Newabbey; and is commemorated in the names of a mansion, a farm, and an estate. The devout and excellent Scottish Worthy, the Rev. John Blackadder, was minister of Troqueer, and suffered ejection from it, amid affecting incidents, at the forced introduction of prelacy.

TROSACHS, a surpassingly romantic mountain-vale, between Lochs Achray and Katrine, in the parishes of Callander and Aberfoil, Monteith, Perthshire. The word Trosachs signifies a bristled region, and is not a little descriptive of the scenery. The road, from end to end of the Trosachs, is rather more than a mile in length, and introduces the tourist to the landscape at the inn of Ardcheanochrochan, about 10 miles west of the village of Callander. The opening which affords ingress is flanked on the left by Benvenue, towering 2,800 feet above sea-level, and on the right by Benawn. The defile of Beal-an-Duine, where Fitz-James lost his "gallant grey," is in the heart of the great gorge; a little west of it is a narrow inlet; and, at a few paces farther, Loch-Katrine bursts upon the view, the Alps of Arquoahar mingling with the clouds in the distance. The Trosachs, in a general view, are a contracted vale, whose sides are soaring eminences wildly and irregularly feathered all over with hazels, oaks, birches, hawthorns, and mountain-ashes, and whose central space is "a tumultuous confusion of little rocky eminences, all of the most fantastic and extraordinary forms, everywhere shagged with trees and shrubs," and presenting "an aspect of roughness and wildness, of tangled and inextricable hoskiness, totally unexampled, it is supposed, in the world." A particular description, after Sir Walter Scott's exquisite one, in the *Lady of the Lake*, could not be very safely attempted by even an adept in literary painting:—

"The western waves of ebbing day  
Roll'd o'er the glen their level way;  
Each purple peak, each flinty spire,  
Was bathed in floods of living fire,  
But not a setting beam could glow  
Within the dark ravine below,  
Where twined the path, in shadow hid,  
Round many a rocky pyramid,  
Shooting abruptly from the dell  
Its thunder-splinter'd pinnacle;  
Round many an insulated mass,  
The native bulwarks of the pass,  
Huge as the tower which builders vain  
Presumptuous piled on Shinar's plain.  
The rocky summits, split and rent,  
Form'd turret, dome, or battlement,  
Or seem'd fantastically set  
With cupola or minaret,  
Wild crests as pagod ever deck'd,  
Or mosque of Eastern architect,  
Nur were these earth-born castles bare,  
Nur lack'd they many a banner fair;  
For, from their silver'd brows display'd,  
Far o'er the unfashionable glade,

All twinkling with the dew-drops sheen,  
The briar-rose fell in streamers green,  
And creeping shrubs, of thousand dyes,  
Waved in the west-wind's summer sighs.

"Boon Nature scatter'd, free and wild,  
Each plant or flower, the mountain's child.  
Here eglantine embalm'd the air,  
Hawthorn and hazel mingled there;  
The primrose pale, and violet flower,  
Found in each cliff a narrow bower;  
Foxglove and nightshade, side by side,  
Emblems of punishment and pride,  
Group'd their dark hues with every stain  
The weather-beaten crags retain.  
With houghs that quaked at every breath,  
Grey birch and aspen wept beneath;  
Aloft, the ash and warrior oak  
Cast anebor in the rifted rock;  
And, higher yet, the pine-tree hung  
His shatter'd trunk, and frequent flung,  
Where seem'd the cliffs to meet on high,  
His boughs athwart the narrow'd sky,  
Highest of all, where white peaks glanced,  
Where glist'ning streamers waved and danced,  
The wanderer's eye could barely view  
The summer leaven's delicious blue;  
So wondrous wild, the whole might seem  
The scenery of a fairy dream."

TROTTERNISH, the eastern and north-eastern division of Skye, comprehending all Kilmuir, Snizort, and Portree, and small parts of Bracadale and Strath. It is not only the largest district of the island, but, irrespective of its extent, the richest, and contains much good arable ground: See SKYE. Trotternish has some celebrity as the scene of various perils and adventures of Prince Charles Edward. The headland, called Trotternish-point, forms the most northerly land in the island; and runs out  $\frac{3}{4}$  of a mile north-westward in a narrow promontory.

TROUP. See GAMRIE.

TRUIM, a small river of Badenoch, Invernessshire. It rises among the alpine recesses of the central Grampians, within 3 furlongs of the boundary with Perthshire, and runs  $12\frac{1}{2}$  miles north-north-eastward to the Spey, near Invernahavon. The glen of the river brings up the great road from Inverness to Perth; and has, on the left bank, the solitary stage-inn of Dalwhinnie. Its lower part has some grandeur of scenery, and slight amenities of wood; but its upper part, which contains Dalwhinnie, and is comprehended in the dismal nominal forest of Drumouchter, utterly chills the feelings of any but the most weather-beaten mountaineer. The mountains are dull in aspect and uninteresting in form, and appear, not arranged into chains, but cut into stupendous detached masses; and the glen between them is everywhere, from Dalwhinnie to its head, "houseless, treeless, and lifeless,—wanting in everything but barrenness and deformity,—while there is not even an object so much worse than another as to attract a moment's attention."

TRUMISGARRY, a *quoad sacra* parish, comprehended in the *quoad civilia* parish of North Uist, in the Outer Hebrides. Its greatest length is about 17 miles; its greatest breadth is about  $1\frac{1}{2}$  miles; and its area is about 140 square miles. Population, in 1836, 1,722. Patron, the Crown. Stipend £120; glebe £4. The church, a parliamentary one, was built in 1829, at a cost of £750. Sittings 326. There are three itinerating schools of the Gaelic school society, and a General Assembly's school.

TUDHOPE. See CASTLETOWN.

TULLA. See INCHMAHOMIE.

TULLIALLAN, a parish in the detached district of Perthshire; bounded on the west and the north by Clackmannan; on the east by Culross; and on the south and south-west by the frith of Forth. Its greatest length from north to south is  $3\frac{1}{2}$  miles; its greatest breadth is 3 miles; and its superficial extent is about 2,760 acres. The surface has a gentle slope from the northern boundary to the Forth, and is

highly improved and cultivated. The soil is various, and consists of clay, rich loam, and sand, lying on till or rock. Woods are comparatively extensive, and give the district a warm and ornate appearance. The Forth, where it touches the parish, is from 5 furlongs to 2½ miles broad; and has a coast 3½ miles in extent. On its margin in Tulliallan are the town of KINCARDINE, and the ancient village of LONGANNAT: which see. Some 30 or 40 pans for the manufacture of salt have all, long ago, been demolished. From the west end of the parish to New Pans the shore is level; and thence to the extreme east, it abounds in rocks which are bare or covered with the alternation of the tide. Coal exists, and is worked. Tulliallan-castle, one of the seats of the Baroness Keith, stands upon a small rising ground about half-a-mile from the Forth. The castle which it succeeded, and ruins of which exist, belonged to the Blackadders, knights baronets, and appears to have been a place of strength. A considerable lake lies in the centre of the parish; and a small one is situated on the eastern boundary. Most of the local interest, and of the facilities of communication, belonging to the district, have their centre in Kincardine. Population, in 1801, 2,800; in 1831, 3,550. Houses 567. Assessed property, in 1815, £5,824.—Tulliallan is in the presbytery of Dunblane, and synod of Perth and Stirling. Patron, Lady Keith. Stipend £259 3s. 9d.; glebe £44 10s. The parish-church was built in 1833, at a cost of about £3,500. Sittings 1,176. An United Secession meeting-house in Kincardine, belonging to a congregation established in 1813, was built in 1819, at a cost of £1,200. Sittings about 800. Stipend £132, with manse, offices, and garden. An Original Burgher meeting-house in Kincardine, belonging to a congregation established in 1813, was built in 1816. Sittings 470. Stipend £85. An ecclesiastical census of 1836 exhibited a population of 3,536, distributed into 2,392 churchmen, and 1,144 dissenters. In 1834 the parish school was attended by 147 scholars; and 7 private schools by 311. Parochial schoolmaster's salary £34 4s., with about £50 fees. In 1659, part of Culross was, by authority of the Court-of-session, annexed to Tulliallan.

**TULLIBODY**, the name of various localities in the parish of Alloa, Clackmannanshire. The ancient parish, the harony, and the mansion of Tullibody, are noticed in the article ALLOA: which see. The village of Tullibody stands ¼ of a mile north of the confluence of the Devon and the Forth, 2½ miles west-north-west of Alloa, and 6½ south-west of Tullibouly. The ancient church of Tullibody, situated in the village, is still in a state of good repair. The parish minister and his assistant preach here on Sabbath evenings during summer, and have an average attendance of from 150 to 200.

**TULLIEBOLE**, a suppressed parish in Kinrossshire, annexed to FOSSAWAY: which see.

**TULLIMET**. See LOGIERAIT.

**TULLOCH**, a village on the north-west border of the parish, and 2 miles north-west of the town, of Perth. It is notable as the site of the first Scottish bleachfield, and the place where the first potatoes produced in Scotland were grown. Mr. Christie, an Irish gentleman, established the bleachfield about the beginning of the 18th century, and soon after introduced the potatoes by seed brought from Ireland. Mr. Sandeman, the present proprietor of the public works, employs about 250 persons in producing pyrolignous acid and in bleaching and printing. Population 200.

**TULLOCH**, a parish in Aberdeenshire, united to GLENMUIK: which see.

**TULLOCH-ARD**, a lofty mountain on the north side of Loch-Duich, in the south-west corner of

Ross-shire. It is of easy extent, and commands an extensive view of the western continental coasts and the northern Hebrides. It figures in legendary story as an object of ancient superstitious veneration. In the Middle ages it was the heacon-post of war; and a fire raised on its summit summoned, within 24 hours, all the tenants and vassals of Seaforth to the rendezvous in readiness for combat. It appears as a burning mountain on the crest of the Seaforth arms.

**TULLOCHGORUM**, the native seat of the clan Phattrick, on the left bank of the river Spey, opposite the influx of the Nethy, 4½ miles south-west of Grantown, Inverness-shire. The name is familiar to almost every Scotsman in connexion with the poetry and ancient music of Strathspey.

**TULLYNESSLE AND FORBES**, an united parish nearly in the centre of Aberdeenshire; bounded on the north by Leslie, Clatt, and Rhynie; on the east by Keig; on the south by Alford; and on the west by Auchindoir. Its length is about 7 miles; and its breadth about 4. The river Don traces nearly the whole of the southern boundary; but cuts off a small wing, comprehended in a single farm. Six indigenous brooks drain the parish southward to the Don; the largest of which, the Esset, drives 9 or 10 corn and thrashing mills, but it is subject, at remote intervals, to overwhelming floods. A lofty hill-range, whose chief summits have an altitude of about 1,300 feet above sea-level, sweeps round the western and northern frontier; and various ridges strike off from it toward the plain of the Don, so as to render the general surface of the parish a series of somewhat parallel glens. The hills are extensively stony, but nowhere broken or bare; and they have, for the most part, a dry hut infertile soil, and a heathy dress. The arable land has, in general, a good loam; and consists of haugh-grounds in the vales, and gentle slopes on the declivity of the hills. Distributing the whole parochial area into 100 parts, about 33 are in tillage, 11 in artificial pasture, 43 in hill-pasture, and 13 under wood. Most of the extensive woods have been planted within the last 25 years by the proprietor of Forbes. The rocks are all primitive; mica-schist is worked in two quarries as a pavement-flag; granite is quarried as a building-stone; argillaceous schist was attempted to be worked as a roofing slate, but has been abandoned; and mountain-limestone was once burnt for manure, but is not abundant. Whitehaugh-house, the seat of Lieut.-colonel Leith, is a splendid mansion, consisting of an ancient central edifice, and two quite modern wings. Driminner, the ancient seat of the family of Forbes, appears to have been built about the middle of the 16th century. The parish is traversed southward by the road from Huntly to Kincardine O'Neil, and westward by that from Aberdeen to Strathdon. A substantial and recently built bridge across the Don forms their point of intersection; and in its immediate vicinity are a commodious inn and a post-office. Population of Tullynessle, in 1801, 330; of Forbes, in 1801, 206; of the conjoined parishes, in 1831, 778. Houses 135. Assessed property, in 1815, £1,765.—This parish is in the presbytery of Alford, and synod of Aberdeenshire. Patron, the Earl of Fife. Stipend £230 10s. 2d.; glebe £10. Unappropriated tithes £51 6s. 2d. Schoolmaster's salary £29 18s. 10d., with £23 2s. fees, about £2 2s. other emoluments, and a share of the Dick bequest. Forbes was, in 1722, united to Kearn; and, in 1808, it was united to Tullynessle. It forms the western division of the present united parish.

**TULM**, a small pasture island on the north-west coast of Skye, near Trotternish-point, and belonging to the parish of Kilmuir.

**TUMMEL (THE)**, the lower part of the northern great head-water of the Tay, Perthshire. It is very generally described by topographers as issuing from Loch-Rannoch, and expanding, near the middle of its course, into Loch-Tummel. But the stream between the two lakes really bears the name of the **RANNOCH** [which see]; and only that between Loch-Tummel and the confluence with the Tay strictly claims to be the Tummel. Its length of run, thus limited, is only about 12 miles, or, including sinuosities, 15 or 16. It leaves the lake at its east end; and at first flows eastward and finally flows southwards, so as to describe from beginning to end the fourth part of a circle, the middle of whose convexity is toward the north-east. Over  $4\frac{1}{2}$  miles below the lake it intersects Dull; over nearly 2 miles immediately above its confluence with the Tay, it intersects Logierait; and, over the intermediate distance, it has on its right bank Dull and Logierait, and on its left Moulin and the detached part of Dowally. Four miles below the lake, it receives the very large trihue of the **GARRY**: which see. Respectively below and above this confluence the Tummel, as to both its current and its banks, possesses very widely different characters. Below, it is a stately stream, grave and majestic in motion, gemmed along its bosom with many pretty islets, and winding among numerous cornfields and enclosed pastures, screened with mountainous heights less wild in character, and much softer in dress, than by far the greater part of those in the Highlands. But above where it receives the Garry, it is almost constantly impetuous, tumbles along in rapids, cataracts, and cascades, tears up and rolls playfully before it considerable masses of rock, and runs through a close and wooded mountain-glen, so narrow that, with very little exception, the alpine acclivities rise immediately from the water, leaving no flat land or space of any kind on its margin. The narrowness and prolongation of this upper glen, the sudden rise and the loftiness of its boundaries, the great variety and the wonderful intricacy of their outline and surface, the profusion of forest and the intersection and clouding of it with rocks and ravines,—these, and the exquisite forms and arrangements of the forested and scattered birches which here form the only wood, render this upper glen of the Tummel decidedly richer in the beauties of a grand and romantic style of landscape than any other space of equal extent in Scotland. Near the junction of the Garry stands the house of Fascally, amid a scene which is magnificently pretty,—strongly pleasing, but soon exhausted. A considerable space below this, and toward Pitlochry, makes a remote approach to the character of the upper glen, and exhibits continuous alternations of picture and romance. But the grand attraction of the Tummel is its celebrated fall near the foot of the upper glen. Though by no means so high as the falls of Foyers and of Bruar, it is nevertheless equally grand, if not more so, on account of the greater volume of its water. It and that of Foyers are both first in rank of the Scottish cascades, each in its distinct character; and though considerably lower than the falls of the Clyde, it very greatly excels them both in its own attractions, and in those of its circumjacent scenery. “It is a peculiar and a rare merit in the cascade of the Tummel,” says Dr. Macculloch, “that it is beautiful in itself, and almost without the aid of its accompaniments. Though the water breaks white almost throughout, the forms are so graceful, so varied, and so well marked, that we can look at it long, without being wearied by monotony, and without attending to the surrounding landscape. Whether low or full, whether the river glides transparent over the rocks

to hurt in foam below, or whether it descends like a torrent of snow from the very edge, this fall is always various and always graceful. The immediate accompaniments are, however, no less beautiful and appropriate; and the general landscape is at the same time rich and romantic; nothing being left to desire to render this one of the most brilliant scenes which our country produces.” In the face of a tremendous rock north-west of the fall, is a cave to which there is only one and a very difficult passage. A party of the Macgregors are said to have been surprised in this cave during the period of their proscription; and some of them slain on the spot, while a remnant climbed a tree which grew on the face of the rock, and were precipitated to the bottom by their pursuers cutting away the tree from its root.

**TUNDERGARTH**, a parish in Annandale, Dumfries-shire. It is a long, narrow hand of country, descending south-westward or diagonally from the watershed with Eskdale to within  $2\frac{1}{2}$  miles of the Annan. Its length is  $9\frac{1}{2}$  miles; its breadth varies between  $2\frac{1}{2}$  and 1; and its superficial extent is about 10,630 imperial acres. It is bounded, along the north-west side, by St. Mungo, Dryfesdale, and Hutton and Corrie; on the north-east end by Wester-kirk; along the south-east side by Langholm, Middlebie, and Hoddam; and on the south-west end by St. Mungo. The water of **MILK** [which see] has its course along most of the north-west and south-west boundary; and it receives from the interior no fewer than about 14 rills, all of which are indigenous, and have an average individual run of only about  $1\frac{1}{2}$  mile. The general surface is, in consequence, a declination to the Milk; but it is singularly worn and broken by the action of the streams, and by other causes, into steep-sided valleys and glens, and, with the aid of wood, abounds in picturesque scenes. Though nowhere strictly hilly, and though possessing only two summits, those of Crieve and Grange-fell, 900 feet above sea-level, it very extensively bids perpetual defiance to the plough, and luxuriates in abruptness and variety of pastoral landscape. Excepting about 160 acres, which are under wood, the area is distributed into pastures and arable lands in the proportions to each other of 79 and 29. Grey-wacke, mica-schist, clay-slate, and greenstone, are almost the only rocks. Antimony has been found in small quantities; and lead has, in various localities and various dates, been the object of laborious but vain search. Whitstone-hill, Grange, and Crieve, are the chief mansions, and belong respectively to the landowners,—Swan, Johnstone, and Beattie. The principal antiquity is part of the Roman road from Brunswark-hill, which overlooks the south-west border, to Upper Nithsdale. The district is badly provided with roads, but lies in the immediate vicinity of the Glasgow and London mail-line, and, at the nearest point, only a mile from Lockerhy. Population, in 1801, 485; in 1831, 530. Houses 90. Assessed property, in 1815, £3,463.—Tundergarth is in the presbytery of Lochmahen, and synod of Dumfries. Patron, the Earl of Mansfield. Stipend £156 15s.; glebe £10. Unappropriated tithes £64 15s. 3d. Schoolmaster's salary £34, with £15 fees, and £4 other emoluments. There is a private school. The manor of Tundergarth having anciently belonged to the family of Johnstone, who had here a now extinct castle, the name Johnstone is still the prevailing one in the district.

**TUN-LAW**, or **EARN SHEUGH**, a precipitous sea-cliff, a little to the north-west of St. Ab's, rising to the height of about 430 feet above sea-level, and surmounted by an ancient British fortification.

**TURNBERRY-CASTLE**, a celebrated ruin on the coast of the parish of Kirkoswald, 6 miles north

of the town of Girvan, Ayrshire. When or by whom it was built, is altogether uncertain. It seems to have been one of the castles of the old Gaelic Lords of Galloway; and, when the Gallowegian dominions became divided into the part which continues to bear their name, and the part which has been integrated with Ayrshire, it appears to have been adopted as the principal seat of the Earls of Carrick. In 1274 Martha, Countess of Carrick, resided here at the epoch of her marriage with Robert Bruce of Annandale. On the 20th of September, 1286, it was the scene of the first recorded association or assembly of Scottish nobles,—one which had for its object to support the title of the competitor Bruce to the Crown. In 1306 it was held by an English garrison under Earl Percy; and some years after, while it still continued in the possession of the English, King Robert Bruce stormed it, drove out the garrison, and obliged them to retire to Ayr. It received such damage in the storming as to be virtually destroyed; and it does not appear to have ever afterwards been inhabited. A kiln-fire lighted in the neighbourhood was once mistaken by Bruce for a preconcerted signal, and brought him prematurely over from Arran to attempt the deliverance of his country and the rescue of his Crown. The castle has suffered so severely from the action of sea and weather, and the ruthlessness of dilapidators, as to have little remaining but its lower vaults and cellars; but from indications which are furnished by these, by some vestiges of a drawbridge, and by the extent of rock which seems to have been included in the site, it appears to have been a fortress of great capaciousness and strength. It occupies a small promontory, so as to be washed on three sides by the sea; and, on the land side, it overlooks a rich plain of upwards of 600 acres. Its site commands a full prospect of all the lower frith of the Clyde. Grose has preserved a view of the ruins as they existed when he wrote.

**TURRET**, a small lake and a rivulet in the parish of Monivaird, Strathearn, Perthshire. The lake is about a mile long, and one-fourth of a mile broad. The rivulet issues from the end of it, and has a run of about 5 miles south-eastward to the Earn, half-a-mile above Crieff. The vale traversed by the stream is noted for its scenery, and bears the name of **GLENTURRET**: which see.

**TURRIFF**, a parish on the north-west border of Aberdeenshire, divided chiefly by the Deveron, and partly by a small brook from Banffshire. It is bounded on the north-west by Forglen; on the north by King Edward; on the east by Montquitter; on the south-east by Fyvie; on the south by Auchterless; on the south-west by Inverkeithnie; and on the west by Marnoch and Forglen. Its greatest length from north to south is  $7\frac{1}{2}$  miles; its greatest breadth is  $5\frac{1}{2}$  miles; and its area is 16,896 Scottish acres. The Deveron makes a large and deep sweep while tracing the boundary, so as, opposite the centre of the curve, to compress the breadth of the parish to less than 3 miles; and a considerable tributary of the river runs down to it from the south-west, dividing the parish into not very unequal parts. Two-thirds of the area is naturally moorish and considerably upland, and, till lately, wore a sombre dress of russet; but now it very extensively feels the power of the plough, or luxuriates beneath a covering of plantation. The remaining third is all under cultivation, or embellished with wood; and has in general a light loamy fertile soil. Haughs and meadow-grounds on the banks of the Deveron, especially below the town, are rich and comparatively large. "It is highly probable," says the old Statist, at once sketching the parochial landscape, and embodying

an antiquary's dream, "that Lathmon, the Pictish prince, whom Ossian celebrates, had his seat in this parish. Not only do Lathers and Durlathers bear a strong resemblance to Lathmon and Dunlathmont, but the landscape drawn by nature exactly corresponds with the description of the poet. We may observe on the bank of the river, 'the green dwelling of Lathmon.' We may wander with 'the blue-eyed Cutha in the vales of Dunlathmon;' and the halls of Nuath are only wanting to realize the description of the dying Oithna. High walls rise on the bank of Durrana, 'and see their massy towers in the stream.' A rock ascends behind them 'with its hending firs.'" The extensive plantations are distributed over the several estates of Troup, Delgaty, Lathers, Muresk, Gask, and Hatton-Lodge. The parish is traversed northward by the post-road from Aberdeen to Banff, and has abundance of other roads, chiefly radiating from the town. Population, in 1801, 2,090; in 1831, 2,807. Houses 577. Assessed property, in 1815, £5,803.—Turrieff is the seat of a presbytery in the synod of Aberdeen. Patron, the Earl of Fife. Stipend £232 4s.; glebe £15. Unappropriated tithes £427 14s. 3d. In 1834 the parish-school was attended by 118 scholars; three private schools by 122; and nine female schools, each by about 20. Salary of the parochial schoolmaster—who employs an assistant—£34 4s., with from £41 to £42 fees, and £18 1s. 8d. other emoluments.

**TURRIFF**, a small town and a burgh-of-harony, near the centre of the above parish, half-a-mile from the most easterly curve of the Deveron, 11 miles south-south-east of Banff, 16 north-east of Huntly, and  $3\frac{1}{2}$  north-north-west of Aberdeen. Its chief structures are the handsome modern parish-church, a venerable old disused church, an Episcopalian chapel, the parish schoolhouse, and a market-cross. Near the churchyard-gate, and between it and the cross, is part of the vaults of an ancient tower, whence the west end of the town has derived the name of the Castlehill. The Knights-Templars appear to have had an establishment at the town, or property in its vicinity; and a spot of ground on the south still bears the name of Temple-brae. An hospital or almshouse was built at Turrieff, in 1272, by Alexander, Earl of Buchan, and dedicated to St. Congan. The Establishment had a master and six chaplains, who wore the dress of secular monks; it maintained 13 decayed husbandmen of the district of Buchan; and it possessed, with some limitations, the right of sanctuary for criminals. King Robert Bruce appears to have further endowed it for the maintenance of a chaplain to say masses for his brother Nigel Bruce, slain by the English after their capture of the castle of Kildrummie. The parsons or prebends of the parish seem to have always been the masters of the hospital; at all events, they held the lands with which the Earl of Buchan had endowed it from the beginning of the 15th century till the Reformation. In 1511, the whole Kirklands, village, and glebe, were, by a charter under the great seal, erected into a free burgh-of-harony, in favour of Thomas Dickson, prebend of Turrieff. Various pieces of land, devoted by the charter to the use of the feuarts, continue unalienated. The town is now a seat of industry, manufacture, and inland trade. A carpet-manufacture, begun in 1760, proved a failure. A linen and thread manufacture, commenced in 1767, also failed, but was subsequently revived and extended. An extensive bleachfield has existed for about 75 years. The town has branch-offices of the North banking company, and the Commercial bank of Scotland. Annual fairs are held on the Wednesday after the last Tuesday of January, the last

Wednesday of March, the second Friday, the Saturday before the 26th, and the last Saturday of May, the Wednesday before the last Saturday of June, the Wednesday after the last Tuesday of July, the Wednesday after the first Tuesday of October, the Saturday before the 22d of November, and the Saturday before the 25th of December,—all old style. Population, in 1801, 750.

TUSHIELAW. See *ETTRICK*.

TWEED (*THE*), a river which, directly or by tributaries, drains nearly the whole area of the central and eastern Border counties of Scotland, and of the detached districts of Durham and the north corner of Northumberland in England. It usually ranks in importance as the fourth of the Scottish rivers, the Tay, the Forth, and Clyde being respectively pronounced the first, the second, and the third. But, estimated according to the extent of country which it drains, it far surpasses every Scottish river except the Tay; for, while the Spey, which this rule places next to it, drains only 1,300 square miles, and the Clyde, which is next to the Spey, drains only 1,200, the Tweed drains 1,870. The Scottish counties with which it has connection are Peebles, Selkirk, Roxburgh, Berwick, and the southern division of Edinburgh; and, excepting a tiny nook of Peebles drained by the head-waters of the Mid-Lothian Esks, the parish of Castletown, and some very small peninsules in Roxburghshire, and the north-east division or about a fourth of Berwickshire, these counties are entirely within its basin. In two great head-waters, the one of which bears the name of Tweed from the outset, while the other is throughout called the Lync, it rises respectively in the south-west and the north-west extremities of Peebles-shire; by the head-streams of the Ettrick, the Yarrow, and the Teviot, it drains Selkirkshire and Roxburghshire from the furthest west; by the Gala, the Leader, the Whitadder, and other streams, it draws off the waters from the southern acclivities of the Moorfoot and the Lammermoor hills, even from a line but 11 or 12 miles south of Edinburgh; and from its remotest source to the sea at Berwick-upon-Tweed, it performs, irrespectively of windings, a run of about 100 miles, about one-third of which is in Peebles-shire, and about another third through or in contact with Roxburghshire.

The popular and the really remotest source of the Tweed is a paltry fountain called Tweed's-well, a little above the farm-house of Tweedshaws, and at the foot of a hill named Tweed's-cross, on the south-western boundary of the parish of Tweedsmuir, Peebles-shire. The well is half-a-mile from Lanarkshire on the west, the same distance from Dumfriesshire on the south, and 1,500 feet above the level of the sea. From other sides of the hill where it springs up proceed rills to the gathering or incipient volumes of the Clyde and the Annan; yet not such rills as can with any justice be pronounced more than secondary head-streams of these rivers. Over 22 miles from its origin the Tweed runs prevalingly north-eastward; and, over the remaining 14 miles of the Peebles-shire part of its course, in the direction of east by south. While performing this run it traverses Tweedsmuir and a linn of Drummelzier; divides Glenholm, Stobo, and a small part of Peebles, on the left, from Drummelzier; a wing of Stoho and Manor on the right; runs across Peebles; and then has, on the left, a small part of Peebles and the whole of Innerleithen; and, on the right, Traquair and a very small part of Yarrow. The independent secondary feeders—rills and brooks of 5 miles and less in length—which enter in Peebles-shire, are not fewer than between seventy and eighty; and, though individually trivial, they aggregately pour into it a con-

siderable volume of water. The chief of the larger Peebles-shire tributaries, on the left bank, are the Biggar, between Glenholm and Stoho; the Lyne, between Stobo and Peebles; the Eddlestone, at the town of Peebles; and the Leithen, at the village of Innerleithen,—and, on the right bank, are the Fruid and the Talla, in Tweedsmuir; the Manor, between Manor and Peebles; and the Quair, nearly opposite the Leithen. During its connexion with Selkirkshire and Roxburghshire the Tweed continues, as in the latter part of its course in Peebles-shire, to run prevalingly eastward, till the last 9 or 10 miles; and, over these, it runs in the direction of north-east by east. In a small part of this run it divides Selkirkshire from Roxburghshire; and in two places it divides Roxburghshire from Berwickshire. The parishes, on its left bank, are Innerleithen, Stow, the original Galashiels, the larger part of Melrose, Merton, Makerston, part of Kelso, Ednam, and Eccles; and, on its right bank, are Yarrow, Selkirk, the annexed part of Galashiels, the smaller part of Melrose, St. Boswell's, Maxton, Roxburgh, part of Kelso, and Sprouston. Its minor tributaries here are only between twenty and thirty; and the chief of its larger tributaries, from the north, are the Cadon, between Stow and Galashiels; the Gala, between Galashiels and Melrose; the Allan, in Melrose; the Leader, between Melrose and Merton; and the Eden, in Ednam;—and, from the south, are the Ettrick, between Selkirk and Galashiels; and the Teviot, at the town of Kelso,—the former previously augmented by the Yarrow, and the latter by far the largest of the Tweed's tributaries, and almost a rival of its upper stream in importance. After leaving Roxburghshire the Tweed is but partially a Scottish river; it divides Berwickshire from England till within  $4\frac{1}{2}$  miles of the sea, and then bids adieu to Scotland, and runs between England and the Liberties of Berwick. Its course for 4 or 5 miles after leaving Roxburghshire, and again for about 5 miles before entering the sea, is eastward; and over the intermediate distance it is in the direction of north-east by north. The Berwickshire parishes which it divides from England are Eccles, Coldstream, Ladykirk, and Hutton; and the chief tributaries which enter it below Roxburghshire are, on the left bank, the Leet, in Coldstream; and the Whitadder, in the Liberties of Berwick,—and, on the right bank, the sluggish Till 3 miles below the mouth of the Leet.

The only towns and considerable villages on or near the margin of the Tweed are Peebles and Innerleithen, in their cognominal parishes, and both on the left bank, in Peebles-shire; Darnick and Melrose, on the right bank, and Gattonside on the left, in the parish of Melrose; Lessudden, in St. Bothwell's; Kelso, on the left bank, in its cognominal parish; Birgham, in Eccles; Coldstream, at the mouth of the Leet; Cornhill, nearly opposite Coldstream, but half-a-mile into the interior of Northumberland; Norham, on the right bank, opposite Ladykirk; and Berwick, on the left bank, a little above the embouchure with its suburb of Tweedmouth on the Durham side of the stream.—The mansions upon the Tweed, even those which command special attention by their architectural elegance and the richness of their pleasure-grounds, are too numerous to admit of succinct enumeration; yet, without invidiousness to the many which might justly be regarded as temples of taste, Abbotsford, the seat of Sir Walter Scott, the son of our national novelist, in Melrose; and Fleurs-castle, the seat of the Duke of Roxburgh, in Kelso, may be named as particularly attractive.—The Tweed was long, and to a very late period, remarkable for poverty in bridges; and between Peebles and the sea, a distance of upwards of 70 miles, was

totally unprovided with them, except with one at Berwick. Bleau's Atlas Scotiae, printed at Amsterdam in 1654, says, when noticing the hridge at Peebles: "Quinque arcus babet—alium pontem, non patitur Tueda, donec Bervicum, pertingat." But now, between Peebles and Berwick, there are eleven bridges; a private suspension one at Kingsmeadows, in the parish of Peebles; a new public timber one at Innerleithen; a public one at Yair, between Selkirk and Galashiels; a fine new one on a recent cut of mail-road near the mouth of the Ettrick; a spacious stone one at Darnick; a public suspension one for pedestrians at Melrose and Gattonside; a public one at Drygrange, near the mouth of the Leader; a private suspension one at Dryburgh, in Merton; a magnificent stone one at Kelso; an elegant stone one at Coldstream; and a very splendid carriage-way suspension one at Paxton, in the parish of Hutton.

The Tweed and the Clyde, for many miles from their source, flow so nearly in one direction as never to diverge to any great distance from each other; and, so long as they continue nearly parallel, they flow upon almost the same level, and keep on a high table-land of country, as if hesitating whether to unite their waters or remain separate, and whether to turn their final course toward the eastern or the western ocean. In the vicinity of Biggar, where the Clyde is 7 miles from the Tweed, and 30 from its own source, and flows along a country by no means mountainous, the indigenous waters descend from within half-a-mile of it to the Tweed; and 10 or 11 miles lower down, running in an opposite direction to that long pursued by the two great streams, splits its waters and sends them away in two separate detachments respectively to the Tweed and the Clyde: see BIGGAR and TARTH. Tradition says that, in former times, before Glasgow had acquired its commercial character, a project was conceived of turning the Clyde into the Tweed, with the view of rendering the latter navigable to a great distance along the Mersc; and, in favour of the project, had it ever been attempted, there existed the remarkable facilities, that, immediately south of Biggar, a hog extends all the way between the rivers, that its waters flow to the Tweed, and its surface is only a few feet above the level of the Clyde, and that abundance of materials are at hand for erecting a dam-dyke. Another tradition—a grinningly monkish one—scribes an attempt at a similar project to the reputed wizard, Michael Scott: see CLYDE. Of the 1,500 feet of the Tweed's total aggregate fall from its source to its embouchure, 1,000 are achieved when it reaches the town of Peebles. In the very long run between that town and the sea, therefore, the river might be expected to become sluggish in current, and, over a considerable distance, navigable. But it accomplishes its remaining fall of 500 feet in so many and so far-apart and so comparatively gentle descents, as to be altogether a stream of beauty, and a stranger to matters of commerce. It abounds in deep pools and in long stretches of scarcely perceptible current; yet, in almost every sweep of it which can come under the eye in the course of its beautiful bends and sinuosities, it presents one or more soft rapids, sometimes of considerable length, where the surface of the water is carried along with just sufficient speed to feature it all over with dimples, and ripples, and glassy slides, and whirls. The banks of gravel or pebbles which form these rapids, and, in one instance, 2 or 3 miles above Kelso, of a perforated broad wacke-dyke quite across its channel, render it both naturally unfit, and artificially unimprovable, for navigation. Yet ferry-boats are stationed upon it in many localities, and have very ample depth of water; and small flat boats used in salmon-fishing, and pro-

vincially called trows, are freely navigated even over the fords. A few miles from its embouchure, too, it loses its prevailing character, and becomes capable of admitting sailing-craft. The tide flows to Norham-castle, 10 miles above Berwick; and up to New-water-ford, 6 miles above Berwick, it produces sufficient depth to float, at any time, a vessel of 30 tons burthen. The real navigation of the Tweed, however, is all confined to Berwick; and, as to either capaciousness or depth of sea-room and harbourage afforded for it, might be quite as well accommodated in many a nameless creek or tiny bay in the raggedly indented parts of the Scottish coast. As the Tweed, while thus undisturbed by traffic, is nearly as much untinctured by the liquid outpourings of manufactories, and as it has, in general, a clear, shining, many-coloured path of gravel and pebbles, it almost everywhere possesses a remarkably limpid and sparkling appearance,—such as, combined with the majestic mirthfulness of its current, and with the prevailing brilliant beauty of its banks, to suggest serenely joyous images to a tasteful observer of landscape.

The Tweed possesses none of the wild romance, the bold and startling groups of picture, or the impressive and at times awful grandeur of such rivers as the Garry, the Tummel, and the Upper Tay; but, in all the properties which gently please, and soothingly fascinate, and lusciously excite, it is surpassingly rich, and not a little various. Till it debouches into the Eden-like vale of Melrose it is aggregately a pastoral stream; yet has stretches of haugh and arable hanging plain, which look like gentle pictures within the rough bold framework of the surrounding hills. Its vale, for a considerable distance from the commencement, is prevalingly cold, naked, and narrow; but, long before reaching Peebles, and at intervals ever after, it is occasionally warmed and embellished with wood, and presents charming alternations of gorge, glen, and variously fashioned haughs. Its screens or flanking heights, except at the openings where large tributaries bring down lateral glens, are so closely pressed behind by towering elevations and so huddled together in their ridgy extensions, as to command no extensive views; yet, by their green, soft surfaces, and their finely curved outlines, in combination with the woods on their skirts, and the cultivation in the baughs which they enclose, they give, in compensation, many agreeable close pictures. While it traverses the plain of Melrose, it is so overshadowed by orchards and broadly sheeted from the margin with the most ornately cultivated plain, and picturesquely screened in the brief distance by the Eildons and Cowdenknowes and diversified sylvan heights as to seem like a river luxuriating in beauty. From this vale to about the point where it leaves Roxburgh it has seldom on its banks any considerable expansion of haugh, but is, in general, shut in by hanging plains and soft rising grounds, all green, or arable, or wooded, allowing very limited views of its immediate channel, but cutting it into series of delightful small scenes and commanding brilliant stretches of dale landscape from the Eildon hills to the Cheviots. But at Kelso and a little above, where the majestic and richly jewelled river rolls past the termination of the broad gay path of the almost rival Teviot coming down to pay it princely tribute, a scene of blushing and brilliant beauty expands around it, on which the imagination lives as if it were a reminiscence of paradise: see KELSO, MAKERSTON, and ROXBURGH. From Roxburghshire, or rather from Kelso, to the sea, the Tweed is a magnificent and imposing stream, and uniformly maintains its characteristic transparency, and winds in constant bend and tortuosity along its career, and, in a general

view, moves in a gigantic furrow, a Lowland glen, exuberantly clothed with wood, and spreading away in a terrace broad as the Merse, and delicately featured with all the properties of a great and highly cultivated plain.

The salmon fisheries of the Tweed were formerly of great value, but, of late years, have suffered a depreciation to the very great amount of about two-thirds. The protrusion of the pier of Berwick, the general use of lime in the fields drained into the river, and an undue increase in the number of boats employed in fishing, have all been assigned as causes, and severally pronounced by competent judges to be either irrelevant or so feeble as to correspond in no considerable degree to the effect. The real cause, or at least the prime and by far the most powerful one, appears to be the illegal destruction of fish, during the close season, in the higher Tweed and its tributaries. The practice exists to an extent greater than could be readily credited, and is carried on with an amount of system and skill and daring which, if the object were good, and the result not deleterious to the health of the parties themselves, and the conservation of the fisheries, would be not a little commendable. The rental of the whole of the fisheries on the Tweed averaged about £12,000 a-year for the seven years preceding 1824. The most valuable fisheries are within 2 miles of the river, and the rental of those within 7 miles of the mouth was about £9,000 a-year. The produce of the fisheries on the Tweed for the twenty-nine years preceding 1824 averaged about 8,000 boxes each year.

**TWEEDDALE**, the ancient and still the popular name of **PEEBLES-SHIRE**: which see. The district, under this name, gives the title of Marquis to the noble family of Hay. In 1646 Baron Hay of Yester was created Earl of Tweeddale; and in 1694 the Earl was made Marquis of Tweeddale, Earl of Gifford, and Viscount of Walden. The family-seat is Yester-house, in the parish of Yester, Haddingtonshire.

**TWEEDEN**, a rivulet of 5 miles in length of run, which falls into the Liddel, half-a-mile below New Castleton, Roxburghshire.

**TWEEDSMUIR**, a parish in the south-west extremity of Peebles-shire; bounded on the north-west and north by Drummelzier; on the east by Megget; on the south-east and south by Dumfries-shire; and on the west by Lanarkshire. It is not very far from being a regular circle of about  $8\frac{1}{2}$  miles in diameter. The surface is a congeries of mountainous hills with narrow intervening flats and morasses. The hills, in general, are luxuriant in verdure on the sides, and often boggy on the tops; affording, on the former, rich supplies of pasture and even crops of hay, and, on the latter, a large proportion of the local supply of fuel. They are broad-based, slow of ascent, soft in outline, and summited with table-land. Horses can easily ascend them, and, even without difficulty, bring down loads of turf. The highest elevations are **HARTFELL** and **BROADLAW**, the loftiest south of the Forth and the Clyde: see these articles. The district is as eminently pastoral in the richness of its herbage, and the prime quality of its flocks, as in the mountainousness of its physical features. About 16,000 sheep are pastured; rather more than half of them Cheviots, and the rest black-faced. Only about 280 acres are in tillage; though, but for the distance and expense of lime and other appliances, a large aggregate extent of the lower declivities of the hills might easily be subjected to the plough. Grey-wacke seems to be all but the only rock, to the exclusion, so far as is known, of even a foot of any of the secondary formations. The river Tweed originates and has its first 10 miles' run in the parish; and, in return, gives its name as the prenomem-

that of both the district itself and several of its localities. No fewer than about twenty-five indigenous and independent streamlets fall into it before it departs, and render it, even in this lofty land of its infancy, not altogether unimportant in volume. The chief of these streamlets are the **FRUID** and the **TALA**: which see. Gameshope-loch, about 600 feet in diameter, is probably the loftiest lochlet in the south of Scotland, and abounds in excellent dark-coloured trout.—Vestiges of ancient castles exist at **FRUID**, **HACKSHAW**, and **OLIVER**; the first, the property of the Earl of Wemyss, as Earl of March; the second, the ancient residence of the family of Porteous, the chief of that name; and the third, the paternal seat of the Frasers, now of **LOVAT**.—The principal landowners are the Earl of Wemyss and Sir James Montgomery of Stanhope, Bart. Population, in 1801, 277; in 1831, 288. Houses 49. Assessed property, in 1815, £3,840.—Tweedsmuir is in the presbytery of Peebles, and synod of Lothian and Tweeddale. Patron, St. Mary's college, St. Andrews. Stipend £227 9s. 5d.; glebe £12 10s. Unappropriated tithes £151 5s. 6d. Schoolmaster's salary £32, with about £12 fees, and about £2 other emoluments. There is a private school. The parish anciently formed part of Drummelzier, and was made a separate erection in 1643.

**TWYNHOLM**, or **TWINEHAM**, a parish extending in a long stripe from north to south, in the southern division of Kirkcudbrightshire. It is bounded on the north by Balmaghie; on the east by Tongland; on the south-east by the river and estuary of the Dee, which divide it from Kirkcudbright; on the south by Borgue; and on the west by Borgue and Girthon. Its length is  $9\frac{3}{4}$  miles; its greatest breadth is  $2\frac{1}{2}$ ; and its mean breadth is about  $1\frac{1}{2}$ . Tarf-water is the boundary-line for nearly 2 miles with Tongland. The Dee is in contact with the border from the influx of the Tarf to a point a little below St. Mary's Isle, where it is  $1\frac{1}{2}$  mile broad; and it offers the parish all such advantages as it gives to the burgh of Kirkcudbright, situated on its opposite bank. The rivers and two brooks abound in both variety and quantity of fish; and the latter possess advantageous water-power for driving machinery. Three lakes,—Whinnion, Trostrie, and Gleugap,—the first much the largest, and measuring about  $2\frac{1}{4}$  miles in circumference, have various sorts of trouts. The surface, as seen at a distance, seems an elevated plain; but seen immediately under the eye, is over the southern and central districts distributed into knolls and arable hills with an interspersing of small valleys, and with some haugh-ground on the Tarf and the Dee, and, over the northern district, becomes ruggedly hill, a congeries of heathy upland, entirely and wildly pastoral. Only about two-thirds of the area, from the southern boundary upward, are inhabited. The soil of the arable lands is variously clay, moss, gravel, sand, and mixtures, generally lies upon rock and partly upon till, and being, for the most part, light, dry, and rich, repays the skilful and industrious farmer with exuberant crops of grass and corn. More than one-half of the parish in value, though not in extent, belongs to the Earl of Selkirk, whose seat is at St. Mary's Isle, on the opposite bank

of the Dee. Plantations cover the rising grounds which confront his lordship's residence, and rise in scattered and beautifying clumps over the whole of his estate; and they exist, also, to a small extent, in other districts. Of an extensive ancient forest, which once fung perpetual shade over this part of Galloway, the only remnant is a patch round the ruin of Cumston-castle,—an old building belonging to the Earl of Selkirk, and pleasantly situated on an eminence a little below the confluence of the Tarf and the Dee. There are in the parish five moats, and a Gallows-hill. Various mansions adorn the south and centre, but especially the eastern side, looking down upon the rivers. "The house of Barwhimock, seen from the highway which passes by Twynholm-kirk; with the ornamented grounds about it; the little clumps of larches, silver-firs, and other pines scattered near; and the numerous snug-looking small farm-houses interspersed; with the two oval hills,—the Bar and the Doon, limiting the foreground on the east and the west sides,—form altogether a very interesting landscape. The church of Twynholm 'below the manse, the glebe in a fine state of cultivation, and a little village named from the church, and half-hid in an adjacent glen, compose another cheerful, animated prospect." The erection, 60 years ago, of a large building, which was meant to be a distillery, and was afterwards converted into a cotton-factory, occasioned the rise of a second small village. The mail or military road between Dumfries and Portpatrick goes diagonally across the parish. Population, in 1801, 683; in 1831, 871. Houses 128. Assessed property, in 1815, £7,998.—Twynholm is in the presbytery of Kirkcudbright, and synod of Galloway. Patron, the Earl of Selkirk. Stipend £225 11s. 1d.; glebe £40. Unappropriated teinds £210 10s. 6d. Schoolmaster's salary £31, with £15 fees, and £2 other emoluments. There are 2 non-parochial schools. The present parish comprehends the ancient parishes of Twynholm and Kirkchrist: see **KIRKCHRIST**. The church of Twynholm was anciently a vicarage under the monks of Holyrood. When Episcopacy was re-established by James VI, the parson was constituted a member of the chapter of Galloway. In the reign of Charles I. the barony of Twynholm, or Cumston, with the castle, and manor-lands, and the salmon-fishing on the Dee, belonged to Lord Kirkcudbright.

**TYNDRUM**, a village at the head of Strathfillan, in the parish of Killin, Breadalbane, Perthshire. It stands on the western military road, about 20 miles west of the village of Killin, 12 miles east of Dalmally, and within a mile of the mountain watershed with Argyleshire, and of the remotest source of the southern great head-stream of the Tay. Penitent supposed, but very mistakenly, that it is the highest inhabited spot in Scotland. A road branches off from it to Glencoe, and is noted for wildness and oppressive dreariness. The village itself is remarkable for the surpassing irksomeness of its position. "If no one would willingly go to Tyntrum a second time, or remain there an hour; so, no one will from choice take the road from this point to the King's-house and Glencoe." The vicinity is rich in variety and rareness of minerals. A lead-mine has been its main support, but, an account of doubtful productiveness, has been at different times wrought and abandoned as the price of the metal fluctuated.—At Dalrigh or Dalrie, 'the King's field,' in the neighbourhood, King Robert Bruce, after a very severe and unsuccessful public engagement, displayed his personal strength and courage in single combat with the Lord of Lorn. "There is a tradition," says Sir Walter Scott, "in the family of the Macdougals of Lorn, that their chieftain engaged in personal battle

with Bruce himself, while the latter was employed in protecting the retreat of his men; that Macdougall was struck down by the king, whose strength of body was equal to his vigour of mind, and would have been slain on the spot, had not two of Lorn's vassals, a father and son—whom tradition terms M'Keoch—rescued him, by seizing the mantle of the monarch, and dragging him from above his adversary. Bruce rid himself of these foes by two blows of his redoubted battle-axe; but was so closely pressed by the other followers of Lorn, that he was forced to abandon the mantle and broach which fastened it, clasped in the dying grasp of the M'Keochs. A studded broach, said to have been that which King Robert lost upon this occasion, was long preserved in the family of Macdougall, and was lost in a fire which consumed their temporary residence." This exploit is celebrated by Sir Walter Scott in the following song, entitled 'The Broach of Lorn,' supposed to be sung by the bard of Lorn at his chieftain's request:—

"Whence the broach of burning gold,  
That clasps the chieftain's mantle-fold,  
Wrought and chased with rare device,  
Studded fair with gems of price,  
On the varied tartans beaming,  
As, through night's pale rainbow gleaming  
Fainter now, now seen afar,  
Fitsil shines the northern star?"

"Gem! ne'er wrought on Highland mountain,  
Did the fairy of the fountain,  
Or the mermaid of the wave,  
Frame thee in some coral cave?  
Did in Iceland's darkness mine  
Dwarf's swart hands thy metal twine?  
Or, mortal-moulded, comest thou here,  
From England's love, or France's fear?"

"No!—thy splendours nothing tell  
Foreign art or faery spell,  
Moulded thou for monarch's use,  
By the overweening Bruce,  
When the royal robe he tied  
O'er a heart of wrath and pride;  
Thence in triumph wert thou torn,  
By the victor hand of Lorn!"

"When the gem was won and lost,  
Widely was the war-cry toss'd!  
Kung aloud Bendourish fell,  
Answered Douclart's sounding dell,  
Fled the deer from wild Teyndrum,  
When the homicide, o'ercome,  
Hardly 'scaped with scathe and scorn,  
Lett the pledge with conquering Loru!"

"Vain was then the Douglas brand!  
Vain the Canpoell's vaunted hand!  
Vain Kirkpatrick's bloody dirk,  
Making sure of murder's work!  
Barendown fled fast away,  
Fled the fiery De la Haye,  
When this broach, triumphant borne,  
Beam'd upon the breast of Lorn!"

"Farthest fled its former Lord,  
Lett his men to brand and cord,  
Bloody braud of Highland steel,  
English gibbet, axe, and wheel,  
Lett him fly from coast to coast,  
Dogg'd by Comyn's vengeful ghost,  
While his spoils in triumph worn,  
Long shall grace victorious Loru!"

*Lord of the Isles, Canto II. Stanza 11, and Notes.*

**TYNE (THE)**, a river of Lothian, originating in Edinburghshire, but belonging almost wholly to Haddingtonshire, and draining the larger part of its area. The stream—with the characteristic unsettledness of the nomenclature of the Haddingtonshire waters—gathers many head-waters, and runs a large part of its course before its name ceases to be capricious and disputed. One incipient rivulet called the Tyne issues from a lochlet in the extreme east of the parish of Borthwick, and has a run of 7 miles northward before entering Haddingtonshire. Over this distance it divides Borthwick on the west from Crichton on the east, sweeps past the village of Ford, and cuts Cranston into nearly equal parts; and after

entering Haddingtonshire, it describes the segment of a circle from a northerly to an easterly direction, over a distance of between 4 and 5 miles, through the parishes of Ormiston and Pencaitland, to a confluence half-a-mile east of East Pencaitland, whence all debate ceases respecting the application of the name. Another rivulet, which claims to be the young Tyne, is itself a collection of four or five head-waters, which rise in Borthwick, in Fala, in Soutra, and in the extreme south of Humble, and, after courses of from 4 to 6½ miles, attain a general confluence three-fourths of a mile below Humble church [see HUMBLE]; and after this confluence, the stream proceeds 3 miles northward, to join the competing head-rivulet of the Tyne,—less than it in length of run, but considerably greater in volume of water. The Tyne, nearly of quite a fixed name, flows north-eastward, near almost the centre of the lowlands of the county, to the sea at Tynninghame, 2½ miles north-west of Dunbar, performing a run of 16 miles, or, if measured from its remotest source, 28 miles. Till it enters Haddington parish, it moves alternately on and near the boundaries between Pencaitland and Gladsmuir on the left, and Haddington on the right; and it afterwards moves principally in the interior of Haddington, Prestonkirk, and Whitekirk. Its banks are studded with numerous and beautiful mansions, with the capital of the county, and with the villages of Pencaitland, Nisbet, Samuelston, Abbey, East Linton, Prestonkirk, and Tynninghame. Its current is placid, in many places dull and sluggish; but near the village of Linton it has a kind of rapid, or tumbles over some broken rocks. Its whole course is through a rich agricultural country, rich in all the embellishments of culture, but quite devoid of any bold or striking features of landscape. Proportionately to its length of run it is a small stream; and viewed intrinsically, it scarcely claims to be more than a rivulet; but it is subject to inundations of such suddenness and magnitude, as, if not well resisted by improvements along the margins, would make fearful compensation for its usual littleness: see HADDINGTON. The tide affects it over a distance of about 2 miles, and expands at high-water into an extensive lake, on what are called the Salt-Greens, in front of Tynninghame-house, the seat of the Earl of Haddington. The Greens form a very fine feature in the grounds around that magnificent residence, and are now a glittering sheet of water, and now an expanse of verdant sward dotted over with sheep, and, in summer, thickly powdered with sea-pink. The river is of much value for driving corn-mills. Its salmon-fisheries belong to the Earl of Haddington.

TYNE (THE), a well-known river of England, which has its sources in Scotland. Three head-waters rise respectively on the south side of Carlintooth in Southdean, and on the east side of Laurieston-hills, and in Hob's flow in Castletown; but they have connection only from half-a-mile to 1½ mile with Scotland, and do not unite till 5 miles after they leave it.

TYNNINGHAME, an ancient parish on the coast of Haddingtonshire, now forming the southern district of the united parish of Whitekirk and Tynninghame: see WHITEKIRK. The name is the *ham*, the *ing*, and the *Tyne*, of the Anglo-Saxon, collocated in reversed order, and meaning the hamlet of the meadow of the Tyne; and graphically describes the position of the kirktown, 300 yards from the northern margin of the Tyne, on a beautiful field which gently slopes to the river's edge. The original church was founded so early as the 6th century by the celebrated St. Baldred, the Culdee apostle of East Lothian; and was one of the three which, in a subsequent age of superstition, contested the honour

of possessing his mortal remains. A creek near Whitherry-point in the parish, bears the name of St. Baldred's-cradle; it is obliquely intersected at the entrance by an insulated rock which occasions a turbid and impetuous influx and efflux of the tide; and 'the Cradle of St. Baldred' is, in consequence, poetically said, in popular adage, to be rocked by the winds and waves. In 941, according to Hoveden and the Melrose Chronicle, Anlaf the Dane spoiled the church of St. Baldred, and burned the village of Tynninghame. A supposititious charter of Duncan to St. Cuthbert grants him Tynninghame and five other places in Haddingtonshire, three of which,—Aldham, Scougal, and Knowes,—are in the present united parish. The church of Tynninghame enjoyed of old the privilege of sanctuary. Patrick de Leuchars, who was rector of it in the reign of David II., rose to be bishop of Brechin, and chancellor of Scotland. Roger de Musselburgh, who succeeded him as rector, obtained, in 1366, a safe conduct for himself and 20 horsemen to enter Berwick, and pay an instalment of David II.'s ransom; and in 1372, he witnessed in the same town a notarial proceeding with regard to the paying of another instalment. George Brown, who was rector in the reign of James III., was raised by the party who overthrew that monarch to be bishop of Dunkeld, and joined them in hunting the king to death on the field of Stirling. The manor of Tynninghame, with the patronage of the church, anciently belonged to the bishops of St. Andrew's, and was included in their regality lying on the south side of the Forth. In 1552, it appears to have been conferred on the college of St. Mary's in St. Andrew's, at the founding of that institution, by Archbishop Hamilton. In 1565, a complaint was made by the parishioners to the General Assembly, that though they paid their tithes to the new college, they had as yet received from it the benefit neither of preaching nor of administration of sacraments. The manor was for a time held under the archbishop by the Earl of Haddington; it was, in 1628, obtained by him in chartered right under the great seal; and it thence became the home-domain, the beautiful seat, gradually the richly embellished forest and park-ground of the noble family. The estate is famed in the east of Scotland for the extent and singular beauty of its woods and its holly-hedges. Upwards of 800 acres of it wave with trees, chiefly of the various hardwood species, and arranged in the most tasteful forms of forest. Thomas, the 6th Earl of Haddington, instigated by his lady, the sister of the 1st Earl of Hopetoun, commenced the planting operations on a great scale about the commencement of the 18th century; and must, in reference to their date and their influence, and to the efforts which he used to provoke imitations of his example, be regarded as the originator of the thousands of fine expanses of modern plantation which now so generally beautify Scotland. His first exploit was to plant Binningwood, a forest of 300 Scottish acres, over the whole face of what was then a moorish common called Tynninghame-moor. The trees are arranged in radii or avenues, diverging from three centres, and affording extensive and beautiful walks and rides. The Earl next drew sheltering belts along the enclosures of fields; and then—boldly putting to the test a received opinion, that no trees would grow near the shore—he planted some expanses of sandy ground upon the beach, which had been cheerless and barren for man, and appreciated only by rabbits. Finding that his trees grew and were thriving, even at the very lip of the beach, and fired by the success which had crowned his enterprise, he determined to "fight no more with the cultivation of bad land, but

to plant it all." Thus arose a forest which, while the earliest modern one in Scotland, has become excelled by no one in the Lowlands for the beauty of either its trees or its arrangements. The holly-hedges were planted by the same nobleman as the forest, and they more than rival it in fame. They aggregately extend to about 9,000 feet; they have a breadth of 10 or 11 feet at the base, and a height of from 15 to upwards of 20 feet; they are arranged in double rows, flanking very spacious walks or avenues; and they are clipped twice a-year, and kept with great care, and in constant conservation. Numerous single hollies, each about 50 feet high, and of proportionate circumference, are interspersed with the forest, and enliven its aspect.—Tynninghame-house stands between 2 and 3 furlongs inward from the north bank of the Tyne. Though a patchwork of pieces added by each of the successive Earls, it has had its exterior walls so entirely re-edified and remodelled by the present Earl, as to possess uniquely the appearance of a very large mansion in the old English style. The interior retains, with little alteration, its original form. Between the mansion and the river, imbosomed in a clump of wood, are two fine arches of Anglo-Saxon architecture, the only remains of the ancient church, and now the family cemetery of the Earls.—The little village of Tynninghame stands a small distance west of the enclosed grounds, 2 miles east-north-east of East Linton, and 5½ west-north-west of Dunhar.

TYNRON, a parish in Nithsdale, Dumfries-shire; bounded on the north-north-east by Penpont; on the east by Keir; on the south and south-west by Glencairn; and on the west by Kirkeudrights-bire. Its form is a slender ohlong, extending north-west and south-east. Its length is 9½ miles; its breadth gradually increases over two-thirds south-eastward from 6 furlongs to 3½ miles, and diminishes over the lower third to 1½ mile; and its superficial extent is 11,390 acres. The SKARR on the north-east boundary, and the SHINNEL, along the whole of the interior, drain the entire district: See these articles. The surface consists principally of the glen or strath of the Shinnel, and two ranges of hills which form its screens. The hills are for the most part green, and, being exuberant in rich grass, constitute prime sheep-pasture. The highest are Lamgarroch and Coremilligan, each about 1,800 feet above sea-level. The flocks maintained on the pastures are Cheviot sheep crossed with Leicester rams, blackfaced sheep, and chiefly Highland, but partly Ayrshire and Galloway black cattle. Very much land which, in other circumstances, would have remained pastoral and unenclosed, has, in consequence of the vicinity of lime at Barjary and Closeburn, been reclaimed and subjected to the plough. Though very few acres are flat, or strictly valley-ground, about 2,500 are in tillage. The soil is rather thin and sandy; and the crops are neither early nor luxuriant. Upwards of 400 acres are under wood, chiefly natural. Greywacke is the prevailing rock; clay-slate occurs in one small hed at Corfardine, and was at one time worked; and Leydian stone occurs in a small hed at Shinnelhead. The most interesting object in the parish is the Dun or Doon of Tynron. This is a beautiful pyramidal and steep hill, rising up on the peninsula of the Skarr and the Shinnel, terminating the north-east hill range of the parish, and commanding an extensive and delightful prospect. Its summit, a small piece of table-land, bears marks of having been the site of a fortified castle, and, about a century ago, supplied from the ruins many building-stones which must have been procured at 4 or 5 miles' distance,

and laboriously carried up the difficult acclivity. Ditches round the top are still partially traceable; and dense large woods anciently feathered its sides, and stretched away from its base. Robert Bruce was conducted to the fortalice on the hill by Kirkpatrick of Closeburn, and probably made it his retreat for some period after killing Comyn at Dumfries. A Roman road leads from the Doon along the face of the range to near the head of the parish; and is, in many places, quite uncovered with grass. One side of the hill has a projection whose outline considerably resembles that of the nose on the human face; and hence received the name, subsequently given to the parish, of Tin-droyn in British, or Dun-rion in Irish, transmuted into Tynron, and signifying the fortified hill with a nose. The principal landowner is the Duke of Buccleuch. The road from Minnyhive to Thornhill crosses the foot of the parish; and two roads go up respectively the Skarr and the Shinnel. The village of Tynron-kirk, with scarcely 100 inhabitants, stands on the Minnyhive road, 2¼ miles from Minnyhive, and 3 from Penpont. Population of the parish, in 1801, 563; in 1831, 493. Houses 90. Assessed property, in 1815, £246. Tynron is in the presbytery of Penpont, and synod of Dumfries. Patron, the Duke of Buccleuch. Stipend £234 18s. 3d.; glebe £30. Schoolmaster's salary £25 13s. 4d., with fees, and 10s. other emoluments. There is a private school. The ancient church was a vicarage of the monks of Holywood.

TYRIE, a parish near the north-east extremity of Aberdeenshire; bounded on the north by Aberdour and Pitsligo; on the north-east by Fraserburgh; on the east by Rathen, the detached districts of Aherdour and Fraserburgh, and by Strichen; on the south by New Deer; and on the west by Aherdour. It forms a slender hut much indented ohlong, extending from north-east to south-west. Its greatest length is 7½ miles; its greatest breadth is about 3¼ miles; and its area is about 15 square miles. Its surface exhibits hill, dale, and tiny valley, variously dressed in heath, moss, grass, corn, and wood. The soil on the hills is comparatively shallow, but in the valleys is generally deep; and, except where mossy or moorish, is, for the most part, a fertile reddish-coloured loam. Much land on the estates of Pitsligo and Strichen has been reclaimed, enclosed, and embellished. The village of NEW PITSLIGO [which see] stands in the south. The kirktown of Tyrie is situated on the northern frontier, 5 miles south-west of Fraserburgh. The road from Peterhead to Banff runs across the south end of the parish; and that from Fraserburgh to Turriff runs along its north-west side. Population, in 1801, 1,044; in 1831, 1,613. Houses 492. Assessed property, in 1815, £2,437.—Tyrie is in the presbytery of Deer, and synod of Aberdeen. Patron, Lord Saltoun. Stipend £158 7s. 7d.; glebe £9 10s. The church was built in 1800. Sittings 400. The former church was supposed to have been built about the year 1004, when the Thane of Buchan routed the Danish army upon the neighbouring hills; and on one of its pews it bore the date 1596. The southern district is included in the *quoad sacra* parish of NEW PITSLIGO. The remaining district, or Tyrie *quoad sacra*, measures 5½ miles by 2, and had, in 1835, a population of 785, of whom 698 were churchmen, and 87 were dissenters. Schoolmaster's salary £25 13s. 4d., with £12 fees, £8 6s. 8d. other emoluments, and a share of the Dick bequest. Five private schools were attended, in 1834, by 202 scholars.

## U

**UDDINGSTON**, a village in the middle ward, and shire of Lanark, parish of Bothwell. It is 4 miles north-west of Hamilton, and is pleasantly situated on the eastern bank of the Clyde.

**UDNY**, a parish in the district of Formartin, Aberdeenshire. It is bounded on the north-west by Bourtie and Tarves; on the north by Tarves; on the north-east by Ellon and Logie-Buchan; on the east by Foveran and Belbelvie; on the south by New Machar; and on the south-west and west by Pintray, the detached part of New Machar, and by Keith-hall. It forms a belt of  $6\frac{3}{4}$  miles by  $1\frac{1}{2}$  mile, extending from north to south; but expands at the middle to a maximum breadth of about 6 miles. Its area is 8,380 acres. Its surface is partly undulated and partly level; the inequalities nowhere amounting to more than small eminences or gentle hills. The streams which drain it are three or four unimportant affluents of the Ythan; all running eastward, so as to indicate an easterly inclination of the whole surface. The soil is, in general, a deep loam; good, where lying upon rock; and naturally marshy, but now drained and improved where lying upon clay. Distributing the whole area into 380 parts, 250 are in tillage, 19 are waste or pastoral, 9 are under wood, and 2 are undivided common. The entire appearance is a combination of warmth, wealth, and gentle beauty. Granite and limestone abound, and are extensively worked. Pittrichie-house, A. Milne, Esq., is a neat mansion; Tillygreig, A. Harvey, Esq., is a small but pleasant house; and Pitmedden, Sir William C. Seton, Bart., has a large and ancient garden, one of the most tastefully arranged and best kept in the north. Dumbrake-castle, on the Udney estate, consists of three stories; the first and second of which are vaulted, and the third disposed in one spacious hall; and it has enormously thick walls, and is believed to have been built about the commencement of the 14th century. A process of modernizing it was begun about 40 years ago; but has never been completed. The north-eastern and eastern extremities of the parish are distant 3 and 4 miles respectively from Ellon and Newburgh; and the interior is traversed by one turnpike westward from Newburgh, and another northward from Aberdeen. Population, in 1801, 1,242; in 1831, 1,309. Houses 257. Assessed property, in 1815, £3,622.—Udny is in the presbytery of Ellon, and synod of Aberdeen. Patron, Udny of Udny. Stipend £217 7s. 2d.; glebe £10. Unappropriated tithes £197 7s. 5d. Schoolmaster's salary £30, with about £14 fees, and £5 10s. other emoluments. There are two non-parochial schools.

**UGIE (THE)**, a river in the north-east of Aberdeenshire, rising  $2\frac{3}{4}$  miles from the north coast at the village of Aberdour, and entering the ocean on the east coast, a mile north-west of the town of Peterhead. It issues from a lochlet near Windyheads, in the parish of Aberdour; and performs an entire run of about 21 miles, generally in a south-easterly direction. Its course, in the higher part, is through Aberdour, Tyrie, the detached district of Aberdour, and Strichen; it next divides Strichen and Lonmay, on its left bank, from New Deer and Longside on its right; and it finally passes through Longside, and between St. Fergus and Peterhead to the sea. Its chief tributary is the water of Deer, which joins it in Longside, has a previous run of 15 or 16 miles,

and almost contests the palm of being the parent stream. The Ugie is navigable for about  $1\frac{1}{3}$  mile from its mouth; and, as its lower course is slow and smooth, it might easily, and at a small expense, be rendered navigable for 6 or 8 miles.

UI. See ARR. D.

**UIG**, an Hebridean parish, in the south-west of Lewis, Ross-shire. It consists of Uig-Propser, and the district of Carloway or Callernish. The former is bounded on the north by the ocean and Carloway; on the east by Stornoway; on the south-east by Lochs; on the south by Harris and Loch-Resort; and on the west by the ocean. Its greatest length, from north-east to south-west, is  $22\frac{1}{2}$  miles; its greatest breadth is  $17\frac{1}{4}$  miles; and its area, exclusive of water, is probably between 220 and 225 square miles. Carloway is bounded on the west by Loch-Roag; on the north by the ocean; and on the east by Barvas; it is nearly a square of 7 miles each way, or 49 square miles in area; and it is indented on the coast by only two small bays, and 6 or 7 creeks. The north-western division of Uig-Propser is cut into a labyrinth of islands and peninsulæ by the numerous and intricate ramifications of Loch-Roag; which see. A large and comparatively little indented peninsula between that sea-loch and Loch-Resort, forms the south-western division, and sends out two prominent headlands, the most westerly ground in the island. Between these promontories, the more northerly of which bears the name of Gallan-head, and which are 3 miles asunder, enters the bay of Uig, the most important one in the parish. This bay penetrates the interior to the extent of  $3\frac{1}{2}$  miles, and has a mean breadth of about a mile; and while quite exposed, over 2 miles of its extent, to the tremendous westerly gales and surges of the Atlantic, it afterwards suddenly contracts, and then shoots out into a series of sheltered creeks. Fresh-water lakes are very numerous in most parts of the interior, and reflect from their surface the brown, bleak features of dismal moors, like the images of deformity from the face of a mirror. The only noticeable one is Loch-Langavat, a belt of waters  $9\frac{1}{2}$  miles long, and chiefly on the boundary with the aptly named continuous parish of Lochs. The lakes, excepting this one, rarely attain 6 miles in circumference; they abound with small trout; and, owing to the moorishness of the grounds which their feeders drain, their water has a brownish colour. There are four rivulets in which a few salmon are caught. The seas and bays on the coast abound with cod, ling, dog-fish, coal-fish, and most kinds of shell-fish, and are frequented by English vessels for supplies of lobsters. The entire parish, though aggregately loftier ground than any other in Lewis, exhibits, throughout the interior, a continuous assemblage of low hills and flat moors. Its sea-board is, for the most part, low; has a sandy soil; and contains nearly all the cultivated land. The soil of the interior is first thin, light, and mixed with a little clay, and, farther back, almost wholly moss; yet it is extensively capable of improvement, and, with the aid of sea-weed for manure, produces forced crops. The proportion which arable grounds and good pasture bear to the moors, is little, if any, more than as 1 to 20. The united rental of this parish, and that of the adjoining parish of Lochs, comprising together 249,918 imperial acres, was, in 1841, £5,390. The parish compre-

hends four inhabited islands, the chief of which is Bernera, eight pasture islands, and various waste islets, in and near Loch-Roag; and the group of Flannan or Flauncl islands, seven in number, and situated about 15 miles north-west of Gallan-head. See FLANNAN ISLES and BERNERA. In Callernish are very complete specimens of a Danish fort and a Druidical temple. The fort is quite circular and well-constructed, with a double wall of dry stone, 30 feet high, very broad at the base, and gradually contracting towards the top, so as to resemble the frustum of a cone. The body of the temple consists of a circle of 12 stones or obelisks, mutually about 6 feet asunder, and each about 7 feet high; with an obelisk 13 feet high in the centre. Due east, south, and west of the circle, radiate 3 straight lines of obelisks, each consisting of 3 stones; and toward the north diverge two straight lines of 6 obelisks each, forming between them the avenue or entrance to the temple.—At Melista are remains of a nunery, still designated by a Gaelic name, which means ‘the House of the old black women.’ A singular discovery was made here in the course of 1840. A peasant of the place, whilst digging in a sand-bank, found several pieces of bone, most of them representing kings, bishops, and knights, dismounted and on horseback. The figures are of excellent workmanship, and, judging from the costume, certainly of very remote antiquity. That they were originally carved for the ancient purpose of chess play seems the most probable conjecture, and had been destined to relieve the sadness of cloistered seclusion. With the other articles was found a buckle of the same kind of bone or ivory, beautifully executed, and in perfect preservation, as are all the rest. The number of these chessmen—for such they are—exclusive of the 14 tablemen, or draughtmen, and the fibula found with them, amounts to 67; of which number 19 are pawns, the rest superior pieces. Of these 6 are kings, 5 queens, 13 bishops, 14 knights, and 10 pieces, which we may designate by the title of warders, which here take the place of the rook or castle, forming altogether the materials of six or more sets. For the sake of distinction, part of them were originally stained of a dark red or beet-root colour; but having been so long subject to the action of salt water, the colouring matter in most cases has been discharged. The pieces vary also in size, according to the sets of which they formed a part; and, although so many remain, it is difficult at present to select even two sets which correspond exactly.—The population is segregated in hamlets and villages; and in each of several of them amounts to 200 or 250. There are no carriage roads. Population, in 1801, 2,086; in 1831, 3,041. Houses 622. Assessed property, in 1815, £13.—Uig is in the presbytery of Lewis, and synod of Glenelg. Patron, the Crown. Stipend £158 6s. 8d.; glebe £7. The church was built in 1829. Sittings upwards of 800. There is a catechist. Schoolmaster’s salary £28, with from £2 to £3 fees, and £3 other emoluments. In 1834, the parish-school was attended by 51 scholars; and two schools of the Christian knowledge-propagation society, two of the Gaelic school society, one of the Inverness education society, and a sixth non-parochial school, were jointly attended by 574. Eight Sabbath schools are attended by about 320.

UIG, a sea-loch and a village on the west coast of the parish of Snizort, in Skye: See SNIZORT. The village, says a late distinguished writer, “presents one of the most singular spectacles in rural economy,—that of a city of farms.”

UIST (NORTH), a large Hebridean island, nearly in the centre of the Long Island chain, and politically

belonging to Inverness-shire. It is bounded on the north-west by the Atlantic ocean; on the north-east by the sound of Harris; on the south-east by the Little Minch; and on the south-west by a narrow, complicated, and shallow strait, which separates it from Benbecula, but is densely packed with islands and a host of islets, and, at a place called the north strand, is fordable between low-water and half-tide. Its greatest length, from east to west, is 17 miles; its breadth varies between  $3\frac{1}{2}$  and  $13\frac{1}{4}$  miles, but over the eastern half does not average more than about 6 miles; and its area, in consequence of all the eastern division being cut into indescribable labyrinths by intersections of sea and lake, cannot be very proximately ascertained. The peninsula of all imaginable forms, and the multitudinously water-studded segments of land into which the eastern half of it are cut, smile silent derision upon any attempt at either enumeration or description. Much of the surface of this district is a crowded segregation of islets; and most of it is so boldly and intricately peninsulated, that the whole appears, from almost every vantage-ground, a continued range of slenderly separated and curiously outlined islands. A large proportion of the singular dismembersments are effected by the manifold ramifications of LOCH-MADDY [which see]; another large proportion are effected by broken, scattered, and many-armed fresh-water lakes; and a considerable proportion are effected by the offshoots of Loch-Evort,—a marine inlet, whose main branch runs nearly 7 miles right through the interior westward, to within  $1\frac{1}{2}$  furlong of another slender sea-loch from the opposite coast. The marine parts of the intersecting waters form many safe and commodious harbours, which offer a welcome retreat to the weather-beaten ship; and both classes of waters, the one with its fuci and its sea-fish, and the other with its trouts below and its flocks of wild geese, ducks, and swans above, vie with the land in intrinsic amount of value. The whole of the territory thus cut into fragments is a dreary, flat, marshy moor.—“a brown, peaty, and boggy tract,” says Dr. Macculloch, “so interspersed with lakes and rocks as to be nearly impassable, and producing a scanty and wretched herbage for a few animals during the driest months of summer, while in the winter it is resigned to wild geese, ducks, and swans, who divide its waste and watery region with the sea-gulls which the ocean can no longer protect or feed.” Yet the tract is not all so low as its general character would seem to indicate; but presents in a frequently broken belt of  $2\frac{1}{2}$  miles mean breadth along the coast, a range of hills, which gradually rise from the north to the south, and vary in altitude between 300, and upwards of 700 feet.—The western division of the island is, comparatively speaking, continuous land; and sends up, in lines from south-east to north-west, three distinct groups or ranges of heights. One of these ranges bounds the sound of Harris; and, though lifting its chief summits of Ben-Breach and Ben-More, to nearly 1,000 feet of altitude, is of tame appearance. The second range extends almost from end to end of the district along very nearly its middle, and sends up its principal eminence, Ben-Croghan, to a height of 1,500 feet. The third range is a prolonged and irregular group of much less elevation than the others, of a smooth and undulating surface, and with declivities which fall off in gentle slopes to the south-west. A belt of uneven low land between this last group and the sea is exceedingly beautiful in summer and autumn, produces luxuriant crops of oats and barley, and forms both the chief and the most profitable area of arable ground in the island. Its soil is naturally a mixture of clay and peat, and, jointly by culture and by the mixtion

of drift sand from the coast, it has become a rich and fertile mould. All its sea-board, with the exception of a few hold rocky headlands, consists chiefly of various minutely comminuted shells; and these, in their finely pulverized condition, are wafted over all the tract by the powerful western winds, and fertilize it with all the power of rich lime manure. Yet beautiful and productive as this district generally is, it often in winter suffers such denudation of its more tender and valuable grasses, by the action of rain, frost, and storms, that the cattle which feed upon it can find no sustenance, and must be sustained by the stores of the corn-yards or left to perish.—A cave, on the coast near the parish-church, enters the solid rock by a regular arch; and sports so sublimely with the assailing surges during a storm, as sometimes to fling them aloft from its mouth to a height of 200 feet. Another cave, 3 miles distant, is more extensive, and displays some impressively grand phenomena. Barrows and remains of Danish forts are numerous. A group of the former exists in one of the sandy tracts of the north-west shore; and may be but a portion of a much larger group, whose other parts have been overwhelmed or blown away. The most remarkable of the forts, though presenting little else than heaps of ruins, are situated on small islands in lakes; and at least one of these is connected by a raised causeway with the shore. Gneiss forms the great bulk of the island; argillaceous schist is the chief constituent of the range of heights on the eastern shore; and trap occurs, among the same heights, in numerous veins. The chief useful mineral, apart from the building material of the rocks, is a species of hog-iron accompanied by pyrites, which, with the assistance of tormentil, gallium, lichens, and other native plants, is employed by the natives for dyeing.—The island has nearly 50 miles of statute-labour roads, and about 30 miles additional of good roads; it has, of late years, experienced a similar great change to what at an earlier period took place in the Highlands by the introduction of carts; it has an inn at the packet-station in Loch-Maddy, and three other inns on a line of road which extends to the west coast; it maintains communication twice a-week by packet with Skye, and thence with the rest of Scotland; but it continues a stranger to the benefit so extensively conferred on the other Hebrides by steam-navigation. Its nearest mart, or that at which any suitable interchange of commodity can be effected, is Greenock or Glasgow, distant about 200 miles. So great is the amount of privation endured by the inhabitants, that two witnesses before the Committee on Emigration expressed a conviction that no fewer than 2,500 ought to be removed.

**NORTH UIST**, along with various inhabited islands in its vicinity, and a great number of pasture islands, and of bare rocky islets, valuable only for the seals which frequent them, constitutes a *quoad civilia* parish. The chief islands are Kirkibost, Ilbery, Balishare, Gramesay, Kaillen, Valley, and Oronsay, all connected with the mainland by dry sands at low water, and thickly inhabited; Borreray, about 2 miles to the north; and Heiskar, about 10 miles to the west, and inhabited by about 50 individuals. Population, in 1801, 3,010; in 1831, 4,603. Houses 797. Assessed property, in 1815, £384. Rental, in 1841, £3,641. Of about 55,240 Scots acres, 10,000 are arable.—This parish is in the presbytery of Uist, and synod of Glenelg. Patron, the Crown. Stipend £158 6s. 8d.; glebe £40. The parish-church was built in 1764. Sittings 400. Districts of the parish have been erected into the *quoad sacra* parish of TRUMISGARRY [which see], and the mission of Carinish. The population of North Uist

*quoad sacra*, or after deducting Trumisgarry, amounted, in 1836, to 3,502; all of whom, except two, belonged to the Establishment, and 1,350 to the mission of Carinish. The church of that mission was built 11 or 12 years ago. Sittings 396. Stipend £80, of which £60 is paid from the Royal burgh. In 1834, the parish school was attended by 57 scholars; and 6 other schools by 287. Parochial schoolmaster's salary £34 4s. 4d., with £10 5s. 7d. fees.

**UIST (SOUTH)**, an island in the Inverness-shire section of the Long Island Hebrides,—the largest in the chain, south of Harris. It is bounded on the north by a strait which separates it from Benbecula, and which is shallow, packed with rocks and flat islets, surpassingly intricate, and nearly dry in one part at low water; on the east by the Little Minch; on the south by a sound of from 5 to 8½ miles broad, which has several considerable isles, and is interspersed with sunk rocks; and on the west by the Atlantic ocean. Its greatest length, from north-north-west to south-south-east, is 22 miles; its greatest breadth is 7¾ miles; and its area, including interior and intersecting waters, is about 110 square miles. Loch-Skiport, penetrating the east coast, nearly 7 miles from the northern extremity, runs north-westward across the island, assumes at the further end the name of Loch-Gamoslechan, and cuts off, from the main body of South Uist, a low flat island which is cut into fragments and shreds by slender, long, and forking bays, and bears the designation of Iachdar. Loch-Eynort, penetrating the same coast 7½ miles farther to the south, runs west-north-westward to within three furlongs of the west coast, and sends off, in its progress, a profusion of raggedly outlined and forking bays. Loch-Boisdale, penetrating also the east coast, 3¼ miles from the south-eastern extremity of the island, extends 4½ miles westward with several ramifications, and a mean breadth of about a mile; and at its head it has communication with Loch-Allan,—a narrow fresh-water lake of 3 miles in length, which ranges along the west coast at the mean distance of 3 or 4 furlongs from the beach. These and other sea-lochs which break the continuity of the east coast, dis sever all the eastern division of the island into peninsulæ; and they wind and debouch with singular irregularity, and are powdered all over with rocky islets. Six or seven of them form practicable natural harbours; Loch-Skiport is roomy and safe; Loch-Eynort is good when entered, but presents danger from a large sunk rock; and Loch-Boisdale is one of the best and most capacious in the Hebrides, and offers a favourite retreat in stormy weather to vessels in the Baltic trade. Three large fresh-water lakes, and an almost countless number of small ones, are diffused along the western side of this island; and a few occur also on the numerous peninsulæ of the east. Most are distinguished for either the quantity or the quality of their fishy produce, and they are generally shallow and impregnated with peat, and appear to be the mere repositories of a general drainage which has few outlets to the sea. With inconsiderable exceptions, perennial streams are unknown; and the ephemeral torrents of which a few can be traced flowing down the declivities during a heavy fall of rain, vanish as they arose, because formed solely by surface drainage. The universal prevalence of hard gneiss rock, or of gneiss nearly granitic, presents neither subterranean receptacles for water, nor fissures to transmit it, and occasions, throughout the island, an almost total absence of springs. The climate, however, for an Hebridean one, is far from being moist; the prevailing clouds from the west generally sweeping along with rapidity, and encoun-

tering no material obstacle till they arrive at the continent of Scotland.

The western side of South Uist presents an uniform alluvial plain of peat; interspersed, as we have seen, with numerous lakes; and skirted along the shore with a white fine sand, composed principally of comminuted sea-shells. The eastern division is upland; but, in consequence of its disseverment by sea-lochs, its heights have not the character of a range, and may, in a general view, be regarded as consisting of three separate groups. The group between the south-eastern extremity and Loch-Boisdale comprises three or four somewhat distinct and rounded eminences, scarcely 1,000 feet high, and not extending so far west as to the head of the Loch. The group between Lochs Boisdale and Eynort rise to a higher altitude, and extend farther west than the former; and they enclose upon the ramifications of Eynort, and on other waters, some beautiful sequestered valleys, which, though barren and deserted, might possibly be worked into an aspect of rich and ornate picturesqueness. The group north of Loch-Eynort occupies apparently between a fifth and a fourth of the island; it forms a conspicuous ridge, which is seen far at sea, and declines by a long slope into Loch-Skiport; it presents, in most of its chief declivities, a profusion of rocky protuberances, rounded and independently scattered; and it sends up, as its chief summit, to an altitude of between 2,500 and 3,000 feet, a mountain with some small precipices on its brow, which bears the name of Hecla, and appears to have received it from the Danes, but resembles its celebrated namesake only in appellation. The only noticeable cave occurs close by the sea at the foot of this lofty range; but it derives its main interest from having been one of the hiding-places of Prince Charles Edward in 1746, and is called the Prince's cave.—The low sandy belt along the west shore presents a most desolate appearance, when stripped of its autumnal crops, and left in wintry nakedness; but, in spring, it is enlivened with a rich growth of clover and other wild flowers, exhibiting them in a gaiety and in a brilliancy of colour, everywhere unknown except on kindred soils, of fine calcareous sand; and it is all arable, and, with the assistance of the ordinary manures, produces good crops of oats, barley, and potatoes. The middle tract, or the belt of low country behind the sand, is under cultivation where the ground is firm and naturally drained by the lakes; and elsewhere it is a gloomy sheet of black peat, undergoing a gradual amelioration from the diffusion upon it of the drift calcareous sand. A belt eastward of this, and rising into low subsidiary hills, which skirt the mountains, is deeply covered with peat, but, owing to drainage by natural cuts, is capable of cultivation, and offers inducements to general georgical improvement. The mountain district affords in the aggregate but poor pasturage; and, though it might probably be more profitably occupied as sheep-walk, it is principally devoted to the rearing of black cattle. Agriculture, though improved in some details, is in general conducted on antiquated and thriftless principles; but, of late years, great and successful attention has been given to the improvement of the breed of black cattle, and, in a few instances, to the introduction of the Cheviot sheep.—A good statute-labour road extends along the whole west coast. Only four decked vessels, and these of small burden, belong to the island and its dependencies. The post communication is maintained by way of North Uist, Skye, and Inverness,—the last nearly 200 miles distant; and market communication is maintained chiefly with the Clyde. There is only one tolerable inn. Much the greater part of the population are Roman

Catholics. A witness before the Emigration Committee expressed a belief that the island is overpeopled to the amount of 3,500.

**SOUTH UIST**, along with **BENBECULA**, **ERISKAY**, and **RONA**, [which see,] and some smaller islands, forms a parochial district. The parish is 40 miles in extreme length, and 8 in extreme breadth. Population, in 1801, 4,597; in 1831, 6,890. Houses 1,298. Assessed property, in 1815, £13,758. The population was reduced, in 1836, to 6,492; of whom 4,713 were Roman Catholics.—The parish is in the presbytery of Uist, and synod of Glenelg. Patron, the Crown. Stipend £231, with an allowance of £50 in lieu of manse and glebe. The parochial place of worship is a house temporarily fitted up several years ago. Sittings 200. The mission of Boisdale has a territory of 12 miles by nearly 8; includes the island of Eriskay; and had, in 1836, a population of 1,989,—of whom 1,535 were Roman Catholics. The place of worship was built in 1836. Sittings 230. Stipend £70, of which £60 is paid from the Royal bounty. The mission of Benbecula comprehends that island and the South Uist district, or rather island of Iachdar; and had, in 1836, a population of 2,605,—of whom 1,719 were Roman Catholics. The place of worship was built about 18 years ago, at a cost of about £200. Sittings about 270. Stipend £80; of which £60 is paid from the Royal bounty.—There are two Roman Catholic charges; both of unknown date of establishment. The one in the south end of the parish comprises two congregations, who meet respectively in a thatched house and a slated chapel,—the latter of which was built in 1827, at a cost of about £300. Sittings, in the two, 706. Stipend about £60. That in the north end of the parish has a thatched chapel in Benbecula, built about 46 years ago, at a cost of £80 or £90; a thatched chapel in Kilvanan, built 21 years ago, at a cost of £70; and a neat chapel and minister's house in Iachdar, built 13 years ago, at a cost of more than £500. Sittings, in the three, 1,100. Stipend £50.—In 1834 the parish-school was attended by 24 scholars; and eight other schools by 350. Parochial schoolmaster's salary £26 8s. 6d., with £4 12s. fees, and £8 other emoluments. One of the non-parochial schools was supported wholly by fees; one partly by the Inverness society; one by the Gaelic society; one by the Glasgow Gaelic society; two by the General Assembly; and two by the Society for propagating Christian knowledge.

**ULBSTER**. See **WICK**.

**ULINISH**, one of the Hebrides and part of the parish of Kilmuir. Here are the remains of a place of refuge, built in the time of James VI. by Hugh Macdonald, who was next heir to the dignity and fortune of his chief, and who suffered for engaging in an execrable plot against the laird's life.

**ULLAPOOL**, a *quoad sacra* parish on the west coast, partly of Ross-shire, but chiefly of Cromartyshire. It was erected, in 1833, by authority of the General Assembly, out of the parish of Loch-Broom; and comprehends all of that parish which lies north of the greater Loch-Broom, and west of a line drawn northward from the point of Corrie. Its greatest length and breadth are respectively 25 and 12 miles. Population, in 1836, about 2,400. The church is a parliamentary one, and was built in 1829. Sittings 600. Patron, the Crown. Stipend £120; glebe £2 12s. The minister officiates once a-month, in the district of Coigach. The rivulet Ullapool has 9 miles' length of course; flows westward; expands, in its progress, into Lochs Damp and Auchall; and falls into Loch-Broom, 2 $\frac{3}{4}$  miles above Ru-Ardihadill, where the loch suddenly contracts. The small bay of Ullapool opens about  $\frac{3}{4}$  of a mile above the mouth

of the rivulet. The village of Ullapool stands between the hay and the rivulet, 30 miles north-east of Poll-Ewe, 45 north-west by west of Dingwall, and 61 in the same direction from Inverness. Its site is overhung by a long precipitous face of rock. It has a small but safe, excellent, and well-kept harbour. Regular packets sail between it and both Portree and Stornoway; but so miserable are the roads which connect it with the interior, that inland communication is very difficult, and the maintenance of a rural police nearly if not quite impossible. The village was built, in 1788, by the British Fishery society; and large sums were afterwards expended upon both it and kindred establishments on the isles Martin and Tanera, at the mouth of Loch-Broom. But the failure, for a long series of years, of the herring-fishery has reduced it to insignificance when compared with its pristine condition, and has involved its inhabitants in comparative destitution. Its buildings, as a fishing establishment, are greatly disproportioned to the present state of its fishery. An abortive attempt was made to make the village a seat of justice-of-peace courts. There were only two justices, the one an agent of the Fishery society, who had only £50 a-year, and the other a merchant in the village; and they neither possessed competent legal knowledge, nor enjoyed sufficient popular respect. A chief reason why all the circumjacent district wants good roads is, that no landed proprietor resides in the vicinity who might interest himself in their formation. Population of the village, in 1836, 730.

ULVA, one of the Argyleshire Hebrides, lying between Loch-Tua and the entrance of Loch-na-Keal, on the west coast of Mull. It is separated, on the west, from Gometra by so narrow a strait that, except as seen on its very shores, they appear to be one island; on the north and north-east, from Mornish in Mull by Loch-Tua, which decreases eastward from a breadth of  $1\frac{1}{2}$  mile to a shallow and very narrow strait; on the south-west, from Torosay in Mull by Loch-na-Keal,  $1\frac{1}{2}$  mile broad; and, on the south, from Colonsay by a sound about a mile broad. Its length, from east to west, is  $4\frac{1}{2}$  miles; and its breadth is nearly 2 miles. The island is distinguished for grand basaltic colonnades and picturesque combinations of these with amorphous masses of trap. Its surface rises from the shore in successive ranges of terraces to an extreme altitude of 1,300 or 1,400 feet. Its rocks are a dark bluish trap, now columnar and now amorphous; and an amygdaloid, abounding in analcime and mesotype, now above the trap, now below it, and now interposed between two ranges of its columns. Some low but well-formed colonnades occur along the shores. The upper ranges seldom exceed 20 feet in height, but are very numerous; and they preserve little or no continuity, but exist in detached parts which, in numerous places, resemble fragments of walls and ruined towers. The ranges, says Dr. Macculloch, "are often as regular as those of Staffa, although on a much less scale; and pass gradually from that regularity of form into the most shapeless masses. In many places they afford elegant and picturesque compositions, which, although passed every day by the crowds who visit Staffa, appear to have been unnoticed. If either their numbers, extent, or picturesque appearance be considered, they are more deserving of admiration than even those of the Giant's Causeway; and had they been the only basaltic columns on this coast, they might have acquired the fame which they merit. But Ulva is eclipsed by the superior lustre of Staffa; and, while the mass of mankind is content to follow the individual who first led the way, its beauties will probably be still con-

signed to neglect." The island is inhabited, and has acquired some embellishments from culture.

ULVA, an Hebridean *quoad sacra* parish, disjoined, as a parliamentary church-district, from the Mull parish of Kilninian and Kilmore in 1828, and made a parochial erection by the General Assembly in 1833. It comprehends the islands of Ulva, Gometra, Colonsay, and Staffa, and a portion of the mainland of Mull. Population, in 1836, 1,050; of whom 260 were in Mull, and the remainder in the islands. Patron, the Crown. Sittings in the church 320. Stipend £120; glebe £1. A Gaelic itinerating school is in Gometra, and a school of the Society for propagating Christian knowledge in Ulva. There are three Sabbath-schools.

UNICORN ROCK. See BRESSAY.

UNION CANAL (THE), a splendid water-way, extending from Port-Hopetoun at Edinburgh to Port-Downie on the Forth and Clyde canal; and, by means of the latter navigation, connecting Glasgow with Edinburgh, from which it is frequently termed the Edinburgh and Glasgow canal. The success of the Forth and Clyde canal, which extends from Port-Dundas, Glasgow, to Grangemouth at the head of the Firth of Forth, had long directed the attention of the public to the expediency of forming a canal which should take the benefit of that already in existence, and thus form a continuous means of communication between the eastern and western capitals of Scotland. The line was accordingly surveyed by able engineers, and amongst others it was reported upon and recommended by the well-known Telford, who reported the proposed route to be highly advantageous in respect to the mineral districts through which it passed, its possessing the most perfect drainage, and the facility which it afforded for being extended to East Lothian and Berwickshire. Accordingly a prospectus was issued, and the scheme met with the most favourable reception from the public at both ends of the proposed canal, especially from Edinburgh, who expected to receive, by means of it, one of the first necessities of life, viz., coal, from the exhaustless western fields at a much more moderate rate than they had hitherto been paying to the Mid-Lothian coal-masters, by whom the price was maintained at a monopoly standard. From these parties, however, and from others who conceived their interests affected by the measure, the proposed canal met with, perhaps, a more determined opposition than had ever assailed a private bill up to that time, and the bill incorporating the company of shareholders did not finally pass till 1817. It was commenced in 1818 and finished in 1822, in the January of which year the committee of management made the first survey of the whole line in the Flora Macivor passage-boat, though the canal was not opened to the public for some time afterwards. The total cost, up till this time, was little short of £400,000, an amount vastly beyond the original sum at which the works had been estimated, and to this cause, in addition to the misconception as to the amount of traffic likely to be obtained, may be attributed the extremely unremunerating character which has all along attached to this really useful and great national undertaking. The line, as has been stated, commences at the Port-Hopetoun basin, at Edinburgh, and extends to Port-Downie, near Falkirk, where it joins the Forth and Clyde canal, by which the communication is carried on to Glasgow. From Port-Hopetoun to Port-Downie, the distance is  $31\frac{1}{2}$  miles, the length being caused by sinuosities in the line, which were adopted to retain the level and avoid the additional expense and delay of lockage. It passes westward through part of the counties of Edinburgh,

Linlithgow, and Stirling, embracing the beautiful and populous country in its route, as well as the towns of Linlithgow and Falkirk. The parishes in the county of Edinburgh, through which the line is carried, are St. Cuthbert's, Colinton, Currie, Ratho, and part of Kirkliston; in Linlithgowshire, those of Uphall, part of Kirkliston, Dalmeny, Abercorn, and Linlithgow; and in Stirlingshire, those of Muiravonside, Polmont, and Falkirk. For about 10 miles from Edinburgh the course of the line is westerly, but it then makes a long sweep to the north, after which its direction again changes, and it makes a varied, though, in general, a north-west course, till its termination, passing Falkirk on the south. Some of the works on the line are not only beautiful but majestic in their construction. Near Slateford it is carried over a ravine and the Water of Leith by a bridge 65 feet in height, and 500 feet in length. It is swept over the valley of the Avon, a little above Linlithgow, by an aqueduct of still more stupendous proportions, which is beautiful and imposing as a work of art, and is seen to great advantage from miles distant, as well as from the line of the Edinburgh and Glasgow railway, which is carried by a splendid viaduct over the same valley. Another bold effort of masonry occurs further on, viz., at Callendar-house, in the neighbourhood of Falkirk, within a short distance of the terminus, where the canal is carried through a hill by a tunnel of 700 yards in length. In addition to these there are many arduous cuttings, embankments, and works of masonry, which have all contributed to swell the vast total cost at which the undertaking has been completed. For 30 miles from Port-Hopetoun the canal is carried on the level, and the remainder and very short distance till its junction with the Forth and Clyde is occupied by 11 locks, each 10 feet in depth, so that the Union, at the head of the locks, is 110 feet above the level of the Forth and Clyde canal adjoining. It is 40 feet broad at the top of the water-way, 20 feet at the bottom, and is 5 feet in depth throughout. The line, for 10 miles west from Edinburgh, was opened on the 22d March, 1822, and throughout its entire length early in May thereafter. Altogether it is one of the most beautiful tracts of artificial navigation in the kingdom, and the only regret is, that it has not conducted, in the same degree, to the interests of the proprietors that it has benefited and convenience the public. For this unfortunate result there have been several reasons, the principal of which are, that the expenses of the undertaking were vastly under-rated on the one hand, and the proceeds of the traffic over-rated on the other. From this it would appear that the principal error lay in the canal being dug at all; for the experience of twenty years has shown that few public companies, on the whole, have been less successful in a pecuniary point of view; and while the public spirit of the proprietors has been of the most praiseworthy kind, it is to be regretted that they were so completely misled by erroneous data. One striking proof of this is found in the fact, that though the estimated cost of the construction was set down by the engineers at £235,167, the actual expense for necessary outlay, in addition to the loss of interest on outlaid money, had advanced, within four years of its opening, to £600,000. Another is, that while the estimated annual revenue was calculated at £55,000, the real return, within seven years after the opening of the canal, did not amount to £17,000 per annum. The prosperity of the Forth and Clyde canal was frequently adduced by the promoters of the Union; but they seemed to forget that the great staple of the former was its tonnage for out-sea vessels passing between the one firth and the other,—a species of

traffic for which the latter was entirely unfit, and, indeed, never intended; and it was soon found that the estimated returns from coal, goods, parcels, and passengers were ridiculously exaggerated. Indifferent as the prospects of this canal have always been, they are now much more hopeless than ever, from the opening of the Edinburgh and Glasgow railway, in opposing which, fruitlessly before parliament, the Union canal company spent an immense sum of money. On the opening of the railway the passenger-fares on the canal were vastly reduced, but the former followed their example, by carrying one class of passengers, between Edinburgh and Glasgow, at the low price of 2s. 6d. each.

UNST, an island and a parish in the extreme north of Shetland. The island is separated on the south-west from Yell by Blumol-sound, a rapid tideway about a mile broad, and from Fetlar on the south by a sound between 3 and 5 miles broad; and it is washed, on all other sides, by the open ocean. It forms a slender, though indented oblong, extending from north-north-east to south-south-west; and it measures  $11\frac{1}{2}$  miles in length, about  $3\frac{1}{2}$  miles in mean breadth, and upwards of 36 square miles in area. The coast, over much the larger part of its extent, is a constant alternation of headlands, and of indenting bays and creeks. The headlands, especially in the west and north, are precipitous, rocky, and high,—the loftiest attaining a height of probably 400 feet. The bays, on the contrary, are, for the most part, fringed with low, shelving, and sandy shores. The chief are Burra-frith on the north; Norwick, Haroldswick, and Sandwick, on the east; Watswick and Wick on the south; and Woodwick on the west;—but though most may often protect a vessel for a tide or two, none of them are safe harbours. Burra-frith and Norwick have a picturesque aspect; and are environed with much good land. Balta-sound on the east, and Uyea-sound on the south, are so covered by isles of their own name, and screened by projecting headlands of Unst at their entrances, as to afford good shelter to shipping. The tides on the coast flow nearly southward, and ebb northward, but are often flung from their direction, and whirled into eddies by the projections and recesses of the coast; they run, at spring, with a velocity of 6 miles an hour; and off Lamban-ness, the north-east extremity of the island, they form a tumbling and spouting sea, inferior in its dangers only to that of Sumburgh-roost, and so impetuous and heaving, even in calm weather, as to prove dangerous to fishermen. The isles Balta and Uyea, the islets Hafgruna and Hunie, and the holms Sha, Burra-frith, Woodwick, Newgord, Hogoland, and Weatherholm, skirt the coast of Unst, and are comprehended in its parish. Of numerous caves upon the coasts, one at Sha displays a roof supported by natural octagonal pillars; several in Burra-frith have the sea for their pavement, and run backward under the hills; one at the hill of Saxaforth, 300 feet long and of considerable height, is entered by a grand natural arch; and one a little east of the last resembles it in character, but is inferior to it in magnificence.—The surface of Unst, compared with that of the other Shetland islands, is reckoned level; yet it has several extensive and moderately high hills. Vallafeld, extending from the north end of the island to within  $\frac{1}{2}$  mile of its south end, and attaining a maximum altitude of nearly 700 feet, runs along the western coast, presenting a powerful rampart against the tremendous onsets of the Atlantic, yet often washed over its summit and down to the skirts of its interior declivities by clouds of foam and spray. Saxaforth, 933 feet high, and the loftiest ground on the island, rises boldly up from the sea, in the cen-

tre of the north coast, and forms a landmark to mariners within a range of 14 leagues. Crossfield, at right angles with Vallafield, but rising apart from it, extends nearly across the middle of the island, and terminates on the east coast in two conical peaks. Vordhill extends  $3\frac{1}{2}$  miles along the east coast south of Crossfield. Several other heights occur; but are inconsiderable in magnitude. The loftier hills are covered, to the depth of some feet, by such moss as forms good fuel; and the lower heights, once similarly covered, but now denuded of their moss, frequently show the bare rock, yet extensively possess a green dry sward which yields excellent pasturage. A valley, immediately east of Vallafield, extends the whole length of the island, and has, from end to end, a chain of fresh water-lakes,—the largest of which, Loch-cliff, is 3 miles long, and of pleasant appearance. Much of the soil of the island is excellent; and in spite of its maltreatment by the miserable, antiquated no system of agriculture, it produces good crops. About 2,000 acres are arable, and, for the most part, suffer the scourge of continual grain-cropping; and nearly an equal number of acres are excellent meadow and grass-lands, which might easily be brought into tillage. Five-sixths of the whole area are in commonage; and might, to a considerable extent, be improved. Gneiss, serpentine, chlorine, schist, and diallage rock, are the principal rocks of the island; and talcose and micaceous schists, primitive limestone, and quartz and hornblende rocks, also occur. Amianthus, asbestos, hydrate of magnesia, and chromate of iron, are the most noticeable included minerals. The last occurs in comparatively great quantity, and is now an object of much commercial value, on account of its yielding a fine yellow pigment, and being used in the dyeing of at once silk, woollen, linen, and cotton. Limestone is quarried and burnt as a manure. Fishing here, as throughout Shetland, forms the prime employment of the inhabitants, and now comprehends the long and strangely neglected department of herrings. Articles of Shetland hosiery form a considerable article of manufacture. A pleasant village has recently been built at Uyeasound, and consists of a range of neat dwelling-houses, some warehouses, a merchant's shop, and workshops for three or four departments of artisanry. The mansions are Belmont, a seat of Thomas Mouat, Esq., in the vicinity of the village; and Bunes, the seat of T. Edmonston, Esq., near the head of Balta-sound. At the latter, the French philosophers, Biot and Kater, in 1817-8, conducted their experiments for determining, in so high a latitude, the variation in the length of the seconds' pendulum. A chain of the Scandinavian towers, called burghs and Picts' houses, extends round the island; stone circles and barrows are numerous; and on one of the cones of Crossfield were held the great courts of Shetland, previous to their removal to the vale of TINGWALL: which see. Population of the parish of Unst, in 1801, 2,259; in 1831, 2,909. Houses 474.

Unst, as a parish, is in the presbytery of Burravoe, and synod of Shetland. Patron, the Earl of Zetland. Stipend £248 6s. 8d. \* glebe £6. The church—a neat structure, arresting the attention of a stranger who enters the harbour of Balta-sound—was built in 1827. Sittings 1,224.—Two chapels, belonging respectively to Independent and Methodist congregations, and each containing 200 sittings, are supplied by ministers at the expense of the Congregational Union of Scotland, and the Methodist

Missionary body. Parochial schoolmaster's salary £25 13s. 3d. There is a General Assembly's school; and some young men, nursed in the parish-school, teach, during winter, in the remote districts. Though Unst has, from time immemorial, formed only one charge, the island is naturally divided into three districts, which are known as the North, the Middle, and the South parishes. Ruins or vestiges exist of upwards of 20 ancient places of worship. Three of these were, during part of last century, occupied, in regular rotation, as parish-churches; six are still surrounded by cemeteries; and one possesses the bad fame of still being, to some extent, as in popish times, a place of superstitious pilgrimage.

UPHALL, a parish in Linlithgowshire; bounded on the north-west by Linlithgow; on the north by the northern part of Ecclesmachan; on the east by Kirkliston; on the south-east and south by Edinburghshire; and on the west by Livingstone and the southern part of Ecclesmachan. Its form is that of a half-moon upon a radius of very nearly 2 miles, with the straight line or chord facing the south-east, and sending out from its middle a projection  $1\frac{1}{2}$  mile long, and 7 furlongs broad. Its superficial extent is 3,922 statute acres. The rivulet Broxburn passes eastward through the main body, and gives its name to a village, with 500 inhabitants, a little north-east of the centre of the parish: see BROXBUURN. The river Almond bounds the south side of the projecting district. Though most of the surface is naturally moorish, and gently but not tumulately upland, it is all enclosed, and exhibits the results of skilful and assiduous cultivation, and possesses extensive plantations. The soil is, in many parts, a rich clay upon till, and, on the lower fields, a fine black loam,—both very fertile. The chief minerals are workable coal, excellent sandstone, many seams of valuable ironstone, limestone, marl, reddish-coloured chalk, clay fit for the uses of the brickmaker and the potter, and some coarse Fuller's-earth. The mansions are Middleton, Kirkhill, Houston, and Almondell. The parish is traversed by the middle road between Edinburgh and Glasgow; and, in bold serpentine curvatures, by the Union canal. The village of Uphall, with 160 inhabitants, and the stage, well-known as Uphall-inn, are situated in the west side of the parish, 13 miles from Edinburgh. Population, in 1801, 786; in 1831, 1,254. Houses 215. Assessed property, in 1815, £3,258.—Uphall is in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. Patron, the Earl of Buchan. Stipend £233 6s. 1d.; glebe £20. Unappropriated tithes £403 10s. 6d. The church is of unknown date, but seems in part to have been built in the middle of the 17th century. Sittings about 300. Of 1,091 persons, whom an ecclesiastical census of 1833 exhibited as then constituting the population, 903 were churchmen, and 188 dissenters. Schoolmaster's salary £34 4s. 4½d., with £56 fees, and £4 other emoluments.—The parish was anciently called Stratbroc, 'the Valley of brocks or badgers;' and it retains the vestige of this name in the designation of its chief stream and larger village. The parish-church, which preceded the present one, stood 700 yards north-east of the mansion of Kirkhill; and, being dedicated to St. Nicholas, had a bell, inscribed, 'Campanum Sancti Nicholai de Stratbrocke, 1411,' and still preserved in the more modern church. The parish was in early times a rectory, and was afterwards annexed to the provosty of Kirkheugh, and formed one of its prebends. A chapel appears to have anciently stood at Bangour. In the chancel of the parish-church lie the mortal remains of the celebrated barrister, the Hon. Henry Erskine, and those of his brother, the Lord-chancellor Erskine.

\* The stipend possesses the unusual character of nearly all consisting of vicarage tithes. The details are curious: "660 lug fish, 1,200 cans oil, 236 cans butter, valued at 246 14s. 8d."

**URIE**, or **URY (THE)**, a river of Aberdeenshire, chiefly in the district of Garioch. It rises in the parish of Gartly, in the district of Strathbogie; flows 4½ miles eastward, through that parish, and between Inch and Culsalmond, on the south, and Drumblade and Fergie on the north; proceeds 4½ miles southward and south-eastward, through Culsalmond, to an union with the Shervock; runs 2¾ miles between Oyne on the south-west, and Rayne and Chapel of Garioch on the north-east, to an union with the Gaudy; and then moves 8 miles sinuously, but chiefly south-eastward, through Chapel of Garioch, and between that parish and Keith-hall on its left bank, and the parish of Inverury on its right, to the Don a little below the royal burgh of Inverury. Its entire length of course is about 20 miles.

**URQUHART**, a parish on the coast of Morayshire. It is nearly an equilateral triangle of 5 miles on each side; the coast side extending from the Spey to the Lossie, and the interior sides being bounded by respectively Speymouth and St. Andrew's Lhanbryd. The coast is low and sandy; and has no creek or landing-place. The north-west corner, to the extent of between 2 and 3 square miles, is nearly a dead level, lying but a few feet higher than tide-mark; and the rest of the surface is undulated, but nowhere presents higher ground than swells and gentle eminences. Original expanses of moorland and some waste hillocks have been covered with plantation; the arable grounds are well-dressed and neatly enclosed; and the whole landscape is trim, pretty, and embellished. The soil, though prevailingly light and sandy, is easily capable of enrichment, produces luxuriant light crops, and, with the aid of suitable manures, even yields good crops of wheat. If the parochial area be distributed into 58 parts, 2 are waste, 25 are under wood, and 31 are arable. The extensive woods consist chiefly of Scottish firs, and were all planted by the late Earl of Fife. Water, whether in streams or springs, is scarce. The Loch of Cotts, formerly a conspicuous feature on the face of the parish, has been completely drained. The mineral well of Fintan has some provincial fame as a medicinal spa; but its waters have not been analyzed. The Abbey well, the fountain which supplied the monks with water, marks the site of an obliterated ancient priory. The monastic structure was built in 1125 by David I., and made a cell of the Abbey of Dunfermline. Its ample endowments, consisting of the lordship of Urquhart, the lands of Fochabers, some other lands in Moray, and a part of the fishing of the Spey, were distributed among patriots and court-favourites at the Reformation. The priory itself, however, had previously gone into decay; for, in the 14th century, it was disunited from Dunfermline, and virtually suppressed by union with Pluscardine. The modern mansions are Innes-house and Leuchars. The parish is traversed westward by the great north mail-road; and southward by a divergent road to Garmouth. Population, in 1801, 1,023; in 1831, 1,019. Houses 218. Assessed property, in 1815, £10,191. —Urquhart is in the preshytery of Elgin, and synd of Moray. Patron, the Earl of Fife. Stipend £233 3s. 8d.; glebe £5. Unappropriated tithes £149 15s. Schoolmaster's salary £36 6s., with £7 1s. fees, and £9 19s. other emoluments. There are two private schools. The insurgents of Moray, in 1160, were met in the moors of Urquhart by the King's army; and, after an obstinate resistance, were defeated with great slaughter. See **MORAY (PROVINCE OF)**.

**URQUHART AND GLENMORISTON**, an united parish in the north-west division of Inverness-shire. It is bounded on the north by Kiltarlity, Kirkhill, and Inverness; on the east by Loch-Ness,

which separates it from Dores and Boleskine; on the south by Boleskine and Kilmorivaig; and on the south-west by Ross-shire; and on the west and north-west by Kilmorack and Kiltarlity. Its greatest length from east to west is 30 miles; and its breadth is, in general, from 8 to 12 miles. The peopled districts are the narrow slopes along Loch-Ness, and the glens of Urquhart and Moriston, the only transverse valleys which branch off from the north-west side of the Ness part of the Glenmorean-Alhin. These glens extend nearly parallel to each other, in a westerly direction, at a mean mutual distance of about 7 miles; they are respectively about 9 and 12 miles long; they are separated by lofty heath-clad heights, terminating, on the east, in the vast and soaring mass of **MEALFOURVOUNIE** [which see]; and, in combination with their screens, they exhibit beauty, picturesqueness, and grandeur of scenery, which is nowhere surpassed in the Northern Highlands, and which presents a rich variety of towering heights and waving declivities, bare rocks and wooded precipices, lofty crags and level and fertile plains. **GLENMORISTON** is separately described. **Glen-Urquhart** opens from Loch-Ness, about 15 miles south-west of Inverness; it displays at the entrance a beautiful semicircular plain, watered by the confluent streams of the Ennerie and the Coiltie, richly cultivated, and all arable and enclosed on the low grounds, and overhung by woods and loftily situated corn-fields on the declivities of the hills; it sends off at a sharp angle, on its south side, the glen of the Coiltie, 5 miles long, and rapidly passing from belts of plough ground to birch lands and hill-pasture; it then contracts into a winding strath of rich haugh; and, after being pent up to a rocky gorge near its middle, it expands into an exquisite scenic oval opening, which constitutes all the upper end of the glen, has Loch-Meikle, with the houses of Lochlotter, Lakefield, and Sbeuglie in its centre, and is hung all round with rich and luxuriant woods of birchs. See **MEIKLE (LOCH)**. Two or three miles beyond the head of Glen-Urquhart, extends the upland plain or table-land of Corryony, possessing an elevation of 800 or 900 feet above sea-level, yet adorned with wood, and, to a considerable extent, passed over by the plough; and, west-south-west of it, or stretching away from the head of Glenmoriston, is a great expanse of high, flat moorland, imbosoming Loch-Cluany. The rivulet Ennerie, which traverses Glen-Urquhart, forms, not far from its source, a small but singularly picturesque cascade, called the Fall of Moral. The Coiltie, though less than 7 miles in length of course, has an aggregate fall, from source to embouchure, probably as great as the Spey; and, in consequence, possesses all the way a medium character between a torrent and a cataract, and such vast power that it tears up and tosses along very large masses of rock, and occasionally wheels up from its bed, and sweeps down house and bridge. The Divach, a tributary of this stream, performs, amidst dense hanging coppices of birch, so mighty and picturesque a leap that it wants only a sufficient volume of water to be a rival to the celebrated Foyers. Two other streams—mere burns, however—display remarkably fine cataracts. The arable soil of Urquhart is in general a rich loam, which, though not deep, is uncommonly fertile; that of Glenmoriston is sandy, and so comparatively unproductive as to be, in a great measure, abandoned to pasturage. While porphyritic granite prevails in the uplands west of the two principal glens, and in the north-east corner of Urquhart; gneiss prevails in Glenmoriston; gneiss, serpentine, and granular limestone, jointly occupy about 4 square miles on one side of Glen-Urquhart; and conglomerate and old red sand-

stone, in unconformable and upheaved position, and superincumbent on gneiss, occupy the district bordering on Loch-Ness. The limestone contains asbestos and tremolite; and is burnt for manure.—Castle-Urquhart stands on the south side of Loch-Ness, upon a rocky promontory which forms the western termination or headland of the bay of Urquhart. The waters of the lake wash the base of the rock on three sides; and a moat from 20 to 25 feet deep, and 16 feet broad, on the land side, separates the castle from the adjoining grounds. A drawbridge—the site of which is still to be seen—gave access to the castle across the moat. From the bridge, a noble gateway opened into the court-yard; the gateway was flanked by two projecting towers, and guarded by a succession of doors, and an enormous porteuillis which, worked by pulleys from above, could be dropped, so as to exclude intruders. The court-yard is extensive, but its surface towards the west is rough and broken. On the other side, however, it is smooth and level, and a broad walk leads from the gateway to the entrance of the great keep or principal tower. For nearly the whole of their extent, the walls which encompass the rock on which the castle stands are double, having platforms, upon which the soldiers stood while discharging missiles against the assailants. To the right of the entrance, there is a small portal, or water-gate, from which a passage led down to a natural harbour; and a similar portal opens upon the lake, from the east side of the principal building. The great tower occupies the north-east corner of the court, and is nearly of a square form. Its height, to the base of the battlements on the top, is about 50 feet; the breadth of each side from 30 to 40 feet; and the walls are 9 feet thick. The interior of the tower is in a very dilapidated and ruinous condition, but it appears to have consisted of three stories, exclusive of the warder's room and battlements at the top. The great hall occupied the middle story, and below appear to have been a guard-room and dungeons, from which there was a communication with the upper, by means of spiral staircases, ascending through the wall at opposite corners of the tower. Four square turrets occupy the angles at the top of the tower, each of which forms a small apartment inside, having its own fire-place, and other conveniences complete. The height of the outer walls varies from 12 to 18 feet, and the thickness from 3 to 6 feet. They enclose altogether an area of about five acres of ground. Nothing whatever is known of the origin or erection of this castle, and very little of its early history; but that it must have been a place of great strength and importance in ancient times, is apparent, from its extensive and magnificent ruins. Indeed, it has obviously been one of the greatest strongholds of that chain of fortresses, which were erected at different distances along the line of the Caledonian valley. In all probability, it was erected for the protection of the Highlands, and repressing the invasions of the turbulent natives of Ross and Murray, by some of the earlier Scottish monarchs; for we find, that in the time of Edward I., it is styled a king's house, or royal garrison. By popular tradition, the building of this fortress is attributed to the Cummings, the most powerful family in the north, prior to the reign of Robert Bruce. No authority, however, has been found for this, beyond popular belief; and too many of the castles in the north have had their origin fixed on these chiefs, to cause much faith to be given to it. In 1303, Urquhart-castle was taken by storm, by the troops of Edward I., and the governor, Alexander Bois, and the garrison put to the sword. In the register of the great seal of Robert II., there is a grant of the castle and har-

ony of Urquhart to his son, David Senechalus; failing whom, to Alexander Senechalus: in 1509, a grant of the castle and harony was made to the rising family of Grant of Grant, in whose possession they still remain.—The other antiquities are a small vitrified fort; several cairns; several Druidical circles; vestiges or memorials, chiefly in the form of burying-grounds, of 6 ancient chapels; and slight remains near Castle-Urquhart, of a small religious house which belonged to the knights of St. John of Jerusalem. The principal mansions are Corrymony and Invermoriston; the latter delightfully situated on Loch-Ness, at the mouth of the river Moriston. At Invermoriston and Drumadroehit—the latter situated in the semicircular opening of Glen-Urquhart—are excellent inns. The largest of several hamlets, Milntown, has about 150 inhabitants. Good roads go up the two principal glens toward Kyle-Rhea, the ferry to Skye; and two roads connect the glens respectively along Loch-Ness, and 8 or 9 miles to the west. Population, in 1801, 2,633; in 1831, 2,942. Houses 600. Assessed property, in 1815, £6,334.—The parish is in the presbytery of Aber-tarf, and synod of Glenelg. Patron, the Earl of Seafield. Stipend £249 9s. 6d.; glebe £6. Unappropriated tithes £350 10s. 6d. The parish-church was built in 1837. Sittings 850. A chapel, at which the parish minister officiates every third Sabbath, is situated at Mickle. Sittings 250. A mission on the Royal bounty comprehends Glenmoriston, and has stations or chapels at both Invermoriston and Toraghon. Sittings 150 and 250. Stipend £80. The population, in 1837, consisted of 3,067 churchmen, and 105 dissenters,—in all 3,172. In 1834, three parochial schools were attended by 429 scholars; and 4 other schools by 467. Salary of the 3 parochial schoolmasters, jointly £34 4s. 4½d., with fees.

URQUHART AND LOGGIE-WESTER, a parish chiefly in the south-east of Ross-shire, but comprehending also the well-known detached district of Nairnshire, called FERRINTOSH; which see. It is bounded on the north-west by the river Conan and the Cromarty frith, which separate it from Urray, Fodderty, Dingwall, and Kiltearn; on the north and east by Kirkmichael; on the south-east by Knock-hain; on the south by Killearnan; and on the west by Urray. It is nearly a regular rectangle, extending from north-north-east to south-south-west; and measures between 9 and 10 miles by about 3½. The water-shed of the MULLBUV [which see], forms the eastern boundary; and from this, which is higher at the north end than at the south, the surface gradually falls off to the frith and the Coum, so as to form an almost regular inclined plane. Two or three hirus run down its face, ploughing up ravines, and flinging over the landscape some mimic features of romance. All the middle and higher parts of the slope command a magnificent view of Wester Ross, skirted with the bold forms of the monarch-height Ben-Wyvis and the adjacent Highland mountains. Agricultural improvements have been so extensive and successful, that the produce now, compared to that of 15 or 20 years ago, is double. The soil, though not rich enough to bear wheat without damage, yields excellent crops of the lighter grains, and of pulse and esculent roots. About 4,860 acres of the whole area are in tillage; 3,960 are in pasture; 855 are under wood; 1,635 are waste moorland. The old red sandstone is the prevailing, almost the only rock; and is worked, in several quarries, as a building material. The mansions are Ferrintosh, Findon, and Conanside, belonging respectively to Mr. Forbes of Culloden, Sir J. M. Mackenzie, Bart., of Scatwell, and Sir F. A. Mackenzie, Bart., of

Gairloch. The village of CONAN BRIDGE [which see] has upwards of 300 inhabitants; and at the hamlet of Culbokie are held four annual fairs. The great north mail-road runs across the south-west corner of the parish; and two roads cross the Mull-buy toward respectively Knockbain and Portrose. Population, in 1801, 2,820; in 1831, 2,864. Houses 321. Assessed property, in 1815, £5,528.—This parish is in the presbytery of Dingwall, and synod of Ross. Patron, Forbes of Culloden. Stipend £220 10s. 11d.; glebe £15 Unappropriated tithes £201 2s. 3d. Schoolmaster's salary £34 4s. 5d., with £12 fees, and £5 other emoluments. There are 3 non-parochial schools. The most eminent names which have been connected with the parish are those of President Forbes, and Dr. Fraser of Kirkhill, the son of a former minister, and the author of a Key to the Prophecies of Isaiah. Urquhart forms the north-eastern, and Loggie-Wester the south-western part of the united parish.

URR, a parish in the south-east part of Kirkcumbrightshire. It forms a long and very irregular belt of country, extending from north to south; and terminating at each end in a slightly rounded point. The parishes which march with it, on the east side, are Kirkpatrick-Irongray, Lochrutton, Kirkgunzeon, and Colvend; and those which march with it along the west side, are Buittle, Crossmichael, and Kirkpatrick-Durham. Its length is 13½ miles; its mean breadth over 9 miles at the extremities, chiefly at the south, is little more than a mile; its greatest breadth is about 4 miles; and its superficial extent is nearly 12,000 acres. The surface, compared to that of most Galloway parishes, is pretty level, few of the hills being of considerable height. The upper districts, though moorish, are, for the most part, capable of tillage. The arable lands of the whole area, compared with those which cannot be ploughed, are as 12 to 1. The soil is in general light and productive. The growth of wood, especially oak, ash, elm, and Scotch fir, is exceedingly rapid; and was, at one time, extensively attended to, simply for its produce in fuel. Shell-marl abounds; limestone occurs, and is very hard; iron-ore is plentiful, but cannot be worked for want of coal. URR WATER [which see] divides the parish from Crossmichael and Buittle. Dalbeattie or Kirkgunzeon-hurn, traces the boundary for some miles on the east, and a little before its confinement with the Urr, sweeps past the village of Dalbeattie. These streams and some minor ones have valuable water-power for the propelling of machinery; and the Urr and its main tributary bring up to Dalbeattie vessels of 60 tons burthen. Auchencroch and Milton lochs are situated in the north; the former a long and narrow expansion of a brook on the western boundary; and the latter a sheet of water, about 3 miles in circumference, in the interior. On the west bank of Urr-water, a little below the parish-church, is the celebrated Moat of Urr, an artificial mount or table-land, rising from concentric and successive terraces, and anciently used as a seat of judicature by the petty chiefs of the feudal times. This is probably the largest work of its kind in Scotland; and, though anything but Roman in its own construction, was attended by outworks, some remains of which existed about 80 years ago, and seemed to be of Roman origin. Two drawings of the Moat are given by Grose. The villages of the parish, with their population, in 1836, are Dalbeattie with 1,393; Haugh, with about 220; and Springholm, with about 300. The population, except in Dalbeattie, which contains a mixture of all occupations, is chiefly agricultural: see DALBEATTIE. The parish is crossed in the north by the mail road from Dumfries to Portpatrick, and traversed for some dis-

tance south-westward by the turnpike branch to Kirkcumbright. Population, in 1801, 1,719; in 1831, 3,098. Houses 589. Assessed property, in 1815, £12,516.

Urr is in the presbytery and synod of Dumfries. Patron, the Crown. Stipend £232 19s. 6d.; glebe £30. Unappropriated tithes £303 6s. 7d. The parish-church was built in 1815. Sittings 815.—There are four dissenting places of worship. A Reformed Presbyterian meeting-house was built in the village of Springholm about 25 years ago, and has about 600 sittings. The minister has charge also of a congregation at Castle Douglas, and officiates at Springholm only on every third Sabbath. Stipend from both congregations £95.—An United Christian congregation was formed in Dalbeattie in 1831. Their place of worship was a house, built in 1811, and purchased for £200 in 1832. Sittings 510. The minister officiates on alternate Sabbaths here and at Castle-Douglas. Stipend about £55.—An United Secession congregation was established at Hardgate in 1760. Their meeting-house was built, in 1798, at a cost of about £400. Sittings 480. Stipend £90, with a house and garden.—A Roman Catholic congregation was established in the contiguous parish of Buittle at a remote but unascertained date, and removed, in 1814, to Dalbeattie. Their place of meeting in Buittle was the mansion-house of Munshes, and in Dalbeattie is a house, called St. Peter's church, which was opened in 1814. Sittings 252. The minister officiates at stated intervals in places of meeting at Kirkcumbright, Gatehouse, and Dalry, but regards Dalbeattie as his home. Stipend about £50, with a dwelling-house.—An ecclesiastical survey of 1836, exhibited the population as then 3,059, and distributed them into 2,030 churchmen, 1,026 dissenters, and 3 nondescripts. There are three parochial and three unendowed schools. In 1834, the former were attended by 364 scholars, and the latter by 185. Salary of the first parish-schoolmaster £22 8s. 9d., with £21 7s. 4d fees; of the second £18 5s. 11d., with £23 8s. 6d. fees; of the third £10 9s., with £15 12s. 7d. fees.—The ancient church was dedicated to the royal and Culdee Saint Constantine; from the 12th century till the Reformation, it was a vicarage under the monks of Holyrood; and, in 1633, it was given by Charles I. to the bishops of Edinburgh to aid the support of their nascent and evanescent see. Of several chapels which anciently stood in the parish, and were subordinate to its church, one was situated at a place which still bears the name of Chapelton.

URR (Loch), a small lake on the boundary between Dumfries-shire and Kirkcumbrightshire, and at the point where the parishes of Dunscore, Glencairn, and Balmaclellan meet. It is about 3 miles in circumference, and 5 fathoms in extreme depth. Its water appears extremely black, the ground under and around it being in general a heathy moss. Pike, some of which are said to be about 5 feet 10 inches long, and a few very large trouts, are the only fish which it produces. The surrounding scenery is a bleak and dreary expanse of tame, naked, heathy hill. An islet in the lake, partially covered with hushwood, is the retreat of vast numbers of water-fowls for bringing forth their young, and has been known to be a breeding-place for eagles. Loch-Urr seems to be the Loch-Cure of Camden, from which he erroneously represents the Nith as issuing, and which he states to have been the site of a town of the Selgove, called by the Romans, Corda. The islet may possibly have borne on its loam some Selgove huts; and it certainly was the site, at a later date, of an important though unstoried castle. Some ruins which remain show the fortalice to have

had great strength of wall, and a variety of apartments. At the extremity of the lake is a peninsula cut by a deep trench.

URR (THE), a river of Kirkeudbrightshire. It issues from the lake just described, and runs 26 miles to the Solway frith at the little island of Heston, midway between the Nith and the Dee. Its prevailing direction is toward the south. With the exception of nearly a mile over which it cuts off a tiny wing of Urr, it is throughout a boundary-line between parishes; having on the east Kirkpatrick-Durham, Urr, and Colvend; and on the west Balmaclellan, Parton, Crossmichael, and Buittle. Its tributaries are numerous; but, excepting Dalbeattie, or Kirkgunzeon-hurn, which has a run of 10 or 11 miles, they are all individually inconsiderable. About  $4\frac{1}{2}$  miles before losing itself in the Solway, it begins to expand into an estuary; and at its embouchure, between Heston island and the headland on the east, it has a breadth of very nearly 2 miles. It is naturally navigable for considerable craft 3 miles above its incipient expansion, or  $7\frac{1}{4}$  above its embouchure, and could easily, and at small expense, be deepened over this distance, and rendered navigable higher up. Salmon are caught in considerable quantities in wet summers; but, in dry seasons, sea-fish can get but little higher than the flow of the tide.—The Urr, for a number of miles after issuing from the lake, holds its course through a wild country, and over an irregular channel. But it eventually begins to show some stripes of level and fertile ground upon its banks; and from the point where it begins to run along the parochial margin of Urr, it pursues its way among increasingly level and cultivated grounds. In its lower course, it is occasionally overshadowed with patches and small thickets of wood; its vales are now and then flotted with little pendicles of morass, but in general have a rich sward of natural grass; and its hill-screens possess no great elevation, and are all over arable.

URRAY, a parish partly on the north border of Inverness-shire, but chiefly in the south end of Wester Ross, Ross-shire. It is bounded on the west and north by Contin; on the east by Urquhart and Killearnan; and on the south by Kirkhill and Kilmorack. Its length from north to south is 7 miles; and its breadth, at the north end, is 6 miles, and at the south end 3. A detached district, consisting of "a dovoch of land," lies in Strathconan, at the distance of 18 miles, embosomed by the western mountains, and surrounded by Contin. The main body of the parish skirts the base of the mountain rampart of the Highlands; and lies so low that the great north mail-road, in traversing it from end to end, nowhere seems to mount higher than 50 feet above sea-level. The general surface presents a pleasing view of corn-fields, coppices, patches of moorland, large plantations, rapid streams, and gentlemen's seats, with a rich perspective athwart the two beautiful friths of Cromarty and Beaully. The soil, though various, is, on the whole, warm, dry, and productive. The plains abound with small water-worn boulders, intermixed with beds of dry sand and gravel, and are, to a considerable extent, barren, heath-clad moor; but the slopes of the gentle rising grounds possess a com-

paratively rich soil, and, in a part of the estate of Lovat, which once belonged to the priory of Beaully, they are a deep, rich, carse-ground. The river Conan partly hounds and partly intersects the north end of the parish; the Orrin traverses part of the interior to the Conan; and the Beaully flows along the southern boundary. On one estate are several small hogs in which beds of shell-marl have been found. The chief antiquity is Fairburn tower, in ruins. The mansions are Brahan-castle, A. Stewart Mackenzie, Esq. of Seaforth; Ord-house, Thomas Mackenzie, Esq.; and Highfield-house, George Gilanders, Esq. The Ord distillery, quite a recent erection, is the only object connected with manufacture. Population, in 1801, 2,083; in 1831, 2,768. Houses 568. Assessed property, in 1815, £5,778.—Urray is in the presbytery of Dingwall, and synod of Ross. Patron, Mackenzie of Cromarty. Stipend £249 9s. 6d.; glebe £15. Unappropriated tithes £162 5s. 2d. Schoolmaster's salary £25 15s., with £19 16s. 8d. fees. There is a non-parochial school. The detached district in the west is comprehended in the *quoad sacra* parish of Carnoch. The present parish comprises the ancient parishes of Urray on the north, and Kilchrist on the south.

USAN, a fishing-village on the coast of the parish of Craig, 3 miles south-south-east of Montrose, Forfarshire. Its inhabitants are about 200; and, in employments and character, they are quite akin to their neighbours of FERRYDEN: which see. The estate of Usan, the property of G. Keith, Esq., comprises nearly 900 acres. The ancient Scottish Kings possessed, in connexion with their seat at Forfar, a right to a cadger-road of the breadth of a mill wad from Usan shore to Forfar cross; and a piece of land of about 30 acres in area, along Usan shore, is traditionally pointed out as the ancient property and residence of the King's cadger.

USKEVAGH (LOCH), an inlet of the sea on the east side of Benbecula, in the Outer Hebrides,—the largest of the singularly ramified sea-lochs which cut that island into an utter labyrinth of land and water. The loch, with the islets which are powdered on its bosom, and along its numerous arms, occupies a space of 10 or 12 miles in circumference, but is invaded, within these limits, by a riotous mob of low-lying peninsulæ. "The visitor who attempts to explore it," says Dr. Macculloch, "is unexpectedly surprised by the occurrence of new channels and fresh headlands, when he had imagined himself at the end of his voyage; and, in the multiplicity of islands and promontories which open and shut upon him at all hands, loses the recollection of his place, and the clue to his return.

UYEA, an isle, a sound, a harbour, and a village, in the parish of Unst, Shetland: see UNST. Uyea is the grand rendezvous of shipping for the deep sea-fishing, and the entrepot for goods to the fishing-stations in Unst and neighbouring islands.

UYEA, a pasture-island, about  $2\frac{1}{2}$  miles in circumference, on the west coast of Northmaven,  $4\frac{1}{2}$  miles from the northern extremity of the mainland of Shetland. It covers a safe harbour on the coast of the mainland; and is esteemed valuable for its pasturage.

## V

**VAAKSAY**, one of the smaller Hebrides in the Sound of Harris, near the north-east extremity of North Uist.

**VAILA**, a valuable little island, about 4 miles in circumference, in the parish of Walls, Shetland. It covers an excellent harbour, called Vaila-sound, on the west side of Mainland, and about 3½ miles north-west of Skeldaness. On the island stands the residence of John Scott, Esq. of Melby, the principal proprietor of the parish.

**VAIN-CASTLE**. See **EARN**.

**VALLAY**, a small Hebridean island on the north-west coast of North Uist, from which it is separated by a narrow sound, dry at low water. It measures about 2½ miles from east to west by a mean breadth of about 3 furlongs. It has a light, sandy, fertile soil.

**VATERNISH**, the northern division of the parish of Duirinish, in the north-west of Skye. It forms a large peninsula between Lochs Suizort and Dunvegan; is indented by several sea-lochs, the chief of which is Loch-bay on its west side; and terminates in Vaternish-point, 6½ miles north-north-east of Dunvegan-head. The district constitutes the government parish of **HALEX**: which see. Population 1,700.

**VATERSA**, or **WATERSA**, one of the Barra islands in the southern division of the Outer Hebrides. It is separated from Saundray and Flodda on the south, by the sound of Saundray, three-fourths of a mile broad; and from Barra, on the north, by the sound of Vatersa, which in one place is so narrow as to afford passage to only small boats, and which is elsewhere studded with Eorsa, Snoasimil, and one or two other islets. Vatersa measures, at certain points, 3 miles from east to west, and 2½ miles in the opposite direction; but is so deeply indented as not to possess more than half the superficial extent which these figures would seem to indicate. Two bays, on opposite sides near its middle, almost cut it into two islands; and the eastern one of these, the bay of Vatersa, forms a safe and excellent harbour. The isthmus between the bays is a sandy bar, whose materials are, in continual alternation, thrown up by the billows, and dispersed by the winds. Though the rest of the island consists of two hills, yet the whole surface may be viewed as under constant revolution, from the accumulations and dispersions of the sand-hills of the isthmus and the western shores. The basis of the land is gneiss. "I had here," says Dr. Macculloch, "an opportunity of imagining how life is passed in a remote island, without society or neighbours, and where people are born and die without ever troubling themselves to inquire whether the world contains any other countries than Vatersa and Barra. The amusement of the evening consisted in catching scallops for supper, milking the cows, and chasing rabbits; and this, I presume, is pretty nearly the round of occupation. The whole group of the southern islands is here seen from the southern part of the island, forming a maritime landscape which is sufficiently picturesque."

**VEMENTRY**, an island about 5½ miles in circumference, on the south side of St. Magnus-bay, on the coast of the parish of Sandsting, Shetland. It is separated from the mainland by a narrow strait called Eye-sound; and lies 3¼ miles east of Papa-Stour. It is verdant on the east, and heath-clad on the west; and is regarded as rich pasture-ground.

**VENACHOIR** (**Loch**), an expansion of the beautiful river Teith, which may be said to take its rise from Loch-Katrine, or more properly to originate in the numerous mountain-streams which pour into the lake in cataracts from its steep and rugged banks. It is a fine expanse of water, about 5 miles in length, and 1½ mile in breadth. The outline of its shores is beautiful and waving, and throughout almost its whole extent it is adorned with a skirting of wood. In approaching Loch-Venachoir from Callander, before arriving at its eastern end, the traveller passes Coillinteogle-ford, which, as all the readers of poetry know, was

"Clan-Alpine's outpost guard;"

and here the combat took place between the knight of Snowdon and the Highland chief. A bridge has now been erected over the river, near the place where it formerly was forded. Some years ago, several stones with rude images engraven on them, resembling the upper part of the human body, were found on the farm of Coillinteogle. Proceeding along the shores of the lake, the traveller arrives at the wooded bank called *Coillebhroine*, or 'the Wood of lamentation.' This name owes its origin, it is said, to a malignant action of the water-kelpie or fiend, perpetrated at this place.\* About a mile beyond this, on the north side of the road, is Duncraggan, the first stage of 'the Fiery cross.' Here Malise, the henchman of Roderick Dhu, burst into the hall, showing the cross, and exclaiming,

"The muster-place is Lanrick-mead;"

while the mourners sung the coronach over the body of Duncan, the late Lord; and from hence his son was obliged to leave the obsequies of his father, and taking the cross from the henchman, to carry it through an additional portion of the Clan-Alpine district. At Duncraggan, the traveller catches a very fine view of Loch-Achray. In passing the western extremity of Loch-Venachoir, the farm of Lanrick is seen to the south-west. This was the place of muster of the Clan-Alpine; and it will be observed that there is here a level piece of ground, centrally situated amid a vast surrounding array of mountains, rocks, and woods; intermingled with lakes, and intersected by rapid streams.

**VENNY**, or **FNNY**, a rivulet of the southern division of Forfarshire. It rises in two head-streams in the north-east of Inverarity, traverses Dunnichen and Kirkden, and falls into the Lunan, 1½ mile above Kinnell-church. Its prevailing direction is east-

\* Most Scotsmen know the general tradition with regard to this supposed inhabitant of the rivers and lakes of Scotland; and many will recollect Dr. Jamieson's fine ballad of 'The Water-Kelpie.' Different traditions are handed down with regard to the action attributed to the malicious fiend of Loch-Venachoir. Sir Walter Scott, in his notes to the Lady of the Lake, says, that it caused the destruction of a funeral party passing along the shores of the lake. The minister of Callander—who has so well illustrated this district of Perthshire—gives another version of the story. "As a number of children," says he, "were one day at play on the border of the lake, a beautiful horse issued forth from it. Such was its apparent gentleness that one of the children, after having long admired its beauty, ventured to mount it; another, and another, followed his example, till the whole of them had mounted, the creature gradually lengthening his back to admit their numbers as they advanced. He then instantly plunged into the deep, and devoured them all in his watery cave except one, who, by a singular fortune, escaped to tell the tale."

north-eastward; and its length of run is 8 miles. It is a fine trouting stream.

VIGEANS (Str.), an important parish, consisting of a large main body and two small detached portions, on the coast of Forfarshire. The main body is bounded on the north by Carmylie and Inverkeilor; on the east by the German ocean; on the south by Arbroath and Arbirlot; and on the west by Carmylie. Its greatest length, from east to west, is 8 miles; and its breadth varies between  $1\frac{1}{2}$  and  $4\frac{1}{2}$ . One of the detached portions lies half-a-mile south of the main body; is separated from it by the burgh roads of Arbroath; measures 6 furlongs inward from the beach, and 4 furlongs in breadth; and, owing to its having been the place where the hospital for the sick of Arbroath abbey stood, bears the name of Hospital-field. The other detached portion is the estate of Inverpeffer; lies 3 miles south of the main body; is bounded on the east by the sea, on the south by Panbride, and on other sides by Arbirlot; measures  $1\frac{1}{2}$  mile by 7 furlongs; and anciently belonged to the Fletchers, afterwards of Salton, but was purchased in the 17th century by the family of Panmure. The town and abbey of Arbroath belonged to the parish till about the year 1560; and no legal division having ever been made, the boundary on their side cannot be exactly ascertained. The whole parish is computed to comprehend 9,385 Scottish acres. The main body is divided south-south-eastward into nearly equal parts by the rivulet Brothock. The coast,  $3\frac{1}{2}$  miles in extent, is flat with a sandy beach for about a mile from Arbroath; and thence it rises abruptly, becomes bold and rocky, and has a mean height of about 100 feet. The interior rises very slowly to DICHMOUNTLAW [which see]; slopes gently thence to the Brothock, and then rises with scarcely perceptible gradient toward inconsiderable heights on the western boundary. The general surface may be regarded as proximately level, with a few gentle elevations. In 1754 the district had not, with the exception of gardens, 40 acres of enclosed ground; but now it everywhere exhibits fine embellishments of enclosure and plantation; and, over eight-ninths of its extent, is arable and improved. The soil is various, but, on the whole, fertile. Several of the landowners have neat mansions on their property; among which are Auchmithy, Seatown, Parkhill, Hospitalfields, North Tarry, and Letham. The parish includes a part of the town of Arbroath, which contains about 4,700 inhabitants, and has been erected into a parish *quoad sacra*: see INVERBROTHOCK. On the coast is the fishing-village of Auchmithy, containing 300 inhabitants: see AUCHMITHY. The rocky part of the coast is deeply perforated by several remarkable caves. One, which can be entered only at low-water, was a favourite retreat of seals when these animals abounded on the coast, and was often visited from above by persons let down to it with ropes, shielded on the limbs with straw rollers to protect them from the abrasion of the rocks, and armed with bludgeons to wage deadly war with the phocæ. Another, called the Maiden-castle cave, measures about 231 feet in length, and from 12 to 24 in breadth, is entered about 10 feet above high-water mark, and was formerly the scene of an annual meeting of the mason-lodge of Arbroath, for the admission of new members. Above this cave, on the brow of the rock, and about 100 feet above sea-level, are vestiges of a fort, with its fosse and rampart. A third and stupendous cavern, about  $\frac{1}{4}$  of a mile south of the fishing-village, leads to what is called the Gaylet-pot of Auchmithy,—a remarkable natural curiosity, well-deserving a visit. The cavern opens from the sea in a grand rude archway, about 70 feet high, 40 feet broad, and 130 feet below the top of the rock, as im-

posing and magnificent as it is spacious; and it extends direct into the interior, over a distance of 300 feet, gradually contracting in spaciousness till it attains a minimum breadth and height, each 10 or 12 feet. At the extremity of this vast subterranean sea-passage is the pot,—a capacious cavity going precipitously down to it from the midst of an arable field. The pot is proximately circular, has an outline resembling that of an inverted urn, and measures 150 feet in diameter, and 120 feet in depth from its immediate lips. The sea enters the cavern, and brings up to the pot the fluctuations of the tide; and when it is urged by an easterly wind and high-water it bursts in with amazing impetuosity, and roars and boils and froths with a noise which only the great depth and the contractedness of the pot prevent from being heard at a considerable distance, and then recedes with proportionate violence, and makes a bellying exit from the vast cavern to the main. About half-way between this place and Auchmithy is a semi-circular cavern, about 160 feet along the chord or straight line toward the sea, with a large rocky pillar in the middle of the entrance, and almost on a line with the rocks on each side. So capacious is this cavernous excavation that a fishing-boat with four oars can sail round the pillar without being in danger of striking on the rock. Of two small conical heights near the Brothock, distant from each other about 180 yards, and very nearly equal height, the one is romantically crowned by the parish-church, and the other is the habitat of a fine echo, which reverberates from the east end of the church, and, on a calm evening, repeats very distinctly eight syllables, nr a line of common metre lyric. The parish is traversed, in its main body or its detached parts, by most of the numerous roads which diverge from Arbroath, and by the Arbroath and Forfar railway. Population, in 1801, 4,243; in 1831, 7,135. Houses 1,116. Assessed property, in 1815, £14,841.—St. Vigeans is in the presbytery of Arbroath, and synod of Angus and Mearns. Patron, the Crown. Stipend £256 5s. 5d.; glebe £10. Unappropriated tithes £1,086 7s. 1d. The church is supposed to have been built about 700 years ago, and was enlarged to the extent of 100 sittings in 1827. Sittings 825. Accommodation exists in a new church at Arbirlot for the inhabitants of Inverpeffer, about 150 in number. A small chapel, in connection with the Establishment, was opened, in 1834, in the village of Auchmilkie. The parish *quoad sacra*, or after deducting the town and separately provided district of Inverbrothock, contained, in 1836, according to a survey made by the minister, a population of 2,600,—of whom 2,397 were churchmen, 158 were dissenters, and 45 were non-descrip'ts. In 1834 the country part of the *quoad civilia* parish had three private-schools, and the town part had eight. The parochial-school is in the country. Schoolmaster's salary £34, with £30 fees, and £40 other emoluments. The ancient church belonged to the abbey of Arbroath, and was usually served by one of the monks sent out by the abbot. Two rooms were maintained for the officiating monk in the steeple, and were traceable, in part of their floors, so late as 1754. The last monk who inhabited them is traditionally said to have been frightened from them by the devil appearing to him in the form of a rat, and to have communicated such a panic to his brethren of the cowl that none of them could be induced to succeed him. But the miserable ministers of superstition, while occasionally duped with their own devices, flung a far greater amount of wild deception on the minds of the people whom they misled, and even entailed it upon generations who have lived since crows were happily tossed out of Scotland. The following remarkable example is

given in the Old Statistical Account: "From the year 1699 to 1736, the sacrament of the Lord's supper had never been dispensed in this church. A tradition had long prevailed here, that the water-kelpy (what Mr. Home, in his tragedy of Douglas, calls 'the angry spirit of the water') carried the stones for building the church; that the foundation of it was supported upon large bars of iron; and that under the fabric there was a lake of great depth. As the administration of the sacrament had been so long delayed, the people had brought themselves to believe, that the first time that ordinance should be dispensed, the church would sink, and the whole people would be carried down and drowned in the lake. The belief of this had taken such hold of the people's minds, that, on the day the sacrament was administered, some hundreds of the parishioners sat on an eminence about 100 yards from the church, expecting every moment the dreadful catastrophe. They were happily disappointed; and this spirit of credulity soon vanished, like the baseless fabric of a vision.' In the present times it would prove a matter of great difficulty to make the people believe such absurdities. Perhaps the local situation of St.

Vigeans, in the vicinity of the abbey, might have disposed the people to imbibe such principles as are not easily rooted out." A chapel dedicated to St. Ninians anciently stood on the sea-side, near the place where the coast begins to rise. St. Ninians' well, in its vicinity, had long a popish and great fame for curing several diseases; but has long since been uniformly estimated at its true value.

VOEL (Loch), a lake in the south-western part of Perthshire, parish of Balquhiddar, about 3 miles long and 1 broad, the source of the river Balvaig, the principal branch of the Teith.

VOGRIE, a village in the parish of Borthwick, Edinburghshire; 3 miles south-east by south from Dalkeith.

VOTERSAY, an Hebridean isle, not 2 miles in circumference, 1 mile north-north-east of Stroma, and 2 miles south of Bernera, in the Sound of Harris.

VRINE (Loch), a narrow lake, about  $2\frac{1}{2}$  miles long, in the north-west of Ross-shire. The rivulet Vrine carries off its superfluous waters, and runs 6 miles northward to the head of Loch-Broom,—joined on its right bank, and at about mid-distance, by Mashak-water.

INVERNESS.

## W

**WALLACETOWN**, a modern but populous suburb of Ayr, situated on the east side of Newton-upon-Ayr, forming with it one compact town, and separated from the royal burgh only by Ayr river. About the year 1760, when there were only eight or ten straggling houses on the site of the suburb, Sir Thomas Wallace of Craigie began to feu at the end of the old bridge. The incipient town took its name from him, and speedily acquired considerable bulk and population. Its increase, owing to the vicinity of coal-works, the general growth of manufactures, the demand for day-labourers, and, especially, the facility afforded for the cheap lodging of Irish immigrants, has been progressive, and still continues. Its inhabitants, in consequence, are almost all of the poorer classes, and consist of colliers, artisans, weavers for the Glasgow and Paisley manufacturers, carters, publicans, small shopkeepers, and a large proportion of Irish employed as labourers, and in a hundred methods of earning a precarious subsistence. Yet, though the town has so medley and poor a population, though it abounds as much in pauperism as probably any place which could be named in Scotland; and though it wants the appliances of burghal government which are possessed by both Ayr and Newton, it does not appear to a stranger to differ very materially in character from its immediate neighbours, but seems to wear an aspect quite in keeping with that of the adjacent parts, both of the burgh-of-barony and the royal burgh. In common with Newton, it is included within the parliamentary boundaries of Ayr. In ecclesiastical *quoad civilia* position it belongs to the parish of St. Quivox; but, in 1836, it was erected by the authority of the presbytery of Ayr into a separate parish *quoad sacra*. The church was opened in March, 1836, and cost £1,550. Sittings 865. Stipend £150.—An United Secession place of worship was built in 1799, and cost £1,010. Sittings 610. Stipend £120, with £6 for sacramental expenses.—An Original Seceder meeting-house was built in 1799, and cost £740. Sittings 605. Stipend £130, with £8 for sacramental expenses, and an allowance of £16 16s. for a house-rent.—A Roman Catholic chapel, belonging to a congregation established upwards of thirty-five years ago, was built in 1836, at the cost of £1,900. Sittings 800. The minister has under his care all the Roman Catholics of Ayrshire, south and east of Ardrossan, and officiates in five or six different towns. Emoluments from £100 to £200.—A Reformed Presbyterian meeting-house was built in 1832, and cost about £500. Sittings 480. Stipend £80.—An Independent place of worship was built in 1805, and cost, up to 1836, about £1,000. Sittings 550. Stipend £65.—An Episcopalian place of worship, used by a congregation which was established in 1832, is the upper floor of a house originally intended for a granary, and rented at £10 a-year. Sittings 182. Stipend about £100.—The population, according to a census taken, in 1836, by a committee of the inhabitants, consisted then of 2,229 churchmen, 1,922 dissenters, and 48 nondescripts,—in all 4,199 persons. The school-statistics are given in the article on St. Quivox; and the social and miscellaneous institutions belong properly either to Ayr or to Newton.

**WALLS and FLOTA**, an united parish at the south-west extremity of Orkney. Walls consists of the southern half of the island of Hoy [which see];

and is about 8 miles long and 7 broad. Flota consists of the islands of Flota, Fara, Cava, and Gransey [see **FLOTA**]; and, including intervening marine straits, is about 5½ miles long and 4 broad. Excepting two or three families, one of whom is that of a resident heritor, the inhabitants are small farmers and fishermen, and are dispersed over the parish. Population, in 1801, 993; in 1831, 1,436. The rental of the estate of Melsetter in this parish, comprehending a tract of country 9 miles in length, by 5 in average breadth, was £1,200 in 1817.—This parish is in the presbytery of Cairston, and synod of Orkney. Patron, the Earl of Zetland. Stipend £158 6s. 8d.; glebe £8. The church of Walls was built in 1822; and that of Flota is of older date. Sittings 500 and 180. The minister officiates on two successive Sabbaths in the former, and on every third Sabbath in the latter. In 1834 two parish-schools were attended by 96 scholars; and three other schools by 112. Salary of each parochial schoolmaster £25, with £1 fees, and £2 other emoluments.

**WALLS and SANDNESS**, an united parish in Shetland. It consists of the districts of Walls and Sandness on the mainland; and of the islands of **FOWLA**, **PAPA-STOUR**, and **VAILA**: which see. The mainland districts lie in the most westerly part of the mainland; and are washed, on the north, by **ST. MAGNUS-BAY**: which see. They are jointly about 7½ miles long, from north to south; and about 5 miles broad. They are frequently, though not deeply, indented by bays and creeks; they present, for the most part, a rocky coast, which often rises to the height of 100 feet; they exhibit a surface much diversified by numerous small eminences; and they are separated from each other by a hill of considerable altitude. Upwards of 1,000 acres are in tillage. The inhabitants, as elsewhere in Shetland, all unite the vocations of farming and fishing. The rocks are gneiss, granitic porphyry, quartz rock, and old red sandstone. Population, in 1801, 1,817; in 1831, 2,143. Houses 389. Assessed property, in 1815, £427.—This parish is in the presbytery of Lerwick, and synod of Shetland. Patron, the Earl of Zetland. Stipend £158 6s. 8d.; glebe £14. The united parish comprehends the four original parishes of Walls, Sandness, Papa-Stour, and Fowla. The churches of these parishes, in the order in which we have named them, were built in 1743, 1749, 1806, and at a date not stated. Sittings 500, 278, 190, and 96,—in all, 1,064. The minister officiates about a fortnight daily in Fowla; and during the rest of the year he officiates every second Sabbath at Walls, and, on the intervening Sabbath, alternately at Sandness and Papa. But different arrangements are often occasioned by the state of the weather. A reader in each parish reads a sermon and conducts devotion when the minister is absent.—A Methodist congregation was established in 1824; and has chapels in Walls, Sandness, and Papa; the first of which was built in 1825, at a cost of £107. Sittings 200, 150, and 100. Stipend about £104, mostly paid from the Conference fund in England. The minister officiates also in a chapel in Sandsting parish, and visits Fowla once a-year.—An Independent congregation was established about 1809; and has chapels in Walls, Sandness, and Fowla; the first of which was built in 1837, at a cost of about £120, and contains 170 sittings. Stipend £50, four-fifths of which are paid

by the Congregational union.—Schoolmaster's salary £25 13s. 5½d., with £4 19s. 6d. fees, and £2 other emoluments. There are four non-parochial schools.

**WALLYFORD**, a small village, inhabited chiefly by colliers, on the eastern border of the parish of Inveresk, 1½ mile east of Musselburgh, Edinburghshire.

**WALSTON**, (sometimes written Welstoun in the old session records,) a small parish in the upper ward of the county of Lanark; bounded by Dunsyre on the north, Biggar on the south, Dolphinton on the east, and Libberton on the west. It is watered on its northern parts by the South Medwin, a small hut beautiful trouting stream; and the parish may contain in all about 3,000 Scotch acres, of which 2,000 or thereabouts are arable, and the remainder heathy pasture. It lies very high, and Walton Black mount is said to stand fully 1,500 feet above the level of the sea. There are two small villages, viz., Walston and Elsridgehill, or Elsrinkel, and the character of the inhabitants of the parish is entirely rural. Population, in 1801, 383; in 1831, 429; and, in 1841, 493, with 101 inhabited houses. Assessed property £1,730.—The parish is situated in the presbytery of Biggar, and synod of Lothian and Tweeddale. Patron, Sir Norman McDonald Lockhart, Bart. of Lee and Carnwath. The stipend amounts to £157 10s. 10d., and the glebe is valued at £12. Schoolmaster's salary £30, with about £8 of school-fees.—There is little or nothing of historical interest attaching to the parish. The tradition of the neighbourhood states, that the name is derived from a copious spring of excellent water in the vicinity, which is called Walston-well; and which, in former times, was much frequented, and held in high repute for its medicinal properties,—a character which, however, is scarcely accorded to the spring in the present day. On a rising ground on the south division of the parish are seen the remains of what rural tradition calls a Roman camp.

**WAMPFRAY**, a parish in Upper Annandale, Dumfries-shire. It is bounded on the north by Moffat; on the east by Hutton and Corrie; on the south by Applegarth; and on the west by the river Annan, which divides it from Johnstone and Kirkpatrick-Juxta. Its greatest length from north to south is 6½ miles; and its greatest breadth is 3½. It is not far from being rectangular; and comprehends an area of about 12,000 acres. All the eastern boundary-line is the watershed of a mountain-ridge whose summits possess elevations of from upwards of 2,500 to about 600 feet above sea-level, and almost regularly diminish in altitude as the ridge recedes from the north. Another ridge, not very much inferior in mean height, and very similar in progressive diminution, runs parallel to the former along the centre of the parish; but, a little south of the middle, is cloven quite through by the vale of Wamphray-water, debouching to the west. The low grounds are principally a considerable band along the Annan, and some small belts along the minor streams; and, over most of their breadth, they rise at different gradients to the skirts of the hills so as to form hanging plains. The heights are variously conical, elongated, and tabular; those in the north are partly green and partly heathy, and, through a change in the system of sheep-farming, have suffered deterioration as to both the value and the aspect of their herbage; and those in the south either are in tillage, or produce rich and plentiful pasturage. The valleys have a warm and secluded aspect; they occasionally put on dresses of picturesqueness and beauty; and they, in general, possess a deep soil, and produce good or even prime crops. Nearly 260 acres are planted; and the remaining area is arable and pastoral in the relative proportions

of 1 to 3. On Bell-craig-lynn burn, which runs to the Annan along the boundary with Moffat, a cascade, whence it derives its name, has much mimic sublimity and some fine accompaniments of landscape, and draws numerous visitors from among "the wellers" at Moffat. Wamphray-water comes down from the north, flows 3½ miles southward between the mountain-ridges, and then moves west-south-westward for 2 miles to the Annan. Three cascades upon this stream, not far distant from one another, and bearing the absurd names of the Pot, the Washing-tub, and Dub's cauldron, are justly admired for their mingled picturesqueness and grandeur. A deep and woody recess on the banks of the stream, gives a romantic site to the parish-church. Wamphray-place, an old mansion a little lower down the vale, is surrounded by some fine large Scottish firs. Girth-head, Rogerson, Esq.; Stenries-hill, Carruthers, Esq.; and Millhouses, Carruthers, Esq.; are the only occupied mansions. The chief landowners are the Earl of Hopetoun, and Rogerson of Wamphray. The antiquities are part of a Roman road, several vestiges of camps, and several small standing-stones. The parish is traversed by the Glasgow and Carlisle mail-road, and by a branch from it to Langholm. Population, in 1801, 423; in 1831, 580. Houses 92. Assessed property, in 1815, £4,667.—Wamphray is in the presbytery of Lochmahon, and synod of Dumfries. Patron, the Earl of Hopetoun. Stipend £221 12s. 10d.; glebe £10. Unappropriated tithes £159 8s. 9d. Schoolmaster's salary £34 4s., with about £25 fees. The parish was anciently a rectory. Its name is the Scots-Irish, *Uamhfrí*, 'the den or deep recess in the forest;' and alludes to the position of the church in a hollow amidst what anciently were extensive woodlands.

**WANDEL**. See LAMINGTON.

**WANLOCK (THE)**, a streamlet of the parish of Sanquhar, Upper Nithsdale, Dumfries-shire. It rises at the mines to which it gives name, near the watershed of the lofty Lowthers which divide Dumfries-shire from Lanarkshire; and runs 4½ miles north-eastward, nearly parallel with the boundary-line, and never at a greater distance from it than 1¼ mile, to a point where it and the Spango—the latter meeting it quite in a straight line—unite to form the Crawick. The streamlet is noticeable chiefly for the wildly mountainous character of its path, and for its connection with the celebrated mines.

**WANLOCK-HEAD**, a large mining village at the head of the Wanlock, 1¼ mile south of Leadhills, and 8½ east-north-east of Sanquhar, Dumfries-shire. It is situated close on the wild boundary with Lanarkshire, about 1,380 feet above sea-level, in one of the most bleak scenes in the southern Highlands. The mines, which alone maintain the village, or could furnish a motive for so cheerless and elevated a region being a seat of population, belong to the Duke of Buccleuch; they are continuous with the mines of Leadhills on the Crawford or Lanarkshire side of the frontier, belonging to the Earl of Hopetoun; and jointly with these, they shoot out to a circumference whose diameter is about 2½ miles. The Wanlock-head mines are said to have been discovered by a German in the reign of James V., or during the minority of James VI. Gold was originally the object of search, and has even very recently been found: see DUMFRIES-SHIRE. Sir James Stampfield commenced the lead mines about the year 1680, and worked them upon a small scale till the Revolution. Matthew Wilson obtained, in 1691, a lease for 19 years, and successfully worked the vein called Margaret's, quite through Dodbill from Whitecleuch to the Wanlock. A mining company procured, in 1710, a lease for 31 years, commenced

to smelt the ore with pit-coal, and partially worked the three veins of Old Glencrieff, Belton, and New Glencrieff,—the last of which they discovered, and was the only compensating one of the three. A new and large company which took the name of the Friendly Mining society, formed, in 1721, a co-partnership with the smelting company, and got 15 years added to the 20 which had yet to run of the latter's lease. The two companies jointly worked all the then known four veins for 6 years; and then separated and pursued their objects in different localities. But, in 1734, both companies resigned their lease; leaving the mines in a condition, and under a depreciation of fame which occasioned, for a series of years, their being in a great measure neglected. In 1755, the Earl of Dumfries, Mr. Ronald Crawford, and Mr. Mason, became lessees of the whole means; they had at first a lease for only 19 years; they afterwards obtained an act of parliament for extending the lease to 1812; and, previous to that year, they were granted a new lease for 30 years more, to expire in 1842, and concentrating its interest in the Marquis of Bute as Earl of Dumfries. The new company were enterprising and eminently successful; they discovered new and rich ramifications of the Belton vein; they discovered also an entirely new vein, called the Cove; and, when workable ore could no longer be found, they erected a series of steam-engines, some on the surface, and some under ground, to carry off water from their borings beneath level. So successful were the operations that, in one year, they yielded upwards of 15,000 bars, each weighing 9 stones avoirdupois, and aggregately selling for about £30,000. The works continued to be highly profitable till about 11 years ago, and then they suffered sudden depreciation from the removal of duty on foreign lead; and they have since had to contend against the superior richness of foreign mines, and the domestic disadvantage of comparatively higher wages.—The veins, five in number, lie parallel, are distant from each other about 120 fathoms, have been worked to the depth of from 60 to 136 fathoms, and measure from a few inches to 4 feet in thickness. Along with the lead ore or lead glance, are small quantities of manganese, ochre, blende, brown hemalite, copper pyrites, green lead ore, white lead ore, and lead-tri-oxide. The ores are sometimes irregular, and have mixtures of calcespar, lamellar heavy spar, and other substances. Drusy cavities have frequently coarse incrustations of quartz, carbonate of zinc, and cognate minerals.—A chapel with 250 sittings was built, in 1755, by the mining company, and cost not more than £70 or £80. A proposal exists to build a new chapel, and get it made a *quoad sacra* parish-church, on the expiry of the current lease. Stipend from £60 to £65, with a house and an acre of land. A considerable library exists for the use of the miners. The population, according to the Government census of 1831, was 675; and, according to an ecclesiastical survey of 1836, was 716,—of whom 678 were churchmen, 24 were dissenters, and 14 were non-descripts.

WARDLAW. See KIRKHILL, Inverness-shire.

WATERSAY. See WATERSAY.

WATLING-STREET, a celebrated Roman road or causeway, the central one of that people into Scotland, and coming up from Yorkshire to Carriden at the east end of Antoninus' Wall. After crossing the walls of Hadrian and of Severus, and passing the stations of Risingham and Roehester, it arrives through a rugged country, by way of the Golden Pots on Thirlmoor, at Chewgreen, the Roman post nearest to the borders. Approaching Scotland in a north-north-westerly direction, it first

touches it at Brownham-law, near the sources of Coquet-water: and, after having divided the kingdoms for  $1\frac{1}{2}$  mile, enters Scotland at Blackhall-hill, on the boundary between Oxnam and Hounam in Roxburghshire. From this point it runs 12 miles north-westward to the Teviot, near the mouth of the Jed; forming for a long way the boundary between Oxnam and Hounam; traversing small wings of Oxnam, Jedburgh, and Crailing,—passing some vestiges of a station, just before reaching the Teviot,—and crossing the Kail at Towford, the Oxnam, a little below Capelope, and the Jed, a little below Boonjed-ward. Near the points respectively of its passage beyond the Oxnam and beyond the Teviot, it seems to have ramified; sending off from the one point a branch northward into Roxburgh, and from the other point a branch deviatingly round the north side of Peniel-beugh. The main line, however, leads through the enclosures of Mount-Teviot, passes along the south side of Peniel-beugh; forms for  $3\frac{1}{2}$  miles the north-east boundary of Ancrum; passes over St. Boswell's-green, and crosses Bowden-burn above Newton, where its remains are very distinct; and thence moves forward to the eastern base of the Eildon-hills, and to the Tweed above Melrose and near Gattonside, amidst an unusually large aggregation of Roman and British camps and fortifications: see EILDON-HILLS and ROXBURGHSHIRE. After passing the Tweed, the road hends from its hitherto north-westerly to a northerly direction; proceeds up Melrose parish and the detached and projecting section of Lauder, on a line nearly parallel with the Leader, but inward from its vale; passes Roman stations at Chesterlee above Clackmae and at Walls, near new Blainslee; becomes very distinct throughout  $1\frac{1}{2}$  mile; and then about half-a-mile east-north-east of Chieldhelles chapel, enters Lauderdale. The road appears to have passed on the west side of Lauder town, and east of Old Lauder, where there are remains of a military station; and about  $1\frac{1}{2}$  mile onward it again becomes visible, takes for a brief way the name of the Ox-road, and leads up to a strong station, called Black Chester. From this post, it passes on by the west of Oxton, crosses the western headstream of the Leader, and leads on in a distinctly marked line to the Roman station at Channel-kirk; thence it proceeds forward to the far-seeing Soutra-hill, in the small projecting district of Haddingtonshire; and descending thence it turns to the left, pursues a north-westerly direction and traverses the parishes of Mid-Lothian onward to Currie, which stands in a bend of Gore-water about 6 miles south-west of Edinburgh, and is ascertained to be the Curia of Ptolemy. Between Soutra-hill and Currie, it crossed the South Esk near Dalhousie-castle, and the North Esk near Mavis-bank, where many Roman antiquities have been found; and thence it pursued its course by Loanhead and Straiton, which probably owe their names to its neighbourhood, to Bow-bridge, at the east end of the Pentland-hills. Beyond Currie, it proceeded to the naval station on the Forth at Cramond, the Alaterna of Roman times; and thence it crossed the Almond into Linlithgowshire, and passing Barnbough hill, went along Ecklin moor to Carriden.—The great western Roman road, or that which came up Annandale, crossed into Crawford, and went down the valley of the Clyde, is also in some localities called Watling-street. See DUMFRIES-SHIRE and LANARKSHIRE.

WATTEN, a parish in Caithness-shire; bounded on the north by Bower; on the east and south-east by Wick; on the south by Latheron; and on the west by Halkirk. It is not far from being a circle of about  $8\frac{1}{4}$  miles in diameter; and comprehends an area of about 60 square miles. Its surface is low

and undulating; some parts of it lying little more than 20 feet above sea-level, and none attaining an altitude which Scottish topography can call a hill. The soil, in the neighbourhood of the moors and mosses, is, for the most part, very light; but elsewhere is of excellent quality, and consists variously of argillaceous earth, a rich deep loam, and a stiff and friable clay. The arable grounds bear the proportion to waste and pasture-lands of only 11 to 67; and they probably could not, with the utmost geological skill yet known, be profitably doubled in extent. A large amount of the untilled lands is deep flow-moss, unfit for sheep-walk, and unsound for cattle. Coppices and plantations do not jointly cover more than 12 or 13 acres. Most of the quondam extensive commons have been enclosed. **TOFTIN-OALL-LOCH** [which see] lies in the south; and **Watten-loch** in the north. The latter is a large and fine sheet of water, extending 3 miles from west to east, with a breadth of from 3 to 10 furlongs; and it is stocked with eels and trouts, and frequented by sea-fowl and wild ducks. The river **Wick** is formed by confluent streams emitted by the two lakes, and then runs nearly 4 miles eastward to the boundary. The **Caitness flagstone** is the prevailing rock; and limestone and trap occur. The chief antiquities are Scandinavian towers or Picts' houses. The principal mansion is **Strath**, the seat of Major-general **Stewart**. The south road from **Wick** to **Thurso** cuts the parish into unequal parts. There is a post-office at the **Bridge-of-Watten**. Population, in 1801, 1,246; in 1831, 1,234. Houses 241. Assessed property, in 1815, £3,676.—**Watten** is in the presbytery of **Caitness**, and synod of **Sutherland** and **Caitness**. Patron, **Sir James Colquhoun, Bart.** Stipend £192 17s. 10d.; glebe £11. Unappropriated tithes, the amount not known. The church is very old, and both unworthy and incapable of repair. Sittings 700. The mission district of **Hallsory** comprehends the south-west part of **Watten**, with a population of between 250 and 300, and parts of **Reay** and **Halkirk**. The mission-chapel is situated in **Watten**, and was built about 35 years ago, at a cost of about £50. Sittings 350. Stipend from **Watten** £15. There is a catechist. Schoolmaster's salary £34, with £12 fees, and £3 13s. other emoluments. Four non-parochial schools have a joint attendance of about 220.

**WAUCHOPE (THE)**, a small river in **Dumfriesshire**, in the parish of **Langholm**, which, augmented by the **Laggan-burn**, after a course of some miles, falls into the **Esk** at **LANGHOLM**: which see.

**WEDALE**. See **Stow**.

**WEDDERBURN**. See **MURROES**.

**WEEM**, a singularly discovered and fragmentary parish in **Pertshire**, dispersed in separate and far-distant portions, over nearly a fourth of that great county from near the head of **Glenloch** on the west, to the vicinity of **Strathbrann** on the east, and from 3 miles south of **Loch-Tummel** on the north, to the vicinity of **Loch-Earn** on the south. It claims, at 22 miles' distance from its parish-church, the very nearest farm to the church of **Killin**; and it has other farms at a still greater distance, some of them upwards of 30 miles, both in **Glenloch** and **Glenlyon**. Its districts are eight in number, all mutually detached, all strangely intermixed with wings and detachments of **Logierait**, **Dull**, **Fortingal**, **Kenmore**, **Killin**, **Comrie**, and **Little Dunkeld**, and, in several instances, individually fantastic in outline, and of almost amorphous shape; so that any brief attempt at a topographical description of them either would be quite abortive, or would produce a miniature picture of nearly one-fourth of **Pertshire**. **Weem Proper**, or the district in which the church is situ-

ated, lies in **Strath-Tay**, along the left bank of the river, opposite the village of **Aberfeldy**; and, though of no great extent, partakes the high brilliance and the rich sylvan embellishment of that fine retreat of the beauties of landscape. **Murthly**, another district, commences half-a-mile to the east of the most easterly point, but on the right bank of the **Tay**, and stretches southward in a very narrow stripe of 5 miles long to the hill **Mealderg**, 3 miles north of **Loch-Freuchie**. **Sticks**, the third district, small and wooded, lies to the west of **Weem Proper**. **Acamore** or **Comrie**, the fourth district, measures  $3\frac{1}{2}$  miles by  $1\frac{1}{2}$ , extends lengthwise and southward from the north end of **Loch-Tay** to the boundary with **Comrie**, and partakes of the wooded and magnificent properties of the general landscape in the finest part of **Pertshire's** greatest lake. **Glenquoich**, the fifth district, lies in the glen whose name it bears, 9 or 10 miles south of **Weem Proper**. **Cranich**, the sixth district, stretches northward in an oblong of 3 miles by  $1\frac{1}{4}$  from about the middle of the north bank of **Loch-Tay**. **Glenlyon** and **Glenloch**, the remaining districts, lie in the glens whose names they assume, are the farthest removed from **Weem's** church, and possess a considerable extent of area, but are wildly upland, and, proportionately to their extent, have but few inhabitants. The great military road from **Crieff** to **Inverness** passes through **Weem Proper**, and is joined by several county roads at **Tay-bridge**, about half-a-mile from the church. **Castle-Menzies**, the seat of **Sir Niel Menzies, Bart.**, a handsome castellated edifice, stands in the vicinity of the church, surrounded with fine plantations, gardens, and orchards. Population, in 1801, 1,337; in 1831, 1,209. Houses 229. Assessed property, in 1815, £4,199.—When part of the presbytery of **Dunkeld** was, a few years ago, detached from the rest, and erected into a separate presbytery, **Weem**, on account probably of having detachments in all its parishes, was made its seat. This presbytery is in the synod of **Perth** and **Stirling**, and has six *quoad civilia* parishes, and four *quoad sacra* parishes. Patron, of **Weem** parish, **Sir Niel Menzies, Bart.** Stipend £149 15s. 8d.; glebe £11. The church was built in 1834. Sittings 561. **Glenlyon** district is annexed to the *quoad sacra* parish of **Glenlyon**, **Glenquoich** to the mission of **Amulree**, **Cranich** to that of **Lawers**, and **Glenloch** district is considered under the pastoral superintendence of the minister of **Killin**. **Weem**, **Murthly**, **Sticks**, and **Comrie**, are under the care of their own minister, and, in 1836, had jointly a population of 541. In 1834, the parish-school was attended by 33 scholars; and 4 private schools—3 of them not held during the summer months—were attended by 201. Parochial schoolmaster's salary £34 4s. 4½d., with £10 fees, and £3 5s. other emoluments.

**WEMYSS**,\* a parish in **Fifeshire**, on the shore of the **Forth**. Its extreme length, from south-west to north-east, is about  $5\frac{3}{4}$  miles; while its breadth varies from 1 to 2 miles. The beach is bold and rocky; beyond this the surface of the parish rises towards the north, and is in some places considerably elevated. The beauty of its appearance has, within the last 40 years, been greatly improved by planting, and particularly in the neighbourhood of **Wemyss-castle**, which is surrounded with extensive pleasure-grounds. On the south the parish is bounded by the **firth**; on the east by **Markinch** and **Scoonie**; on the north by **Kennoway** and **Markinch**; and on the west by **Dy-sart**. Population, in 1801, 3,264; in 1831, 5,001. Houses 653. Assessed property £6,805. The num-

\* The name of this parish is obviously derived from the Celtic *Uamh*: \* a Cave, an appropriate name enough, when the number of caves in the rocks on the shore here is considered.

ber of families, in 1831, was 1,089; of which there were engaged in agriculture 84; and in trade, manufactures, and handicraft, 806. There were at this time 187 individuals employed in coal-pits, and 152 in fishing. There are seven villages in the parish: 1. West Wemyss, a burgh-of-barony, under the management of two bailies, a treasurer, and several councillors, the population of which, in 1831, was 858;—2. East Wemyss, in which is the parish-church, population 753;—3. Buckhaven, a fishing-town, population, in 1831, 1,363;—4. Methill, having a population of 509; and which is said to have been created into a burgh-of-barony, by the Bishop of St. Andrew's in 1662;—5. Kirkland, where there are extensive spinning-mills, population 509;—6. West-Coaltown, inhabited by colliers, population 332;—and 7. East-Coaltown, also inhabited by colliers, population 124. The population of the country part of the parish, in 1831, was 455. The sole proprietor of the parish is Captain James Erskine Wemyss of Wemyss, R. N. and M. P. for the county, the representative of the oldest family existing in the county.\* The present proprietor is the 25th proprietor of the estate of Wemyss, in direct descent from Hugo, the son of Gillimichael, 4th Earl of Fife; and, therefore, the 29th generation from Macduff, the great Maormor of Fife. A short way east of the village of West Wemyss is Wemyss-castle, the residence of the family. It is a large and magnificent building; part of it is of considerable antiquity. It is situated on the top of the rocks, about 40 feet above the level of the sea, and while it commands an extensive view of the frith of Forth, is itself an object of interest to those passing up or down the river, and an addition to the beauty of the landscape. In July, 1650, Wemyss-castle was visited by Charles II., who spent a day in it; and on the 13th of July, 1657, he again paid a visit, and slept a night at the castle. Among other reliques of the olden time preserved in the castle of Wemyss, is a silver bowl presented to Sir Michael Wemyss of Wemyss by Eric, King of Norway, in 1290, when he and Sir Michael Scott of Balwearie went to bring home the Princess Margaret on the death of Alexander III.—The parish of Wemyss is in the presbytery of Kirkealdy, and synod of Fife. Patrons, the town-council of Edinburgh. Stipend £253 11s. 3d.; glebe £25. Unappropriated teinds £1,066 2s. 9d. Church sittings 853. There is an extension chapel at METHILL [which see], and a United Secession congregation at BUCKHAVEN: which see.—The schoolmaster has the maximum salary, with about £25 school-fees, and about £20 other emoluments. There are six non-parochial schools.

WESTER (THE), a rivulet rising in the parish of Bower, and entering the sea at the head of Keissbay, in Caithness-shire. It has an easterly course of 6 miles in Bower; and a south-south-easterly course of 4 miles partly on the boundary, but chiefly through the interior, of Wick. About  $\frac{1}{3}$  mile above

\* Of the origin of this family there are more accounts than one; but all agree as to their being derived from the family of Macduff, Maormor of Fife, in the reign of Malcolm Canmore. The family of Wemyss, therefore, is one of the very few Lowland families which, through the male line, can claim kindred with Celtic blood. The lands now forming the parish of Wemyss are said to have been part of the estate of Macduff, Shakespeare's well-known Thane of Fife, during the reign of Malcolm Canmore. According to Sibbald, Gillimichael, the 3d in descent from Macduff, had a second son named Hugo, who obtained the lands from his father, with lands in Loch-oreshire, and in the parish of Kennoway, with the patronage of the church of Markinch. He is mentioned in the chartulary of Dunfermline, as Hugo, the son of Gillimichael, during the reign of Malcolm IV. According to a manuscript account of the family, in the possession of the Earl of Wemyss, the first of his family is said to have been Michael Wemyss, second son of Ducean, 5th Earl of Fife, who died in 1165; but Sibbald's account seems sanctioned by ancient charters.

its embouchure, it expands into Loeh-Wester. The trouts of this stream are remarkable for their size and favour. They have been caught above 20 lbs. in weight.

WESTERKIRK, a parish in Eskdale, Dumfriesshire; bounded on the west and north by Eskdalemuir; on the north-east by Roxburghshire; on the east by Eves; and on the south by Langholm, Tun-dergarth, and Hutton and Corrie. Its greatest length from north to south is 10 miles; its greatest breadth is  $6\frac{1}{2}$  miles; and its superficial extent is 27,307 Scottish acres. The Esk, just after being formed by the confluence of the Black Esk and the White Esk, has a beautifully sinuous and a long course through the southern district. The Meggat and the Stennis, aided by a few independent brooks, drain the northern district to the Esk: see MEGGAT and STENNIS. All the boundary-lines, except at two gorges, or deep, large, natural cuts, where the Esk enters and where it departs, are the watersheds of mountainous or hilly ranges. The line along the north-east is the summit-ridge of the Southern Highlands, and the line of division between the waters of the eastern and of the western seas. The whole surface, except a narrow belt of valley-ground along the Esk, is upland; and a large part of it is toweringly mountainous. The heights are in a few instances heathy; but, in general, they are verdant, soft in outline, and finely pastoral. About 200 acres are wooded; about 1,600 are tilled or productive of meadow-grass; and all the remainder, amounting to nearly 16-17ths of the whole, are grazing-ground and sheep-walk. The soil on the low grounds along the Esk is a light and very fertile loam; on the rising ground is a deep strong loam, interspersed with stones; and, on the tops of many of the hills, degenerates into moss. A pit of excellent shell-marl exists on the farm of Megdale, the property of the Duke of Buccleuch, "but is little used," says the Old Statistical Account, "because it cannot be got for money, but must be asked as a favour;" and says the New Account, because "the pit is not of easy access, being situated on the declivity of a hill." An antimony-mine in the parish is noticed in the article JAMES-TOWN: which see. The streams and the mountains possess great attractions for the sportsman. Westerhall, the family-mansion of the Johnstones of Westerhall, is romantically imbosomed in woods, and overhung by steep high hills on the left bank of the Esk,  $4\frac{1}{2}$  miles north-west of Langholm. Dowglen, the seat of Sir Pulteney Malcolm, is a mile farther down the vale. The parish-church stands a mile above Westerhall. In the churchyard is the family-vault of the Johnstones, a circular colonnade of fluted Doric pillars, surmounted by a beautifully carved frieze and an elegant dome.—Thomas Telford, Esq., the celebrated engineer, and the well-known constructor of Menai-bridge, the Caledonian canal, and many other great public works, was a native of Westerkirk, and commenced active life in it as a common mason. Sir John Malcolm, known jointly as an officer, a statesman, and an author, was also a native, and has recently had a monument erected to his memory on Langholm-hill.—The antiquities are vestiges of old towers at Westerhall and Glendinning; vestiges of hill-top camps, supposed to have been outposts of the Roman station of Castle-O'er in Eskdalemuir; traces along the vale of the Esk of a supposed chain of communication between Castle-O'er and Netherby; a triangular and seemingly very ancient fortification on the farm of Enzieholm; and remains of a Druidical circle on the peninsula of the Esk and the Meggat. The road from Langholm to Ettrick and Selkirk passes up the vale of the Esk. Population, in 1801, 638; in 1831, 642. Houses 117. Assessed

property, in 1815, £5,789.—Westerkirk is in the presbytery of Langholm, and synod of Dumfries. Patron, the Duke of Buccleuch. Stipend £153 4s. 7d.; glebe £20. Unappropriated tithes £485 8s. 5d. Schoolmaster's salary £34 4s. 4½d., with £10 fees, and £7 other emoluments.—The church and half of the barony of Westerkirk were given, in 1321, by Robert I., to the monks of Melrose; and the church thence, till the Reformation, was a vicarage. A chapel subordinate to the church, and dedicated to St. Martin, stood at Boykin, and was, in 1391, endowed with some lands by Adam de Glendonnyng or Glendinning of Hawick. Another chapel subordinate to the church stood at Carrick, now in Eskdalemuir. In 1703 the district, which now forms Eskdalemuir, and which hitherto had belonged to Westerkirk, was erected into a separate parish; and, in the same year, part of Staplegorton was annexed to Westerkirk, the other part being annexed to Langholm.

WESTER-LENZIE, the ancient name of Kirk-infilloch.

WESTERN ISLANDS. See HEBRIDES.

WESTMOINE. See DURNES, MOINE, and TONGUE.

WEST-PANS, a village in the north-east corner, and on the coast of the parish of Inveresk, Edinburghshire. It is 1¼ mile east-north-east of Musselburgh, 1½ mile south-west of Prestonpans, and 2½ miles west of Tranent. Its name alludes to the position of salt-pans relative to those of Prestonpans. Its inhabitants are principally colliers. Population 300.

WESTQUARTER. See GLASSFORD.

WESTRAY, an island at the north-west extremity of the Orkney group. It lies 9½ miles north-north-east of Costa-head, the nearest point of Pomona; and 4½ and 6½ miles north of two headlands in Rousay, from which it is separated by the Westray frith. Within distances of from half-a-mile to 2½ miles from its east and south-east coasts lie Papa-Westray, Eday, Faray, and Farayholm. Its extreme length, from north-north-west to south-south-east, is 9 miles; and its extreme breadth is 4 miles. But it consists of a main body of about 3½ miles mean measurement each way; and two arms or peninsulæ which have a mean breadth of only about a mile. The only safe harbour is that of Pierowall, on the east coast, at the commencement of the northern peninsula, and nearly opposite the south end of Papa-Westray. The chief headlands are Noup-head on the north-west, Ackerness on the north, Sponess on the east, Weatherness on the south-east, Rapness on the south, and Skea on the south-west. The coast is, in general, rocky; and, over part of the west, consists of magnificent precipices, sprinkled and feathered with vast flocks of sea-fowl. A ridge of considerably high bills, called Pitty and Gallo, extends along the west of the broader part of the island; and two heights, respectively in the east and in the southern peninsula; but the rest of the surface is pretty level. The soil of the arable lands, which probably do not amount to quite one-sixth of the area, is variably pure sand, a mixture of sand and clay, a black mossy-mould, a rich loamy black mould, and a mixture of black mould and sand. At the head of the bay or harbour of Pierowall, is a cognominal village with an inn. On an eminence in the vicinity stands the castle of Nothland, a stately Gothic ruin. The edifice was, in one part, never finished; it is traditionally said to have been built as a place of retreat for Mary of Scotland and the Earl of Bothwell, but probably was built much earlier; and, after the queen's detronement, it passed, with some adjoining lands, to a gentleman of the

name of Balfour, and was sculptured with the Balfour arms. In a small cavern, called the Gentleman's cave, in the bluff rocky coast of Rapness, several Orkney Jacobites lay concealed for several months in 1745; they were eagerly but vainly searched for throughout Orkney by a party of royal troops; and, while in the cave, they depended for their daily food upon the precarious means of a single person's stealthy visits to their retreat. Their houses were destroyed by the baffled military; but afterwards, when the excitement occasioned by the rebellion passed away, these were replaced, at the expense of Government, by others of better structure. In several places along the shores are graves or tombs of a very ancient date; and in one place is a high monumental stone. The principal mansion is Brough; and the principal proprietors are Mr. Stewart of Brough, Captain Balfour of Elwick, and Mr. Traill of Holland. Population, in 1811, 1,396; in 1831, 1,795.

WESTRAY AND PAPA-WESTRAY, an united parish in the north-west of Orkney. It comprehends the parish and island of Papa-Westray, and North and East or Mary and Lady parishes, which divide between them the island of Westray. Population, in 1801, 1,624; in 1831, 2,032. Houses 392. Assessed property, in 1815, £1,160.—This parish is in the presbytery of North Isles, and synod of Orkney. Patron, the Earl of Zetland. Stipend £208 6s. 8d.; glebe £15. Unappropriated tithes £86 7s. 5d. The East parish-church was built about 70 or 75 years ago; and the churches of the other two parishes are of unknown date of erection. Sittings in the North church, 431; in the East church, 309; in Papa-Westray church, 169. The minister officiates in the churches in regular rotation.—An United Secession congregation was established in the parish in 1821; and their place of worship was built in 1823. Sittings 440. Stipend £85, with a house and glebe jointly worth £10.—A Scottish Baptist congregation was established at Rackwick in 1805; and their place of worship was built in 1806 or 1807. Sittings between 400 and 500. Stipend £9 or £10, with an allowance from the Baptist Home Missionary society.—In 1834, there were 10 schools, attended by upwards of 300 scholars. Parochial schoolmaster's salary £28, with between £2 and £3 fees.—In 1836, the population of the North parish was 802, of the East parish 905, of Papa-Westray 335,—in all, 2,042; of whom 940 were churchmen, 670 were dissenters, and 432 were non-descrip.

WESTRUTHER, a parish lying debateably between Lauderdale and Lammermoor, Berwickshire. It is bounded on the north by Cranshaw; on the east by Longformacus and Greenlaw; on the south by Gordon and Legerwood; and on the west by Legerwood and Lauder. Its length, from north to south, is 6 miles; its breadth varies from 3 to 5½ miles; and its superficial extent is about 22½ square miles. The northern district, comprising between a third and a half of the whole area, comes slowly down from an elevation of about 1,260 feet above sea-level, and is a lumpy and rolling mass of bleak, barren, cheerless upland, but commands brilliant and far-stretching prospects of Merse and Teviotdale. The southern district consists of a broad vale, along the base of the uplands, a narrower vale along the southern border, and an intermediate ridgy swell; and has a well-cultivated, pleasant, and warm appearance. Between 800 and 900 acres are wooded; and about 11,000 are either regularly or occasionally under the plough. The streams which drain the parish are chiefly three, which run on the boundaries,—one of them a head-stream of the Blackadder, and the other two confluent tributaries of the Leader. The mansion of Spottiswoode, situated on

the west, and the seat of the principal landowner, Spottiswoode of that ilk, is partly a splendid new house, quite recently finished, and built in the old English style, with an encincturing and architecturally ornamented terrace, and partly the old family-residence repaired, altered, and worked into proximate harmony of character with the new edifice. Bassendeau-house in the south, and the seat of Colonel Home, is a neatly modernized plain old building, in the midst of tastefully embellished grounds. Wedderlie, once a seat, but now a mere shooting-box, belonging to Lord Blantyre, stands at the base of the uplands, and is an ancient structure crumbling into utter disrepair.—The village of Westruther stands in the centre of the parish, 7 miles east of Lauder, and about the same distance west-north-west of Greenlaw. It is a place of high antiquity, yet has a population of only about 170, almost all connected with agriculture. Here are a library and a savings' bank. **HOUNSLOW** [which see] stands  $1\frac{1}{2}$  mile to the south. A third village, Wedderlie, which figured in the Old Statistical Account, has disappeared.—On Twinlaw, one of the summits of the uplands, are two huge piles of stones, conspicuous at a great distance, well-known over the circumjacent country as the Twinlaw-Cairns, and said to be commemorative generally of a great though unrecorded national fight for Scottish independence, and specially of twin-brothers of the name of Edgar, who led the opposite hosts, and, ignorant of their mutual relationship, fought out a stiff contest between their armies by a personal and single combat. Of various peel-houses or horder fortalices which once bristled athwart the surface, the only surviving one, even in ruin, is at Evelau,  $1\frac{1}{2}$  mile north-east of Wedderlie.—The turnpikes respectively from Kelso, from Greenlaw, and from Dunse to Edinburgh, all traverse the parish toward Lauder, and converge at Whithorn just before crossing the western frontier. Population, in 1801, 779; in 1831, 830. Houses 151. Assessed property, in 1815, £4,683.—Westruther is in the presbytery of Lauder, and synod of Merse and Teviotdale. Patron, the Crown. Stipend £158 6s. 8d.; glebe £25, with £2 10s. in commutation of right to turf for fuel. The church was built in 1649, and last repaired in 1807. Sittings 277. In 1836, the minister computed the whole population to be churchmen except 58. Schoolmaster's salary £25 13s. 3d., with £10 fees, and £10 other emoluments. Two non-parochial schools are supported by private subscription. The parish of Westruther was formed in the 17th century by uniting to the parish of Bassendeau the lands of Westruther and the ancient territory of Spottiswoode, which had belonged to the parish of Gordon: See **BASSEDEAN**. A new church being, soon after the annexation, built at the village of Westruther, that site, more central than the old church of Bassendeau, gave its obscure name to the enlarged parish. The word Strother or Struther frequently appears in the topographical nomenclature of the south and east of Scotland, but not in that of England; and it sufficiently indicates its import by uniformity of application to swamps and marshes. An extensive swamp, in the bosom of which stood the village, was early denominated West-Strother, in contradistinction to a large marsh at some distance to the east, now called Dogden-moss. Two ancient chapels stood at Wedderlie and Spottiswoode: See **GORDON**. John Spottiswoode, the superintendent of Lothian and Merse, in the early period of Presbyterianism,—the well-known Archbishop Spottiswoode, who crowned Charles I. at Holyrood, and afterwards became Lord-high-chancellor of Scotland, —Sir Robert Spottiswoode, the archbishop's son, and eventually Lord-president of the Court-of-Ses-

sion and Secretary of State,—and John Spottiswoode the first law professor in Edinburgh University, and the author of several works on jurisprudence,—were all members of the Spottiswoode family of Westruther. George Home of Bassendeau, another native of the parish, suffered much for zealous attachment to the cause of religious and civil liberty during the persecuting reigns of the later Stuarts; and he fled to Holland, and was one of the little band of eleven, who, in 1685, concocted at Amsterdam the scheme of the Revolution. John Veitch, the brother of the celebrated Veitch, whose life was written by M'Crie, and himself a preacher of great eminence, was a landowner in Westruther, and its first Presbyterian minister.

**WEST-WATER**. See **ESK (NORTH)**, Forfarshire.

**WHALSAY**, an island in Shetland, belonging to the parish of **NESTING**: which see. Its length from north-east to south-west is about 5 miles; and its breadth is from a few furlongs to about 2 miles. The coast is rocky, and has numerous alternations of creek and headland. The surface is unequal, but has a tolerably fertile soil, and exhibits a dressedness of appearance, and a maturity of cultural embellishment, which are rarely equalled in either Shetland, Orcadian, or Hebridean islands. The mansion of the proprietor is a modern, large, elegant edifice, built of imported sandstone. Mariners observe that, on approaching this island, the compass becomes unsteady, indicating a magnetic influence in the rocks.

**WHINNION (LOCH)**, a small but fine lake on the boundary between Twynholm and Girthon, Kirkcudbrightshire. Its superfluous waters form Glen-gap-hurn, the chief head-stream of the Tarf. The lake abounds in delicious yellow trout.

**WHITADDER (THE)**, a river whose sources are in East Lothian, and most of whose course is in Berwickshire. It rises near the middle of the hilly parish of Whittingham, close on the water-shed or summit-range of the broad-based Lammermoors; and has a course of nearly 7 miles, chiefly south-south-eastward, and partly eastward to St. Agnes, where it receives Bothwell-water on its left bank, and enters Berwickshire. During this brief connection with Haddingtonshire, it is a cold, moorland streamlet, and flows partly along Whittingham, and partly between that parish and Berwickshire on its right bank, and detached sections of Stenton and Spott on its left. After entering Berwickshire it achieves a distance of 12 miles in 5 hold sweeps in very various and even opposite directions; and it then runs prevailing eastward, over a distance of about 15 miles, to the Tweed at a point  $2\frac{1}{2}$  miles above Berwick. Its principal tributaries are Dye-water, which enters it on the right side near the middle of Longformacus, and the Blackadder, which enters it at the village of Allanton in Edrom. Its entire length of course is about 34 miles. From the point of its debouching into the Merse, or over about four-fifths of its run, in Berwickshire, it is a stream of much gentle beauty. It traverses a country which is cultivated like a garden; it is overlooked and highly adorned at frequent intervals by fine mansions and demesnes; it runs almost constantly in the curving, the ever-waving, and sinuous line of beauty; it very generally has a deeply excavated path through earth or soft rock, so as to form a lowland dell, a gigantic and sometimes precipitous furrow, tufted up the sides with wood; and, though prevailing destitute of decided picturesqueness or romance, it has a fair gross amount of landscape. It descends from source to embouchure about 1,100 feet; and as it achieves little of its fall in races and none in leaps, it is nearly throughout a rapid stream, brisk and

cheery in its movement. Like most of the streams which descend from either side of the Lammermoors, it is subject to sudden freshets; and it rises in ordinary maximum about 9 feet above its usual level, and, in extraordinary or rare floods, so high as 15 feet. It is an excellent trout-stream.

**WHITEBURN**, or **WHITBURN**, a parish occupying the south-west corner of Linlithgowshire. It is bounded on the north by Lanarkshire and Bathgate; on the east by Livingstone; on the south by the south-west projection of Edinburghshire; and on the west by Lanarkshire. Its greatest length from east to west is  $6\frac{1}{2}$  miles; its greatest breadth is a little upwards of 4 miles; its mean breadth is nearly 3 miles; and its superficial extent is about 18 square miles. From the west end, where the parish is broadest, and nearly along the middle, extends  $2\frac{1}{2}$  miles in length, and in some places upwards of a mile in breadth, a high ridge of very deep barren moss. The surface elsewhere is proximately level, and has been worked into a fine state of cultivation, and sheltered by enclosures and a due proportion of woods. The soil is in general a clayey loam; and, in some parts, it has a mixture of moss, and lies on a strong clay or till bottom. A valuable bed of coal exists in the moorish or upland district. The low grounds are chiefly in tillage; and have, in almost every form, cultivated pastures for the grazing of a few black cattle. Almond Water drains the parish along the whole of the north, partly in the interior and partly on the boundary; and Briech Water, afterwards a tributary of the Almond, traces all the boundary-line along the south. The chief mansions are Polkemmet, Culthouse, Berryhill, and Mossball on the north; and Burnhead, Crofthead, Craighead, and Fauldhouse on the south. The principal roads are that from Edinburgh to Glasgow by way of Mid-Calder westward, that from Edinburgh to Hamilton west-westward, and that from Linlithgow to Wilsontown southward. On the last of these roads, a little south of the centre of the parish, and  $1\frac{1}{2}$  mile south of the village of Whiteburn, stands the small village of Longridge. It is the site of an Original Burgher meeting-house, and has in its vicinity a quarry. On the Edinburgh and Glasgow road, a mile east of Whiteburn, stands the small village of East Whiteburn. At the intersection of the Edinburgh and Glasgow, and the Linlithgow and Wilsontown roads, stands Whiteburn itself, 21 miles west-south-west of Edinburgh, and 23 east of Glasgow. It is regularly built, and is inhabited principally by cotton-weavers, in the employment of the manufacturers of Glasgow. In 1828, it had 150 looms for cotton fabrics; and, in 1838, it had 218,—all plain. Here are the parish-church, a meeting-house of the United Secession, a meeting-house of the Original Seceders, a handsome school-house built by the trustees of Mr. Wilson, and two public libraries. Its population includes probably the larger moiety of that of the parish. Population of the parish, in 1801, 1,537; in 1831, 2,075. Houses 373. Assessed property, in 1815, £4,804.—Whiteburn is in the presbytery of Linlithgow, and synod of Lothian and Tweeddale. Patron, Sir William Baillie of Polkemmet, Bart. Stipend £203 6s. 11d.; glebe £3 10s. The stipend is burdened with payment to the minister of Livingstone of 7 holls, 2 firlots, 3 pecks, 1 lippy of meal, 2 holls, 1 firlot of hear, and £8 10s. 4d. The parish is the most modern in Linlithgowshire, and was disjoined from Livingstone in 1730. Parish schoolmaster's salary £34 4s. 4½d., with £18 fees, and about £4 other emoluments. There are 4 non-parochial schools.

**WHITE-COOM (THE)**, a very lofty mountain in Ettrick, sometimes called the Coom of Polmoody,

and considered by some to exceed Hartfell in altitude. The friths of Forth, Solway, and Clyde, are all visible from its summit, and the range of the Grampians from Benlomond to Benvoirllich.

**WHITEHILLS**, a fishing-village in the parish of Boindie, Banffshire. It encircles a creek or small bay, half-a-mile south-west of Knock-head,  $2\frac{1}{2}$  miles west-north-west of Banff, and  $4\frac{1}{4}$  miles east of Portsoy. Population about 580.

**WHITEKIRK AND TYNNINGHAME**, an united parish on the coast of Haddingtonshire. It is bounded on the north by North-Berwick; on the east by the German ocean; on the south by the estuary of the Tyne and by Dunbar; and on the west by Prestonkirk. Its greatest length from north to south is  $5\frac{1}{2}$  miles; its greatest breadth is  $4\frac{1}{2}$  miles; and its superficial extent is about 6,000 imperial acres. Whitekirk-hill, on the northern border, and Lawhead, 2 miles to the south, are the highest ground; and, though possessing an altitude of less than 250 feet above sea-level, they command a thrilling prospect of the frith of Forth and the coast of Fife, of the German ocean, and of the brilliant Lothians, stretching away in a sheet of beauty,—the Bass, North-Berwick-Law, Tantallan-castle, Dunbar-castle, Traprain-Law, and the Garleton-hills appearing as distinctive and prominent objects in the picture. A belt of flat rich haugh extends south of Lawhead from nearly the western boundary to the sea. The rest of the surface either ascends slowly to the two little master-heights, or is otherwise so diversified as to possess all the lusciousness without any of the monotony of a luxuriant plain. The whole area, as seen immediately under the eye from Lawhead, is a landscape singularly opulent in the beauties of cultivation, yet uniform in nothing but extreme luxuriance, and profusely clad in far-flaunting robes of rich plantation. About 300 acres at the mouth of the Tyne are sandy marsh; nearly 2,000 are under wood and in artificial pasture; and about 4,000 are regularly cropped according to the highly productive system so well understood in East Lothian. The soil varies in different parts of the parish; but, in general, consists of such rich gravelly loams as are highly favourable to the most approved mode of agriculture. The Tyne and the eastern Peffer-burn run north-eastward across the parish to the sea, the former along the belt of haugh in the southern district, and the latter midway between Lawhead and Whitekirk-hill. Whiteberry-Point, a small promontory or headland, projects  $\frac{1}{2}$  of a mile beyond the coast-line at the northern entrance of the estuary of the Tyne. Ravensheugh-craig rises abruptly from the beach, but without forming a promontory,  $\frac{2}{3}$  of a mile to the north-west. These two rocky lumpish protrusions consist of greenstone, trap-tufa, and red sandstone; and form the only exceptions to an uniform stretch of low and sandy coast between the southern frontier and the mouth of the Peffer. A rocky and bluff coast commences a little north of the Peffer, and extends to the northern boundary, a distance of 2 miles, increasing in ruggedness and precipitousness as it proceeds, and rising in some places sheer up 100 feet from the sea. The cliffs of this coast-line, and the ledges which project from their bases into the sea, consist chiefly of red and green slaty clays, red sandstone, clay-ironstone, and trap-tufa; and they are noted among seamen for their menaces to navigation, and the number of wrecks which they have occasioned.—Seacliff-house, surmounting the crags, and situated a little north of the ruin of Old Scougal, is the seat of George Sligo, Esq., the proprietor of Aldham, and commands singularly fine sea-views.—Newhyth, or Whitekirk-house, the seat of Sir David Baird, Bart.,

the proprietor of the Whitekirk district of the united parish, stands on Peffer-burn, near the western boundary, surrounded by expanses and varied arrangements of beautiful wood.—Tynninghame-house, the seat of the Earl of Haddington, the proprietor of the Tynninghame district, is noticed in the article **TYNNINGHAME**: which see.—The parish is traversed across an extreme south wing by the Edinburgh and London east mail-road, and along the centre by the turnpike between Dunbar and North-Berwick. Population, in 1801, 925; in 1831, 1,109. Houses 217. Assessed property, in 1815, £11,426.—This parish is in the presbytery of Dunbar, and synod of Lothian and Tweeddale. Patron, the Crown and the Earl of Haddington. Stipend £306 11s. 2d.; glebe £30. Unappropriated teinds £850 10s. 8d. There are two parochial schools. Salary of the Whitekirk master £34 4s. 4½d., with £27 fees, and £6 other emoluments; of the Tynninghame master £34 4s. 4½d., with £32 fees, and £1 7s. 9d. other emoluments.—The present parish comprehends the ancient parishes of Tynninghame, Aldham, and Hamer, or Whitekirk. **TYNNINGHAME** is separately noticed. Aldham—popularly but corruptedly Adam—lay on the north, and included the lands of Aldham and of Scougal. Some desolated vestiges of this hamlet are still traceable on the coast, a short distance east of Tantallan-castle. The original church was probably founded by St. Baldred, and, in consequence, dated back to the 6th century; and the last church in use was demolished in 1770, yet may still be partially traced in the out-houses of a farm-yard adjacent to the vestiges of the hamlet. At Scougal, about a mile to the south-east, and overlooking the sea, anciently stood a chapel, whose ruins are still extant.—Whitekirk had its ancient name of Hamer, or the greater ham, from contradistinction to Ald-ham; and its modern name of Whitekirk, from the whiteness of its church. The parish forms the central part of the united district, and, of course, lay between Aldham and Tynninghame. The church was dedicated to the Virgin Mary; and, from the 12th century till the Reformation, belonged to the monks of Holyrood. It early became a resort of pilgrims, a place of reputed supereminent sanctity, a means of entralling devotees and enriching monks. Under pretext of a pilgrimage to it, with the alleged purpose of performing a vow for the safety of her son, the dowager-queen of James I. outwitted Chancellor Crichton, and carried off James II. in a chest to Stirling. In 1356, when Edward III. invaded East Lothian, some sailors of his fleet entered the church and despoiled the idol-image of the Virgin Mary of its ornaments. Though the canons of Holyrood who resided on the spot, and probably occupied a large house situated behind the church, and now used as a granary, were unable to prevent, or practically stigmatize, the outrage on their idol, they were, in their own style and that of their dark age, entirely indemnified by Fordun's coolly relating that the Virgin herself raised such a storm as made the sailors deeply regret their having offended her by their spoliation.—During the 17th century the parish of Whitekirk had annexed to it the little parish of Aldham; and, in 1761, this united parish was augmented by the annexation of Tynninghame. The united parish-church is a handsome Gothic structure.

**WHITELETS**, a thriving village in the parish of St. Quivox, 1½ mile north-east of Ayr. It stands at the point where a hitherto common or joint road from Ayr, splits into branches toward respectively Mauchline and Galston. The inhabitants are principally colliers. A railway for the conveyance of

coal connects the village with the harbour of Newton-upon-Ayr.

**WHITENESS**, a parish in Orkney united to **TINGWALL**: which see.

**WHITENHEAD**, a headland, a little east of the entrance of Loch-Eriboll, on the north coast of Sutherlandshire. A doubt exists whether it is in Tongue or in Durness, or on the boundary between them. Its vicinity displays some remarkable caves. See **TONGUE**.

**WHITHORN**, a parish in the district of Machers, Wigtonshire. It is bounded on the north by Sorbie; on the east by Sorbie and the sea; on the south by the sea; and on the west by Glasserton. Its greatest length from north to south is 8 miles; its greatest breadth is 4; its mean breadth is only about 2; and its superficial extent is about 10,000 imperial acres. In the extreme south is Burrowhead, the slowly rounded headland which separates the two gulfs or bays of Luce and Wigton, and the most southerly ground of the district of Machers. The coast of the headland and its vicinity is rocky and precipitous, occasionally perforated with deep caves, and generally rising to a height of 200 feet. The coast-line extends from Burrowhead on the west or south-west only 1½ mile, and is there an almost straight line of cliff, but a degree less bold than at the extremity; but, on the east side of the parish, it extends 5¼ miles, is still, though mitigatedly, rugged and hold, runs out into the little promontories of Port-Yarrock-head and Stun-head, and admits the little bays of Isle of Whithorn, Port-Allan, and Port-Yarrock: see **ISLE OF WHITHORN** and **PORT-ALLAN**. From Port-Yarrock round Burrowhead the tide flows close along the shore 3 hours and ebb 9. Three streamlets have sufficient water-power to drive each a corn-mill a little before passing into the sea. The surface of the parish has the broken, knolly, tumulated appearance which characterizes so much of Wigtonshire,—an expanse of hillocks and little hollows, scratched and freckled with protruding rock, and extensively scurried with such briars and other coarse brushwood as form a miserable apology for the general absence of wood. Forest stretches out to some extent round the mansion of Castlewigg, and a few groups and files of trees elsewhere look up from the surface; but they are far from relieving the parish of an irksome and comparatively naked aspect. Yet much of the ground which at a small distance seems barren or moorish, is carpeted with fertile soil, and produces excellent herbage or crops of grain. Excepting the summits and occasionally the sides of a considerable number of the knolls, and excepting the planted acres and a small aggregate extent of little hogs, the whole area is in tillage. Some of the hogs produce turf-fuel, and others contain beds of shell-marl. Near Burrowhead are found what the Old Statistical Account calls "very fine variegated marble and strong slate." Copper has been found in some large pieces, and in a small disturbed vein; but has never been searched for to an extent which could justify an opinion as to the probable results of regularly mining it. The prevailing rocks are transition or silurian. Castlewigg, the seat of Hugh Hathorn, Esq., situated 2 miles north-west of the burgh, is a venerable old castle, vividly picturing by association the state and hospitality of the old Scottish barons, and looking down to Wigton-hay, and over a low though tumulated country, extensive enough to give the best effect to an imposing chain of mountains, which are adorned by woods running along their base, and washed by the river Cree. Tonderghie-house, the seat of Hugh D. Stewart, Esq., situated in the ex-

trema south-west, is a handsome modern mansion, commanding a splendid marine view, screened in the far distance by the coast of England and the Isle of Man. An ancient fortification, called Carghidoun, and enclosing about half an acre, crowns a precipice on the coast of the estate of Tonderghie; another, called Castle Feather, and enclosing nearly an acre, crowns another precipice some distance to the south-east; a third, less traceable, but seemingly about the extent of the second, occurs on a cliff still farther south-east; and a fourth, whose vestiges lie dispersed over three crowns, surmounts the bold brow of Burrowhead. All these look out to the Isle of Man, and probably were erected to defend the country from the descents of the Scandinavians during the sea-roving period of their possessing that island. Remains of a Roman camp exist about  $\frac{3}{4}$  of a mile west of the burgh; and though greatly defaced, are distinct enough to leave no doubt of its having been Roman, and a castra statira. The only village, as well as the only noticeable port, is ISLE-OF-WHITHORN. Though the burgh is what a colloquial phrase calls "a one-eyed town," it sends out sufficient radiations of road to the limited territory of the parish, and to places at a distance. Population, in 1801, 1,904; in 1831, 2,415. Houses 418. Population, in 1841, 2,719. Assessed property, in 1815, £11,698.—Whithorn is in the presbytery of Wigton, and synod of Galloway. Patron, the Crown. Stipend £246 15s. 9d.; glebe £15. Unappropriated tithes £47 16s. 3d. The parish-church, a neat and commodious structure, was built in 1822. In the parish, and situated in the burgh, are three places of worship belonging respectively to United Seceders, to Reformed Presbyterians, and to Roman Catholics. In 1834, two parochial schools were attended by 122 scholars; and seven private schools by 210. The ancient church belonged to the prior and canons of Whithorn, and was served by a vicar pensioner. In 1606, it was granted to the bishops of Galloway, with the other property of the priory; in 1641, it was transferred to the university of Glasgow; in 1661, it was restored to the bishops of Galloway; and, at the abolition of Episcopacy in 1689, it was vested in the Crown. Besides the ancient chapel noticed in the article ISLE-OF-WHITHORN, one called Octoun Chapel, stood on lands of Octoun, now corrupted into Aughton, and has bequeathed to its site  $1\frac{1}{2}$  mile north of the burgh the name of Chapel-Aughton.

WHITHORN, a royal burgh situated near the centre of the parish to which it gives name, stands 11 miles south of Wigton, 18 south of Newton-Stewart, 32 east-south-east of Stranraer, 40 east by south of Portpatrick, 97 $\frac{1}{2}$  south of Glasgow, and 115 $\frac{3}{4}$  south-south-west of Edinburgh. It consists of a principal street,  $\frac{3}{4}$  of a mile in length, and extending north and south; a cross or transverse street, near the middle, of about 400 yards in length; a divergent street, at the south end, of about 200 yards in length; and one or two very brief and unimportant alleys. The principal street makes two considerable bends from the straight line; is very narrow for upwards of 300 yards at the north end; is split for a brief way into two thoroughfares toward the south end, and possesses needless and vacant spaciousness over several hundred yards toward the middle. The houses are slated, and, according to the notions which prevailed at the dates of their erection, were originally commodious; but they entirely want regularity of plan, and aggregate suggest—what accords with fact—the idea of an altogether stagnant and probably decaying ancient town. A beautiful little stream of water, spanned at the place by a good bridge, runs across the main street, and cuts it into nearly equal

parts. On the west side of the main street, a little south of the cross street, stand the town-house and jail, adorned with a spire and turrets, and provided with a set of bells. In the churchyard, on a rising ground at the west end of the cross street, are some remains of the priory of Whithorn, afterwards to be noticed, sculptured with the arms of Scotland and those of the bishops of Galloway. These consist of a Saxon arch, some Gothic arches, and several large vaults. The Saxon arch is a pure specimen of that ancient and beautiful style of architecture, continues very nearly entire, and is greatly admired as probably the finest object of its class in the kingdom.—Whithorn, laconically say the Burgh-commissioners, "has no trade or manufactures, and there is no prospect of increase." Yet it possesses certain marketing and trading appearances which indicate a state of things not quite so bad as this language might seem to announce. It has branch-offices of the bank of Scotland and the Southern bank; an office of the Aberdeen Fire and Life insurance company; a savings' bank; five or six times more inns and public-houses than even relaxed ideas of temperance can regard as requisite for health and business; a cattle-market every month except February and March; and two annual fairs respectively at Midsummer and at Lammas. One mail-coach is daily in transit to communicate with Stranraer, and another to communicate with Newton-Stewart. The Galloway steamer occasionally touches at the Isle of Whithorn—the port of the burgh—on her trips between Stranraer and Liverpool.—Whithorn is governed by a provost, 2 bailies, and 15 councillors. The old royalty comprehended only the principal street, and a horder of ground behind it on each side; but the parliamentary boundaries now include a considerable tract of adjacent ground,—all within the parish of Whithorn. In 1833, the combined property and revenue of the burgh produced an annual income of £153 8s. In 1839–40, the revenue amounted to £230 11s. The whole debt consists of a borrowed public fund which originated about 1754 in small contributions for the benefit of poor councillors and their families, and which amounts to £403, is called the Contribution Fund, and bears annual interest at 4 per cent. The expenditure of the burgh is generally equal to the free income, and in some years has exceeded it. There are no burghal taxes; no assessments for the poor; no guildry; no incorporated trades; no exactions of fee for leave to trade within the boundaries. The magistrates exercise very trifling jurisdiction; they rarely try civil causes; and they interfere with criminal matters only to the extent of breaches of the peace. Whithorn unites with Wigton, Stranraer, and New Galloway, in sending a member to parliament. Constituency, in 1837, both municipal and parliamentary, 50; in 1841, 54. Population, in 1831, 1,300; in 1841, 1,513.

Whithorn boasts a very high antiquity, and early and prolonged importance. As a royal burgh, indeed, it seems to have had its earliest charter from King Robert Bruce, and it rests its appeal upon a confirmatory charter given in 1571 by James IV.; but as simply a seat of population, and as the scene of stir and of highly modelling influences among early and successive races of Scotland's colonists, it figures among the few places which were prominent many centuries before most of our present great towns had even an embryo existence. It was the capital of the British tribe of Novantes, who possessed all Galloway west of the river Dee; and, on the influx and ascendancy of the Romans, it was adopted by that people as a station. Ptolemy mentions it under the name of Leucophibia, supposed to be a corruption of the Greek *Λευκή οικία*, 'the White-house.' Ninnian,

a simple Christian missionary, and not improbably the earliest who made any marked impression upon Scotland, but a man whose character was transmuted by the monkish romancing of a subsequent age into that of a popish or papistic saint, and the events of whose life were all but utterly enveloped in a dense mist of thaumaturgical fable.—Ninian was born in the vicinity of Leucophibia, about the year 365; and obtaining a knowledge of the gospel where or how we know not, though probably among the un-Arianised and non-Catholic sects of the continent of Europe, he spent the vigour of his life in successful efforts to plant Christianity in the region of his natal soil. He commenced his labours in the islet, whence the modern village of the Isle of Whithorn has its name, and probably founded there what tradition asserts to have been the first place of Christian worship in North Britain; and, then removing to Leucophibia, he founded there an edifice which seems to have been speedily occupied by a Christian congregation, and which became, in 432, the burial-place of his own mortal remains. This simple building, as much perhaps as any one known to record, is usually exhibited to posterity boldly, and with all multiplicity, through the kaleidoscope of such historiography as was proper to the cell of cowed dreamers. Ninian, we are told, was ordained at Rome the bishop of the Britons, and erected the edifice at Leucophibia as the cathedral of Caledonia; yet having taken lessons in monkery from Martin of Tours, he assumed his preceptor to be already canonized, and dedicated the cathedral to him as its tutelary saint! This—as every person knows, who has looked soberly into the ecclesiastical history of the 4th and 5th centuries—stands self-convicted as outrageous fiction. While popery reigned, however, the fable, like many a clumsy one, was not only believed but venerated, and occasioned the place to be regarded as the oldest prelatic seat, and one of the chief retreats of physical sacredness in Scotland. Bede emphatically notices the humble edifice of Ninian as the first church which was built of stone, and says that, on that account, it was called Candida Casa. But the name Candida Casa means, in the Roman language, the same thing which the previously-known designation of the town means in the Greek, and probably was a Roman translation of *λευκή οικία*, applied, not to the new Christian edifice, but to the Roman station, or station of the Romanized Britons, at which it stood. Even Candida Casa was, in its turn, translated into the Saxon *Hwit-tern*, which has been corrupted successively into *Whit-tern* and *Whithorn*, and which, in that form, has been transmitted to the present day the originally used designation, the ‘White House,’ of the aboriginal Novantes. Keith asserts that Ninian appointed a person to succeed him in his alleged bishopric, and refers us for his authority to words or passages in Bede which have no existence. Ninian, even in his true character of a plain missionary and Christian pastor, appears to have had no local successor for several generations. The weakness of the civil power, the irruptions of barbarous tribes, and the infantile condition of the congregation whom the missionary had formed, prevented, so far as can be ascertained, any second Christian labourer from settling at Candida Casa till the year 723,—nearly three centuries after Ninian’s death. The Saxons, on pushing their conquests hither, adopted the place as a seat of population, and, of course, as the scene of a Christian minister’s labours. Yet ingenuity will be at a premium to prove either that the house of worship used was the edifice founded by Ninian, or that the ‘bishops’ who officiated were more than the slightly prelatized offshoot of the Culdees who

took root in the kingdoms of Northumbria and Strathclyde. A succession of Saxon bishops, proximately though corruptedly Culdee in character, seem to have officiated in Candida Casa about three-fourths of a century; but seem to have been dislodged by the anarchy which swept across the Northumbrian territories after the assassination of Ethelred in 794. The Scoto-Irish, who now obtained ascendancy in Galloway, appear to have known, or at least recognised, nothing respecting a bishopric of Candida Casa; yet they professed Christianity, and, had the place been a see in any sense even remotely akin to that contended for in the usual monkish style of ecclesiastical history, they could scarcely have failed to set up their series of bishops as formally and distinctly as the Saxons. But about the year 1124, or from that to 1130, nearly 3½ centuries after the disappearance of the Saxon ‘bishops’ of Candida Casa, forth came David I. warm in the blush of championship for the pomp and prelacy and papacy of Romanism, and set up at Whithorn an undoubted episcopal see, which, under the wide name of the bishopric of Galloway, held coeval sway with that of popery and of Stuart prelacy till the final triumph of presbyterianism in 1689. This bishopric comprehended the whole of Wigtonshire, and by far the greater part of Kirkcudbrightshire, or all of it lying west of the river Urr; and it was divided into the three deaneries of the Rhinns, Farines, and Desnes, lying westward respectively of Luce-hay, of the Cree, and of the Urr, and corresponding proximately, though not quite, to the limits of the respective existing presbyteries of Stranraer, Wigton, and Kirkcudbright. Gilla Aldan or Gilaldan, the first bishop, was consecrated by the archbishop of York; and his successors looked to that arch-bishop as their proper metropolitan till at least the 14th century. The bishops of Galloway afterwards, like all their Scottish brethren, became suffragans of St. Andrews; but on the erection of Glasgow, in 1491, into an archbishopric, they, along with the bishops of Argyle, Dunkeld, and Dunblane, passed under the surveillance of that arch-see, and, on account of their being the chief suffragans, they were appointed vicars-general of it during vacancies. The canons of Whithorn priory formed the chapter of the Galloway see, their prior standing next in rank to the bishop; but they appear to have been sometimes thwarted in their elections, and counter-worked in their power, by the secular clergy and the people of the country. The revenues of the bishopric, which had previously been small, were, in the beginning of the 16th century, greatly augmented by the annexation to them of the deanery of the chapel-royal of Stirling, and, some years later, by that of the abbey of Tongland. In a rental of the bishopric, reported, in 1566, to Sir William Murray, the queen’s comptroller, the annual value, including both the temporality and the spirituality, was stated to be £1,357 4s. 2d. Though the revenues were in a great measure dispersed between the Reformation and James VI.’s revival of episcopacy, and though they again suffered diminution in 1619 by the dismemberment of the deanery of the chapel-royal, in order to its being conferred on the see of Dunblane; yet they were augmented in 1606 by the annexation of the priory of Whithorn, and afterwards by that of the abbey of Glenluce; and, in 1637, by the accession of the patronage and tithes of five parishes in Dumfriesshire, which had belonged to the monks of Kelso. At the epoch of the Revolution, the net rent amounted to £5,634 15s. Scottish; and exceeded that of any other see in Scotland, except the archbishoprics of St. Andrews and Glasgow.

During the reign of David I., Fergus, Lord of

Galloway, founded, at Whithorn, a priory for canons of the Premonstratensian order. The church belonging to it—and neither the original nor a renovation of the edifice founded by St. Ninian—seems, from its size, to have been used as the cathedral-church of the bishopric, set up by David I. Adjoining the cathedral stood another church, called the Outer-kirk, or the Cross-kirk; and at some distance on the hill stood the chapel. In the cathedral and in the Outer-kirk were various altars, the offerings made at which, during ages of intense superstition and ceremonious formalism, formed the principal revenue of the priory. Excepting that of Morice, who swore fealty to Edward I. in 1296, the names of none of the early priors of Whithorn have survived. James Beaton or Bethune, who was prior during some time before the year 1504, and uncle of the infamous Cardinal Beaton, whom he acquired influence to place in his chair of ignominious tyranny at St. Andrews, acted a conspicuous, and, in some particulars, an inglorious part in the history of his country, and rose to the highest offices in both church and state,—becoming successively, in the one, bishop of Galloway, archbishop of Glasgow, and archbishop of St. Andrews, and, in the other, lord-treasurer and lord-chancellor of the kingdom. Though he had the honour, such as it was, of making elegant alterations on the cathedral of Glasgow, and of founding St. Mary's college in St. Andrews, he must be ever infamous in Scotland as the murderer of Patrick Hamilton, and other early Scottish martyrs, and for setting the bold example of truculent oppression, which was so fearfully copied by his sanguinary though ill-fated nephew. Gavin Dunbar, who succeeded Beaton as prior of Whithorn, was tutor to James V., and rose to be archbishop of Glasgow, lord-chancellor of the kingdom, and, during one period of the King's absence in France, one of the Lords of the Regency. The last prior, Mancolalyne, was present at the trial of Sir John Borthwick in St. Andrew's for alleged heresy. At the epoch of the Reformation the rental of the priory, as reported to Government, amounted to £1,016 3s. 4d. Scottish, besides upwards of 15 chalders of hear, and 51 chalders of meal. The property, as we have seen, was given by James VI. to the bishops of Galloway; and it afterwards followed the same fates as that of the parish-church of Whithorn.

The canons of Whithorn, however individually shrouded from the knowledge of posterity, collectively loom largely in fame as adepts in the art of monkish chicanery. Pilgrimages, at all times and by all classes of persons, from a short period after the founding of the priory onward, were made from every part of Scotland to the shrine of St. Ninian at Whithorn. In 1425, James I. granted a protection to all strangers coming into Scotland as pilgrims to the shrine; and in 1506 the Regent Albany granted a general safe-conduct to all pilgrims hither from England, Ireland, and the Isle of Man. Many of the most distinguished personages of the kingdom, including kings, queens, and the highest nobles, visited Whithorn on pilgrimage. In 1473, Margaret, the queen of James III., made a pilgrimage hither, accompanied by six ladies of her chamber, who were furnished on the nonce with new livery gowns. Among other charges in the treasurer's account, for articles preparatory to her journey, are 8 shillings for "panzell crelis," or panniers, 10 shillings for "a pair of Bulgis," and 12 shillings for "a cover to the queen's cop." James IV. made pilgrimages to Whithorn, generally once and frequently twice a-year, through the whole period of his reign. He appears to have been accompanied by his minstrels, and a numerous additional retinue; he made offerings in the churches,

at the altars, and at the reputed saintly relics of Whithorn; he gave donations to priests, to minstrels, and to pilgrims, and, through his almoner, to the poor; and, in his journey both hither and hack, he, in addition, made offerings at various churches on his way. In 1507, after his queen had recovered from a menacing illness, he and she made a joint pilgrimage, and occupied 31 days from leaving Stirling till they returned. They were accompanied by a large retinue, and processed in a style of regal pomp. In 1513, the Old Earl of Angus, Bell-the-Cat, made a pilgrimage to Whithorn; engaging before he set out, to reform all disorders on his way. In 1532 and 1533, James V. appears from the treasurer's accounts to have made several pilgrimages. So infatuatedly popular, in fact, was the practice of travelling to the reputed bones of St. Ninian's in quest of both physical and spiritual good, that, in spite of all which the preachers could inculcate or Sir David Lyndsay could write, it continued for some time after the Reformation, and was not effectually put down till an act of parliament, passed, in 1581, rendered it illegal. The overthrow of the traffic of monkery, and the extinction of the factitious attractions of St. Ninian's shrine, terminated the social importance of Whithorn, and permanently consigned it to comparative obscurity.

WHITSOME AND HILTON, an united parish in the district of Merse, Berwickshire. It is bounded on the west and north by Edrom; on the north-east and east by Hutton; and on the south by Ladykirk and Swinton. Its greatest length from east to west is  $4\frac{1}{2}$  miles; its greatest breadth is  $2\frac{1}{2}$  miles; and its superficial extent is  $7\frac{3}{4}$  square miles. The Lect rises in the interior near the northern boundary, and runs to the south. Bands of flat ground stretch along the course of the stream, and along the eastern and the northern frontiers; and they give place, over the rest of the area, to undulations of surface whose highest ground exceeds 300 feet above sea-level. The district has everywhere the beautifully enclosed and the richly cultivated appearance which so generally distinguishes the Merse. Nearly 200 acres are planted; a necessary proportion of ground is occupied by fences, roads, and houses; and all the remaining area, amounting to upwards of 4,500 acres, is in tillage. The village of Whitsome, an entirely rural place, inhabited by the cultivators of the soil, stands in the centre of the parish,  $2\frac{1}{2}$  miles south of Allanton, and  $\frac{6}{7}$  east-south-east of Dunse. It dates back to a considerable antiquity; and, in 1482, was, along with many other seats of population on the Border, burned by the Duke of Gloucester, afterwards Richard III. It is the site of the parish-church, possesses a Bible society and a Temperance society, and sends carriers once a-week to Dunse, Berwick, and Edinburgh. Its population, in 1836, was 212. Vestiges of a Roman camp exist in a field to which it has given the name of Battle-knowes. The parish is traversed by the road from Berwick to Dunse, and by the north road from Berwick to Kelso. Population, in 1801, 560; in 1831, 664. Houses 119. Assessed property, in 1815, £7,264.—This parish is in the presbytery of Chirside, and synod of Merse and Teviotdale. Patron, Wilson of Whitsome-hill. Stipend £233 17s. 11d.; glebe £60. Unappropriated teinds £102 8s. 6d. The church was built in 1803. Sittings 239. Of 633 persons, who composed the population in 1836, 475 were churchmen, and the rest were dissenters. In 1834, the parish school was attended by 58 scholars; and a private school by 47. Schoolmaster's salary £34 4s. 4d., with £26 fees, and £6 other emoluments. Whitsome and Hilton were united in 1735; See HILTON. The ancient Whitsome was a rectory

in the deanery of the Merse. When the celebrated Thomas Boston once preached in Whitsome church, crowds who could not obtain access to the small thatched edifice, climbed to its roof, and tore away part of the straw, that they might hear and see him from above.

**WHITTINGHAM**, a parish in Haddingtonshire; bounded on the north by Moreham, Prestonkirk, and Stenton; on the east by the main body of Stenton, Dunbar common, and the largest detached part of Stenton; on the south by Berwickshire; and on the west by Garvald and Moreham. Its greatest length from north to south is  $10\frac{1}{2}$  miles; its breadth at two points near the extremities is respectively  $4\frac{1}{2}$  and  $5\frac{1}{2}$  miles; its mean breadth over 6 miles of the central district is considerably less than  $1\frac{1}{2}$  mile; and its entire superficial extent is about 20,700 acres. About five-eighths of the surface is moorish upland, declining from both sides of the summit-range of the broad Lammermoors; and a still greater proportion is unconquerable by the plough,—making an aggregate of about 17 parts in 21 of the whole area pastoral. The sheep pastured amount to about 5,500; and are a prime object of attention, almost to the exclusion of black cattle. All the southern division, comprehending one-half of the area, is farrowed athwart its upland and heathy bleakness, by the broadly ramified head-waters of the river Whitadder. The northern district is cut diagonally, or north-eastward, by what is here called Whittingham-water,—a stream which wears successively the names of all the districts which it traverses, and is the longest in Haddingtonshire except the Tyne. From the foot of the Lammermoors to this stream, the ground gradually but undulatingly descends; and from the stream, westward and northward, it slowly rises to the top of Blaikie-heugh,—an arable and very fertile ridgy height on the boundary. The path of the stream is a sinuous and sylvan dell, highly tintured with beauty and romance. The circumjacent grounds are the cultivated district of the parish, and possess that richness of aspect which so eminently characterizes the lowlands of East Lothian. On one of the Lammermoor hills, called Priest's-law, is an oval camp, strongly and regularly fortified, having four ditches on the north side, and three on each of the other sides, measuring about 2,000 feet in circumference, and still existing in a proximately entire state. Whittingham-castle, the place in which the Earl of Morton and his associates plotted the murder of Darnley, is still in good repair, and, though showing marks of great antiquity, has been lately renovated and continues to be inhabited. It stands on elevated ground, overlooking Whittingham-water, surrounded by many natural beauties, improved by the embellishments of art. Ruins of the baronial strengths of Stoneypath and Pensbiel still exist. Ruchlaw, though an ancient edifice, is the occupied mansion of Capt. B. Sydserrif, one of the heritors. Whittingham-house, the seat of James Balfour, Esq., another heritor, is an elegant mansion in the Grecian style of architecture, and has three noble approaches,—two of them of great length, and winding through very fine scenery. The village of Whittingham stands on a rising ground, on the left bank of Whittingham-water, about 350 feet above sea-level, 6 miles east of Haddington, and 7 miles south-west of Dunbar. The chief roads, respectively in the southern and in the northern districts, are that between Gifford and Dunse, and that between Gifford and Dunbar. Population, in 1801, 658; in 1831, 715. Houses 135. Assessed property, in 1815, £8,623.—Whittingham is in the presbytery of Dunbar, and synod of Lothian and Tweeddale. Patron, Balfour of Whittingham. Stipend £266 12s. 1d.; glebe £18. Unappropriated

teinds £192 18s. 4d. Schoolmaster's salary £34 4s. 4½d., with £27 fees, and £12 other emoluments. Whittingham parish formed of old two chapelries which were subordinate to the church of Dunbar. The chapel of Whittingham served the lower district, and that of Penshiel the Lammermoor district; and these chapels formed two of the prebends of Dunbar church after its being made, in 1342, a collegiate establishment. Penshiel chapel stood below Penshiel tower, in a glen which is still called from it Chapel-haugh. The Earls of March held their haronial courts at Whittingham.

**WIA**, a small island of the Outer Hebrides. It lies off the south-east corner of Benbecula; and is separated from it by a narrow strait called the sound of Wia. Its length, from north-east to south-west, is  $2\frac{1}{2}$  miles; and its breadth is  $1\frac{1}{2}$  mile. The island, compared with the large ones in its vicinity, is little invaded by water; and, like nearly all the group, it consists wholly of gneiss.

**WICK**, a parish on the east coast of Caithnessshire; bounded on the north-west by Bower; on the north by Canisbay; on the east and south-east by the German ocean; on the south and south-west by Latheron; and on the west by Watten. Its greatest length, from north-north-east to south-south-west, is  $14\frac{1}{4}$  miles; its breadth, over nearly the whole northern half, nowhere exceeds  $4\frac{1}{2}$  miles; its greatest breadth is about 7 miles; and its superficial extent is 75 square miles. Keiss-hay, called also Reiss, Ackergill, and Sinclair-bay, penetrates the northern half of the coast to the extent of  $3\frac{1}{2}$  miles; measures  $5\frac{1}{2}$  miles across the entrance; and has proximately a form between that of a half and a three-quarter moon. Wick-bay, measuring a mile across the entrance and stretching inland to the extent of  $1\frac{1}{2}$  mile, opens 3 miles south of Keiss-hay. Creeks—here called *goes*—with rocky and precipitous sides, and in some instances accessible only by winding steps in the face of the rock, thickly indent other parts of the coast, and offer curious retreats to fishing-boats. The chief headland is **NOSS-HEAD**: which see. The shore of the north side of Keiss-bay is sloping, and of the interior is a low beach of siliceous sand. The coast, almost everywhere else, is a breastwork of cliffs, serrated by the 'goes,' and perforated with numerous shelving-sided and hideous caverns, the retreats of cormorants and seals. At one of the creeks, called Falligoe, a fine cascade leaps over the face of the cliff, and, when played upon by the sun's rays, makes a conspicuous and very beautiful appearance, as seen from even a considerable distance at sea. At various points along the coast many stacks or insulated rocky pyramids of great height rise up from the sea; and, among a group of these opposite Hempriggs is a singular rock 200 or 300 yards long and 24 feet wide, perforated from top to bottom and from side to side, affording passage to a boat, and exhibiting two huge natural pillars so regularly formed as almost to appear artificial. These insulated rocks and the cliffs of the coast are frequented by large flocks and great varieties of sea-gull, some species of which are shot for food, picked up by the fishermen in their boats, and salted as winter store. The surface of the parish is almost all flat; and, as to its scenic character, is partly tame and partly irksome or even dismal. Across its centre, and even 7 miles into the adjacent parish of Watten, extends one wide strath, no part of which rises more than 60 feet above sea-level; along the northern district, somewhat parallel with the coast-line, extends another strath nearly as low; and along the western frontier extends another, both wide and long, which is nearly all a deep, dreary, impracticable bog. Extensive tracts of moss occur also on the northern frontier, and near the centre of

the southern division. The hills of Camsten, Yarrow, and Bean, in the south-west, are the only high ground; but, though possessing considerable altitude, they have no scenic character, and fail to relieve the prevailing tameness of the landscape. Yet relief from ennui is afforded by magnificent sea-views, and, in a degree, by the begun embellishments of quick-set enclosure, improved land, and some small plantations. Agriculture, till about the commencement of the present century, was nowhere in Britain in a more degraded and semi-barbarous condition than in Wick; but it now walks abroad with a rapidity of movement, and an address and skill in practice, which are making the amende honorable for its former deep delinquencies. The land-rent has increased about tenfold during the last 100 years; and that of one estate, and probably the average for the parish, has increased threefold since 1814. The Wick, after being formed by head-waters from Watten and Toftingall, lakes in the conterminous parish of Watten, moves sluggishly down the great low central strath, which we have noticed, to the head of Wick-bay. It performs an entire run of only 9 or 10 miles, a little upwards of 5 of which are within the parish; yet it has a mean breadth of about 30 feet, and often, in rainy weather, lays a large part of the strath under flood. Kilminster-loch, nearly a circle of almost a mile in diameter, and Windless-loch, a stripe of rather more than a mile in length, are both situated in the western bog; and a streamlet issues from the former, traverses the latter, and falls into the north side of the Wick. Dbu-loch, 6 or 7 furlongs in length, is situated in the southern bog, and sends northward to the Wick a small affluent. Yarrow's-loch, in the south, 2 miles in circumference, sends a streamlet north-eastward to Hempriggs-loch; and the latter, similar in form and size to Kilminster-loch, sends one stream by a natural channel to the Wick, and another, by an artificial channel, to drive mills in Pulteney-town. Wester-water and loch are in the north: see Wester.—Hempriggs-house, Lord Duffus, though an old mansion, is large and commodious. Keiss-house, Sir George Sinclair, Bart., is an elegant modern house; and Ulbster-house, the patrimonial seat of the same proprietor, now of Thurso-castle, stands in the south. Thrumster, Innes, Esq.; Stirkoake, Horne, Esq.; and Rosehank, Macleay, Esq.—are all fine houses. The other mansions are Bilbster, Sibster, Tannaeh, and Harlan. On a narrow promontory, at the south side of the entrance of Wick-bay, stands the dismal ruin of Old Wick-castle, once the seat of the Lord's Oliphant, forming a good land-mark to mariners, and called by them 'the Auld Man o' Wick.' Traces exist of a ditch, a drawbridge, and some attached buildings; and a stair, apparently for retreat, descends through the rock to the sea. On the south side of Keiss-bay, a mile west of Noss-head, stand in close juxtaposition, Castles Girnigoc and Sinclair, formerly the residence of the Earls of Caithness. The former, though much the older of the two, is in a much higher state of preservation; and both were agglomerated with now nearly extinct buildings, to cover the entire surface of a peninsulated rock or small promontory. A chamber in one of the out-buildings, situated on the extremity of the rock, and said to have been the bed-chamber of the Earls, communicated through a trap-door with the sea, and by a flight of steps with the court of Castle-Girnigoc. A chasm in the rock, spanned by a drawbridge, separated the two castles. About  $1\frac{1}{2}$  mile west of these ruins stands the ancient tower of Ackergill, rectangular, battlemented, 82 feet high, and, at least, 13 feet thick in the walls, once the residence of the Earls Marischal, and now the seat of the Hon. George Dunbar, the Master

of Duffus. Other antiquities are chiefly Picts' houses and two standing stones,—the latter associated with vague traditional story. The fishing-village of Broadhaven is situated about a mile east of Wick, and has about 170 inhabitants. The other villages, either suburban to the burgh or situated at a distance, are PULTENEY-TOWN, LOUISBURGH, STAXIGOE, and SARLET: see these articles. One road runs along the whole coast; and two go respectively westward and north-westward from the burgh toward Thurso and Castletown. Population, in 1801, 3,986; in 1831, 9,850. Houses 1,578. Assessed property of the parish, in 1815, £7,324; of the burgh £746.

Wick is in the presbytery of Caithness, and synod of Sutherland and Caithness. Patron, Lord Duffus. Stipend £232 ls. 8d.; glebe £50. Unappropriated teinds £340 9s. 4d. The parish-church was built in 1830. Sittings 1,981. A district is comprehended in the *quoad sacra* parish of KEISS; which see. Another district, the population of which, in 1836, was 1,272, unites with a district of Latheron, the population of which, in 1836, was 1,592, to form the mission of Bruan. The chapel, situated within Wick, hut almost on the boundary, is a thatched house which may have cost about £80. Sitting 563. Stipend £43 from the people, and £25 from the Society for propagating Christian knowledge; with a manse which cost £230.—The foundation-stone of a church-extension erection, designed to contain 950 sittings, was laid in Pulteney-town in March 1841.—An United Secession congregation was established in 1770, and their place of worship, situated in Pulteney-town, was built in 1815. Sittings 658. Stipend £100, with a manse and small glebe.—An Independent congregation was established and their place of worship built in 1799. Sittings 716. Stipend £100, with a house and garden rented at £15.—A Baptist congregation was formed in 1808, and assembles in a large room rented at £10. Sittings 150.—A Wesleyan Methodist congregation was established in 1837, and assembles in the Masons'-hall, rented at £15. Sittings 300.—An Original Seeder congregation was established in 1835, and assembles in a large room rented at £10.—A Reformed Presbyterian congregation was established in 1835, and their place of worship, situated in Pulteney-town, was built in 1839. Sittings 330, with capacity of enlargement.—A Separatist congregation was established in 1824, and assembles in a room in a dwelling-house, rent free.—A Roman Catholic chapel was built in 1836, in Pulteney-town, for the use of such Roman Catholics as frequent Wick during the fishing season; and, except at that season, it is shut.—In 1836 the population of Wick, *quoad sacra*, was, according to an ecclesiastical survey, 8,971; of whom 7,498 were churchmen and 1,473 were dissenters.—In 1834 the parish-school was attended by 121 scholars; and twenty other schools, two of which belonged to the General Assembly and two to the Society for propagating Christian knowledge, were attended by 565. Four non-parochial schools, also within the Keiss district, were attended by 156. Parochial schoolmaster's salary £34 4s. 10d., with about £90 fees, and about £10 other emoluments.—Popish chapels were anciently sprinkled all over the parish; and the remains of several still exist. One, a little below Ackergill tower, has the sanguinary fame of having been the scene of a massacre, in cold blood, by the clan Gun, of many persons who were assembled in it for religious service. The people of Wick were debasingly attached to popish superstitions, and made very laggard and reluctant progress in enlightenment after the Reformation. "They were accustomed," says the Rev. Charles Thomson, in the New Statistical Account, "to visit

the chapels with which the parish abounded, and pay their devotions to the stone images of their tutelary saints and saintesses. Dr. Richard Mercheston, minister of Bower, in 1613, exerted himself to suppress this atrocious and degrading sin; and procured the demolition of the stone images. On his return homewards he was drowned by the blind and infuriated idolaters. It was given out, however, that it was the saints who did it, and that a lapideous saintess, whom he had cast down and broken to pieces the day before, was seen a-top of him in the water. \* \* Within the memory of persons yet living it was customary for persons to visit the chapel of St. Tears on Innocent's day, and leave in it bread and cheese as an offering to the souls of the children slain by Herod; but which the dog-keeper of a neighbouring gentleman used to take out and give to the hounds. Till within a few years, it was customary for all the inhabitants of Mirelandorn to visit the kirk of Moss every Christmas before sunrise, placing on a stone bread and cheese and a silver coin, which, as they alleged, disappeared in some mysterious way. There are still several holy lochs, especially one at Dunnet, to which people go from Wick, and, indeed, from all parts of Caithness, to be cured of their diseases. They cast a penny into the water, walk or are carried withershins around the loch, and return home. If they recover, their cure is ascribed to the mystic virtues of 'the Halie-loch;' and if they do not, their want of faith gets all the blame."

Wick, a royal burgh, the capital of Caithness, and the principal seat of the northern herring-fishery, is situated at the head of Wick-hay, 18½ miles south of John o'Groat's, 20½ south-east by east of Thurso, 5¼ north-east by north of Golspie, and 119¼ or 139¾, according to the route, north-north-east of Inverness. The town lies low, encompassed by a tame and level strath; and, but for being washed by its eponymous river, and swept by the sharp breezes of the north, the stench of its fish and garbage would be utterly unendurable. Even with all appliances, its atmosphere and everything connected is so laden with the peculiar odours of its fisheries, and fish-curing establishments, that a transient visitor ever afterwards associates recollections of it with the idea of vast masses of herrings. "When I entered it," says Miss Sinclair, "I thought of your brother's voyage in a herring-smack, when the seats were barrels of herrings, and the staircase from the cabin formed by piles of casks. One year, many fields in Caithness were manured with herrings; but none of the proprietors find the perfume so oppressive as strangers do, because these fisheries are the chief sources of their wealth." Yet, at the fishing-season, when the town swarms with Lowlanders, Highlanders, Orcadians, Irishmen, and Dutchmen, a view, on a fine summer's morning, from the seaward cliffs in the vicinity, is one of the finest scenes of its class anywhere to be seen, and displays on the bosom of the ocean 800 or 1,000 herring-boats, with larger vessels gliding among the small craft "like stately swans surrounded by a flock of lively sea-gulls."

The town consists of three parts, Wick-Proper, Louisburgh, and Pulteney-town. Wick consists principally of one crooked street about 220 yards long, winged with lanes, and situated on the north side of the river, immediately above the commencement of the estuary or hay; it is irregularly built, and, in spite of modern improvements, exhibits much slovenliness and filth; and, though giving name and burgh importance to its modern adjuncts, it possesses so little comparative consequence as to contain not one-fourth of the aggregate town population, and to claim neither the harbour, the chief trade, nor the seat of the herring-curing estab-

lishments. Louisburgh, situated quite adjacent to it on the north, nearly vies with it in bulk, and far excels it in regularity and freedom from unpleasantness: see LOUISBURGH. Pulteney-town, situated on the south side of the river, but extending eastward till it lines part of the coast of the bay, is the division of prime importance, and contains several hundreds more than one-half of the population: see PULTENEY-TOWN. This division is all constructed on a regular plan of street lines; it has Argyle-square in its centre; and, while receiving constant and rapid augmentation, it spreads out its accessions with the same regularity which characterized its nucleus. A bridge of three arches, flung across a narrow part of the river, a little above the head of the hay, connects Pulteney-town with the other two divisions. The town and county hall is built of Caithness flag, faced with sandstone; it is surmounted by a cupola-shaped heltry; and it has a spacious principal apartment, adorned with three or four good portraits. The Commercial banking-office is built of sandstone, and adorned in front with Ionic pillars. The parish-church is built partly of Caithness flag, and partly of sandstone; it was erected at a cost of nearly £5,000; and it is an imposing edifice, in plain modern Gothic, surmounted by a spire. The dissenting chapels are all unpretending structures. A large school-house, built by the British fishery company, is a neat building. A temperance hall, capacious enough to accommodate 1,000 persons, has just been erected by the total abstinence society of the town. The Sinclairs' aisle, a part of a very old parochial church, the predecessor of that which preceded the present, has the form of a small, elegant chapel, and, though roofless, is undilapidated in the walls. A suite of gas-works, if not already quite completed, are far advanced in erection.

The present manufactures of the town are all of quite modern origin; and seem to have sprung up in connection with the fishing-establishment. Four rope-works employ about 80 persons; the dressing of pavement-flags for exportation employs about 70; boat-building, in about a dozen yards, employs 70 or 80; a recently-erected iron-foundry, employs as yet very few persons, but has promising prospects; and the making of herring-nets, and the spinning of material for them, employ a large number of females. In the town are a distillery, a brewery, and some grain and sawmills.—Though Wick appears to have had, from an early date, a little seaward trade, it possessed no other harbour than the natural one of the hay, till the erection of Pulteney-town. Two harbours in the immediate vicinity of each other, at the head of the hay, and on the Pulteney-town side, were constructed respectively in 1810, in 1831, at costs of £14,000 and £40,000, by the British fishery society, partly at their own expense, and partly with the aid of Government. But though spacious and skilfully executed, they are so much exposed to the sea-swell in the hay, which, during easterly winds, is probably the most dangerous sea-ground on the east coast, that they egregiously failed to answer expectation. A large proportion of the trade of the port has, in consequence, to be conducted at the little harbour of Staxigoe. A large steam-vessel plies once a fortnight, during eight months of the year, between Wick and Leith, calling at some intermediate ports, and extending her trips to Orkney and Shetland. Two smacks sail regularly between Wick and Leith. About a score of vessels, averaging nearly 60 tons burden each, belong to the port; and vessels visit it to the aggregate amount of about 30,000 tons burden in the year. The exports consist partly of wool and grain, but chiefly of the produce of the fisheries.—So great is the herring-fishery that, during the pe-

riod of its continuance, nearly 10,000 strangers, almost equal to double the number of the stated inhabitants, are in the town. Yet, so late as 1768, an incipient adventure in the fishery, encouraged by parliamentary bounty, proved all but a total failure. In 1782, the produce amounted to 363 barrels; and, in 1790, to upwards of 13,000. In 1808, the establishment of Pulteney-town was commenced by the British fishery society; and, since that date, the annual fishings, during eight or ten weeks succeeding the middle of July, have been regularly conducted both at Pulteney-town itself, and at the subordinate stations of Broadhaven, Staxigoe, Keiss, and Sarclet. A boat, with outfit of nets, costs about £120; a boat's crew are four in number, and, when the boat is their own, earn from £20 to £50 each in a season; a hired crew receive each, for the season, from £3 to £7, with a weekly  $1\frac{1}{2}$  peck of meal; and poor women earn from £1 to £3 a season, in gutting and packing the fish. Though the fishery is somewhat fluctuating, the following statistics of it for the years 1829 and 1840, may be regarded as a fair index of its condition:—

	In 1829.	In 1840.
Boats belonging to Wick, . . .	457 ...	428
Boats not belonging to Wick, . . .	498 ...	337
Total of boats at the fishery, . . .	955 ...	765
Fishermen, . . .	3,761 ...	3,828
Gutters, curers, and packers, . . .	4,083 ...	2,266
Coopers, . . .	442 ...	265
Carters, . . .	117 ...	127
Other labourers, . . .	177 ...	246
Seamen in coasting-vessels, . . .	3,200 ...	1,200
Total of persons employed, . . .	11,780 ...	7,632

The total of barrels cured in 1839 was 84,208; in 1840, 63,495. The total of barrels bung-packed, branded, in 1839, was 19,451; in 1840, 10,333. The total of barrels exported, in 1839, was 64,114, of which 60,045 were to Ireland; in 1840, it was 55,711, of which 51,250 were to Ireland.—Wick has a custom-house; a chamber of commerce; branch-offices of the Commercial bank of Scotland, and the Aberdeen town and country bank; a Savings' bank; two public news-rooms; a public library; a Caithness agricultural society; a masons' lodge; three inns; and a number of insurance agents. The *John o' Groat Journal*, a liberal newspaper, is published every Friday; and the *Northern Star*, a conservative and fortnightly paper, became extinct in 1839, after a precarious existence of 2½ years. A weekly market is held on Friday; and annual fairs are held in March, June, July, and November.

Wick was erected into a royal burgh by a charter of James VI. in 1589. But though invested with the privileges of a royal burgh, it exhibited the anomaly of being subjected to the superiority of a subject somewhat in the manner of a burgh-of-barony. Yet the superiority—which belonged originally to George, Earl of Caithness, and his heirs and successors, and which afterwards passed to the families of Ulster and Sutherland—became virtually annulled at the date of the municipal reform act. The burgh seems never to have had any landed property; and it draws its chief revenues from customs, harbour-dues, and rent of curing stations. In 1832, the receipts were £424 3s. 11½d.; the expenditure £523 13s., of which £429 19s. 2d. was classed as extraordinary; the debt due to the burgh £100; and the debt due by it £1,450. The corporation-revenue, in 1840–1, was £375. The only burgh-taxes are of three kinds, amounting to about £34. The town-council consists of a provost, 2 bailies, a dean-of-guild, a treasurer, and 7 councillors. Municipal constituency, in 1840, 90. The jurisdiction of the magistrates is limited to the royalty, or to Wick-*Proper*; and even within these narrow limits a pre-

ference is given to the justice-of-peace and sheriff-courts. The British fishery society are the superiors of Pulteney-town; and the only impost there, additional to feu-duty, is five shillings a-year for keeping the streets in repair. There are, in the burgh, no incorporated crafts; yet formerly £8 8s. was exigible, and now £4 4s., as fee for burgh-ship. The aggregate sum levied in fees, during five years preceding 1832, was £193 3s. 6d.; and the number of burgesses in that year was 66. There is no police act, nor any special police regulation. The sheriff has held his ordinary courts in Wick since 1828: See *TURNER*. The burgh unites with Dingwall, Tain, Cromarty, Kirkwall, and Dornoch, in sending a member to parliament; and is the returning burgh. Parliamentary constituency, in 1840, 254. The parliamentary boundaries comprehend Pulteney-town, Louisburgh, Broadhaven, and a considerable extent of circumjacent country. Population, in 1810, about 1,000; in 1821, 2,900; in 1836, of Wick, 1,195,—of Louisburgh, 801,—of Pulteney-town, 2,872,—in all, 4,868, exclusive of Broadhaven and the rural parts of the parliamentary burgh.

WIG, a bay affording commodious and safe anchoring-ground, on the west side of Lochryan, nearly opposite the village of Cairn.

WIGTON, a parish in the eastern border of Wigtownshire. Its form is ellipsoidal, with the greater axis extending from east to west. It is bounded on the north-west, north, and north-east, by Penninghame; on the east by Wigton-bay, which divides it from Kirkcudbrightshire; and on the south and south-west by the river Bladenoch, which divides it from Kirkcubright. Its greatest length is 5 miles; its greatest breadth is 4 miles; and its superficial extent is 5,500 acres. A streamlet, called Bishopburn, runs to the bay over a distance of nearly 4 miles along the boundary with Penninghame. The bay of Wigton, or the estuary of the Cree, while washing the parish, is from  $1\frac{1}{2}$  to  $2\frac{1}{2}$  miles broad; yet, at the recess of the tide, it becomes simply an expanse of sand, furrowed by the channels of the streams. A district in the north-east, lying on the bay and measuring  $2\frac{1}{2}$  miles by  $1\frac{1}{2}$ , is an almost uninterrupted level, and bears decided marks of having, at a comparatively recent period, been constantly submarine. Both its soil and its subsoil are a kind of indurated silt, intermixed with shells; and they are stratified, and jointly very deep. The tract, after being forsaken by the sea, appears to have been first forest, and next bog; and though now very extensively reclaimed and arable, still has a large aggregate of bog, and exhibits many trunks of its quondam trees, especially of oaks. The district inward from it, and constituting the north-west division, is roughly tumulated, and, along with some improved lands, and others which are improvable, contains probably 1,000 acres of irreclaimable moor and moss. The southern district, though hillocky and broken, has much good low ground, sends the plough over most of its rising grounds, and exhibits no small amount of the happy results of agricultural improvement. The soil, both on the heights and on the plains, is a dry, light, hazle mould, lying in some places on till, and in others on gravel; and being in general thin, it agrees well with showeriness of weather. The only village is *BLADENOCH*: which see. The principal landmark antiquity is the standing-stones of Torhouse. These are all of unpolished granite; and form a circle of 19 stones, and a centre of 3. The stones on the circumference are from 2 to 5 feet long, from 4 to 9 in girth, and from 5 to nearly 12 asunder,—forming a circle of 218 feet; and the stones in or near the centre, stand on a line from east to west, the exterior ones 5, and the interior one 3 feet high.

Some single stones, and several cairns—the latter originally large, but now wasted by having been used as quarries for fences—occur in the vicinity. Some writers regard these remains as Druidical; others, as an ancient court of justice; and others, among whom are Sir Robert Sibbald, Timothy Pont, and Symson, as monuments of the person, the chief officers, and the common soldiers of Galdus, the Scottish prince, who conquered the province from the Romans. Four great lines of road traverse the parish, radiating from the burgh in the directions respectively of Newton-Stewart, Ferry-town of Cree, Whithorn, and Stranraer. Population, in 1801, 1,475; in 1831, 2,337. Houses 493. Population, in 1841, 2,552. Assessed property, in 1815, £6,499.—Wigton is the seat of a presbytery in the synod of Galloway. Patron, the Earl of Galloway. Stipend £272 Os. 9d.; glebe £24. Unappropriated teinds £162 13s. 9d. The parish-church was built in 1730, repaired and enlarged in 1770, and re-roofed in 1830 or 1831. Sittings 660. An United Secession chapel in the burgh, belonging to a congregation established in 1748, was built in 1750, and enlarged about 1785. Sittings 448. Stipend £120, with £10 for sacramental expenses. A Relief congregation was established in the burgh in 1834, and has been gratuitously accommodated with the town-hall. An ecclesiastical census, not of the whole population, but of examinable persons in 1836, exhibited the latter as 1,302, and distributed them into 918 churchmen, and 384 dissenters. There are two schools in the burgh under the direction of the magistrates, the one for boys and the other for girls. Salary of the schoolmaster £24; of his assistant £10; of the schoolmistress £10; of her assistant £6. The fees are moderate; and the schoolrooms are much too confined for either comfort or health. In 1834, there were 8 private schools, attended by 320 scholars.—The ancient church was dedicated to St. Machute, a saint of British origin who died in 554; it was given by Edward Bruce, lord of Galloway, and brother of the royal Robert, to the canons of Whithorn; and it afterwards became a free parsonage, and in the feeble reign of James III. had for its rector a younger son of Sir Walter Scott of Buccleuch.—A convent for Dominican or preaching friars was founded at Wigton, in 1267, by the well-known Lady Dervorgille. This convent stood on the south-east of the town, and was governed by a prior; but, even in 1684, when Symson wrote, “the very ruins thereof were almost ruined,” and now they have entirely disappeared. The friars obtained from Alexander III. a grant of a large portion of the “firms” annually due to him from the town of Wigton; and they gave lodging to James IV., and received frequent gratuities from him on his many pilgrimages to the shrine of St. Ninian at Whithorn. “Ronald Makhretun, clarschawner,” or harper, received from James IV., during life, six marks worth of land of Knoekar in Wigton, for his fee as one of the King’s musicians, on the condition of his annually paying the friars of Wigton six holls of meal. The friars had in perpetuity a fishery on the south side of the Bladenoch upwards from its embouchure; and, in compensation or purchase of their “singing daily, after evensang, *Salve regina*, with a special orison, for the King’s father and mother, predecessors and successors,” they obtained temporary grants of the fishery on the north side of the same river from James III., James IV., and James V. The revenues of the convent, never considerable, were vested in the Crown by the general annexation act. The friars, compared to kindred communities throughout the country, seem to have been quite obscure.

WIGTON, a royal burgh, and the capital of Wig-

tonshire, stands in the south-east corner of its cognominal parish,  $7\frac{1}{4}$  miles south of Newton-Stewart, 11 north of Whithorn, 20 east of Stranraer, 58 west-south-west of Dumfries, and 105 south-south-west of Edinburgh. Its site is a rising ground or tableland of about 200 acres in extent, and about 200 feet above sea-level, near the heach of Wigton-hay, and about 3 furlongs north of the mouth of the Bladenoch. As seen from some distance, the town has a beautiful appearance; and as seen from within, it presents a cleanliness, a neatness, and a general taste, rarely, if at all, found in towns of its size. Its principal locality is a rectangle or parallelogram about 250 yards long, proportionally broad, and extending from east-north-east to west-south-west. This area, excepting sufficient space around its exterior for carriage and pathways, is all enclosed. The central part of the enclosure presents the smooth, green, level sward of a public bowling-green. At the lower end is an intricate and excellent dial. At the upper end is an artificial circular bank, cut into a series of terraces, or concentric sward seats, whence the burghers, rising above one another as on the section of a galleried pyramid, may look down on the sport of the bowl-players below. Round the whole of the enclosure, between the inner objects and the roadways, are umbrageous gravel walks, planted along the sides with shrubs and evergreens and forest trees, and almost completely hid by them from the intrusive gaze of peers on the streets. So fine and judicious a burghal ornament as this enclosure, with its contents, is quite unique of its kind, indicates much good taste, and ought to provoke imitation; and, while it pleases and delights a stranger simply by its intrinsic properties, how much is he surprised, how greatly is he charmed, when he learns that it occupies the quondam site of a huge common dunghill of the burgh, and thus stands before him the type of transformation from moral turpitude to the sweets and the odoriferousness of moral beauty! Most of the town, additional to the rectangle, consists of a street, proceeding 230 yards west-south-westward, on a line with the south side of the rectangle; a street of nearly the same length, going off from the south side of the latter, bending round in the form of the segment of a circle, and leading out the thoroughfare toward Bladenoch and Whithorn; two streets, each about 130 yards long, and parallel to each other, going off at right angles from the ends of the north side of the rectangle, one of them leading out the highway to Newton-Stewart; and three other streets, short, not fully edified, but combining with the rest of the town arrangement to produce a tout-ensemble of beautiful intersections and interlacy of plan which could hardly have been producible out of so small a number of houses, and which has an agreeableness of effect seldom equalled in neatly constructed towns of even considerable size. Many of the houses are new; and a sufficient number are neat, entirely to redeem the place from the careworn and tawdry aspect which so generally belongs to old Scottish towns of its class. On the street at the upper extremity of the rectangle stands the market-cross, a structure of great architectural elegance, and adorned with tasteful sculptures. At the opposite extremity, looking up the unedified and enclosed area, is the town-house, surmounted by a considerably high tower, and distributed into court-room, assembly-room, and an apartment for a subscription library. In a fine retired spot, nearly 100 yards from the east end of the town, stands the parish-church. In itself it is patched and shabby, and possesses no interest; but in its surrounding cemetery are two monuments which will suggest to many minds of the best cast very thrilling and in-

structive associations. Both are to the memory of martyrs. Margaret M'Lauchlan, a woman of advanced years, and Margaret Wilson, a young woman of 18, were tried at Wigton by the inglorious Grierison of Lag, Colonel Graham the brother of the infamous Claverhouse, Major Windram and Captain Strachan, commissioners appointed to try nonconformists with power of extreme penalty, and having been condemned by these brutal tools of truculent persecution to be staked at low water and drowned by the flow of the tide, they underwent the martyrdom with a steadiness which resisted all allurements to recant, and a grandeur of moral heroism which might have put the bull-dog bravery of all the troops of the king to the blush. One of the monuments commemorates these females, and bears suitable inscriptions, in reference to each, followed, in the case of that which refers to Margaret Wilson, by the doggerel rhymes:

"Let earth and stone still witness beare  
There lys a virgine martyr here,  
Murdered for owning Christ Supreme  
Head of his Church, and no more crime,  
But not abjuring Presbytry,  
And her not owning Prelacy.  
Of Heaven nor Hell they stood no awe;  
Within the sea, ty'd to a stake,  
She suffered for Christ Jesus' sake.  
The actors of this cruel crime  
Was Lagg, Strachan, Wiram, and Ghrame;  
Neither young years nor old age  
Could stop the fury of their rage."

Three men, William Johnston, John Milroy, and George Walker, all in humble worldly circumstances, were interrogated, not tried, by Winram at Wigton; and failing to please him with their answers about attending the services of the curate, they were next day, without even a poor show of justice being done them, publicly executed. The second interesting monument in the churchyard is to the memory of these men; and it bears an inscription which simply states that they were, "without sentence of law," put to death "for their adherence to Scotland's reformation, covenants, and national solemn league."

Wigton has no manufactures except the ordinary artisan products for local use, and very little trade beyond the transfer of commodities for the supply of a limited circumjacent country. Though there are nominally five annual fairs, they possess hardly any connection with business, and have fallen into all but complete neglect. A weekly market is held on Saturday; but it entirely wants the stir and the importance of markets in many other agricultural districts. The sum of the most valuable part of the export trade is the annual shipment of probably, on the average, 10,000 or 12,000 bushels of grain, with a proportionate quantity of potatoes, and a smaller quantity of oatmeal. A creek previously used as a harbour became inaccessible in 1817 or 1818, in consequence of a change in the current of the river Bladenoch; and a new harbour and breastwork were soon after erected at a considerable expense by the magistrates. Though the dues levied at the new harbour are questionable as to their legality, no authority having been obtained for making the erection, they appear to be very moderate, and to yield no more than a fair return for the money laid out in giving accommodation to shipping. Up to 1833, the harbour-dues averaged about £30 19s. In 1831, the vessels belonging to the town were 14 in number, and aggregate carried about 880 tons; and the number of vessels which cleared out from the harbour was 76, cargoes with upwards of 5,000 tons. In 1840 there were 63 vessels measuring 4,199 tons, belonging to this port, and manned by 311 men and boys. The Countess of Galloway steamer maintains communication generally twice a-week with Garlieston,

Kirkcudbright, and Liverpool. The Stranraer and Newton-Stewart mail is daily in transit. Wigton has an office of the British Linen Company's bank; a customhouse; a stamp-office; 5 insurance offices; a masonic lodge; a friendly society; and a Bible society.

Wigton is governed by a provost, two bailies, a treasurer, and 14 councillors. Municipal constituency, in 1840, 111. The affairs of the burgh appear to be in a very flourishing condition. There is no debt; there have been no alienations of the common property for nearly two centuries; the public property is of considerable value; and the revenue in ordinary years exceeds the expenditure. In 1832, the revenue was £393 4s. 4d.; and the expenditure £391 5s. 11d. There is no local assessment for burghal purposes. The cess payable for the burgh is £4 16s. 4d., and is defrayed out of the common funds. The affairs of the poor are maintained by voluntary subscription, and managed jointly by the magistrates, the kirk-session, and the heritors. The ancient royalty comprehended about 1,200 acres, almost wholly alienated for trifling feu-duties, nearly two centuries ago, to the Galloway family. The boundaries under the Reform act exclude most of these grounds, and include the farms of Maitland and Kirklandhill which formerly were not held in burghage. The jurisdiction exercised by the magistrates is very trifling; and, during 10 years ending in 1833, disposed of only 5 civil and 33 criminal cases. Nearly all the civil cases on the burgh are tried before the sheriff-court. The patronage of the magistrates extends to the election only of their own officers, and the teachers of the endowed schools. There being no guildry and no incorporated trades, no fees are exacted from any trader who settles in the burgh. The sheriff and commissary court sits every Tuesday during session. There reside in the town the principal clerk of the peace for Wigtonshire, 4 justices of peace, and 7 procurators. Wigton unites with Stranraer, Whithorn, and New-Galloway in sending a member to parliament. Parliamentary constituency, in 1840, 108.

An old castle, which dated back to at latest the middle of the 13th century, and was built by a body of successful Saxon invaders, appears to have occasioned the origin of the town. It stood on the banks of the Bladenoch at a place now abandoned by the river, but where anciently it fell into the bay. Vestiges of the fosse, and some confused small masses of stone and mortar, are the only remains. The castle was sufficiently important to be demanded and obtained by Edward I. in 1291, to be held by him till the competing claims for the crown should be adjusted. While in his possession, it was successively under the charge of Walter de Currie, Laird of Dunskey, and others; and it was afterwards delivered up to John Baliol as king of Scotland, and became for a time a royal residence. The town was incorporated and recognised as a royal burgh from a very early period. The original grants having been lost or destroyed, James II., in 1457, of new granted a charter, confirming the burgh in all its ancient rights and privileges. In 1661, this charter was ratified by the Scottish parliament. Shortly afterwards, Charles II. granted a new charter, confirming the former grants, and conferring such rights of taxation as the burgh continues to exercise.—Wigton gave the title of Earl to the noble family of Fleming. The earldom was created, in 1341, jointly with the title of Baron Fleming and Cumbernauld, and it became dormant, in 1747, at the death of Charles, the 7th Earl. The Hon. Admiral Fleming, governor of Greenwich hospital, who died in 1840, was said to be the representative of the Earls.

**WIGTON-BAY**, the estuary or frith of the Cree, bringing up the sea north-north-westward between the counties of Wigton and Kirkcudbright. Its extremities or the headlands at which it becomes lost in the Irish sea, are Burrowhead in the Wigtonshire parish of Whithorn, and the Slack of the Ross in the Kirkcudbrightshire parish of Borgue. Its entrance, measured in a straight line between these points, is 12 miles wide. Its length, measured from the middle of this straight line to a point a little north of Creetown, where the river begins to be estuary, is 15 miles. Its breadth over the upper half slowly expands from 6 furlongs to 4 miles; and over the lower half averages about  $7\frac{1}{2}$  miles. Fleet-bay opens from about the middle of its Kirkcudbrightshire side; and forms of itself a considerable estuary: See **FLEET (THE)**. Of smaller bays which open from it, the chief on the Wigtonshire side are Isle of Whitburn-bay, Port-Yarroch, Rigg-bay, Garies-ton-bay, and the little estuary of the Bladenoch,—and on the Kirkcudbrightshire side are Bridgehouse, Boreness, Kirkandrew, and Knockhrex bays. Five islets look up from its bosom, but lie near the shores; the Isle of Whithorn, at the mouth of the bay to which it gives name; two Murray Isles off the coast of Girthon; and Knockbrenx and Barlocco Isles off the coast of Borgue. Though a large aggregate extent of the coast is bold, rocky, and precipitous, most of the bays afford good and safe anchoring-ground. Over between 5 and 6 miles from the head or begun expansion of the estuary, broad belts of sandy heath are on both sides left dry at the efflux of the tide.

**WIGTONSHIRE**, a county forming the western division of Galloway, and occupying the south-western extremity, as well as containing the most southerly land of Scotland. It is bounded on the north partly by the Irish channel or frith of Clyde, principally by Ayrshire, and to a small extent by Kirkcudbrightshire; on the east by Kirkcudbrightshire; on the south by the Irish sea; and on the west by the Irish channel. The whole of the boundary with Kirkcudbrightshire is formed by the Cree and its estuary, Wigton-bay; and the boundary with Ayrshire is formed for 2 miles by Loch-Dornal and a brook flowing from it to the Cree,—for nearly 4 miles by Loch-Maberry, and a brook which enters it from the west,—for 1 mile by the Cross-water of Luce,—for 3 miles by Craigoeb-burn and the Main-water of Luce,—for  $\frac{1}{2}$  mile by an easterly flowing head-stream of Drumorawhirn-burn,—and for  $2\frac{1}{2}$  miles by Lochryan. The boundary in every part, except between 6 and 7 miles on the north, is thus formed by water; yet as it consists of no fewer than six separate or uncontinuous lines of water on the north, and as most of these lines are rilly and unvoluminous, it can be regarded as geographical or naturally distinct only over a small part of the north, and over the whole of the other sides. The county lies between  $54^{\circ} 36' 45''$  and  $55^{\circ} 3' 40''$  north latitude; and between  $4^{\circ} 15' 50''$  and  $5^{\circ} 7' 10''$  longitude west of Greenwich. It extends from east to west between 30 and 31 miles; and from north to south between 28 and 29. Its form would be proximately square but for the enormous indentation of Luce-bay on the south, and the smaller though very considerable indentation of Lochryan on the north. The superficial extent is variously stated by the New Statistical Account at 459 square miles,—by the Rev. Samuel Smith, in his View of the Agriculture of Galloway, at 485.5 square miles, or 244.498 Scottish acres,—and by Chalmers, in his Caledonia, at 484 square miles, or 309,760 statute acres.

**LUCE-BAY**, **LOCHRYAN**, and **WIGTON-BAY**, each of which is fully described in its proper alphabeti-

cal place, must be understood in their outlines, extent, and relations, in order to a fair conception being formed of either the configuration of the county, or the trending of its coasts. The district or double peninsula west of Luce-bay and Lochryan, and of the isthmus of  $6\frac{1}{2}$  miles which lies between them, is called the **RHINNS OF GALLOWAY**: See that article. The district which forms the broad large peninsula between Luce-bay and Wigton-bay is called the **MACHERS**: which also see. The remaining district, or all the country north of the Machers and east of Lochryan, bears the loose general name of the **MOORS**. Ordinary reckoning, or that of the Rev. Samuel Smith, restricts the Machers to little more than one-half of the large peninsula, or to about 64 square miles; and, estimating the Rhinns at 116, it consequently assigns to the Moors about 305 square miles, or an area not very much more than double of the joint area of the other districts. Though the really moorish part of what bears the name of the Moors is quite extensive enough to render the name proximately correct, when used in contrast to the rest of the county, yet it is by no means either sufficiently extensive, or of sufficiently marked character, to make the designation more descriptive of Wigtonshire than it would be of many other Scottish counties.

The physical aspect of Wigtonshire is not striking or broadly varied, and offers very few large interesting landscapes. While almost uniformly tumulated, a restless and continuous sea of knolls and hillocks and hills, it aggregately rises less above sea-level than probably any other county in Scotland. Hillocks rise almost everywhere immediately from the shore to the height of 100 or 200 feet, and occasionally to such additional elevation as to become strictly hills. Similar heights, aggregated in constant congeries, stretch away for several miles into the interior, nearly at the same elevation, producing a very unequal surface, everywhere intersected with innumerable valleys, furrowed out by streams, or depressed into hollows, containing either lochlets or little arable dingles. The face of the heights is generally broken by abrupt protuberances, and by steep banks and rocky knolls diversified into every variety of shape. A plain or valley, bearing marks of having at a comparatively recent period lain under the sea, extends from Luce-bay to Loch-Ryan, and measures  $6\frac{1}{2}$  miles in length and about 3 in breadth. A considerable extent of low and level ground, also at a comparatively late date submarine, lies likewise along the lower Cree and the upper part of Wigton-bay. The heights, as the county recedes northward, become bolder and of a more decidedly hilly character than near the coast; and, in the vicinity or along the line of the boundary with Ayrshire, they often rise to 1,000, and occasionally to not very far from 1,500 or 1,600 feet above sea-level. The loftiest grounds, in a general view, occupy a mere belt of country, and form only the skirts of the broad range of the southern Highlands, as it sweeps across the south of Ayrshire, to communicate, along Kirkcudbrightshire and other counties, with the eastern Cheviots. All the Moors and the Machers have thus a southern exposure, coming down from the northern boundary to the Irish sea. The Rhinns district looks in every direction; yet has its prevailing line of water-shed much nearer the west than the east, and sends up its highest ground almost in the middle, around the finely commanding eminence of **CAIRNPAT**: which see.—In keeping with the configuration, position, and general declination of the shore, the climate is very moist, with prevalingly south-western winds, which are usually laden with rain. Snow seldom lies long; and frosts are seldom

severe or of long continuance. Though humidity of atmosphere abounds, it is rarely injurious to the fruits of the soil, and becomes mischievous principally when the cultivator has not bestowed due care upon his lands.

The coast, except at the head of the three very large indentations of the sea, and in a few of the minor bays and creeks, is very generally—indeed, almost continuously—bold and rocky. Though it aggregately extends, including curvatures, to something upwards of 120 miles, it contains comparatively few recesses where a large ship may safely ride at anchor or attempt to land a cargo, and not very many which afford fair landing-places for even small craft. Loch-Ryan, all round, indeed, is one huge, fine harbour, and two or three of the creeks of Wigton-bay are decidedly hospitable; but with these exceptions, almost the whole coast is a rampart of stern cliffs bristling defiance to a foe, and interrupted across the head of Luce-bay with a stretch of low sands which woos him to ruin. The rocky cliffs, very generally, rise sheer up from the sea; and, with singular frequency, they are perforated with caves and twisted into curious forms. The minor bays are, in the great majority of instances, mere creeks; and are far too numerous to bear enumeration. The minor headlands possess a character in keeping with the creeks; and often form, jointly with them, a slightly waving or serrated coast-line. The grand headlands are the Mull of Galloway, the southern extremity of the Rhinns, and the most southerly land in Scotland; and Burrow-head, the extreme point of the Machers, and only 2½ miles less southerly than the Mull. The most important harbours are Carty, near the foot of the Cree; Wigton, at the mouth of the Bladenoch; Garlieston, about the middle of Wigton-bay; Isle of Whithorn, a little north-east of Burrowhead; Port-William, about the middle of the east side of Luce-bay; Port-Logan, on the west coast of Kirkmaiden; Portpatrick, at the cognominal town; and Cairnryan on the east side, and Stranraer at the head of Loch-Ryan.

The streams of Wigtonshire are, for the most part, small and unsuited to topographical notice; yet, in a few instances, they afford admission, for a brief way, to light coasting-vessels, and are ornamental to a country of no great scenic beauty. The principal are the CREE and the BLADENOCH, southward to Wigton-bay; the TARR, a tributary of the Bladenoch; and the LUCE southward, and PELTANTON-BURN south-eastward, to the head of Luce-bay: see these articles. The lakes are very numerous; but are all small, and aggregately cover only 7½ square miles. In several parishes, as in Inch, Mochrum, Kirkcowan, and Penningham, they occur in clusters, or rapidly spot the face of the country. The largest are DOWALTON-LOCH [which see] and Castle-Kennedy-loch, described in the article INCH. Several in the south possess much beauty, and furnish some fine close landscapes; but the great majority, especially in the north, are cold and cheerless watery expanses, surrounded by bleak and moorish banks. Chalybeate springs occur in Whithorn and Stoneykirk; and mineral springs, and a sulphureous one, occur in Inch. Springs of pure water are, in general, many and copious.

The most prevalent rocks are primary, transition, and secondary schists. Greywacke, greywacke slate, and argillaceous scbist, are particularly abundant. Beds of greywacke occur of all thicknesses, from a few inches to many feet, of hard compact grain, and of a blue or greyish brown colour, for the most part breaking irregularly, but often splitting into parallel slices. These beds are interspersed in all different proportions with strata of a soft, shivering, argilla-

ceous stone, which easily yields to the weather, and locally bears the name of slate-band. Both the greywacke and the argillaceous strata generally make a rapid dip, but occur at all angles from an absolutely vertical position to one nearly horizontal; they are frequently contorted in a manner not a little curious; and occasionally they are intersected with veins or dykes of porphyry. Hillocks and hills occur of till and gravel, evidently formed by water, and singularly contrasting in the roundness and smoothness of their surface, to the roughness of the rest of the country. When one chiefly or wholly of tilly composition is opened it presents a curious spectacle; the general mass of till being confusedly interspersed with blocks of stone, some rounded and some angular, of all sizes up to the most enormous blocks, and of substances which indicate their having been wrenched and carried along from mountains at least 10 or 12 miles distant. Slate quarries have been worked in Kirkmaiden. Sandstone occurs in the north of the Rhinns. Coals have been an object of earnest but vain search. Limestone occurs in no great plenty, and is generally of too poor a quality to be worked for the uses of the farmer, but assumes, in Whithorn, the character of what two authorities before us call "fine variegated marble." Copper ore occurs in Whithorn.—The soil of nearly all the Machers and a considerable part of the moors is of a hazel colour, and is of the species sometimes termed dry loam, though it often inclines to gravel. The bed of scbist on which it lies is frequently so near the surface as to be scratched and rutted by the plough; and where soft, it probably gives off by attrition a considerable though slow accession to the soil's depth. The low ground along the Cree and the head of Wigton-bay seems all alluvial, or formed of substances brought down by the river, flung back by the tide, and mixed with clay, shells, and sand. The Carse of Baldoon, which constitutes the larger part of it, and measures about 3,000 acres, has all the qualities of carse or strong clay soil, and justly possesses the fame of being the richest and best cultivated land in Wigtonshire, and the Carse of Gowrie of the south-west of Scotland. Like the luxuriant carses of the Forth, this opulent tract, after being left by the sea, became successively forest and moss, and retains some remains of its morassy condition. In the valley between Luce-bay and Loch-Ryan, the soil consists chiefly of a deposition of sea-sand, interspersed with considerable but extensively reclaimed tracts of shallow flow-moss. A belt of sandy soil occurs also on the west side of Loch-Ryan. The lands of the Rhinns, in a general view, possess all the characters of the best soils of Galloway, and are, to a large extent, arable; and they have subsoils now absorbent and finely conducive to good tillage, and now retentive and occasioning the soils to be wet and spongy. The central and northern sections of the district of the Moors present a pervading aspect of extreme barrenness. Extensive regions appear covered entirely with a soil of peat earth,—large and deep flows, which chill the air with their humid exhalations, and admit, even amid the genial glow of summer, very little vegetation. Some of these flows extend, with little interruption, to a length of 8 or 10 miles; and they are perfectly useless for black cattle, and readier to swallow than to feed them.

From the barbarian character of the original Novantes, and the comparatively superior civilization of the colonists of the Middle ages, we may easily infer that the usual progress of agricultural economy, from rudeness to refinement, took place in Wigtonshire. Under the mild management of the Baliols, lords of Galloway, husbandry began to prosper. Even in 1300, that year of conflict and of conquest, more

wheat was found in Galloway by the English armies than the mills of the province could manufacture into flour. But succeeding ages of warfare and waste, of local tyranny and general misgovernment, deprived the husbandman of all spirit and hope. To so monstrous a condition were landed interests progressively reduced that, in the sad reign of Charles I., lands were offered for no other rent than payment of the public taxes, and estates were exposed for sale at two years' purchase. Agriculture deteriorated from the beginning of the 14th century onward, till it became all but extinct, or crawled along in combined slothfulness and absurdity of movement. In 1684, when Symson wrote, the routine of crops, so far as tillage existed, was a constant succession of oats and bear, and hear and oats. Marsbal Lord Stair, the earliest improver, retired from public life in 1728, and, till his death, in 1747, divided his time between Wigtonshire and West Lothian, in establishing upon his lands such superior arts of husbandry as he had observed in England or on the continent. He enclosed his grounds; drained marshes and swamps; cultivated potatoes, turnips, cabbages, and carrots, in the open fields; introduced artificial grasses; practised the horse-hoeing husbandry; and altogether displayed a skill and an energy of improvement which surely, though slowly, worked a revolution in the wretched agricultural practices which prevailed. In 1760, principles and plans of improvement, founded in reason and experiment, began to be introduced by an intelligent agent of the Earl of Selkirk, of the name of Jeffrey, upon his lordship's estate of Baldoon; and they somewhat extensively, though in a silent way, recommended themselves to the adoption of intelligent and wealthy landowners. The Earl of Galloway, one and a chief imitator, took under his own management farm after farm; made stone-dyke enclosures; freely used lime and sea-shell manures; introduced a rotation of first oats, next potatoes and turnips, and next barley with grass-seeds; and, after his farms were thus enclosed and systematized, let them upon a lease of 19 years, at a considerable advance of rent. In the summer of 1777, Wight, who was sent into Wigtonshire to tell the farmers what he thought wrong and what he presumed to be right, found the inhabitants of the county-town and its vicinity "a drowsy people," who discerned only "some symptoms of a dawn" in rational agriculture; and, on proceeding farther into the county, saw excellent soil execrably managed,—the tenants poor and torpid,—and the rotation an exhausting process of first a crop of oats, and next three or four successive crops of bear. But impelled principally by the influence and example of the Earl of Stair, on his lands of Inch, and by the vigorous efforts of the Agricultural society of Dumfries-shire, conducted, as these were, by the talents and genius of Mr. Craik, Wigtonshire, had, about the commencement of the present century, moved onward to a position of very decided and general improvement. Two agricultural societies have long been at work in the county; the farmers, as a body, are respectable in both intelligence and practical tact; and the existing methods of agriculture, though flinging an aspect over the country very much inferior to that of several other Scottish counties, are, when viewed in connexion with the difficulties of the soil, highly creditable to the farming community's discernment and skill. The land of the county lies, for the most part, under entail; and is very little subdivided among proprietors. Farms, compared to those in other districts, are generally of medium size; and they are usually let on leases of 19 years. The proportions of the whole area which are arable and pastoral are to each other respectively as 7 to 11; or the arable

grounds amount to about 35 per cent. of the entire county. While improvement and the war-stimulus were jointly in operation, the value of land increased with almost incredible rapidity; but it afterwards reached a maximum, and even experienced a marked fall. One farm, on the property of the Earl of Stair, which, previous to 1790, rented for £7 2s. 6d., paid only 16 years after a rent of £195. The average rent of land throughout the county is at present little more than 6s. per acre; but, in 1810, it amounted to 8s. 6d.

Wigtonshire is celebrated, in common with the eastern and larger section of Galloway, for the excellence of its pastures, the good points of its peculiar breed of black cattle, and the largeness of its produce in oxen and sheep for the markets of England. But in these particulars, and in all others which belonged to its pastoral districts, it has a strict community of character with Kirkcudbrightshire, and may be regarded as fairly described in what we have said respecting that county: see KIRKCUDBRIGHTSHIRE. Though all or most of the area seems anciently to have been covered with forest, the aggregate remaining extent of natural or copewood does not exceed 200 acres. Plantations are, on the whole, very far from being numerous or extensive enough to give the county a sheltered or well-cultivated aspect. Yet John, Earl of Stair, and his son, the celebrated Marshal, planted annually, for a considerable period, at least 20,000 trees, chiefly Scottish firs, with a happy mixture of larch, ash, beech, and some other forest trees. Though the plantations on the Earl's large property are aggregately not extensive, those around Castle-Kennedy are peculiarly beautiful and embellishing,—many of the trees being of a most luxuriant growth, and some heech hedges, 70 feet high, excelling, perhaps, all in the kingdom. The plantations on the estate of the Earl of Galloway, too, are interesting: they occur in clumps and belts on the extensive pleasure-grounds around Galloway-house, and are continued for several miles on the rising grounds along the coast of Wigton-hay, and amount altogether to upwards of 500 acres.

Wigtonshire is an agricultural and a grazing county, to the almost total exclusion both of manufactures and of all such commerce as is unconnected with the exchange of the produce of the soil for foreign articles of local consumpt. Excepting some trivial manufactures in Stranraer, the only products of artisanship are all for local use, and of the limited kinds with which no great seat of manufacture competes. The only exports from the county consist of grain, wool, sheep, and black cattle, which are sent to England and the west of Scotland; and the imports are chiefly lime, coals, and all sorts of groceries, and manufactured goods from the markets to which the exports are taken, and occasionally timber from America, and timber and iron from the Baltic. Attempts have been made to enlarge the commerce by trading on a large scale to America and the Baltic, opening a trade with the West Indies, and embarking in the herring-fishery; but they have almost uniformly failed. At the close of the 17th century Wigtonshire—with the exception of four boats which were employed in 1692 by the people of Stranraer—was utterly destitute of shipping. In 1788, when the register of shipping was established, the county had 52 vessels, carrying 2,290 tons; in 1801 it had 74, carrying 2,926 tons; and in 1818 it had 99, carrying 4,760 tons. Since the last of these dates steam-navigation has greatly altered the complexion of the commerce; and produced a rapidity in the exchange of produce for money, which powerfully contrasts with the former slow and uncertain methods, and applies a constant stimulus to every department, of

traffic. Two large steam-vessels regularly ply between the leading ports and Whitehaven and Liverpool; others ply between Stranraer, and both Glasgow and Belfast; and one maintains constant daily communication between Portpatrick and Donaghadee. But steam-navigation elsewhere has damaged the country to an amount which greatly deducts from the advantages yielded by the increase of its own facilities. Wigtonshire was formerly the great highway between the northern counties of Ireland on the one side, and nearly all Scotland and the northern counties of England on the other, and it enjoyed many advantages from the transit, not only of numerous travellers, but of large flocks of Irish cattle in exchange for articles of British manufacture; but now, except for the almost solitary and cheerless passage of the mail, it is quite forsaken, and flung back to the seclusion of an age when little intercommunication with Ireland existed.—The principal roads are the old military road, constructed about 76 years ago between Newton-Stewart and Portpatrick, and, for a time, the only road, as it was the earliest one, along which wheeled vehicles could be drawn without an extravagant and unmanageable number of horses; the newer and greatly more level mail-road between the same points; the mail-road from Glasgow down the east side of Loch-Ryan to the former road at Stranraer; a road southward from Newton-Stewart through Wigton to Whithorn; a road north-westward, along the coast of Luce-bay, from Whithorn through Glenluce to Stranraer; the east road, down the vale of the river Luce, from Girvan to Glenluce; and roads from Stranraer to near the extremities of the double peninsula of the Rhinns.—A mail-coach was introduced so late as the year 1804, and has since regularly run from Newton-Stewart to Portpatrick, carrying the Dumfries and West of England mail to Ireland. Another coach, carrying the Glasgow and Ayrshire mail to Ireland, runs along the side of Loch-Ryan. A third was started a few years ago to run circuitously between Newton-Stewart and Stranraer, by way of Wigton, Whithorn, Glenluce, and Portpatrick. A mere stage-coach, and two public coaches competing with each other, or running on the same road, are a phenomena which the country has not yet witnessed.

The principal gentlemen's seats in Wigtonshire are Galloway-house, the Earl of Galloway; Culhorn-house and Castle-Stewart, the Earl of Stair; Lochnaw-castle, Sir Andrew Agnew, Bart.; Monreith-house, Sir William Maxwell, Bart.; Park, Sir James Dalrymple Hay, Bart.; Isle of Whithorn-castle, Sir John Reid of Barra, Bart.; Lochryan-house, Lieutenant-General Sir J. A. Agnew Wallace, Bart.; Glasserton and Physgill, Stair H. Stewart, Esq.; Tor-house, Macculloch, Esq.; Barnbarroch, Colonel Vans Agnew; Castlewig, Hugh Hathorn, Esq.; Tonderghie, Hugh D. Stewart, Esq.; Broughton, Alexander Murray, Esq.; Genoch, R. Cathcart, Esq.; Balkail, John Adair, Esq.; Corswall-house, Dr. Carrick Moore; Dunskey, Colonel T. Hunter Blair; Ardwel, John M'Taggart, Esq.; Freugh, Patrick Maitland, Esq.; Garthland, Vans Hathorn, Esq.; Penninghame-house, James Blair, Esq.; Craighlaw-house, W. C. Hamilton, Esq.; and Logan-house, Major Macdougall. The royal burghs are Wigton, Stranraer, and Whithorn; and they, jointly with New Galloway in Kirkcudbrightshire, send a member to parliament. The existing burghs-of-barony are Portpatrick, Glenluce, and Newton-Stewart. The extinct burghs-of-barony are Invermessan, on the shore of Loch-Ryan; Myreton, in the parish of Penningbame; and Merton, in the parish of Mochrum. The principal villages, additional to the existing burghs-of-barony,

are Garlieston, Isle-of-Whithorn, Port-Logan, and Stewarton. Wigtonshire sends a member to parliament. Constituency, in 1840, 1,038. The sheriff and commissary courts are held every Tuesday, and the small-debt court every alternate Tuesday, during session in Wigton. Quarter sessions are held at Wigton on the first Tuesday of March and May, and the last Tuesday of October; and at Glenluce, on the first Tuesday of August. Circuit sheriff-courts for small-debt cases are held at Stranraer every alternate month; and at Whithorn and Newton-Stewart every three months. The valued rent, in 1674, was £67,646 17s. Scottish; and the annual value of real property, as assessed in 1815, was £143,425 sterling. Population, in 1801, 22,918; in 1811, 26,891; in 1821, 33,240; in 1831, 36,258. In 1831, the inhabited houses were 6,404; the families 7,514. In 1841, the population was 39,179. Houses 7,440.

Ecclesiastical notices of Wigtonshire, in reference to all its early history and to the hishopric of Galloway, are identified with WHITHORN, and will be found in our article on that town. The only great religious houses of the Roman Catholic period were Whithorn priory, Souleseat-abbey, Glenluce-abbey, and Wigton Dominican convent, all noticed either separately, or in the articles on their localities. At the Reformation, there were 21 parish churches, and several chapels; and seven of the former, and all the latter, were suppressed. On the other hand, 3 new parishes were erected during the 17th century; so that the whole number of parishes in the county is now 17. In 1581, the parishes of the eastern district were formed into the presbytery of Whithorn, which, jointly with the large presbytery of Kirkcudbright, was declared the synod of Galloway; and the parishes of the western district, along with those of the south of Carrick, were formed into the presbytery of Colmonell, which was included in the synod of Ayr. In 1593, all the parishes of the county were erected into the presbytery of Wigton; and that body and the presbytery of Kirkcudbright were constituted the synod of Galloway. In 1638, eight parishes in the east, along with the Kirkcudbrightshire parishes of Kirkmahreck and Mingaff, were declared to be the presbytery of Wigton; nine parishes in the west, along with the Carrick parishes of Ballantrae and Colmonell, were erected into the presbytery of Stranraer; and these two presbyteries, jointly with that of Kirkcudbright, were made to be the synod of Galloway. This last arrangement has ever since continued.—The chief dissenting congregations are five of the United Secession, at Stranraer, Wigton, Whithorn, Stranraer, and Wigton; four of the Relief, at Newton-Stewart, Port-William, Stranraer, and Wigton; three Reformed Presbyterian, at Stranraer, Newton-Stewart, and Whithorn; one Independent at Garlieston; and one Roman Catholic at Newton-Stewart.—In 1834, there were eighteen parochial schools, conducted by 21 teachers, and attended by a maximum of 1,394 scholars, and a minimum of 917; and 81 non-parochial schools, conducted by 92 teachers, and attended by a maximum of 3,195 scholars, and a minimum of 2,027.

In ancient times, and even for ages after the abdication of the Roman government in Britain, the powerful tribe of the Novantes inhabited the territory which now forms Wigtonshire and the western half of Kirkcudbrightshire. They had Leucophibia on the site of the present Whithorn for their chief town, and possessed also another town, called Rerigonium, on the Rerigonius Sinus, the modern Loch-Ryan. Their antiquities, contrary to the rule which prevails in the territories of other ancient British tribes, are much more abundant than those of the

Romans. Their descriptive language extensively survives, and forms a large aggregate of significant monuments, in the names of rivers and hills, and numerous other departments of topographical nomenclature. Conical tumuli of a green appearance, and composed entirely of earth, are not infrequent in occurrence; and when opened, are discovered to have been repositories of the dead,—but whether more or less ancient than cairns cannot easily be ascertained. Grey cairns inhuming rude urns which are enclosed by flat stones, and contain half-burnt human bones, have been observed in every parish. Standing stones, either of worship or memorial, belonging to Druidism, or connected with warlike deeds of the aboriginal tribes, occur at Tor-house in Wigton, and at Ardwell in Stoneykirk. Caves, distinguished by peculiar circumstances from the multitudes which perforate the rocky coast, and used by the ancient tribes as houses or hiding-places, may be seen in the sea-cliffs of the parishes of Inch, Port-Patrick, Kirkmaiden, and Glasserton. Of the larger conical mounds, while some, like the smaller, were sepulchral, others were moats for seats of the courts of justice, and others, as is proved by vestiges of intrenchments round their base, and of encampment on their summit, were converted into places of defence. A noted one of this last class is the tower of Cragach in Leswalt. —Fortifications and fortalices of a later age, castles standing, ruinous, or extinct, are very numerous, and, in some instances, of obscure or quite unknown history. Wigton-castle, the nucleus of what is now the county-town, is entirely extinct. Crugelton and Eagerness castles stood on cliffs on the coast of Sorbie, and are traceable only in their foundations. Dunskey-castle exhibits interesting remains on a cliff a little south of Portpatrick. Garthland-castle, in Stoneykirk, and Lochnav-castle in Leswalt, are surviving haronial keeps. Crosswell-castle in Kirkcolm, Galdenoch-tower in Leswalt, Claynurd-castle in Kirkmaiden, Carghdown-castle, on a precipice of the coast of Glasserton, Castle-Feather, and three other fortifications on cliffs of the coast of Whithorn, one of them on Burrowhead, exist only in slender vestiges. Synnyness-castle, in Old Luce, is probably of no great antiquity, and was called by Symson, “a good stone-house” in 1684. Long-castle, Lochmaherly-castle, and Castle-Dornal stood on islets respectively in Dowalton-loch between Sorbie, Glasserton, and Kirkinner; in Lochmaherly, between Penninghame, Kirkcovan, and Ayrshire; and in Loch-Dornal on the northern boundary of Penninghame. Mochrum and Merton castles stand on the margin respectively of Mochrum-loch and White-loch in the parish of Mochrum, and possess antiquarian interest as to both their structure and their history. Castle-Kennedy stands on a remarkable peninsula of the lake in Ineh to which it gives name; and, though comparatively modern, is, as to picturesqueness and general interest, much the most attractive of all its class of antiquities. Though some of these castles are of ascertained dates, others, especially the large proportion which surmounted the cliffs of the coast, and which aggregately have crumbled far toward extinction, are of very doubtful origin. The local antiquaries, with great show of reason, suppose that they were constructed as defences against the Scandinavian rovers of the sea, who had possession of them and the Hebrides, and scoured the intervening Irish channel and Irish sea; others, looking principally at the magnitude of the works, and, comparing them with such comparatively small surviving structures in the interior as the castles of Physgill and Mochrum, conjecture them to have been built by the Viking or Sea-kings them-

selves to give them command of the shore intervening between sections of their territory; and one writer asserts that “there is reason,” but without saying what the reason is, “to believe that these vast works were the elaborate labours of Magnus, the powerful king of Norway, who came with a mighty force into these seas during the year 1098, and who compelled the Galloway men to cut wood and carry it for him.”

The civil history of the county is nearly all common to it with that of Kirkcudbrightshire, and will be found in our article on GALLOWAY: which see. Attempts to erect western Galloway into a shrievalty or shire, subject to the jurisdiction of a sheriff, seem to have been made as early as the 12th century. But the Gaelic people of the district who hated Saxon forms of administration, and loved their own laws, doubtless greatly abridged the efficient power of the sheriff. Wigton was certainly a sheriffdom in the 13th century, at the demise of Alexander III., while the Baliols were still lords of Galloway. Edward I., in his ordinance for the government of Scotland, appointed a sheriff for Wigtonshire, and two justices for Galloway. During four reigns succeeding the accession of Bruce, the appointments must have been in keeping with a state of things in which every pretension was decided by the sword. In 1341, David II. formed the county into an earldom, with a regality jurisdiction, including even the four pleas of the Crown, and conferred it on his faithful mentor, Sir Malcolm Fleming, with Wigton as the shire town or principal manor-place. The regality jurisdiction, which was mixed up with the earldom, greatly abridged the jurisdiction of the sheriffdom. In 1372, Thomas, Earl of Wigton, and grandson of Sir Malcolm Fleming, sold his estate to Sir Archibald Douglas, lord of Galloway. During the reign of James I., William Douglas of Leswalt was sheriff of Wigton, and constable of the castle of Lochnav. In 1426, Andrew Agnew acquired the constablership of the castle, and some lands in Leswalt, and was secured in the possession of them by a charter of the superior, Margaret, Duchess of Turenne, in which she calls him “dilecto scutifero meo.” Andrew Agnew, the son of this scutifer of the Duchess, was scutifer to James II., and, in 1451, obtained from him the office of sheriff of Wigtonshire. Quinten Agnew, the son of the latter Andrew, was sheriff during a great part of the reign of James III., and the first half of the reign of James IV. Three Agnews, all called Patrick, and linked together as father and son, successively monopolized the office. Sir Andrew, Sir Patrick, Sir Andrew, and Sir Andrew Agnew, the first a knight, and the other haronets, and all still connected as father and son, continued, amid all political changes and convulsions to hold the office firmly and solely in their family till the wild had reign of James VII. The Agnews thus kept uninterrupted possession during 230 years, and discharged their public duty sometimes well and sometimes ill. Sir Andrew, the present sheriff, being favourably disposed to the persecuted Covenanters, and inclined rather to shelter their worthy ministers than to hunt them down, first, the odious Graham of Claverhouse, and afterwards his brother of kindred character, were sent down by the Scottish privy council to show the sheriff how a truculent government wished its tools to cut, and were appointed conjoint-sheriff, during pleasure, with power to nominate deputies. The hereditary sheriff, in consequence, was virtually, and perhaps even formally, superseded. In 1682–3, a violent conflict arose between Graham of Claverhouse and Sir John Dalrymple of Stair, hailies of the regality of Glenluce, founded upon a charge of the former that the

latter had endeavoured to lessen his authority as sheriff of Wigton; and issued in a decision by the privy council, which praised Claverhouse, and deprived Dalrymple of his bailiery, and fined him £500 sterling. Sir Andrew Agnew was restored to his sheriffship by the Revolution; and, in 1724, was succeeded by Sir James, his son. The latter was the last of the hereditary sheriffs; and, at the abolition of hereditary jurisdictions in 1747, received no less a sum in compensation than £4,000. The first sheriff-depute under the new regime was Alexander Boswell of Auchinleck, who afterwards rose to the bench under the title of Lord Auchinleck. The office of coroner for the county was granted by David II. to Patrick McCulloch, and, in 1557, was given hereditarily to Sir John Dunbar of Mochrum, but it seems to have fallen into disuse before the abolition of hereditary jurisdictions, as it was not then made a ground of claim.—David II. when granting a new charter of the earldom of Wigton, withdrew from it the right of regality, and the four pleas of the Crown, privileges greater than ought ever to have been granted.—Jurisdictions of regality existed over the lands respectively of the prior of Whithorn, the abbot of Glenluce, the abbot of Souleseat, and the bishop of Galloway; and their bailieries were obtained in the order in which we have stated them, by the Earl of Galloway, Dalrymple of Stair, Agnew of Lochnaw, and the Earl of Cassilis. Compensation for Souleseat seems not to have been claimed; for Whithorn was claimed at £3,000, and paid with £166 16s. 2d.; for Glenluce, at £2,000, and paid with £450; and for Penninghame or the bishop's lands, at £1,000, and refused all payment. A baronial jurisdiction over the lands of Inch belonged to the Earls of Cassilis, and was transferred, during the reign of Charles II., to Dalrymple of Stair; and, like the regality of Penninghame, it was pronounced valueless at the epoch of compensation. Several other baronial jurisdictions existed; but they either became extinct, or were merged in larger jurisdictions, before the general abolition.

**WILLIAM (FORT)**, a fortress on the east side of Loch-Eil, overhung by Ben-Nevis, near the south-west end of the great glen, Inverness-shire. It stands contiguous to the village of **MARYBURGH**: which see. It was originally built by General Monk, during the time of Cromwell; took from an ancient castle in the vicinity the name of the garrison of Inverlochry; and had accommodations for about 2,000 men. But the original structure was chiefly earth-built, and altogether of a temporary character. The present fort was built on a smaller scale, with stone and lime, in the reign of William III., and took its name from that monarch. It is an irregular work of a triangular form, with two bastions mounting 15 twelve-pounders; and is defended by a ditch, glacis, and ravelin. It contains a bomb-proof magazine; and accommodations for 2 field-officers, 2 captains, 4 subalterns, and 96 privates. It withstood a siege of 5 weeks in 1745; yet cannot be regarded as a place of much strength.

**WILTON**, a parish in Roxburghshire; bounded on the north-west by Ashkirk; and a detached part of Selkirk; on the north and north-east by Minto; on the east by Cavers; on the south-east and south by Hawick; and on the west by Robertson. It is nearly a parallelogram, extending north-east and south-west. Its greatest length is a little upwards of 5 miles; its greatest breadth is 4 miles; and its superficial extent is 17½ square miles. Borthwick-water traces the boundary on the south. The Teviot, coming down from the south-west, and receiving the tribute of the Borthwick, traces for 5

miles the south-eastern and eastern boundary, but cuts off a tiny wing of edified territory at the town of Hawick. The haughs and hill-screens which recede from the river are everywhere beautiful; and part of them a little south of the middle, forms the larger section of the fine close hill-locked landscape which environs the pleasant little metropolis of the Scottish woollen trade. Though the interior is all hilly, the heights are broad-based, and gentle in the ascent; and they generally admit the dominion of the plough, and become pastoral only toward the north-western boundary. About two-thirds of the area is in tillage, and most of the other third, though now continually in pasture, has been turned up by the plough. The soil is in general fertile and well-cultivated. About 100 acres are covered with plantation. Limestone and marl abound, and have been of great advantage in improving the arable land. Wilton-lodge, formerly the property of Lord Napier, and now the residence of Miss Anderson, is charmingly situated on the Teviot, about a mile above Hawick. The small wing of Wilton which lies on the right bank of the Teviot, forms part of what is called the Sandbed, and is the site of Hawick grammar-school, and of a small portion of the town. Wilton village consists principally of a long street, which commences near the end of the old bridge across the Teviot, and flies away in the segment of a circle behind the town's "common haugh." It contains about one-half of the parish's population; and, as to its factories and nearly all its social interests, is completely identified with Hawick, so as to have been virtually described in our notice of that town: see **HAWICK**. The village of Wilton-Dean or Langlands-Dean consists of a considerable sprinkling of houses on the face of a declivity ½ of a mile south-west of Wilton. The village of Apple-tree-hall consists of a row of cottages, and some detached houses 2½ miles north-east of Hawick. The Duke of Buccleuch is the principal landowner. The Edinburgh and Carlisle mail-road cuts the parish southward into unequal parts. Population, in 1801, 1,307; in 1831, 1,870. Houses 263. Assessed property, in 1815, £5,921.—Wilton, anciently a rectory, is in the presbytery of Jedburgh, and synod of Merse and Teviotdale. Patron, the Duke of Buccleuch. Stipend £294 2s. 9d.; glebe £30. Unappropriated tithes £412 2s. 6d. The church was built in 1762, enlarged by the addition of an aisle in 1801, and repaired and painted in 1829. Sittings 460. The aisle contributes only a gallery to the church; and in its lower story is used as a hurrying-place. An ecclesiastical survey of 1836 exhibited the population as then amounting to 1,983, and consisting of 1,272 churchmen, 673 dissenters, and 48 nondescripts. In 1834, the parish-school was attended by 134 scholars; and three other schools by 132. Parish-schoolmaster's salary, subject to the salarizing of an assistant, £34 4s. 2d., with £43 fees, and £6 other emoluments. The present parish comprehends all the original parish of Wilton and part of the abrogated parish of Hassendean. Mr. Crawford and Dr. Charter, both former ministers of Wilton, are known, the former by a work entitled 'Dying Thoughts,' and the latter by some published sermons.

**WINCHBURGH**, a village in the parish of Kirkliston, Linlithgowshire. It stands by the side of the Union canal, on the road between Edinburgh and Falkirk, 11 miles west of Edinburgh, 6 east of Linlithgow, and 4 south-west of Queensferry. It has a posting-inn. Population about 170.

**WINTON**. See **PENCAITLAND**.

**WISHAW AND COLTNESS RAILWAY (THE)**.—This railway passes through one of the most extensive and finest coal fields in Scotland,

and was constructed for the purpose of giving facilities to the transmission of these mineral treasures to the masses of population in and around Glasgow. The act of Parliament incorporating the company was obtained on 1st June, 1829, with a capital of £60,000. Since then several supplementary acts have been obtained for extending, improving, and completing the line, and raising the necessary amount of capital for these objects, which has now been augmented to £240,000, divided into 9,600 shares of £25 each. The first or northern division of the railway was commenced in 1830, and finished in 1833; the second or south or eastern division was begun in 1833, and completed in 1841. The length of the division earliest constructed amounts to nearly 3 miles, and the second or last made portion to about 8 miles,—thus affording a direct line of about 11 miles, besides 2½ miles of a branch railway in connection with the main trunk. The expense of construction, up till this period, has amounted to about £180,000, which embraces several improvements, such as laying a double rail on the first made portion, where only one had been laid before, and of adopting heavier rails. As those first laid down were of light construction, they are now being gradually replaced by rails of the weight of 56 lbs. to the yard. The line passes through the parishes of Old Monkland, Bothwell, Hamilton, Dalziel, and Cambusnethan, in the county of Lanark. The north-western terminus joins the Monkland and Kirkintilloch railway, by means of which it is brought into communication with the Forth and Clyde canal near the town of Kirkintilloch; it has another communication with Glasgow by the Monkland canal and the Garnkirk and Glasgow railway; and it may extend itself to Edinburgh and the frith of Forth, by the Ballochney and Slamannan railways, and the Union canal. The eastern terminus is to be connected by a junction with the Morningside and Wilsonton railway,—a new line which is planned to extend northward, and for which an act has been obtained by a separate company. In the Wishaw and Coltness the cuttings are moderate, and the works generally of a similar kind to those met with in other mineral railways. There is a tunnel on the line about the fourth of a mile in length, formed only for a single line of rails, but it is at present being enlarged to admit a double line. The most prominent feature in its construction is the viaduct over the valley of South Calder, near the village of Motherwell, which extends to upwards of 300 yards in length, and consists of ten piers of 100 feet span each. Three of these are 110 feet in height, and the others descend from 80 to 45 feet. The roadway is formed by horizontal beams resting on these piers, and strongly bound and supported. It is the only structure of the kind in Scotland, and as a work of art has a substantial and elegant appearance, which is much enhanced by the picturesque and natural beauty of the valley which it spans. The traffic on the line consists almost entirely of coal, iron-ore, &c., which form the abundant mineral produce of the district which the railway traverses, and are of superior quality,—in addition to a considerable trade in pig-iron, from the furnaces in the vicinity. The revenue derived from the undertaking since its opening has been gradually, if not rapidly, increasing, as will be seen from the following returns of the yearly receipts:—

	£	s.	d.
For the year 1834, . . . . .	422	13	4
— 1835, . . . . .	1,711	1	11
— 1836, . . . . .	2,471	5	7
— 1837, . . . . .	2,330	16	8
— 1838, . . . . .	3,972	9	4
— 1839, . . . . .	6,501	1	3
— 1840, . . . . .	7,883	9	0
— 1841, . . . . .	12,518	7	7

A passenger trade, in connection with the Garnkirk and Glasgow railway, has been carried on for several years, but it is limited in amount, although it is expected to be considerably increased from the facilities afforded by the recent construction of the south-eastern division of the line. For some years at the outset the traffic was principally moved by means of horse power; but lately locomotive engines have been substituted, which, from the superior power, speed, and cheapness over animal draft, are likely to supersede the use of horses entirely, except on the short branches or off-shoots from the main-trunk.

WISTON, a parish in the upper ward of the county of Lanark, to which that of Robertson was united in 1772. The parish lies on the north bank of the Clyde, and is bounded on the south by Lamington, on the opposite side of the river; Carmichael on the north; Symington on the east; and Douglas on the west. It is irregular in form, and about 6 miles in length, by from 3 to 4½ in breadth. The most imposing feature connected with the parish is the well-known hill of Tinto, which stands on its northern boundary, raising its beautiful crest 2,000 feet above the level of the sea, and green to the very summit. From this elevation may be enjoyed one of the most extensive views in broad Scotland; for the eye embraces within its range an immense tract of country and sweep of sea, including Hartfell and Queensberry, in Dumfries-shire; Goatfell, in the Isle of Arran; the lonely Bass; and even the hills in the north of England and north of Ireland. There is a peculiarly shaped hill, almost in the centre of the parish, viz., Dungavel, with two craggy and frowning peaks. From its elevation the parish is not considered one of great fertility, but nowhere can a district boast of more intelligent or enterprising farmers, as a proof of which one of them obtained a few years ago, from the Highland society, the silver medal for the reclaiming of waste lands. Much as has been done in this way, however, there is ample need for more, as nearly the half of the entire superfluities of the parish lies in its natural state, and is used for the pasture of sheep, a great proportion of which, it is believed, might be reclaimed by the exercise of industry and capital, and brought under healthy tillage. There are fully 200 acres under wood. The principal products of the soil are oats, barley, potatoes, turnips, hay, cattle, and sheep. The sheep are principally of the West Linton breed; and the cattle or cows, which are, to a great extent, of the dairy kind, are much esteemed. Including the minerals, it is computed that the parish produces more than £12,000 per annum. Of the minerals alluded to, the principal is lime, which is extensively worked, and the produce of which is estimated to amount to 18,000 bolls per annum. Coal is believed to exist, and though attempts have been made to discover a workable and remunerating seam, these have been never successful, and the principal supplies for the inhabitants are drawn from the adjoining parishes of Douglas and Carmichael. There are three villages in the parish, viz., Robertson, Wiston, and Newton of Wiston. The market and post-town is Biggar, about 7 miles distant, and the turnpike-road from Stirling to Carlisle runs through the entire length of the parish. Population, in 1801, 757; in 1831, 940; and in 1841, 929, with 200 inhabited houses. It may be worthy of note, that 87 years ago the population of the united parishes was greater than it now is, for, in 1755, according to the return made to Dr. Wehster, the numbers were 1,102. This falling-off, however, is easily accounted for, for at that time the parish was parcelled out in pendicles in the *rig-and-far* fashion, but as these small patches were gradually clustered together to form larger farms, the unne-

cessary population which resided on them had to transfer their industry elsewhere. Assessed property £4,162.—Wiston and Robertson is in the presbytery of Lanark, and synod of Glasgow and Ayr. Patron, alternately the Crown and Lord Douglas. This division arose from the Crown having been patron of Wiston, and the Douglas family of Robertson, when they were separate and independent of each other. Stipend £204 9s. The glebe both of Wiston and Robertson are attached to the living, and valued at £40. The present parish-church is the old edifice of Wiston, which is seated for about 370. A Relief church was established at the village of Robertson about forty years ago, and is seated for 377. The separate parochial schools of the old parishes have been retained, greatly to the benefit of the population, for by this means education amongst the young is universal. The salary of the schoolmaster of Wiston is £25 13s. 3d., and that of Robertson £30. The additional fees in both cases are very respectable.

**WOODHAVEN**, a small village in the parish of Forgan, Fifeshire, 9 miles north of Cupar, and 10 north-west of St. Andrews; on the river Tay, opposite to Dundee, to which there is a regular ferry.

**WOODHOUSE**. See **KIRKPATRICK-FLEMING**.

**WOODHOUSELEE**, the seat of P. Fraser Tyt-

ler, Esq., on the southern slope of the Pentland-hills, surrounded by fine woods, 6½ miles south of Edinburgh, and also the ancient seat, 4 miles from the former, of Hamilton of Bothwellhaugh: see **GLEN-CROSS**. From old Woodhouselee, which Regent Murray boldly bestowed on Sir James Bellenden, one of his favourites, Lady Bothwellhaugh was turned out in a cold night, in a state of undress, to the open fields; and she, in consequence, became, previous to the next morning, furiously insane. This occurrence forms the subject of Sir Walter Scott's first ballad of Cadzow castle:—

“O, change accursed! past are those days;  
False Murray's ruthless spoilers came,  
And for the hearth's domestic blaze,  
Ascends destruction's volumed flame.

What sheeted phantom wanders wild,  
Where mountain Esk, through woodland flows,  
Her arms enfold a shadowy child—  
Oh! is it she, the pallid rose?”

Hamilton, the injured husband of the lady, and the robbed proprietor of the mansion, became, it will be remembered, the assassin of the Regent. See **LIN-LITHGOW**.

WOOD OF COLLEBHOINE ON LOCH VENNACHOIR.

## Y

**YARROW (THE)**, a river of Selkirkshire, more celebrated in song than any other stream in Scotland. The occurrence upon its banks of an early melancholy event which made a deep impression on the popular mind,—the facility with which its name yields to the adaptation of rhyme,—the pervading wildness which, with occasional dashes of beauty and romance, characterizes its landscape,—and the disposition of later poets to rival and excel predecessors in the discussion of a favourite theme,—scem all to have had an influence in recommending the stream to so high a place in poetic favour. An idea of lugubrious sadness is associated with much of the river's scenery, and with its early and chief historical reminiscence. What that reminiscence precisely is cannot be ascertained beyond the general tradition of a deadly feud, which terminated in the death of two antagonist lords or leaders, and in the rude inhumation of the bodies of their slain followers in a marshy pool called the Dead-lake. Yet some have identified it with a duel fought between John Scott of Tushielaw and his brother-in-law Walter Scott of Thirlestane,—a duel which was fatal to the latter, but is ascertained to have been fought on Deuchar-swire, at a considerable distance; and others suppose it to have been a fray at a hunting-match in Ettrick-forest, which issued in the slaughter of a son of Scott of Harden, residing at Kirkhope, by his kinsman Scott of Gilmanscleuch. Be the event what it might, the tradition of the country, and, above all, a well-known ancient ballad entitled 'the Dowie Dens of Yarrow,' have imparted to it a high tragic interest, and have long occasioned the scene of it to be regarded as classic ground. A more modern song, by Mr. Hamilton of Bangour, beginning,

"Busk ye, busk ye, my bonnie bonnie bride!  
Busk ye, busk ye, my winsome marrow!"

was suggested by the same event, and has rivalled the ancient song in influence. The dejected loneliness of the Yarrow's vale, so well and so succinctly depicted in the phrase of 'Dowie Dens,' sadly harmonizes with the wailing tones of the ballads and the traditions, and powerfully appeals to the lachrymose sympathies of poets. The sound of the stream has not one note of the joyousness which would seem naturally to belong to the rate of its current; the aspect of the green hills which come down upon its margin possesses not one indication of the vocal and the vegetable animation which might be expected from their softness and their seeming fertility; and the whole landscape, in spite of objects which, in other circumstances, might arouse and gladden, looks to be in a condition of appalling repose, of unearthly stillness, of strength and beauty in the inaction of death. Hence, of the numerous poems which describe the stream or allude to it, the majority are deeply pathetic. An old fragment, 'Willie's drowned in Yarrow,' is entirely plaintive. Logan's piece, 'Thy braes were bonnie, Yarrow stream,' is also plaintive. The 'Douglas Tragedie,' the 'Sang of the Outlaw Murray,' and the oldest verses of the 'Yellow-hair'd Laddie,' are proved by their allusions to have borrowed both their scenery and much of their sadness from the Yarrow. Among numerous pieces either descriptive of the stream or chiefly devoted to it, the chief are 'the Braes of Yarrow,' by Allan Ramsay, and 'Yarrow Vale,' by Mr. M'Donald. Two songs in praise of the distinguished female

beauty so well-known as 'the Flower of Yarrow, bear the titles of 'Mary Scott' and 'the Rose in Yarrow,' and have been not a little popular. But the most distinguished verses which have been written upon the stream, or those, at least, which have written it most into notice, are three pieces by Wordsworth, entitled respectively 'Yarrow Unvisited,' 'Yarrow Visited,' and 'Yarrow Revisited.' The first was composed eleven years before, and the latter immediately after the poet saw the vale; and though they entirely refer to the poetical charm thrown over the stream by the various ballads in its praise, they themselves produce an interest fully equal to the aggregate of all that had been previously accumulated. "And is this Yarrow?" exclaims the poet in the 'Yarrow Visited,'—

And is this Yarrow?—This the stream  
Of which my fancy cherished  
So faithfully a waking dream?  
An image that hath perished!  
O that some minstrel's harp were near  
To utter tones of gladness,  
And chase this silence from the air  
That fills my heart with sadness!  
Yet why? A silvery current flows  
With uncontrolled meanderings;  
Nor have these eyes, by greener hills,  
Been soothed in all my wanderings."

"The hills whence classic Yarrow flows," are the summit-range of the Southern Highlands, part of the towering series which divide Dumfriesshire from the counties of Selkirk and Peebles, and form a centre to all the great ranges of the south: see HARTFELL. The stream rises at a place called Yarrow-cleuch, within half-a-mile of the source of Moffat-water, and only  $1\frac{1}{2}$  mile east of Loch-Skene. After flowing  $3\frac{1}{2}$  miles north-north-eastward it expands into the Loch of the Lowes, about  $\frac{3}{4}$  of a mile in length; and a very brief distance lower down becomes lost for 4 miles in St. Mary's-loch: see LOWES, LOCH OF (THE), and MARY'S (ST.) LOCH. Its course, after leaving St. Mary's-loch; is 11 miles north-eastward to Yarrow ford; and thence 3 miles eastward and east-south-eastward to the Ettrick at the head of Philiphaugh, or  $1\frac{1}{2}$  mile above Selkirk. Its length of run, including its lacustrine expansions, is about 25 miles. Its tributaries are not fewer than, at least, 40; but, excepting Megget-water and Douglas-burn, respectively  $6\frac{1}{2}$  and  $5\frac{1}{2}$  miles long, they do not average 2 miles in length. Floods on a small scale are sometimes occasioned merely by the action of a south-west wind upon St. Mary's-loch; and, when they proceed from rain, they rise more suddenly than before drainage became general, yet attain no great bulk till the lake overflow.—The vale of the Yarrow may be viewed as commencing at the head of "lone St. Mary's silent lake," where

—"nor fen nor sege  
Pollute the pure lake's crystal edge.  
Abrupt and sheer the mountain sink,  
At once upon the level brink;  
And just a trace of silver saud,  
Marks where the water meets the land."

On the right bank of the lake, about a mile from its east end, is the ancient burying-ground of St. Mary's. A church which stood in the middle of it, and continued, in the early part of the 17th century, to be used as a place of worship, was damaged by the Scotts in a feud with the Cranstons, and has entirely disappeared. The whole scenery around this singularly sequestered cemetery is very bold and fine; and a

funeral at the place has a peculiarly striking and solemnly picturesque appearance.—About 400 yards to the east is a small mound, called Binram's cross, surmounted by a few stones, and supposed to be the burying-place of a necromantic priest, a sacrilegious officiate at the ancient altar,—

“That wizard priest whose bones are thrust,  
From company of holy dust.”

A little north of the eastern extremity of the lake stands the lower part of the massive walls of Dryhope tower, the paternal home of ‘the Flower of Yarrow.’ This lady, the daughter of John Scott of Dryhope, was married to Walter Scott of Harden, a man as famous for his freebooting as she was for her beauty; and, by giving her daughter in marriage to Gilbert Elliott of Minto, ‘Gibbie wi’ the gowden hair,’ she became the ancestress of the talented lady who wrote ‘the Flowers of the Forest.’ See HARDEN and MINTO.—About 3 miles below the lake stands Mount-Benger, the residence, for some time, of James Hogg, the well-known ‘Etrick shepherd;’ and a little farther down, about 13 miles from Selkirk, are Gordou inn and the little village of Yarrow-feus. A bridge over the stream at the inn leads the way to Altrive, ‘the shepherd’s’ last residence, and the scene of his death.—Three miles farther on, upon the left bank of the stream, is the church of Yarrow, a neat little edifice built in 1840.—A piece of ground, a little west of the church, is pointed out by tradition as the scene of slaughter and sepulchre, whence the vale had its prime melancholy association. Till about thirty years ago, when it became enclosed, subdivided, and cultivated, it was a low waste moor; and, in upwards of twenty places, it was dotted with large cairns. The only monuments now remaining are two tall massive unheven stones, about 80 yards apart, and supposed to mark the spots on which the slaughtered leaders in the conflict respectively fell.—About 3½ miles below the church stands the little village of Yarrow-ford. Near the latter, in a romantic and solitary situation, are the ruins of the strong ancient castle of Hangingshaw, the scene of the old ballad, ‘The Sang of the Outlaw Murray,’ and formerly the property of that outlaw and his descendants. The house was accidentally burnt down about the middle of last century. Tradition, in illustration of the hospitality practised at Hangingshaw, says that every person who called at the house was treated to a draught of stout ale, from a large drinking vessel called ‘the Hangingshaw-ladle.’—A little east of Yarrow-ford is the handsome modern mansion of Broadmeadows. A mile farther down is the peculiarly interesting ruin of NEWARK-CASTLE: which see. Farther on are the ducal seat of Bowside, and other objects which, along with an abundance of wood, and the occurrence of picturesqueness and beauty in the configuration of the banks, render the Yarrow, from Hangingshaw downwards, a stream of high scenic attractions, and quite wipe away all or most of the lugubriousness of its former aspect. See SELKIRK.

YARROW, a parish in Selkirkshire, one of the largest in the Lowlands of Scotland, and comprehending considerably more than one-third of the area of its county. It is bounded on the north by Traquair and Innerleithen in Peebles-shire, and by the Selkirkshire parts of Innerleithen and Stow; on the east by both the Selkirkshire and the Roxburghshire parts of both Selkirk and Ashkirk; on the south by Roberton and Etrick; and on the west by Megget, Manor, and Peebles in Peebles-shire. Its greatest length is 10 miles; its greatest breadth is 18 miles; and its superficial extent is 71,142 imperial acres. Its outline, especially on the north, is

singularly irregular, and includes several long and intricate projections which are nearly insulated by conterminous parishes. The district comprehends several miles of the south side of the vale of the Tweed, about four-fifths of the vale of the Yarrow, about 8 miles of the central parts of the vale of the Etrick, and a south-easterly declination or hanging table-land of 8 miles in length and 2 in breadth, whence flow the head-streams of the Roxburghshire Ale-water, and some feeders of the river Borthwick. These four lines or belts of vale-ground are separated from one another by three chains of mountain or lofty hill, two of which pass at the south-west end respectively into Etrick and into Peebles-shire, while the third or central one becomes lost at the extremity of the parish in the nucleus of the summit-range of the southern Highlands. The hill-chains run nearly parallel to each other, and extend from west-south-west to east-north-east. Excepting over some space on the south, they are generally elongated in their outline and rounded on their summits; and they rarely exceed 2,000, or come short of 1,000, feet of altitude above sea-level. The vales are generally narrow and confined, yet do not want occasional picturesqueness; and when they have a protuberating hill or an elbow on the one side, they usually exhibit a corresponding recess on the other. Various appearances along the course of the principal streams indicate that the vales were formerly chains of lakes, or that the rivers flowed at a higher level than now, and formed themselves into lacustrine expansions. So decidedly is the district upland, and so closely do its heights press one another’s bases, that the proportion of pasture compared to that of arable ground is as 24 to 1. The arable soil, though various in quality and composition, is generally a light formation from greywacke and clay-slate rocks, abounding in large stones, and is not well-adapted to culture. The rearing of sheep is the chief branch of husbandry, and expends its care upon upwards of 55,000, most of which are Cheviots crossed with Leicester rams. About 260 acres of natural underwood remain as a stunted memorial of the great royal forest which once covered the whole area; and about 350 acres additional have been devoted to plantation. The principal waters, as well as most of the interesting objects of the parish, are noticed in the preceding article: which see. The Tweed is touched by a projection of the parish between two sections of TRAQUAIR [which see], and by 3½ miles of it in the district of Tweedside from the vicinity of Scrogbank to Glenkinnen-burn. See SELKIRKSHIRE and TWEED. The Etrick, while connected with the parish, has a very similar aspect to the upper Yarrow, but with more agriculture, more life, and less solitude; and, at Newhouse, it runs between almost perpendicular rocks, which are tufted with furze, and overhung with copsewood, and furnish the elements of a romantic picture. Five lochlets, two of them called Shaws-lochs, and the others Akermoor, Hellmoor, and Clearburn lochs, occur in the southern table-land, measure from a mile to nearly 2 miles in circumference, and have furnished very large supplies of shell-marl. Calcareous springs are numerous, and, in some instances, form bulky accumulations of calcareous deposit. Sulphureous springs occur at Craig and at Catslacknowe; and that at the latter place bears the name of St. Philip’s-well, and seems to have been in superstitious request during the times of popery. Chalybeate springs occur at Bowerhope. A view of the geognostic features of the district is given in our article on SELKIRKSHIRE. The condition and history of its ancient woods are noticed in the article on ETRICK FOREST.—Elibank tower, an ancient

peel-house, associated in Border story with deeds of barbarous bravery, still overlooks the Tweed,  $4\frac{1}{2}$  miles below Traquair.—Blackhouse tower, another peel-house, but small, very ancient, and of peculiar form, exists in ruin on the farm of Blackhouse in the wild glen of Douglas-burn. The desolate district around the tower and along the stream, now a part of the Traquair estate, was one of the most ancient possessions of the Black Douglasses, having belonged to them so early as in the reign of Malcolm Canmore; and, according to tradition, confirmed by allusions in the document, and by the existence of seven monumental stones, which are pointed out on the overshadowing heights as marking the spot where the seven brethren fell, it was the scene of “the Douglas tragedy.”—The villages—all small, and aggregately containing 159 inhabitants in 1836—are Yarrow-feus and Yarrow-ford on the Yarrow, and Ettrick-bridge on the Ettrick.—The chief landowners are the Duke of Buccleuch and the Earl of Traquair. Among eminent persons born in the parish, or connected with it, have been Dr. John Rutherford, a pupil of Boerhaave, professor of the Practice of Physic in the University of Edinburgh, and long known as ‘the Yarrow doctor;’ Sir Gideon Murray, better known as Lord Elibank, a title which belonged to him as a member of the College-of-justice; Colonel William Russel of Ashiesteel, celebrated for his military exploits in India, and especially for the affair of Manilla; Russell of Elibank, the learned and well-known historian of ancient and of modern Europe; Sir Walter Scott, who resided 10 years at Ashiesteel subsequently to his becoming sheriff of ‘the Forest,’ and who composed much of his poetry on a sylvan hillock on the grounds still known as ‘the Sherra’s knowe;’ and, finally, James Hogg, ‘the Ettrick shepherd,’ who long resided at Mount Bengier, and eventually lived and died at Altrive. One road leads up the Yarrow; another leads up the Ettrick; two connect them; one leads from them to Tweed-side; and all are good and kept in excellent order. Population, in 1801, 1,216; in 1831, 1,221. Houses 216. Assessed property, in 1815, £5,856.—Yarrow is in the presbytery of Selkirk, and synod of Merse and Teviotdale. Patron, the Crown. Stipend £233 8s. 1d.; glebe £34 9s. 4d. Unappropriated teinds £1,127 15s. 11d. The church was built in 1640, and altered, but not enlarged, in 1826. Sittings 430. An ecclesiastical survey made in 1836, exhibited the population as then consisting of 1,095 churchmen, and 143 dissenters,—in all 1,238 persons. In 1834, two parish and two private schools were attended respectively by 115 and by 60 scholars. The former are situated at Yarrow and at Ettrick-bridge. Salary of the Yarrow schoolmaster £31 6s. 6 $\frac{3}{4}$ d., with £12 fees, and £7 other emoluments; of the Ettrick-bridge schoolmaster £20, with £11 fees.—The present parish comprehends within its ample limits the ancient parishes of Duchoire, St. Mary’s, and Kirkhope. Duchoire, corrupted or modernized into Dewchar, forms the eastern district of the united parish, and had its church and the tower or stronghold of its feudal proprietor on a rill which comes down to the Yarrow immediately east of the present parish-church. St. Mary’s forms the western district of the united parish, and had its church on the margin of the lake to which it gave name: see preceding article. The church, as its designation implies, was dedicated to the Virgin Mary; it was described colloquially as ‘St. Mary’s kirk of the Lowes’ or lochs, and in charters as ‘the Church of the Virgin Mary in Ettrick Forest;’ and it seems to have become a vicarage under the monks of Dryburgh. The parish of Kirkhope forms the east and south-east or the Et-

trick district of the united parish, and had its church in a close-headed vale or a “hope,” called from it ‘Kirkhope,’ along which a rill runs to the Ettrick at Ettrick-bridge.

YELL, one of the Shetland islands, the second of the group in point of size, and the most northerly in situation, excepting Unst. It is washed, on part of the west and on the north, by the North sea; separated from Unst, on the north-east, by Blomel sound; washed on the east partly by the Atlantic, and partly by Colgrave sound, which separates it from Fetlar; and, washed on the south, on the south-west, and partly on the west, by Yell sound, which is studded with isles and islets, and separates Yell from the northern part of Mainland. Its length from north to south is 19 miles; its greatest breadth is  $7\frac{1}{2}$  miles; and its superficial extent is about 94 square miles. The tides on both sides of the island are very impetuous; and, both on Yell and Blomel sounds, where they meet with obstructions, and often run at the rate of 9 or 10 miles, they for continuous hours defy boat-navigation, and toss the sea, even during a calm, into foam and tumult. The chief bays which indent the bay are Cloup-voe on the north; Basta-voe, and Refirth or Midyell voe, on the east; Burra-voe on the south-east; Hamna-voe on the south; and Whalefirth-voe on the west. All these, and some smaller bays or creeks, form natural harbours, several of which are sound, capacious, and sheltered. Refirth and Whalefirth voes are opposite each other, a little north of the centre of the island, and make such a mutual approach as to leave between them only a low boggy isthmus of a few hundred yards which could be cut into a canal communication. A landing can be effected at almost any point on the east coast; but, even in calm weather, it can nowhere be effected on the west except in Whalefirth-voe and one small creek. The ends of the island, though of brief measurement, have good harbours. The coast, along the east, is generally low and often sandy; but along the west it is to a considerable extent rocky, bold, and even precipitous. The surface of the island presents a heavy and cheerless aspect. Two nearly parallel ridges of gneiss rocks, of almost uniform outline, and only from 200 to 400 feet, traverse it nearly from end to end; sloping gradually toward the shores, and, in some places, connected by transverse ridges, running from east to west. Almost the whole soil is moss; occasionally, yet seldom, mixed with clay or sand. Agriculture is in a miserable condition. Only about 4,000 acres are enclosed; probably not above 1,000 are at any time under culture; and the spade is the only implement of tillage. The island, however, “is an excellent fishing-station; and, from the days of George Buchanan, has been noted for its booths, or small warerooms, filled with all sorts of vendible articles, now chiefly imported from Scotland, but anciently from Hamburgh and Bremen. In the troubled sea of Yell sound, and the vicinity of its little holms or islets, distinguished for their fine succulent pastures, and as the breeding-places of the tern, parasitic gull, and eider duck, herring shoals, and swarms of young sillocks, are always to be seen; and perhaps the tourist may witness the pursuit and capture of a drove of ‘ca’ing whales,’ as the Delphinus deductor is styled in Shetland, which occasionally appear off these coasts in a gregarious assemblage of from 100 to 500 at a time. Their seizure is always attended with great excitement and cruelty; and although the hluher affords a rich prize to the captors, nothing can better display the debased state of the husbandry in some of these north isles, than the fact that the carcasses of the whales are in general allowed to remain untouched,

tainting the air until they are completely devoured by the gulls and crows." [Guide to the Highlands, p. 706.] Fishing is here attended with more risk of life to the fisherman than in most other seas; sad disasters occur almost every year; and, in the summer of 1832, so many as 27 men out of 30, who manned four boats, perished, 23 of them leaving widows and dependent children. The antiquities are some Picts' houses, or circular burghs; and nearly a score of shapeless ruins, or faint vestiges of ancient chapels. Population, in 1835, 2,693.

Yell is ecclesiastically distributed into three parishes, North, Mid, and South. North Yell is united to FETLAR: which see. Mid Yell and South Yell form one ministry, or an united parish. This parochial district comprehends also the island of Samphray, lying  $1\frac{1}{2}$  mile south-south-west of the southern extremity of Yell, and measuring about 360 acres in area,—and the island of Bigga, lying  $1\frac{1}{4}$  mile north-west of the former, and measuring about 540 acres in area; and, exclusive of these, it has a superficial extent of 36,000 acres, and an extreme length and breadth of respectively 13 and  $6\frac{1}{2}$  miles. Population, in 1801, of North Yell and Fetlar, 1,389; in 1831, 1,812. Houses 284. Assessed property, in 1815, £264.—This parish is in the presbytery of Burra-voe, and synod of Shetland. Patron, the Earl of Zetland. Stipend £158 6s. 8d.; glebe £20. The church of Mid Yell was built in 1832. Sittings 500. The church of South Yell, after its predecessor being in ruins for 34 years, was built in 1841. Sittings 384. South Yell is a mission on the Royal bounty. Stipend £50, with a house and glebe worth £3. There is a Wesleyan Methodist chapel, and a house for the minister. Sittings 200. Schoolmaster's salary £26, with £5 fees, and £3 other emoluments. Population of South and Mid Yell, in 1801, 1,576; in 1831, 1,812. Assessed property 666. Houses 340.

YESTER—anciently St. BOTHAN'S or St. BATHAN'S, and popularly GIFFORD—a parish in the south of Haddingtonshire. It is bounded on the north by Haddington; on the north-east, the east, and the south-east by Garvald; on the south by Berwickshire and Humber; and on the west by Humber and Bolton. Its greatest length is 5 miles from north to south; its greatest breadth is about  $4\frac{1}{2}$  miles; and its superficial extent is nearly 14 square miles. The southern district comes down from Lammerlaw and other heights along the water-shed of the Lammermoors, over a descent of 2 miles to the plain; and is all upland and heathy, yet affords good pasturage for sheep. The southern district consists of a strath—in Cambro-British, *ystrad* or *yestred*, the radix of its expressive name Yester. This strath is watered by the GIFFORD [which see]; it lies about 400 feet above sea-level, and is richly cultivated and wooded; and it has along its sides such soft low ridgy rising grounds as relieve it from the monotony of a plain, without drawing round it the limits of a valley. So richly is the district wooded that about 950 acres are under plantation. The trees on the grounds of Yester-house are large and luxuriant; and, both there and elsewhere, consist principally of oaks, beeches, elms, ashes, and limes. The arable grounds, compared to the hill pastures, are a small fraction more than as two to one. Though the soil is pre-vaillingly a cold clay, and even where loamy and light lies upon a retentive subsoil, and though it is in consequence all naturally churlish, yet it has been worked into a condition of great fertility, and exhibits in its singularly ameliorated properties a remarkable instance of the results of well-directed georgical operations. A quarry of limestone occurs at Kidlaw, and one of red sandstone at Barra; but they long ago ceased to be worked. The large and

pleasing village of GIFFORD [which see] stands in the middle of the northern division of the strath. The other villages are Long-Yester and Long-Newton, both situated at the foot of the Lammermoors, respectively 2 and  $2\frac{3}{4}$  miles south-south-east and south-south-west of Gifford, and jointly containing a population of about 150.—Yester-house, the seat of the Marquis of Tweeddale, stands amidst extensive and richly-wooded grounds about a mile east-south-east of Gifford.—Yester-castle, the ancient residence of the ancestors of the Marquis, famed for its 'Hobgoblin Hall,' stands within the adjacent parish of GARVALD and BARRA: which see.—Dr. Witherspoon, the well-known president of New Jersey college, and author of numerous theological works, was the son of a minister of Yester, and was born in its manse. Dr. Charles Nisbet, president of Carlisle college in America, was the son of a schoolmaster of the parish, and was born at Long-Yester. The parish is traversed by the road between Haddington and Lauder, and by that between Tranent and Dunse, and is otherwise well-provided with roads. Population, in 1801, 929; in 1831, 1,019. Houses 196. Assessed property, in 1815, £7,031.—Yester is in the presbytery of Haddington, and synod of Lothian and Tweeddale. Patron, the Marquis of Tweeddale. Stipend £222 5s. 3d.; glebe £25. Unappropriated teinds £3 12s. 9d. In 1834, three parochial and two private schools were attended respectively by 149 and by 70 scholars. The parochial schools are situated respectively at Gifford, at Long-Yester, and at Long-Newton. Salary of the Gifford schoolmaster £34 4s. 4d., with £40 fees, and £1 7s. 10d. other emoluments; of the Long-Yester schoolmaster £8 11s. 1d., with £18 fees; of the Long-Newton schoolmaster £8 11s. 1d., with £14 fees.—The manor of Yester or Yestred was granted by William the Lion to Hugh Gifford, the son of Hugh, an English gentleman who settled in Lothian under David I. From that early age to the present, Yestred has remained with his descendants. Hugh Gifford of Yester, who lived under David II. and Robert II., had not a son to inherit his large estates; and Johanna, the eldest of his daughters, marrying Sir William Hay of Locherwart, transferred the manor, with the patronage of the church, to him and their conjoint posterity. Thus arose the family of Yester and Locherwart, who obtained the titles of Lord Yester in 1488, Earl of Tweeddale in 1646, and Marquis of Tweeddale and Earl of Gifford in 1694. The church, originally called St. Bothan's, and afterwards called Yester's, was, in 1421, restored to its old name, and, at the same time, converted by Sir William Hay into a collegiate establishment for a provost, 6 prebendaries, and 2 singing-boys. The Reformation upset the collegiate establishment, and placed the church in a simply parochial position under the revived name of Yester. A chapel, dedicated to St. Nicholas, and subordinate to the parish-church, anciently stood at Duncanlaw.

YETHOLM, a parish on the north-east border of Roxburghshire, bounded on the north-west by Linton; on the north-east and east by England; and on the south-west and west by Morehattle. It is nearly an equilateral triangle of  $2\frac{1}{2}$  miles along the base on the north-west, and  $4\frac{1}{2}$  miles along each of the equal sides, terminating in an apex in the south-east. Its superficial extent is nearly 6,000 acres. Beaumont-water bisects the parish from south to north; it has a sandy bed and a rapid current; it abounds in trout, and is subject to sudden and high freshets. Yetholm or Primside-loch, on the western boundary with Morehattle, measures nearly  $1\frac{1}{2}$  mile in circumference, has abundance of pike and perch, and is the

resort of many species, some of them rare ones, of water-fowl. The vale of the Beaumont, so far as it lies within the parish, is the seat of 9-10ths of the population, measures  $2\frac{1}{2}$  miles in length by from 2 to  $3\frac{1}{2}$  furlongs in breadth, and, though hill-locked on all other sides, goes freely and flatly out on the north into England. Touching the lips of the stream are some pretty large haughs; and from the mansc to the north-west there is a piece of flat ground along with the haughs for about  $1\frac{1}{4}$  mile. The surface from the sides of the vales to the houndaries is a congeries of hills, all soft in feature, and gay in dress, and nowhere, even when in the south they become identified with the Cheviots, exceeding 800 feet of altitude above sea-level. The heights imhosom several sequestered, beautiful, and romantic dingles. The lower hills are arahle; and the higher are green to their summit, and form a prime sheep-walk. About 100 acres are covered with wood; about 200 are a wild moor, called Yetholm-common, on the boundary with England, and rather doubtfully helonging to Scotland; and the rest of the area is distributed into tillage and pasturage grounds, in the mutual proportions of 13 to 15. The soil of the arable land is good, and adapted for wheat-husbandry, though chiefly used in raising oats, harley, and turnips. Felspar-porphry is the prevailing rock, and contains agate and common jasper. **KIRK-YETHOLM** and **TOWN-YETHOLM** are the only villages, and are separately noticed. The principal land-owners are Wauchope of Niddrie and the Marquis of Tweeddale. The chief antiquities are apparently a Roman camp on Yetholm-law, and two British camps respectively on Camp-hill and Castlelaw. The old mansion of Thirlestane, which has now disappeared, had an apartment called 'The Warlock's-room;' and probably acquired its wizard fame from the chemical or alchymical researches of one of the proprietors of Thirlestane, Dr. Scott, a physician of Charles II. Jean Gordon, the prototype of Meg Merrilees, and her grand-daughter Madge, or Marjory, who probably sat to Sir Walter Scott as the representative of her person, were among the gipsy inhabitants of Yetholm. Several of the descendants of the celebrated gipsy Faa are still Yetholmites: see **KIRK-YETHOLM**. The parish is traversed by a road down the Beaumont, and by one leading north-westward from the villages toward Kelso. Population, in 1801, 1,011; in 1831, 1,289. Houses 222. Assessed property, in 1815, £5,384.—Yetholm is in

the presbytery of Kelso, and synod of Merse and Teviotdale. Patron, Wauchope of Niddrie. Stipend £210 4s. 2d.; glehe £25. Unappropriated teinds £171 19s. 1d. There are in the villages two meeting-houses, helonging respectively to the United Secession and the Original Burghers. In 1834 the parish-school was attended by 118 scholars, and two other schools by 170. Parochial schoolmaster's salary £34 4s. 4½d., with £29 10s. 6d. fees, and £6 other emoluments.—The advowson, hut not the temporal property of the ancient church, helonged to the monks of Kelso. In 1304, Edward I. visited Yetholm on his return from his northern expedition. In 1375, Edward III. issued a writ of presentation to the parish; and, in the same year, he negotiated an exchange of the church for that of Minto.

**YTHAN**, or **ITHAN**, (**THE**), a river of Aberdeenshire. It rises from two springs, called the wells of Ythan, in the uplands of Forgue, about a mile west of the boundary of that parish with Auchterless; and flows through these parishes, through those of Fyvie, Methlick, Tarves, Ellon, and Loggie-Buchan, and between those of Slains on the left hank, and Foveran on the right, to the sea a little helow the village of Newburgh. It runs in a north-easterly direction till near the point where it first touches Fyvie, and there it is within about 4 miles of the Deveron at Turriff, and wheels suddenly on a new course; thence, till it touches Slains, it makes numerous sweeps, some of which are long, yet runs prevailingly toward the south-east; and, over  $2\frac{3}{4}$  miles, above its emhouchure, it runs nearly due south. It achieves, from its source to the sea, a distance of about 31 miles; and receives in its progress, besides many smaller trihutaries, eight or nine affluents of each more than 5 miles length of course. It has a smooth and slow current; and, owing to the general construction of drains in the lands which form its hasin, it rises more rapidly in freshets than formerly, and occasionally flows far over its hanks. Much of the country which it immediately traverses is low and alluvial; and, previous to recent improvements for its protection, was, in a great measure, desolated by the river's floods. The stream has two good salmon-fishings,—the one at its mouth, and the other at Ellon, 6 miles up; and it has some celebrity for having at one time produced valuable pearls: see **SLAINS**. It is navigable for river-craft to Ellon, and for vessels of 150 tons to the distance of about a mile from the sea.
